◆ Reports and Announcements ◆

AMA CENTENNIAL

The annual meeting of the American Medical Association to be held in Atlantic City, June 9-13, 1947, will celebrate the 100th anniversary of the association.

The resignation of Dr. Olin West, president-elect of the AMA, because of ill health, will cause deep regrets in many quarters. The presidency of the association would have been a fitting culmination to the many years of service rendered to the national organization by Dr. West.

Announcement has been made that Dr. Edward L. Bortz, of Philadelphia, at present a vice president, will succeed Dr. West and will be inaugurated as president of the association in June.

Dr. Bortz was born in Greenberg, Pennsylvania, February 10, 1896, and now lives in Philadelphia. He became a Fellow of the American College of Physicians in 1929, was certified by the American Board of Internal Medicine in 1937, and in 1942 was made a member of the Council on Scientific Assembly of the AMA. He has been a delegate to the AMA since 1945 and is chairman of the Committee on National Emergency Medical Service of the association. During World War II, Dr. Bortz served as captain in the U. S. Naval Medical Corps.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty-fifth annual scientific and clinical session September 2, 3, 4, 5 and 6, inclusive, at the Hotel Radisson, Minneapolis. Scientific and clinical sessions will be given the days of September 3, 4, 5 and 6. All sessions will be open to members of the medical profession in good standing with the American Medical Association.

In addition to the scientific sessions, the annual instruction courses will be held September 2, 3, 4 and 5. These courses will be open to physicians and the therapists registered with the American Registry of Physical Therapy Technicians.

For information concerning the convention and the instruction course, address the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION

The National Gastroenterological Association will hold its 12th annual convention and scientific sessions at the Hotel Chelsea in Atlantic City, N. J., on June 4, 5, 6, 1947, affording those interested in attending the centennial celebration of the American Medical Association and the meeting of the National Gastroenterological Association a chance to be present at both.

The program will consist of eighteen papers on various phases of gastroenterology and allied subjects. Among those presenting papers will be: Dr. Manuel G. Spiesman, Chicago, Ill.; Dr. Emanuel M. Rappaport, New York, N. Y.; Dr. L. C. Sanders, Memphis, Tenn.; Dr. Herman Osgood, Boston, Mass.; Dr. James P. Campbell and Dr. Harold A. Grimm, Wheaton, Ill.; Dr. Edward T. Whitney, Boston, Mass.; Dr. F. Steigmann and Dr. Hans Popper, Chicago, Ill.; Dr. Lester M. Morrison, Los Angeles, Calif.; Dr. M. E. Steinberg, Portland, Oregon; Dr. John E. Cox, Memphis, Tenn.; Dr. George Miley, Philadelphia, Pa.; Dr. Tom D. Spies, Birmingham, Ala.; Dr. Fernando Milanes and Dr. Guillermo Garcia Lopez, Havana, Cuba, and Mr. R. Johnson, Birmingham, Ala.; Dr. Donald Cook, Chicago, Ill.; Dr. Norman Jolliffe, New York, N. Y.; Dr. Matthew T. Moore, Philadelphia, Pa.; Dr. Verne G. Burden, Philadelphia, Pa.; Dr. Thomas J. Fitz-Hugh, Jr., and Dr. A. J. Creskoff, Philadelphia, Pa.

At the luncheon round-table conference Thursday, June 5, 1947, Dr. Hyman I. Goldstein of Camden, N. J., will speak on "The History of Gastroenterology and the Development of this Specialty in America."

At the annual banquet to be held on Thursday evening, June 5, 1947, the winner of the National Gastroenterological Association's 1947 Cash Prize Award Contest for the best unpublished contribution on gastroenterology or an allied subject, will receive the prize of $100.00 and a Certificate of Merit. The guest speaker of the evening will be Dr. Homer T. Smith of the New York University College of Medicine whose subject will be "Plato and Clementine."

Program and further details may be obtained from the National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

AMERICAN COLLEGE OF PHYSICIANS

During March the American College of Physicians held two one-week postgraduate courses at Rochester, one dealing with peripheral vascular disease, including hypertension, and the other concerned with rheumatic diseases. The courses were under the direction of Dr. E. V. Allen and Dr. P. S. Hench, respectively, both of Rochester. Approximately seventy-five members of the American College of Physicians came from all parts of the United States to hear lectures and discussions presented by guest speakers from throughout the nation.

CENTRAL ASSOCIATION OF OBSTETRICIANS AND GYNECOLOGISTS

Two $100 prize awards are offered annually by the Central Association of Obstetricians and Gynecologists to any accredited physician, research worker or medical student within the confines of the Central Association, which includes Minnesota. One award is for the best investigative work, and the other for the best clinical work, in the field of obstetrics and/or gynecology. Pa-

THE
SPENCERFLEX
FOR MEN

Welcome!
SPENCER
EXHIBIT
A. M. A.
Convention
BOOTH E7

Individually designed for each patient, the Spencerflex provides pelvic control and abdominal uplift with freedom for muscular action. Improves posture and body mechanics. Non-elastic. Will not yield or slip under strain. Very durable, moderate cost. Can be put on, removed, or adjusted in a moment.

Also designed as adjunct to treatment following upper abdominal surgery. Completely covers and protects scar without "digging in" at lower ribs. Relieves fatigue and strain on tissues and muscles of wound area. *We know of no other support for men providing these benefits.*

For information about Spencer Supports, telephone your local "Spencer corsetiere" or "Spencer Support Shop", or send coupon below.

pers submitted for either award must be in the hands of the secretary of the organization not later than August 15, 1947. Further information may be obtained from Dr. John I. Brewer, secretary-treasurer of the association, 104 South Michigan Avenue, Chicago, Illinois.

MINNESOTA PATHOLOGICAL SOCIETY

The regular meeting of the Minnesota Pathological Society was held in the Medical Science Amphitheater of the University of Minnesota Medical School on April 22, at 8:00 P.M. Dr. G. T. Evans and Dr. D. T. Kaung presented a discussion of the topic, "A Consideration of the Action of Insulin."

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

Members of the Minnesota Society of Neurology and Psychiatry attended a one-day clinic-lecture conference at Rochester on May 3.

The program began at 8:00 A.M. with surgical clinics conducted by the Mayo Clinic neurosurgical staff in the operating rooms at St. Mary's Hospital. At 10:30 A.M. the lecture part of the program started. The following subjects were presented:

"Classification of Nystagmus" (with motion picture demonstration)—Dr. C. W. Rucker.

"Comments on Infantile Muscular Myopathies"—Dr. Mary E. Giffin.

"Misleading Rhythms in the Electroencephalogram in the Diagnosis of Tumors of the Brain"—Dr. R. G. Bickford.

"The Present Status of Thymectomy in the Treatment of Myasthenia Gravis"—Dr. L. M. Eaton.

"Metastatic Brain Abscess"—Dr. E. M. Gates.

At 12:30 P.M. the group was served a luncheon at the Mayo Foundation House, after which Dr. F. J. Braceland spoke on "European Neuropsychiatry."

MINNEAPOLIS SURGICAL SOCIETY

Newly elected officers of the Minneapolis Surgical Society are Dr. L. Haynes Fowler, president; Dr. Carl O. Rice, vice president; Dr. Rudolph E. Hultkrans, treasurer, and Dr. Theodore H. Sweetser, council president.

WASHINGTON COUNTY

The Washington County Medical Society met April 8, 1947, and was addressed by Dr. Oswald S. Wyatt of Minneapolis on the subject, "Appendicitis in Children."

Two visitors were present: Captain Scott Swisher, Jr., of Bayport, who was home on terminal leave and will soon begin a fourteen months' residency at the Strong Memorial Hospital at Rochester, New York, and Dr. Edgar C. Bunseth, who is now associated with Dr. G. McC. Ruggles of Forest Lake, Minnesota.

TWO DISTINCTIVE PENICILLIN PRODUCTS

1

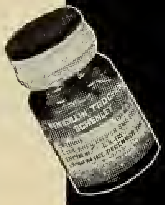
PENICILLIN TABLETS *Schenley*

A special coating masks the penicillin taste of these tablets. Valuable in supplementing injections to maintain effective blood levels. Given in five times the parenteral dose, they may be employed to replace injections after the acute phase of the disease has subsided. Particularly useful in ambulatory cases.

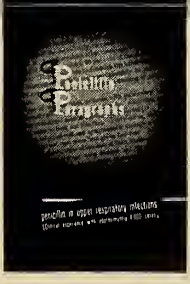
Each tablet provides 50,000 units of calcium penicillin, buffered with calcium carbonate. Requires no refrigeration.
Available in bottles of twelve.

2

PENICILLIN TROCHES *Schenley*



Rectangular in shape, agreeably flavored, these troches provide a rational means of obtaining the benefits of penicillin in infections of the mouth and throat caused by penicillin-sensitive organisms. Each troche supplies 1,000 units of calcium penicillin. They dissolve slowly, thus prolonging the action of the drug.



A SCHENLEY SERVICE
Penicillin Paragraphs, providing a continuing summary of penicillin therapy in specific disease entities, will be sent to physicians requesting to be placed on our mailing list.

SURGICAL SOLUTION
MERCUROCHROME
ARMY E NAVY

Prevent
INFECTION
with
MERCUROCHROME

(H. W. & D. brand of merbromin, dibromoxymercurifluorescein-sodium)

Extensive use of the Surgical Solution of Mercurochrome has demonstrated its value in preoperative skin disinfection. Among the many advantages of this solution are:

Solvents which permit the antiseptic to reach bacteria protected by fatty secretions or epithelial debris.

Clear definition of treated areas. Rapid drying.

Ease and economy of preparing stock solutions.

Solutions keep indefinitely.

The Surgical Solution may be prepared in the hospital or purchased ready to use.

Mercurochrome is also supplied in Aqueous Solution, Powder and Tablets.

WOMAN'S AUXILIARY

LAST CALL!

Last Call for reservations for the Twenty-fourth Annual Convention of the Woman's Auxiliary to the American Medical Association, which will be held at Haddon Hall Hotel, Atlantic City, New Jersey.

Atlantic City Extends a Hearty Welcome to You.

HENNEPIN COUNTY

To raise funds for its various philanthropies, the Woman's Auxiliary to the Hennepin County Medical Society sponsored their annual Easter Monday Benefit party at the Calhoun Beach Club on April 7. Mrs. Harold G. Benjamin was general chairman with Mrs. Ernest L. Meland as co-chairman. Mrs. C. L. Norman Nelson was in charge of tickets.

Luncheon was served at 1:30 p.m., followed by a delightful Dayton's Style Show, and a short drama entitled, "If Men Played Bridge as Women Do," presented by the North Star Drama Guild.

RAMSEY COUNTY

The Ramsey County Medical Auxiliary was the first Red Cross group in Saint Paul, working in the current drive, to complete solicitation in the campaign to raise $200,000, it was announced by Mr. Douglas K. Baldwin, Saint Paul and Ramsey County, campaign chairman.

On Monday, March 24, the Auxiliary entertained about three hundred guests at its annual guest day tea and program. Representatives of many women's organizations were present, including Mrs. Luther Youngdahl of Minneapolis and Mrs. Melvin S. Henderson of Rochester.

Preceding the tea, Dr. Raymond N. Bieter, head of the Department of Pharmacology at the University of Minnesota, talked on newly discovered drugs and how they are helping the medical profession in its fight against disease.

OLMSTED-HOUSTON-FILLMORE-DODGE COUNTY

At the quarterly meeting of the OHFD Auxiliary in March, Mrs. Russell M. Wilder, a member of the National Board on Juvenile Delinquency, and Dr. Maurice N. Walsh from the Department of Neurology at the Mayo Clinic, collaborated in presenting a program on juvenile delinquency. Officers of the Parent-Teacher Association and the principals of the city schools were invited guests. The program and discussion embraced both national and local problems and was well received.

The Auxiliary is sponsoring the cancer essay and poster awards in all Junior and Senior High Schools in the four counties.

Several members are working on the April drive for funds by the county cancer society. Small informal groups are organizing to make cancer dressings.

The Auxiliary is holding open house for the doctors' wives in the outlying counties who wish to accompany their husbands to Rochester on the evenings when the Medical Society holds its meetings.

In Memoriam

JAMES LINN ADAMS

Dr. James L. Adams, for thirty-six years a general practitioner at Morgan, Minnesota, died in March, 1947, at Van Nuys, California, whither he had moved on retiring in 1928. He was eighty-seven years old, and he and Mrs. Adams had recently celebrated their golden wedding.

Dr. Adams obtained his M.D. degree at the Missouri Medical College in 1886. He came to Morgan, Minnesota, in 1892, and prided himself on being a "real horse and buggy doctor."

In 1941, he returned to Morgan when grateful citizens unveiled a granite monument with a bronze plaque bearing his likeness in Vernon Park. The legend on the monument reads: "James L. Adams, a Pioneer Doctor. Service to His People Filled the Life of This Man, Without Thought of Personal Gain."

Dr. Adams is survived by his widow; three daughters —Frances of Long Beach, and Mildred and Marian of Carmel, California; and one son, James, Jr., of Olivia, Minnesota.

CLEMENT CAMPBELL BLAKELY

Dr. C. C. Blakely of Barnum, Minnesota, passed away on March 29, 1947, following a stroke. He was seventy-one years of age. He had practiced medicine and had been active in the social life of Barnum since 1920.

Dr. Blakely was born in Foo Chow, China, March 13, 1876, the son of Presbyterian missionaries in that field. In his early childhood, his family returned to America and lived in Neenah, Wisconsin, where he attended high school. Later, he attended Ripon College and obtained his medical degree from the University of Minnesota in 1909. After spending a year in pathology at the University, he interned at Ancker Hospital, Saint Paul, and began practicing at Saint Peter in 1911. He entered the army in 1918, serving as captain in the medical corps, 183rd Depot Brigade.

Following his discharge from the army, Dr. Blakely came to Barnum in January, 1920, looking for a location. The community, without a doctor, was in the midst of a scarlet fever epidemic, and he was induced to stay. This was two years after the disasterous Moose Lake-Kettle River forest fire, and there were still many reminders of that tragedy in ruined dwellings and burned-over woods. As a result of the fire, practice at Barnum was rather primitive. The roads being poor, the horse and buggy, bobsled, and even snow shoes were resorted to. He at one time invested in a snowmobile which would make thirty miles an hour. With the advent of the big county snowplows, the snowmobile was given up. The doctor many times had reason to be grateful to the snowplow crews who always responded promptly to a call to open up snowfilled roads, so he could reach a patient in an emergency.

During his residence at Barnum, Dr. Blakely was active in various lines of endeavor. He was a member of the Board of Education for twelve years, serving as its president for several terms; president of the Parent-Teachers Association; trustee of the Presbyterian church for six years; and member of the Commercial Club. He was also a member of the A.F. and A.M., the IOOF, the American Legion, St. Louis County Medical Society, the Minnesota State and American Medical Associations.

Dr. Blakely was a very successful practitioner. His life was not an easy one—a country doctor's life seldom is. But he enjoyed his work and had the satisfaction of feeling that he was working for the good of mankind. As one former patient wrote, "He has fought the good fight and finished his course."

GEORGE CLAUDE DITTMAN

Dr. George C. Dittman was born in Saint Paul, Minnesota, on October 9, 1882, and died after a short illness, from heart disease, on January 9, 1947.

He attended the Webster grade school, Central High School in Saint Paul, and received his degree of doctor of medicine from the University of Minnesota in 1904. After completing his internship at Ancker Hospital in Saint Paul in 1905, he practiced for a year in South Saint Paul. Not satisfied with his work there, he went abroad and studied in his specialty in eye, ear, nose and throat diseases. He returned in 1907 and practiced his specialty for two years until 1909. At that time he became associated with his uncle, the late Dr. Joseph Bettingen, with whom he remained in partnership until Dr. Bettingen's death in 1921, after which he continued in his specialty alone until his death in January, 1947.

Dr. Dittman served in World War I in the Medical Corps. He was a member of the staff of St. Joseph's Hospital. He was an active member of the Ramsey County Medical Society, Minnesota State Medical Association, and was a Fellow of the American Medical Association.

Surviving Dr. Dittman is his sister, Miss Georgiana Dittman of Saint Paul.

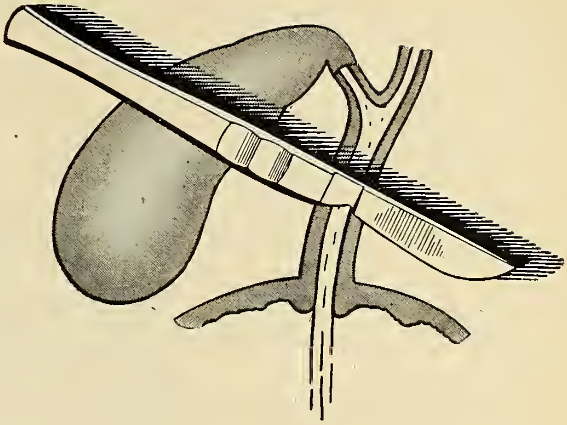
KARL DEDOLPH, M.D.

FLOYD LESTER GILLES

Dr. F. L. Gilles, Minneapolis, died of a heart attack as he was entering his car in front of Fairview Hospital on April 24, 1947. He was fifty-five years of age.

Dr. Gilles was born in Sherburne, New York, May 27, 1891. He attended high school in Shortsville, New York, and obtained his medical education from Syracuse College, receiving the degrees of B.S. and M.D. in 1917. He interned at Asbury Hospital, Minneapolis, and served with the Medical Corps of the Army, being discharged in March, 1919. He was associated with Dr. A. E. Wilcox from May, 1919, until October, 1920, and has since practiced surgery, having been on the Fairview and Asbury hospital staffs.

Dr. Gilles was a past master of Khurum Lodge, A.F. and A.M., and a member of the Scottish Rite consistory, Zuhrah Temple Legion of Honor. He was also a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations.



Surgical Principle Accomplished Medically

Drainage in the presence of infection or congestion is a sound surgical principle.

In chronic inflammatory conditions of the bile passages without stones, drainage is accomplished by increasing the production and flow of free-flowing, low viscosity bile, employing Decholin for its hydrocholeretic action.

Decholin (dehydrocholic acid) stimulates the production of thin bile by the liver cells, with a resultant cleansing action on the entire biliary tract.

Decholin
REG. U.S. PAT. OFF.

Decholin is supplied in boxes of 25, 100, 500 and 1000 3¾ gr. tablets.

CARL M. JOHNSON

The death of Dr. Carl M. Johnson on February 1, 1947, removed one of the state's leading physicians, a valued Councilor of the State Medical Association, and an outstanding citizen of Dawson, Minnesota.

Carl Johnson was born July 27, 1882, on a farm northwest of Pelican Rapids, a spot chosen by his father, John M. Johnson, when he came to that region as the first settler.

It is always a matter for debate whether environment or heredity is most important in formation of character; this in his case was settled, by giving him both. His parents were outstanding citizens for over fifty years—very successful farmers, pillars of the church, and his father's advice was sought by large numbers throughout his long life. Carl carried these ideals absorbed in youth to the end.

Carl Johnson was educated in the Park Region Lutheran College, Fergus Falls; Hamline University, and the University of Minnesota, graduating in medicine in 1910. He interned in St. Barnabas Hospital, and took postgraduate work in New York. Following this, he was associated with Dr. L. G. Smith, Montevideo, until 1916, when he joined his brother, Herman, in Dawson.

This partnership was ideal. Most, who know, agree that Herman was one of Minnesota's great men, possessing a remarkable mind, fine judgment, unlimited drive, high ideals and character. Herman would have dominated anywhere he chose, but was satisfied in giving his community the best in medical and surgical service, leading the citizens on the right road in civil and political affairs, and acting as an outstanding advisor to the Minnesota State Medical Association; refusing through his whole life to accept public office.

Carl, though having equal ability, was Herman's complement—thoughtful, very slow in making a decision, kindly and deliberate, never irritable. It was Carl who always had time to discuss problems with anyone in the city or hospital, thus becoming the greatly valued advisor of the community. Though generous, he was wise in finance; at the time of his death being president of the Northwestern State Bank of Dawson, president of the City Council, and chief of staff of the Dawson Community Hospital.

The high standards set by Herman and Carl will be carried on by two cousins and Dr. J. G. Boody, a valued partner in practice for many years.

Vilhem (Bill), Herman's son, who greatly distinguished himself in the last war, becoming a Major, is now carrying the chief burden. He will soon be joined by Curtis, Carl's son, who is now finishing his internship.

Besides Curtis, Carl leaves Douglas and Dorothea, fine young people still in college, and Mrs. Johnson, formerly Anna Loberg.

It can be said that Carl lived a full and useful life, dying with as few reasons for regrets as it is humanly possible.

LEE W. POLLOCK

Dr. Lee W. Pollock, head of the sections of medicine at the Mayo Clinic at Rochester, died following a stroke February 2, 1947.

Dr. Pollock was born at Evansville, Minnesota, February 7, 1887. He attended high school at Rochester and for fifteen months after graduation he worked in the laboratory at St. Mary's Hospital under the tutelage of Dr. L. B. Wilson. His interest in laboratory work continued and while he was an undergraduate at the University of Minnesota his spare hours and summer vacations throughout his course were spent in the pathologic laboratory under Dean F. F. Wesbrook, Dr. H. E. Robertson, Dr. R. H. Mullin and others. He received the degrees of B. S. in 1911 and M.D. in 1912 from the University of Minnesota. After an internship in City and County Hospital (later Ancker), St. Paul, he practiced in Warren, Minnesota, for about a year and then went to the Mayo Clinic in November, 1914. During World War I he was a first lieutenant and served on the Board of Examiners for tuberculosis in various army camps. He returned to the clinic and in 1925 was made head of a section. He was also an assistant professor of medicine in the Mayo Foundation.

In the clinic his work was always associated with Dr. A. H. Logan and for a number of years he performed the proctoscopic examinations and supervised the tedious treatment of ulcerative colitis and other medically treated colon conditions.

Because of his persistence in his diagnostic work and his refusal to dismiss a patient until he himself was satisfied, his pleasant personality and his patience, a great number of patients always sought him on their return visits. He was a great reader on medical subjects and always purchased his own books so that he could utilize any free moments available from the care of his patients. He was considered a good teacher by the fellows who were fortunate enough to come under his influence and he wrote well but infrequently. His rather retiring disposition deterred him from participating in medical meetings.

His hobbies were numerous. As a student his chief delight was playing baseball, and after college he was an ardent follower of the University of Minnesota football team. He always liked dogs and owned several good ones. In 1926 he acquired some wooded hillside land in the outskirts of Rochester and on this project expended much energy and satisfied several urgent impulses to produce the best of whatever he undertook. He had chickens, and being on the dietetic committee of the clinic he early used his training to formulate a ration for his laying hens which produced satisfying results in growth of the birds and egg production. In 1926 crude cod liver oil was added to the chicken mash as well as the milk fed to his prize Jersey calves. During the year preceding his death, his few excellently bred Jersey cows topped the county records in milk production and butterfat.

He always loved to see things grow. His interest began with apples and plums, continued on into iris, lilacs and gladiolus. His greatest effort was in his prize peonies. On his small plat of land there were between 6,000 and 7,000 plants with more than 500 named varieties. Many prizes were acquired for his beautiful blooms at the peony shows.

He married Addie Baihly of Rochester on June 14, 1916, and is survived by his wife and a sister, Mrs. Frank Jacobs, of Rochester, and a host of friends.

He was a member of the Southern Minnesota Medical Association, the American Medical Association, the Alumni Association of the Mayo Foundation and Sigma Xi.

THOMAS HALL SHASTID

Dr. Thomas H. Shastid, a practicing ophthalmologist and author in Duluth since 1920, died February 15, 1947, at the age of eighty.

Born in Pittsfield, Illinois, July 19, 1866, Dr. Shastid attended the local schools and Eureka College, Illinois. He obtained his medical education at Columbia University and the University of Vermont, obtaining his M.D. degree in 1888. He also obtained a B.A. degree from Harvard in 1893, an M.A. from the University of Michigan in 1901, and an LL.B. from the same university in 1902. Postgraduate work was taken also at the Postgraduate Medical School in New York and in Vienna on two occasions.

Dr. Shastid was indeed a remarkable individual, and during his long life he took an active and combative interest in anything and everything pertaining to medicine and to his chosen specialty of eye, ear, nose and throat. For many years he assisted in the editing and the collecting of data pertaining to the American Encyclopedia of Ophthalmology and its publication.

Prior to coming to the Head of the Lakes (Superior and Duluth) he traveled about considerably, and practiced in several cities of Illinois: Pittsfield, Galesburg, Fairfield, Charleston and Marion. He is credited with more than 3,000 publications. Two thick tomes, copiously illustrated, dealing with what he called his "first and second lives," were published by him. Much of the information concerned in these books is extremely personal but it has considerable historical value because it connotes the gradual development of medicine in its various fields within that extensive period of sixty years in which he was student, practitioner, teacher and specialist. Not a little of the material covered in these books illustrates the limitless bickering and argument, not to say controversy, written and spoken just prior to the turn of the century, when doctors were finding their way to more congenial associations and the medical societies to more scientific pursuits. As an author, he went into great detail concerning his own confusing illnesses and the variety of approaches and diagnostic impressions, as, for example, when violent indigestion persecuted him at great length, only to be ultimately solved by an abdominal operation and an exploration. In later years he had a great fear of "sinus disease." He would frequently attend a medical meeting, where the air in the room was never too satisfactory, wearing a heavy fur cap pulled well down over his ears because, as he stated, "the slightest cold drives me fran-

tic." His writing was by no means confined to medical fields, and one of his books, *Simon of Cyrene,* was very well received and had excellent mention from the critics about two decades ago.

His habits of living in later years became intensely individual. He arose about noon, and then went to his office, where he saw many people, for he had developed an unusual reputation in rather complicated optometry. In addition, he had some unusual avocations. One of these was to go out to the zoo and make ophthalmoscopic examinations of the various animals, including fish, birds, snakes, and in fact any other living creature submitting to approach. He made extensive contributions relative to the pupil, both of human beings and animals.

SHELBY E. STINNETTE

Dr. Shelby E. Stinnette died March 27, 1947, in Los Angeles, California. The cause of death was coronary thrombosis, complicated by cerebral thrombosis.

Dr. Stinnette was born August 10, 1886, at Louisville, Kentucky. He was graduated from the Louisville Male High School in 1907, the Kentucky School of Pharmacy in 1909, and Hahnemann Medical College of Chicago in 1913, following which he came to Saint Paul.

He was first associated with Dr. S. G. Cobb at 365 Prior Avenue. In 1920 he opened offices with Dr. Hugh Beals at 322 Hamm Building, where he continued to practice until his retirement in 1946.

He was a member of Ramsey County Medical Society and Minnesota State Medical Association, Triune Lodge No. 190, A.F. and A.M.; Palmyra Chapter No. 55, Royal Arch Masons; the Saint Paul Athletic Club, Kiwanis Club, the Automobile Club and the Midway Club. He was a trustee of Trinity Methodist Church and a staff member of Midway and Bethesda Hospitals.

Dr. Stinnette was a man devoted to his family and his patients, as they were to him. He lived cleanly and honestly, and from those who knew him he achieved an affection which is given to few men. He loved his home and was a genial and charming host. He loved the out-of-doors, and there could be no better fishing or hunting companion. He was a faithful servant of his church. These things made him an outstanding member of his profession.

He is survived by his wife; two daughters, Mrs. W. D. Schmidt of Saint Paul, and Mrs. H. F. Wilenchek of Atlanta, Ga.; two brothers, a sister, and four grandchildren.

There is peculiar pathos in the fact that Dr. Beals, with whom Dr. Stinnette shared offices for twenty-six years chanced to be near when Dr. Stinnette was stricken and was in constant attendance during the last days of his illness.

Charles C. Cooper, M.D.

Of General Interest

On March 29, Dr. Paul R. Lipscomb and Dr. G. B. Logan, Rochester, participated in a clinic for crippled children at Worthington.

* * *

Dr. H. H. Albrecht Lindstrom, purchased the Chisago Lakes Clinic in Chisago City, March 14, taking over the interests of Dr. C. A. Peterson.

* * *

A recent addition to the staff of the River Falls Clinic is Dr. R. R. Davis, formerly of Wisconsin General Hospital, Madison, Wisconsin.

* * *

Dr. Henry J. Wynsen, after a year's residency in medicine at Ancker Hospital, Saint Paul, has entered a residency in pathology at St. Mary's Hospital, Duluth.

* * *

Dr. T. R. Fritsche, New Ulm, was elected president of the Minnesota Academy of Ophthalmology and Otolargngology at a meeting held in Minneapolis on March 14.

* * *

Dr. J. C. Crabtree and Dr. Alfred Kapsner, Princeton, have purchased the former Ewing Building in that city and are having it remodeled to house a new medical clinic.

* * *

After nine years of medical and surgical practice in Two Harbors, Dr. Roland F. Mueller has moved to Lincoln, Nebraska, where he is now a surgeon with the Olney Clinic.

* * *

While Dr. N. F. Musachio, Foley, attended a short course in surgery in Chicago, Illinois, in late March, his practice was conducted by Dr. John H. O'Leary, formerly of Minneapolis.

* * *

At a meeting of the Chicago Medical Society in Chicago in the early part of March, Dr. H. W. Meyerding, Rochester, received the first award for his scientific exhibit on "Benign and Malignant Tumors of Bone."

* * *

Speaking at a Rotary Club meeting in Fergus Falls on March 12, Dr. H. K. Helseth of that city pointed out the disadvantages of socialized medicine by discussing the reasons for which the medical and dental professions are opposed to medical regimentation.

* * *

Dr. Victor Johnson, recently appointed director of the Mayo Foundation, to take office in October, has arrived in Rochester and has joined the staff of the Foundation as professor of physiology, in order to begin the task of learning the duties of director.

* * *

Seven army medical officers are attending continuation courses this spring at the University of Minnesota, it was recently announced. When the officers' training is completed, they will assist the army in setting up basic science courses at service hospitals for the training of regular officers in the various specialties.

* * *

Dr. Gordon R. Kamman, Saint Paul, addressed the Polk County (Wisconsin) Medical Society at its monthly meeting held in Stillwater on March 20. Dr. Kamman's subject was "Neuropsychiatry in General Office Practice."

* * *

During the annual meeting of the American Medical Association in Atlantic City, the Alumni Association of the Jefferson Medical College will hold a smoker at the Traymore Hotel, Atlantic City, on Wednesday, June 11, 1947.

* * *

Speaking at the Surgeon General's Conference at Walter Reed General Hospital in Washington, D. C., March 20, was Dr. F. H. Krusen, Rochester, who discussed "The Developments of the Modern Era of Physical Medicine as Observed During the Past Two Decades."

* * *

Dr. Carleton W. Leverenz has become associated with Dr. Harry Oerting, with offices at 914 Lowry Medical Arts Building, Saint Paul, specializing in internal medicine. A graduate of the University of Illinois, Dr. Leverenz served his internship and a residency at Ancker Hospital, Saint Paul.

* * *

Dr. A. M. Snell, Rochester, spoke at the April 7 meeting of the Hennepin County Medical Society on the subject, "Some Clinical and Physiologic Aspects of Portal Cirrhosis." While in Minneapolis, he also was a speaker at the University of Minnesota Center for Continuation Study, where his topic was "Some Current Problems in the Field of Gastronenterology."

* * *

At the eleventh annual meeting of the Saint Paul Surgical Society, held April 19 at the Minnesota Club in Saint Paul, 158 members and guests of the society heard Dr. Karl Meyer, professor of surgery at Northwestern University Medical School, speak on the subject, "The Early Ambulatory Treatment of the Postoperative Patient."

* * *

April showered lecture duties upon Dr. Philip S. Hench, Rochester, who started the month by journeying to Portland, Oregon, to deliver three Sommer Memorial lectures. From there he went to Denver, Colorado, where he gave four lectures at the Fort Logan Veterans Hospital and at the University of Colorado School of Medicine.

* * *

Among the speakers at a meeting of the Missouri State Medical Association at Kansas City in the first week in April were Dr. D. R. Nichols and Dr. A. M. Olsen, Rochester. Dr. Nichols presented a paper entitled, "Chemotherapy as Used in Medical Conditions," while the subject of Dr. Olsen's address was "Diagnosis and Treatment of Bronchial Lesions."

* * *

April 3 was the ninety-first birthday aniversary of Dr. Christopher Graham, Rochester, and was marked by an all-day celebration that included the presentation of a giant birthday cake at a Rotary Club meeting, a constant flow of telegrams, telephone calls and gifts, and an evening dinner party attended by all members of his family.

* * *

The president of the Northwestern Pediatric Society, Dr. George C. Kimmell, Red Wing, has endorsed the campaign of the Minnesota American Legion to establish a research professorship for rheumatic fever and heart disease in connection with the proposed heart hospital at the University of Minnesota. Goal of the campaign is $500,000.

* * *

Dr. Bruce Boynton, who formerly practiced in Park River, North Dakota, has moved to Ada and opened an office there. Dr. Boynton graduated from the University of Minnesota Medical School in 1944, after which he served in the United States Navy. Upon discharge in February, 1946, he began his medical practice in Park River.

* * *

Dr. J. Arthur Myers, Minneapolis, was a member of a fifteen-man delegation from the United States to the seventh Pan-American Congress on Tuberculosis which began its meeting on March 17 at Lima, Peru. The delegation was headed by Dr. Herman E. Hilleboe, assistant surgeon general of the United States Public Health Service.

* * *

Dr. John P. Cooper, formerly an industrial surgeon at the Minneapolis-Moline Company in Hopkins, has opened offices in the Tonka Building in Excelsior. A graduate of the University of Minnesota Medical School, Dr. Cooper spent two years at the Hospital of the Good Samaritan, Los Angeles, California, before serving in the navy during World War II.

* * *

Dr. Bernard Zondek, professor of gynecology at the Hebrew University in Jerusalem, and co-discoverer of the Aschheim-Zondek pregnancy test, spoke at the University of Minnesota Center for Continuation Study on April 19. He addressed approximately seventy Minnesota doctors recently discharged from the military services, speaking on "Observations on Female Sterility."

* * *

The American Bureau for Medical Aid to China, a co-operating agency of United Service to China, has provided for 125 fellowship awards annually, to enable Chinese doctors, dentists, public health experts, and nurses to engage in advanced studies in leading American universities. After a year of study they will return to China to join the faculties of six national medical colleges that have been selected to receive this assistance.

SULFATEST

A 10 SECOND URINE TEST
FOR SULFA DRUGS

SULFATEST
SULF A TEST

Sulf-A-Test will show:
1. If previous treatment has been given.
2. If the kidneys are excreting the sulfa compounds after the initial dose.
3. The approximate mgms. % in the blood per 100cc.
4. If renal damage has been done, the sulfa compounds will be present after they normally should have been excreted from the body.

Directions: Place one drop of urine on a Sulf-A-Test disc. Add one drop of Sulf-A-Test solution. Ready to compare in 10 seconds.

The Royal Flemish Academy of Medicine of Belgium elected Dr. Frank D. Mann, Rochester, as a foreign honorary member of the organization, at a meeting of the academy in Brussels on November 25, 1946. The election of Dr. Mann was approved by a Decree of the Regent of the Kingdom under the date of January 28, 1947, promulgated in the *Belgian State Journal* of February 19, 1947.

* * *

Remodeling of the long-unused Crosby Hotel building, Crosby, was completed early in April to provide quarters for a new medical clinic opened by Dr. L. N. Dale and Dr. James Nixon of that city. The clinic consists of nine rooms on the ground floor of the building, including offices for both doctors, examining rooms, an x-ray room, darkroom, laboratory and small operating room.

* * *

Acceptance of Dr. K. W. Anderson, Minneapolis, of the newly appointed office of chairman of the Health and Medical Care Division of the Minneapolis Council of Social Agencies, has been announced. Dr. Anderson, a past president of the Minneapolis Academy of Medicine, is the medical directorof the Northwestern National Insurance Company and an associate professor of medicine at the University of Minnesota.

* * *

More than forty public health specialists in the Northwest attended the Middle States Region Health Educators' Conference at the University of Minnesota Center for Continuation Study on April 25 and 26. Health films were shown and panel discussions were held during the business sessions. Governor Luther Youngdahl spoke on "Conservation of Human Resources and Health Education" at the conference banquet on April 25.

* * *

Formerly of Saint Paul, Dr. R. W. Maertz has begun practice in Goodhue, replacing Dr. James R. Weir of that city.

Dr. Maertz, a graduate of Creighton College, Omaha, Nebraska, interned at St. Joseph's Hospital, Saint Paul.

Dr. Weir has moved to Monroe, Wisconsin, and has become affiliated with a medical clinic there.

* * *

Dr. Albert V. Stoesser, clinical professor of pediatrics at the University of Minnesota, and head of the allergy clinics at Minneapolis General and University Hospitals, was a guest instructor at a four-day symposium on allergy held at the University of Kansas School of Medicine, May 5 to 8. Dr. Stoesser spoke on "Hay Fever—Diagnosis and Management" and "Dermatologic Allergy in Children."

* * *

Tribute was paid on March 20 to Dr. Charles W. Mayo by the Rochester Elks Lodge, which selected him at its annual honor night program as an outstanding citizen of Rochester. Toastmaster at the program was Allen J. Furlow, who said of Dr. Mayo: "He has the heritage of a great name, but unless he had what it takes, we wouldn't be honoring him tonight." Mr. Furlow pointed out that the honor "is presented for

Dr. J. S. Lundy and Dr. E. B. Tuohy, Rochester anesthesiologists, journeyed to Los Angeles in the middle of April to attend a meeting of the American Board of Anesthesiology, at which Dr. Lundy assisted with the board's oral examinations. While in Los Angeles, they attended a joint meeting of the American Society of Anesthesiologists, of which Dr. Tuohy is president, and the Anesthesia Section of the Los Angeles County Medical Society.

* * *

Dr. W. R. Lovelace II, a former Mayo Clinic staff member, who left Rochester recently to join the staff of the Lovelace Clinic in Albuquerque, New Mexico, has been named physician-in-charge of passenger comforts in high flying by the Trans World Airline. Dr. Lovelace was a colonel in World War II, during which he received international acclaim for his daring parachute jumps from high altitudes—part of a research program in high altitude flying.

* * *

Dr. Miriam M. Pennoyer, St. Louis, Missouri, who was engaged in postgraduate work in pediatrics at the University of Minnesota Hospitals from 1939 to 1944, has been awarded a research fellowship in medicine by the American College of Physicians, and will investigate adrenal function in the newborn at the St. Louis Children's Hospital, under the direction of Dr. A. F. Hartmann of the Washington University School of Medicine.

* * *

Recently Dr. H. S. Diehl, dean of the University of Minnesota Medical School, stated that for some time 30 to 40 per cent of students admitted to the Medical School had had positive Mantoux reactions, and that two-thirds of those who reacted negatively on admission showed positive reactions before graduation. This incidence has now been reduced to 10 per cent. In the last five years only one medical student has developed clinical tuberculosis.

* * *

The association of Dr. Robert H. Conley with Dr. Roger G. Hassett, Mankato, was announced on March 17. Dr. Conley, a graduate of the University of Minnesota Medical School, served his internship at General Hospital in Rochester, New York. During the war he was in the naval medical corps for thirty-eight months, thirty months of which were spent with amphibious forces in the Pacific theater. Following his discharge, Dr. Conley completed a year of postgraduate work in medicine a the University of Minnesota.

* * *

Retirement in March of Dr. A. J. Wentworth, radiologist of the Mankato Clinic, ended a medical career which began in Mankato in 1914. A graduate of the University of Minnesota Medical School, Dr. Wentworth conducted a private practice in Mankato for two years before joining the x-ray department of the Mankato Clinic. In the first World War he served

for two years as a radiologist in this country and overseas.

Dr. Wentworth has been replaced by Dr. W. E. Macklin, Jr., formerly of Litchfield.

* * *

Dr. Benjamin Spock, a pediatric psychiatrist, former member of the Cornell University Medical School, and consultant in child psychiatry in the New York City Health Department, has become a consultant in psychiatry at the Mayo Clinic and an associate of Dr. C. Anderson Aldrich in the Rochester Child Health Project.

Dr. Spock, a graduate of Columbia University, is the author of *The Common Sense Book of Baby and Child Care,* which was published in 1946 and has since been reprinted as *The Pocket Book of Baby and Child Care.*

* * *

Resigning from his positions as professor of surgery at the University of Minnesota and head of the surgical service at the Minneapolis Veterans Hospital, Dr. John R. Paine has accepted the posts of professor of surgery at the University of Buffalo Medical School and chief of the Department of Surgery at Buffalo General Hospital. He will assume his duties there on June 1.

A graduate of the medical school at Harvard University, Dr. Paine also holds the degrees of M.S. and Ph.D. in surgery, both from the University of Minnesota. Dr. Paine has been on the faculty of the University of Minnesota Medical School for ten years. From 1942 to 1945 he served with an army hospital unit in England, North Africa and Italy.

An opening for a young surgeon who has had a year or two in the army, or a year or more of surgical training as a hospital resident, is available, as an assistant project surgeon on a large government construction job at Okinawa. The salary authorized by the War Department is base pay of $6,500 per annum with a possible maximum salary of $7,980 per year. The contract is for one year, and all travel expenses are paid. The project is expected to last from one and one-half to eight years. Living quarters are furnished, and "mess" is obtainable at $1.50 per day. Further information may be obtained by communicating with C. J. Iverson, Aetna Casualty and Surety Company, 1550 Northwestern Bank Building, Minneapolis.

* * *

On March 5, 1947, a bill setting aside $130,500 annually, for providing state aid to counties that wish to employ public health nurses, was passed unanimously by the state legislature. In 1922 the legislature passed legislation enabling counties to employ public health nurses. Forty-nine of Minnesota's eighty-seven counties have voted funds to employ such nurses. At present there are fifty-two public health nurses employed in counties and eighty-six employed by school boards. Although there is a shortage of qualified public health nurses at present, it is hoped that many of the 300 students now securing special training in public health at the University of Minnesota School of Public Health will seek these county positions.

REST HOSPITAL

A quiet, ethical hospital with therapeutic facilities for the diagnosis, care and treatment of Nervous and Medical cases. Invites coöperation of all reputable physicians who may supervise the treatment of their patients.

5511 Lyndale Ave. So. LO. 0773 Minneapolis, Minn.

Two Minneapolis physicians have literally made an art of a hobby.

Working at their hobbies during well-earned spare moments, Dr. Carl G. Swendseen and Dr. Robert Wilder have won recognition at painting and sculpturing, respectively. Both have been awarded top prizes in past art contests, and both will exhibit their work again this June in the annual meeting of the American Medical Association in Atlantic City. The exhibit at the AMA convention will be sponsored jointly by Mead Johnson and Company and the American Physicians' Art Association, of which both Dr. Swendseen and Dr. Wilder are members.

Dr. Swendseen began his hobby of painting only four years ago, while Dr. Wilder made his initial attempt at sculpture ten years ago when he first started wood carving. Dr. Swendseen now has a collection of more than fifty of his own oil paintings, and Dr. Wilder has progressed to advanced clay modeling and stone sculpture.

HOSPITAL NEWS

At St. Mary's Hospital in Duluth a three-man committee is planning a homecoming reunion for former interns at the hospital, many of whom are expected to attend the annual meeting of the Minnesota State Medical Association in Duluth in July. Members of the committee making arrangements for the reunion are Dr. W. J. Ryan, Dr. R. P. Buckley and Dr. K. R. Fawcett.

* * *

Announcement has been made by the hospital board at Blue Earth that donations of several pieces of equipment have been made for use in the local hospital. Included in the equipment are an electric blanket, a supply table and an instrument sterilizer. Further contributions, the board stated, would be gratefully welcomed.

* * *

Dr. Jorge Lazarte, Rochester, has been appointed assistant superintendent of the Rochester State Hospital.

Dr. Lazarte, who came to Rochester in 1941 from Lima, Peru, has an M.A. degree in neurology from the University of Minnesota, and has served five years on a fellowship in the Mayo Foundation, majoring in neurology and psychiatry. He joined the staff of the state hospital in July, 1946. In addition to his local duties, Dr. Lazarte represents the Peruvian government on the United Nations committee for drug control.

* * *

Following the grant of a hospital permit to Greenbush by the Federal government, officers and committee chairmen of the Greenbush Hospital Association have been announced. Officers are William Anderson, president; W. O. Gordon, vice president, and I. S. Folland, secretary-treasurer.

Committee chairmen are Herbert Reese, building; W. O. Gordon, medical; R. W. Huggett, health insurance, and William Paulson, executive.

A delegation of Brainerd representatives in March appealed to the Civilian Production Authority in Minneapolis to reconsider a request for vital materials for St. Joseph's Hospital in Brainerd.

The delegation was formed after the Authority had rejected a request for materials with which to build a $50,000 service building and heating plant on the hospital grounds. Engineers had previously informed the hospital authorities that unless a new heating plant is installed, the institution might be required to close next winter.

Included in the delegation were Dr. John Thabes, Sr., chief of the hospital medical staff; Lester Hage, chairman of the Brainerd Civic Association, and Norris Ryder, secretary-manager of the association.

* * *

The initial step toward the construction of a hospital at Isle was taken on March 10 when a citizens' committee of Isle met with Dr. Viktor O. Wilson and Ether McClure of the Hospital Licensing Division of the State Department of Health, to discuss possibilities for a hospital in that area. At the meeting Dr. Wilson suggested that a committee be organized to investigate the various aspects of the problem and to obtain the necessary preliminary information for hospital planning.

* * *

Increased efforts to reach an understanding between the hospital boards of St. Luke's and Mercy Hospitals, Thief River Falls, were made by members of the Civic and Commerce Association at their March 6 meeting after the reading of an architect's report dealing with methods for expanding hospital facilities in Thief River Falls. Although the detailed report was not made public, it did recommend that an addition to St. Luke's Hospital would be the least costly means of providing extra facilities.

Association members pointed out the need for a prompt settlement of differences between the two hospital boards if the city were to become eligible for Federa financial aid. It was suggested that the services of a hospital consultant be secured to survey the local situation, with the understanding that the two boards be guided by his recommendations.

Among the speakers at the meeting were Dr. M. D. Starekow and Dr. Theodor Bratrud.

* * *

A community auction, with items contributed by Zumbrota townspeople and farmers in the area, was staged on May 1 as part of a drive to raise funds for the construction of a municipal hospital at Zumbrota. Objects placed on the hospital auction block ranged from tractors and refrigerators to farm produce and household goods.

Proceeds from a noon lunch and an evening dance were added to the auction receipts and to funds obtained by individual solicitation, in an effort to reach the $35,000 total anticipated before the event by the local planning board.

* * *

A report of the interim committee appointed by the 1945 legislature to study needs of the mental hospitals of the state, submitted to the legislature in March, emphasized the over-crowding in all seven of the state mental hospitals.

The report indicated that at least 2,000 additional beds are needed to meet present needs, and proposed a building program that would provide $16,854,000 in improvements over a period of ten years. At the St. Peter State Hospital, for example, rebuilding of administrative offices, kitchen, bakery, steward's offices, warehouses and wards, would cost about $2,910,000, while erection of two buildings, each to house 150 senile patients, would require an additional $800,000.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

Obstetrical Practice. Fourth Edition. Alfred C. Beck, M.D. Professor of Obstetrics and Gynecology, Long Island College of Medicine; Obstetrician and Gynecologist-in-Chief, Long Island College Hospital, Brooklyn. 966 pages. Illus. Price, $7.00, cloth. Baltimore: Williams & Wilkins Co., 1947.

Rh—Its Relation to Congenital Hemolytic Disease and to Intragroup Transfusion Reactions. Edith L. Potter, M.D., Ph.D., Assistant Professor of Pathology, Department of Obstetrics and Gynecology, the University of Chicago and the Chicago Lying-in Hospital. 455 pages. Illus. Price, $5.50, cloth. Chicago: Year Book Publishers, 1947.

Nutritional and Vitamin Therapy in General Practice. Third Edition. Edgar S. Gordon, M.D., Ph.D. Associate Professor of Medicine, University of Wisconsin. 410 pages. Price, $5.00, cloth. Chicago: Year Book Publishers, Inc., 1947.

Physician's Handbook. Fourth Edition. John Warkentin, Ph.D., M.D., and Jack D. Lange, M.S., M.D. 272 pages. Illus. Price, $1.50, paper cover. Chicago: University Medical Publishers, 1946

RADIOLOGY FOR MEDICAL STUDENTS. F. J. Hodges, I. Lampe, and J. F. Holt. 424 pages. Illus. $6.75. Chicago: Year Book Publishers, 1947.

The authors, who are members of the Department of Roentgenology of the University of Michigan, have produced a more complete work than the title implies and have understated themselves in speaking of it as a "limited treatise." This book is in two parts; one concerns diagnostic roentgenology and the other x-ray and radium therapy. Either part could stand on its own merits. In the section on therapy, emphasis is placed on the clinical indications and probable results. Every doctor should be familiar with these aspects of therapeutic radiology and information on the subject of the type presented concisely in this work is not generally available. Of interest is the fact that, excluding dermatologic conditions, 40 per cent of the x-ray therapy patients at the University of Michigan have benign conditions.

The first portion of the book takes the reader through a brief history of medical roentgenology with a discussion of the generalities of equipment and the methods of roentgenology, and defines the position of roentgenology as a specialty, and the radiologist. The diagnostic section represents the major portion of the book and is excellently prepared and presented with regard to the clinical aspect of x-ray diagnosis. Controversial subjects are covered dogmatically enough for the beginner but are free from prejudiced conclusions to serve the more advanced reader. The limitations of x-ray diagnosis are mentioned. A bibliography is appended to each chapter.

The publishers have again done an outstanding job in the reproduction of actual radiographs used in the illustrations. This book should find wide acceptance.

L. A. Nash, M.D.

EVERYDAY PSYCHIATRY. John D. Campbell, M.D., Commander, MC, U.S.N.R., Chief Neuropsychiatrist, U. S. Naval Base Hospital No. 8. Formerly Chief Neuropsychiatrist, U. S. Naval Hospital, Charleston, S. C., and Visiting Lecturer in Psychiatry, Medical College of South Carolina, Diplomate American Board of Neurology and Psychiatry. 333 pages. Price $6.00, cloth. Philadelphia: J. B. Lippincott Co., 1945.

The author states that this book "seeks to fill a gap between medicine and psychiatry." He opens Chapter I with the following paragraph: "In an endeavor to present psychiatry to practicing physicians, medical students, and social workers in a usable practical manner, I have concluded that the most expedient approach is

through the abnormal personality types. These milder mental aberrations constitute 90 per cent of the private practice of psychiatry, a large percentage of military psychiatry, and approximately 30 per cent of all patients who consult physicians in general. Ten per cent of the selectees rejected for military service are rejected because of these borderline mental conditions." This statement indicates the type of and prevalence of the abnormalities discussed in the book.

Mental deficiency, psychopathic personality, psychoneurosis, homosexual personality, schizoid personality, and cycloid personality are each discussed under the following headings: intelligence, conscience and work record, emotional stability, socialability, psychosexual development, and special modes of adjustment. In addition, the etiology and treatment of each of these entities are considered. Chapters on chronic alcoholism, personality examination, and rehabilitation, are included.

Early in the book the reader gains the impression that the four basic personality traits which he describes, intelligence, conscience, emotional reaction, and psychosexual development, as well as two secondary factors, sociability and special modes of adjustment, "are inherited, constitutional and immutable, and are not subject to change by environment, education or training." This attitude may well discourage the reader from perusing it further. Actually, as indicated above, considerable material is devoted to treatment and rehabilitation. It would appear that the more optimistic attitude developed as the material is presented is the correct one.

Although the section on mental deficiency and the attitude that the autonomic nervous system and the endocrine glands are not modifiable by environmental factors will meet with adverse criticism from many readers, the references to the literature and the content of the work as a whole are deserving of commendation.

This book is easily read and is worthy of the careful consideration of those to whom it is addressed.

Walter P. Gardner, M.D.

BRIEF HISTORICAL NOTES ON MEAD'S CEREAL, PABLUM AND PABENA

HAND in hand with pediatric progress, the introduction of Mead's Cereal in 1930 marked a new concept in the function of cereals in the child's dietary. For 150 years before that, since the days of "pap" and "panada," there had been no noteworthy improvement in the nutritive quality of cereals for infant feeding. Cereals were fed principally for their carbohydrate content.

The formula of Mead's Cereal was designed to supplement the baby's diet in minerals and vitamins, especially iron and thiamine. How well it has succeeded in these functions may be seen from two examples:

(1) As little as one-sixth ounce of Mead's Cereal* supplies over 50% of the iron and 20% of the thiamine minimum requirements of the 3-months-old infant. (2) One-half ounce of Mead's Cereal furnishes all of the iron and 60% of the thiamine minimum requirements of the 6-months-old baby.

That the medical profession has recognized the importance of this contribution is indicated by the fact that cereal is now routinely included in the infant's diet as early as the third or fourth month instead of at the sixth to twelfth month as was the custom only a decade or two ago.

In 1933 Mead Johnson & Company went a step further, improving the Mead's Cereal mixture by a special process of cooking, which rendered it easily tolerated by the infant and at the same time did away with the need for prolonged cereal cooking in the home. The result is Pablum, an original product which offers all of the nutritional qualities of Mead's Cereal, plus the convenience of thorough scientific cooking.

During the last twelve years, these products have been used in a great deal of clinical investigation of various aspects of nutrition, which have been reported in the scientific literature.

Many physicians recognize the pioneer efforts on the part of Mead Johnson & Company by specifying Mead's Cereal and PABLUM—and also the new Pablum-like oatmeal cereal known as PABENA.

---

*Pablum, the precooked form of Mead's Cereal, has practically the same composition: wheatmeal (farina), oatmeal, cornmeal, wheat embryo, beef bone, brewers yeast, alfalfa leaf, sodium chloride, and reduced iron.

Mead Johnson & Co., Evansville 21, Indiana, U. S. A.

there's a common defense

Now there is a defense against many of the allergic reactions elicited by everything from feathers to codfish. This defense is BENADRYL, a product of Parke-Davis research.

The treatment of most cases of hypersensitivity with this antihistaminic is largely symptomatic. It has been found that from 25 to 50 mg., repeated as may be indicated, are usually sufficient to produce relief.

BENADRYL (diphenhydramine hydrochloride) is available in Kapseals ® of 50 mg. each, in capsules of 25 mg. each, and as a palatable elixir containing 10 mg. in each teaspoonful.

Benadryl® hydrochloride

Notice: This Special Policy available only through Professional Group Department Representatives. Authorized registrars will carry a letter of identification signed by State Manager, Professional Group Dept.

Special Notice to Members

This Disability UPG20 Program shown on the opposite page, extended to the Minnesota State Professional Groups is a program that provides protection which gives Lifetime Benefits and is not subject to cancellation on account of age leaving you without protection when your loss of time is most valuable. It pays benefits for one day or more and covers permanent total disability. This UPG20 Program pays for every injury or accident, even Commercial Air Line travel is fully covered. It covers all sickness and every disease except insanity and venereal diseases. The maximum benefits are $600.00 monthly and its minimum benefits are $200.00 monthly for any illness. Accident benefits pay double indemnity for travel accidents on a common carrier, excepting air travel, which pays only the regular indemnity benefits.

To broaden the benefits while this UPG20 Program is in operation, the following limitations, common to most policies, have been omitted and are not a part of these policies.

(1) The Company's right to cancel the policy at any time—(Standard Provision No. 16).

(2) The Company's right to terminate the policy at a certain age—(Standard Provision No. 20).

(3) The Company's right to refuse renewal of policy to any individual practicing member of your group is forfeited except for non-payment of premium on or before due date.

(4) The Company's power to impose a Rider, eliminating the benefit for something that may happen or develop to render you an undesirable, or un-insurable risk, is canceled thru the elimination of each of the above.

The Minnesota enrollment is proceeding most satisfactorily, but it is the desire of the Companies, not only to conduct the enrollment in the manner found to be most successful for completing the group, but with full consideration for the policy and practice of the Minnesota Professional Associations mentioned.

Most Professional Groups, Associations, or Societies find it inexpedient to make specific endorsement of any company or plan to its members. It is the practice of the Mutual Benefit Health and Accident Association and the United Benefit Life Insurance Company both of Omaha, to submit their Disability Plan to the individual members of the group for their personal consideration. This has proven to be the most successful way to complete the enrollment of members of these groups since it brings about a decidedly better understanding of the plan to the members and, thereby, increases the ultimate total enrollment.

Therefore, should any Authorized Registrar, or Mutual Benefit Salesman represent that he is from either of the designated Associations, or that this plan has been endorsed by either Association, will you kindly report same together with the name of the representative to State Manager, Professional Group Department, 420 Plymouth Bldg., Minneapolis, Minn. —Phone AT. 2579.

ONE PINT

FLEXIBILITY

Pediatricians recognize the advantages of flexibility in prescribing infant feeding formulas, as the protein, fat, and carbohydrate requirement may vary with the individual baby. Formula preparation with CARTOSE* is simple, rapid, and accurate.

CARTOSE supplies carefully balanced proportions of nonfermentable dextrins in association with maltose and dextrose. Due to the time required for hydrolysis of the higher sugars, absorption is spaced. This lessens the likelihood of distress attributable to the presence of excessive amounts of readily fermentable sugars in the intestinal tract at one time.

When supplementation with vitamins of the B complex is indicated, KINNEY'S YEAST EXTRACT* is suggested for routine incorporation in the daily feeding. The full daily dose is simply added to the twenty-four-hour formula.

KINNEY'S YEAST EXTRACT is prepared from a specially cultured yeast and contains all the known factors of the B complex in natural, palatable form.

CARTOSE and KINNEY'S YEAST EXTRACT are offered for use under the guidance of physicians. They are available only at drugstores.

Liver Protein Hydrolysate supplying

AMINO ACIDS for ORAL THERAPY

The amino acids in LEDINAC Liver Protein Hydrolysate *Lederle* provide a rapidly absorbable supplement which tends to combat "protein starvation" in patients and secure normal nitrogen balance in the tissues. Amino acids furnish one of the best means of providing convalescent patients with nitrogenous foods.

LEDINAC Liver Protein Hydrolysate *Lederle* provides in a palatable, *chocolate-flavored form*, a rapidly absorbable dietary supplement that does not tax unduly the digestive powers of the patient.

LEDINAC Liver Protein Hydrolysate *Lederle* is a source not only of modified protein and amino acids, but also of vitamins, minerals, and carbohydrates. It is derived from mammalian liver—the richest nutritional storehouse in the body.

*Reg. U. S. Pat. Off.

LISTEN to the latest developments in research and clinical medicine discussed by eminent members of the medical profession in the Lederle radio series, "The Doctors Talk It Over," broadcast coast-to-coast every Monday evening over the American Broadcasting Company network and affiliated stations.

FORMULA

Liver Protein Digest	54.0%
Maltose	38.5%
Flavoring Agents (including chocolate and saccharin)	7.5%
Supplying: Carbohydrate	32.5%
Fat	3.5%
Protein	50.0%
Free Amino Nitrogen	1.0%

including the amino acids, Arginine, Histidine, Lysine, Tryptophane, Phenylalanine, Methionine, Threonine, Leucine, Isoleucine, Valine, and Cystine.

Each 30 Gm. contains:

Thiamine Hydrochloride (B_1)	1.00 mg.
Riboflavin (B_2)	2.00 mg.
Niacinamide	6.60 mg.
Pantothenic Acid	2.30 mg.
Pyridoxine Hydrochloride (B_6)	0.24 mg.
Biotin	2.70 gamma
Inositol	23.00 mg.
Choline	120.00 mg.
Calcium	106.00 mg.
Phosphorus	297.00 mg.
Iron	4.80 mg.
Calories	103.8

Brighter horizons for the petit mal patient

One important fact stands out in the rapidly expanding clinical record of Tridione: Thousands of children formerly handicapped in school and play by petit mal, myoclonic or akinetic seizures are finding substantial relief through treatment with Tridione. In one test, Tridione was given to 150 patients who had not received material benefit from other drugs.[11] With Tridione, 33% became seizure free; 30% had a reduction of more than three-fourths of their seizures; 21% were moderately improved; 13% were unchanged, and only 3% became worse. In some cases, the seizures, once stopped, did not return when medication was discontinued. Tridione also has been shown to be beneficial in the control of certain psychomotor epileptic seizures when used in conjunction with other antiepileptic drugs.[12] Wish more information? Just drop a line to Abbott Laboratories, North Chicago, Ill.

For an active middle age
a "PLUS"

The "sense of well-being" so frequently reported by patients following "Premarin" therapy often means the difference between an active, enjoyable middle age and a sedentary one. Not only prompt relief from distressing menopausal symptoms but also a brighter mental outlook which may be translated into a desire "to be doing things"...such are the results which may usually be expected following "Premarin" administration . . . therapy with a "plus."

"Premarin" provides effective estrogenic therapy through the oral route with comparative freedom from untoward side effects.

"Premarin" is available as follows:

Tablets of 2.5 mg.................................bottles of 20 and 100.
Tablets of 1.25 mg.............................bottles of 20, 100 and 1000.
Tablets of 0.625 mg..............................bottles of 100 and 1000.
Liquid, containing 0.625 mg. in each 4 cc. (1 teaspoonful).....bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present as water-soluble sulfates. The water solubility of conjugated estrogens (equine) assures rapid absorption from the gastrointestinal tract.

"the knife"
and the fork

"... the physiological state of the patient affects the mortality and morbidity of surgical practice as much or more than the correctness or skillfulness of that practice."[1] For that reason the fork must share with the scalpel the responsibility of favorable prognosis. The food the patient eats contributes greatly to the outcome of an operation. Faulty diet and a resultant avitaminosis make surgery more hazardous and impede recovery. For pre- or postoperative supplementation and therapy, Upjohn vitamins afford a full range of high-potency oral and parenteral formulas.

Experience is the Best Teacher

Herman von Helmholtz
(1821-1894)
proved it in ophthalmology

Although the inventor of the ophthalmoscope, Helmholtz's greatest contribution to medicine was his exhaustive researches on the mechanism of accommodation and the problem of color vision. The famous Young-Helmholtz theory of color vision resulted from his studies which confirmed and elaborated the findings of Young. His every work showed—*experience is the best teacher!*

CAMEL
TURKISH & DOMESTIC BLEND CIGARETTES
CHOICE QUALITY

Yes, experience is the best teacher in smoking too!

DURING the wartime cigarette shortage, people smoked many different brands—more than they would normally try in years. That's how so many learned the differences in cigarette quality. And from that experience millions more smokers came to prefer Camels. Today more people are smoking Camels than ever before.

But, no matter how great the demand, we don't tamper with Camel quality. Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.

According to a recent Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

INJURIES OR DISEASES
of the
LUMBAR SPINE

For patient of thin type-of-build.

CAMP lumbosacral supports are widely recommended by orthopedic surgeons and physicians.

An important factor in the good results reported from their use is that they extend downward over the sacroiliac and gluteal regions. The Camp adjustment provides exceptional restraint of movement.

In more severe lesions, aluminum uprights or the Camp spinal brace are easily incorporated.

Camp lumbosacral supports are moderately priced.

radiographic vs. surgical

Exploration

When confusing abdominal symptoms and signs create a diagnostic tangle or do not yield properly to medical management, *radiographic exploration* of the gallbladder with PRIODAX will often reduce the need for *surgical exploration.* PRIODAX cholecystography almost never fails to reveal disease of the gallbladder if it exists, or to produce unequivocally clear silhouettes if the organ is normal.

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

PRIODAX

(brand of iodoalphionic acid)

PRIODAX is rarely eliminated prematurely from the gastrointestinal tract. The opacities produced by it are homogeneous, sharp and unstratified. Moreover, clear visualization will not be obscured by contrast substance in the colon when PRIODAX is used. PRIODAX, therefore, provides maximum dependable concentration of the most desirable type for reliable interpretation.

PRIODAX Tablets, beta-(4-hydroxy-3,5-diiodophenyl)-alpha-phenylpropionic acid, available as six 0.5 Gm. tablets in individual cellophane envelopes. Boxes of 1, 5, 25 and 100 envelopes.

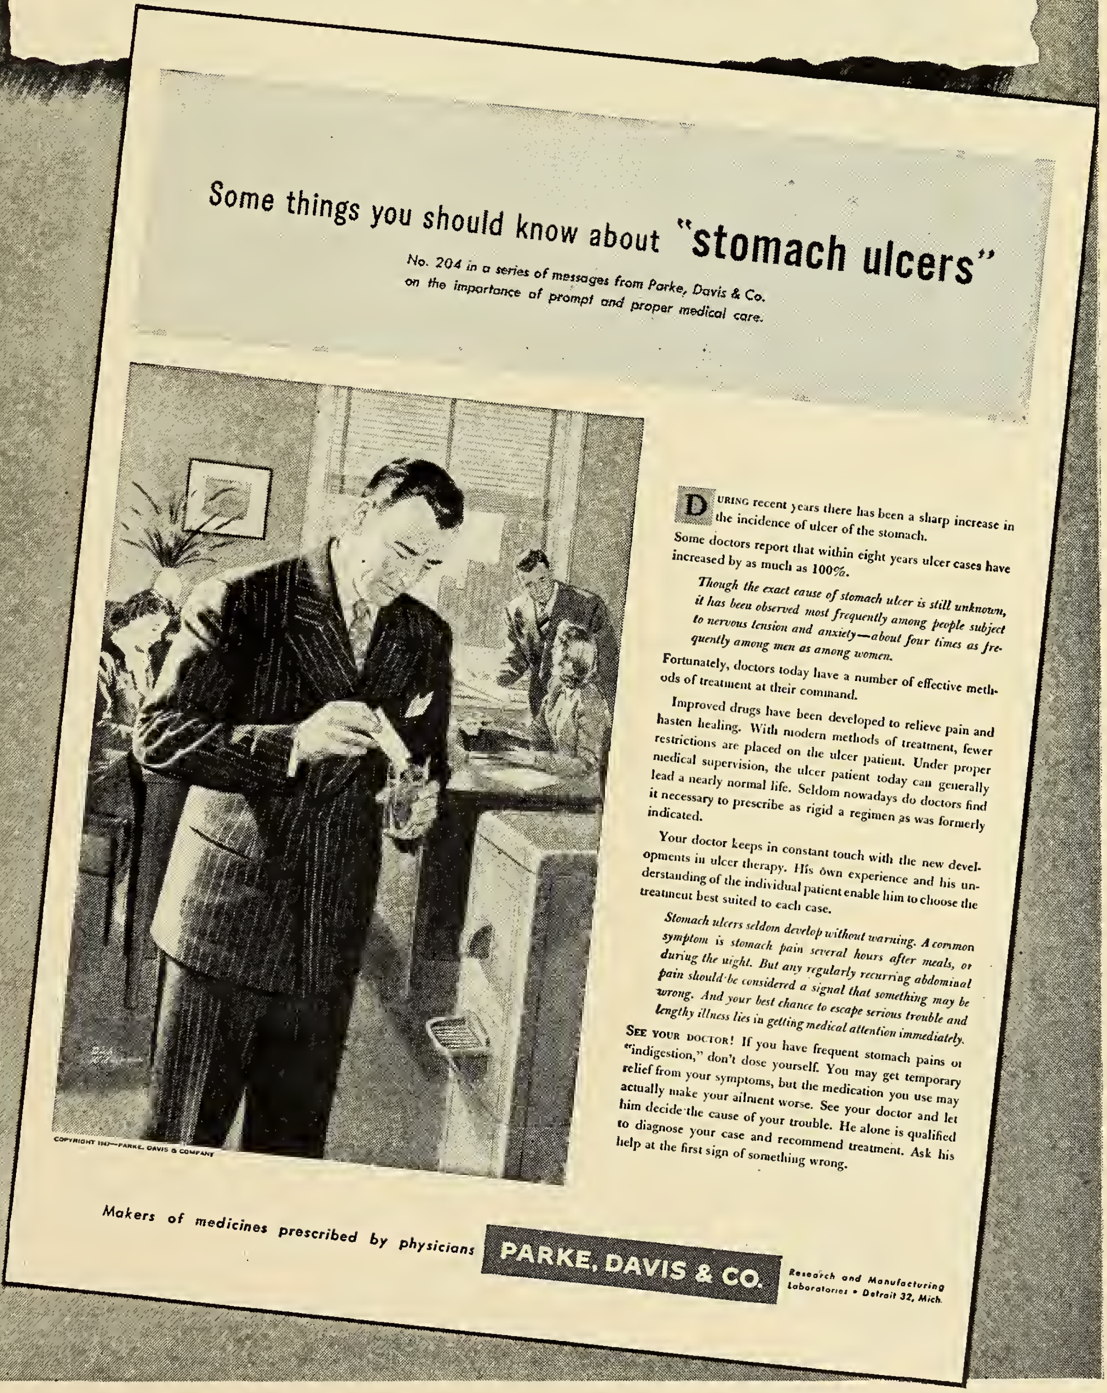
Reminding people to "See Your Doctor"

Parke, Davis & Company believes that people need to be constantly reminded of the value of prompt and proper medical care. Educational advertisements—like the latest one, reproduced below—appear regularly, in color, in LIFE and other national magazines. Audience: more than 22 million people!



Some things you should know about "stomach ulcers"

No. 204 in a series of messages from Parke, Davis & Co. on the importance of prompt and proper medical care.

COPYRIGHT 1947—PARKE, DAVIS & COMPANY

DURING recent years there has been a sharp increase in the incidence of ulcer of the stomach.

Some doctors report that within eight years ulcer cases have increased by as much as 100%.

Though the exact cause of stomach ulcer is still unknown, it has been observed most frequently among people subject to nervous tension and anxiety—about four times as frequently among men as among women.

Fortunately, doctors today have a number of effective methods of treatment at their command.

Improved drugs have been developed to relieve pain and hasten healing. With modern methods of treatment, fewer restrictions are placed on the ulcer patient. Under proper medical supervision, the ulcer patient today can generally lead a nearly normal life. Seldom nowadays do doctors find it necessary to prescribe as rigid a regimen as was formerly indicated.

Your doctor keeps in constant touch with the new developments in ulcer therapy. His own experience and his understanding of the individual patient enable him to choose the treatment best suited to each case.

Stomach ulcers seldom develop without warning. A common symptom is stomach pain several hours after meals, or during the night. But any regularly recurring abdominal pain should be considered a signal that something may be wrong. And your best chance to escape serious trouble and lengthy illness lies in getting medical attention immediately.

SEE YOUR DOCTOR! If you have frequent stomach pains or "indigestion," don't dose yourself. You may get temporary relief from your symptoms, but the medication you use may actually make your ailment worse. See your doctor and let him decide the cause of your trouble. He alone is qualified to diagnose your case and recommend treatment. Ask his help at the first sign of something wrong.

Makers of medicines prescribed by physicians

PARKE, DAVIS & CO.

HIGHLY NUTRITIOUS . . .
YET PALATABLE AND SATISFYING

Dietary supplements, in order to accomplish their desired nutritional influence, must be tasty and appealing to the palate. Otherwise, refusal by the patient will defeat their very purpose and will limit nutrient intake.

The food drink made by mixing Ovaltine with milk ranks high in nutrient content and palatability. This dietary supplement provides generous amounts of virtually all essential nutrients including ascorbic acid, in readily digestible, thoroughly bland form. Its delicious taste is appealing to all patients, young and old, who drink it with relish in the recommended quantities—two to three glassfuls daily. This amount, as can be seen from the table of composition, readily complements to adequacy even a poor daily dietary.

This nutritional supplement finds wide application whenever nutrient intake must be augmented, as in under-par nutrition, following recovery from infectious disease, and during chronic debilitating illnesses.

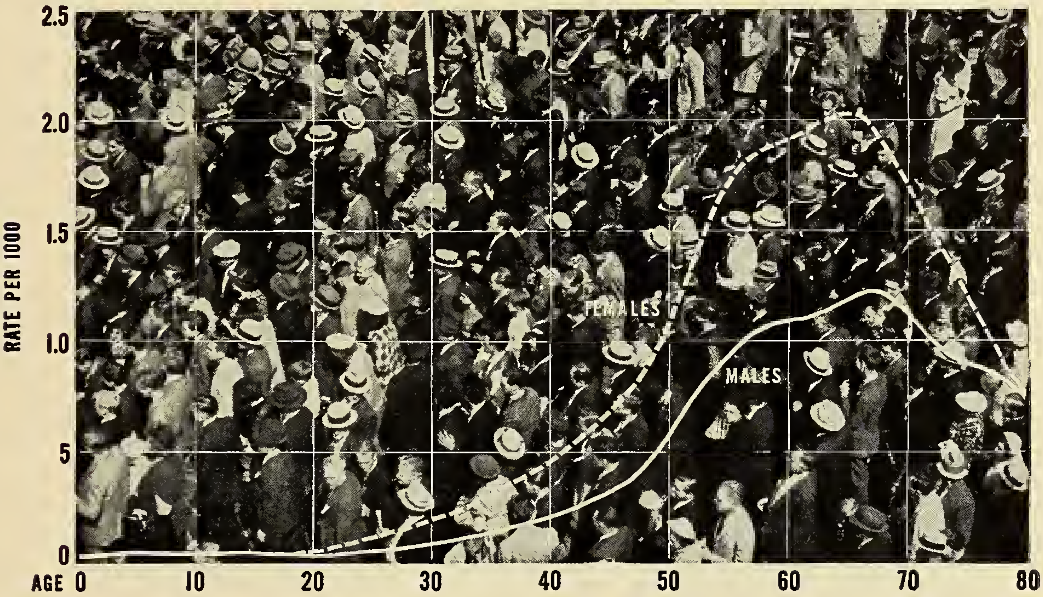
WITHIN THE YEAR: 50,000 *new diabetics*

CHANCES PER THOUSAND OF BECOMING DIABETIC WITHIN THE YEAR OF AGE. Adapted from Statistical Bull.[2]



Of our present population, about 4,000,000 will become diabetic sometime in their lives. More than 4% of females and 2% of males under 50 will acquire the disease. With an increase of 50,000 a year, their number will grow in the next few decades at a rate greater than that of the total population. When our population reaches its expected maximum in 1985, it will be 22% larger than in 1940—but by then the diabetic population may increase by 74%![1,2]

Control with but *one injection a day* of 'Wellcome' Globin Insulin with Zinc has been made possible for many diabetic patients who formerly required *multiple injections* of regular insulin alone or in conjunction with protamine zinc insulin. Favorable results with Globin Insulin have been achieved by virtue of the following advantages:

1. The action of Globin Insulin is *intermediate* between that of regular and protamine zinc insulin.

2. Its onset of action is moderately rapid; no accompanying injection of regular insulin is ordinarily required to take care of breakfast carbohydrate.

3. Maximum activity of Globin Insulin occurs during the day when the patient needs insulin most to balance carbohydrate intake. This contributes to a relatively uniform blood sugar level.

4. The action of Globin Insulin wanes during the night. Since the patient is not eating and has less need for insulin at this time, the danger of hypoglycemic night reactions is remote. However, adequate action persists up to the 24th hour so that a normal fasting blood sugar level is ordinarily obtained the following morning.

5. The globin constituent does not appear to be allergenic. It is thus comparable to regular insulin in its freedom from allergic reactions.

6. Globin Insulin is a clear solution which requires no mixing or shaking before use. The danger of variable dosage is thereby minimized.

'Wellcome' Globin Insulin with Zinc is available in 40 and 80 units per cc., in vials of 10 cc. Accepted by the Council on Pharmacy and Chemistry, American Medical Association. Developed in The Wellcome Research Laboratories, Tuckahoe, New York. U. S. Patent No. 2,161,198.

1. Spiegelman, M., and Marks, H. H.: Am. J. Pub. Health 36:26 (Jan.) 1946. 2. Statistical Bull., Met. Life Ins. Co. 27:6 (Feb.) 1946.

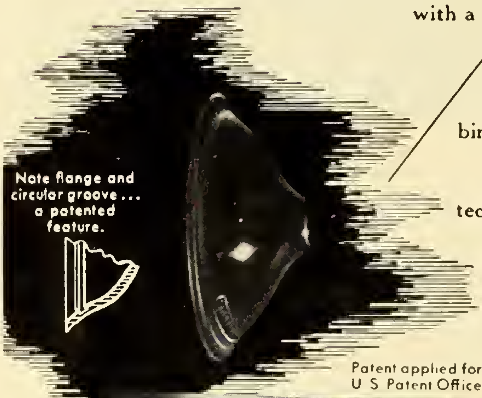
Presenting...

PLASTISHIELDS

A new technique for postpartum breast care.

PLASTISHIELDS are transparent shields, formed to receive the breast. They have an extruded central portion to *loosely* receive the nipple. Made from a plastic which does not react with skin or milk, they are moulded and hand-finished to assure perfect smoothness and comfort. A flange around the circumference with a circular groove in its inner surface forms a suction to hold the shield firmly to the breast. Used with either a hospital binder or brassiere. The method is adaptable as a simple standard routine technique, usable in both hospital and home.



Patent applied for
U S Patent Office

ADVANTAGES:

1. Prevents irritation of nipples by clothing.
2. Protects nipples and breasts from infection.
3. Reduces nursing discomfort.
4. Simplifies nipple care.
5. Eliminates use of ointments, gauze, etc.
6. Increases patient's comfort.
7. Easily sterilized by patient, after each nursing, thus saving nurse's time.
8. Shortens latent period of nursing.
9. Minimizes milk seepage and soiling of clothing.
10. Corrects certain cases of flat or partially inverted nipples.
11. Not affected by ordinary antiseptics.

Now being successfully used in many hospitals throughout the Northwest for routine postpartum breast care.

OBSTETRICAL SUPERVISORS SAY:

"Convinced of their superiority over other methods of breast care."

"Its use has improved and simplified our nursing care . . . protects nipples from contamination . . . an added source of comfort to nursing mothers."

"Excellent reception by both patients and nurses . . . happy to recommend continued use at our hospital."

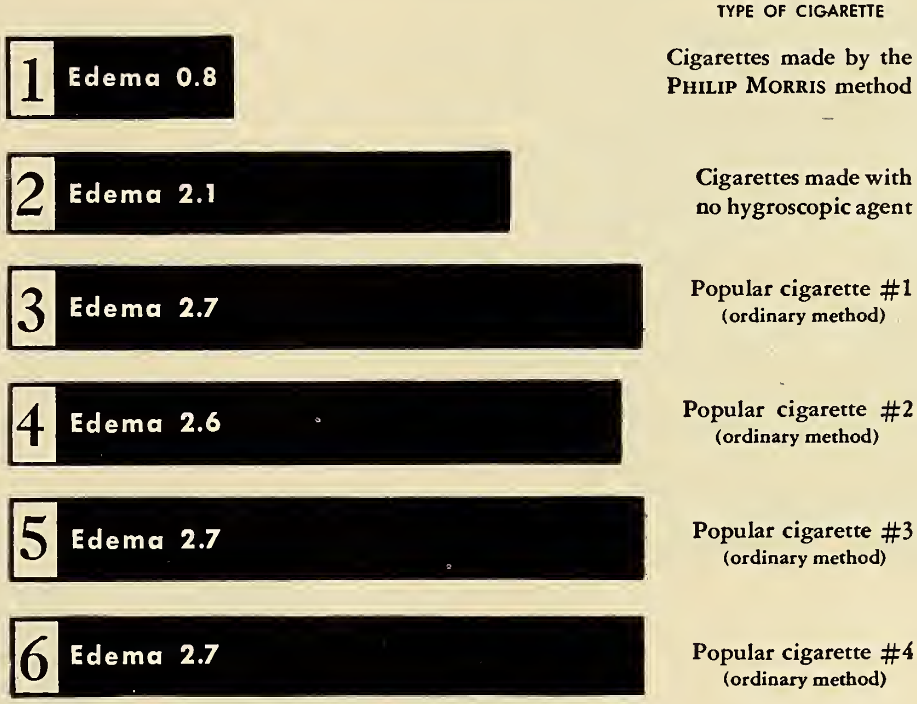
How irritation varies from *different* cigarettes

Tests made on rabbits' eyes reveal the influence of hygroscopic agents*



CONCLUSION:* Results show that regardless of blend of tobacco, flavoring materials, or method of manufacture, the irritation produced by all ordinary cigarettes is substantially the same, and measurably greater than that caused by PHILIP MORRIS.

CLINICAL CONFIRMATION:** When *smokers* changed to PHILIP MORRIS, substantially every case of irritation of the nose and throat due to smoking cleared completely or definitely improved.

**N. Y. State Journ. Med. 35 No. 11,590* ***Laryngoscope 1935, XLV, No. 2, 149-154*

TO THE PHYSICIAN WHO SMOKES A PIPE: We suggest an unusually fine new blend—COUNTRY DOCTOR PIPE MIXTURE. Made by the same process as used in the manufacture of Philip Morris Cigarettes.

SOPRONOL®

for Dermatophytosis

EFFECTIVE—Sopronol is *fungistatic* and *fungicidal.* A preparation of propionate and propionic acid, it combats invading fungi powerfully, yet mildly. Sopronol, the modern fatty acid treatment, meets requirements for the management of superficial fungous infections of the feet and hands.

POWER OF MILDNESS—Sopronol has the power of mildness—virtually nonirritating and nonsensitizing. The active principle of Sopronol is propionic acid—a component of human sweat, and a natural physiological defense against invasive organisms.

CLINICAL USE—Sopronol gives excellent results in tinea pedis. It does not cause "id" reactions (due to absorption of mycotic debris), which are likely to occur through use of agents with more violent action.

Sopronol Solution and Ointment contain sodium propionate 16.4%, propionic acid 3.6%. Sopronol Powder contains calcium propionate 15%, zinc propionate 5%.

Sopronol is supplied in 3 forms—

SOPRONOL
OINTMENT
FOR EXTERNAL USE ONLY
FOR DERMATOPHYTOSIS
"ATHLETE'S FOOT"
KEEP TIGHTLY CLOSED

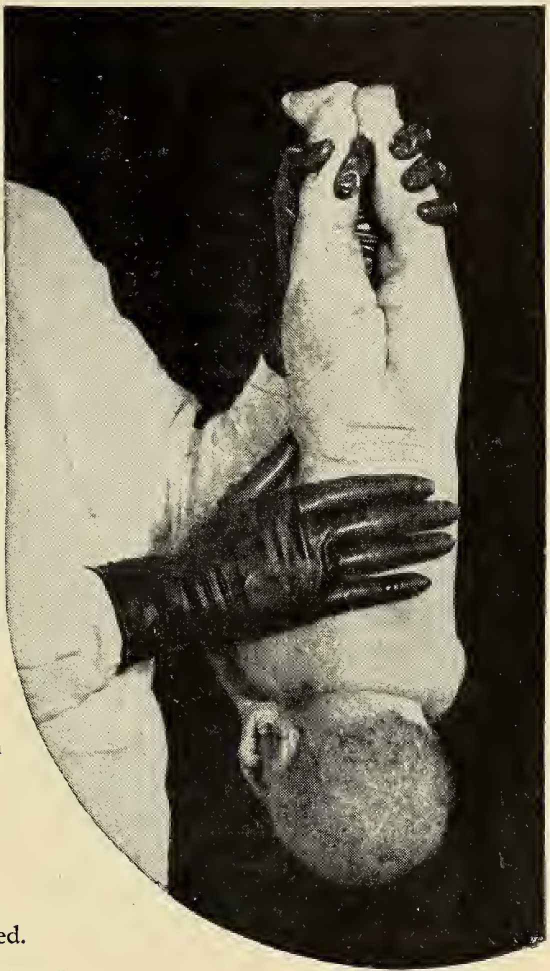
A NATURAL PHYSIOLOGICAL DEFENSE AGAINST INVASIVE ORGANISMS

WYETH INCORPORATED • PHILADELPHIA 3, PA.



Life expectancy 30 days?

Infant mortality during the first 30 days of life is on the *increase.* While the total infant mortality has been declining, the proportion of those who died within the first month *has actually increased* from 52.7% to 62.1%*. During this fatal first month the infant should be given every possible benefit. One step in the right direction is good feeding. In this way the gastro-intestinal hazards of excessive fermentation, upset digestion and diarrhea may be minimized.

'Dexin' has proved an excellent "first carbohydrate" because of its high dextrin content. It (1) resists fermentation by the usual intestinal organisms; (2) tends to hold gas formation, distention and diarrhea to a minimum, and (3) promotes the formation of soft, flocculent, easily digested curds.

Simply prepared in hot or cold milk, 'Dexin' brand High Dextrin Carbohydrate provides well-taken and well-retained nourishment. 'Dexin' *does* make a difference.

*Vital Statistics—Special Reports: Vol. 25, No. 12, National Office of Vital Statistics, Washington, D. C. (Oct. 15) 1946, p. 206.

HIGH DEXTRIN CARBOHYDRATE 'Dexin' BRAND

Composition—Dextrins 75% • Maltose 24% • Mineral Ash 0.25% • Moisture 0.75% • Available carbohydrate 99% • 115 calories per ounce • 6 level packed tablespoonfuls equal 1 ounce • Containers of twelve ounces and three pounds • Accepted by the Council on Foods and Nutrition, American Medical Association.

DISTRIBUTORS OF

A Complete Line of Drugs for Every Medical and Hospital Need

In addition to the hospital and medical equipment, instruments and supplies of all kinds, that we handle, we are also distributors for a complete line of pharmaceuticals manufactured by the Ulmer Pharmacal Company. This is an extremely high quality as well as economical line of Ethical Drug Specialties and General Pharmaceuticals, including:

OINTMENTS

AMPOULES ULMER Quality **CAPSULES**

TABLETS **VITAMINS**

PHARMACEUTICALS

● **and many SPECIALTY ITEMS**

Every one of these Ulmer products is prepared under strict control by experienced graduate chemists and pharmacists in modern, air-conditioned laboratories to insure accuracy and dependability. All are quality items, compounded to meet the exacting standards of the medical profession. They are strictly ethical, not advertised to the laity and dispensed only upon prescription.

We also handle a complete line of wholesale drugs—chemicals, biologicals, ampoules, stains, and reagents, volatile oils, drug room supplies, general pharmaceuticals and pharmaceutical specialties of all the leading drug manufacturers. We can supply you with any item in the line of drugs and pharmaceuticals.

•

Send us your Order for any Drug Items you need. Write us for information about any of the many outstanding Ulmer Quality products which you may wish to prescribe.

a modern Formulac infant food

Formulac Infant Food is a concentrated milk in liquid form, fortified with all vitamins known to be necessary to adequate infant nutrition. No supplementary vitamin administration is required.

By incorporating the vitamins into the milk itself, the risk of human error or oversight is reduced. Formulac contains sufficient B complex, Vitamin C in stabilized form, Vitamin D (800 U.S.P. units), copper, manganese and easily assimilated ferric lactate—rendering it a flexible formula basis both for normal and difficult feeding cases. The only carbohydrate in Formulac is the natural lactose found in cow's milk. *No carbohydrate has been added.*

Formulac, a product of National Dairy research, has been tested clinically, and proved satisfactory. It is promoted to the medical profession alone. Formulac is on sale at grocery and drug stores nationally.

An Appeal to You..Doctor

SCHOOL OF PSYCHIATRIC NURSING

•

FALL CLASS will start in September

•

Candidates for the September class should make reservations at once. School and health record must be reviewed and correspondence completed prior to acceptance.

Leading physicians recognize that there must be close co-operation between the doctor, hospital, and school of nursing if the current trained-nurse shortage is to be overcome.

✦ ✦ ✦

"Hospital administrators and doctors throughout the country are seriously concerned over the dangerously inadequate nursing care available. Results of a recent survey indicate that 55 to 60 per cent of the required amount is obtainable. . . .

"'. . . approved hospitals should provide training for such vocational nurses by means of short courses.'

"The doctor is responsible for the care of the patient. In order to meet this obligation, the medical staff together with the hospital and nursing administrators, are urged to undertake the development and execution of this program."[1]

"It is time that some of the present-day advantages of a nursing career be made known to young women."[2]

✦ ✦ ✦

A Career in Nursing Offers:

- **Training in a highly paid profession**
- **A secure position unaffected by economic depression**
- **Work with skilled professional men and women**
- **The best preparation for marriage**

✦ ✦ ✦

ONE YEAR NURSING COURSE

Glenwood Hills Hospitals are currently offering to qualified applicants a one year course in psychiatric nursing. All phases of the subject are skillfully presented by a capable and experienced faculty. Tuition is free. Regular classes begin in January, June, and September.

YOUR HELP is greatly needed in recruiting candidates for such training schools as this. As a leading citizen of your community you are in position to guide and advise. A trained nurse is a benefit to both you and your patient. We are prepared to refer the student nurse back to you on completion of her training. For full information write Miss Margaret Chase, R.N., B.S., Director, School of Nursing, Glenwood Hills Hospitals.

Analgesic power

Demerol hydrochloride ranks between morphine and codeine in analgesic power. Furthermore, it possesses marked spasmolytic and mild sedative action. It causes less nausea and vomiting and less urinary retention than morphine, and no constipation. The danger of respiratory depression is also greatly reduced with Demerol hydrochloride. Warning: May be habit forming. Ampuls of 2 cc. (100 mg.) and tablets of 50 mg. Narcotic blank required.

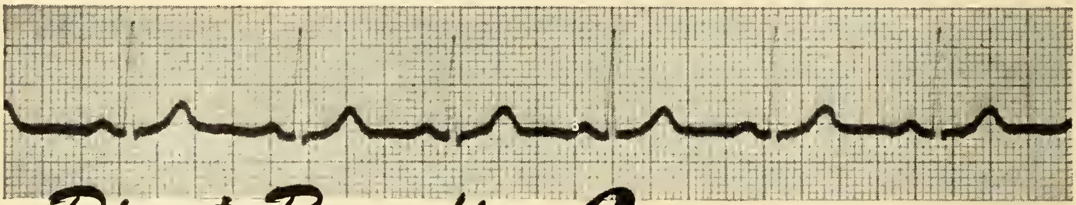
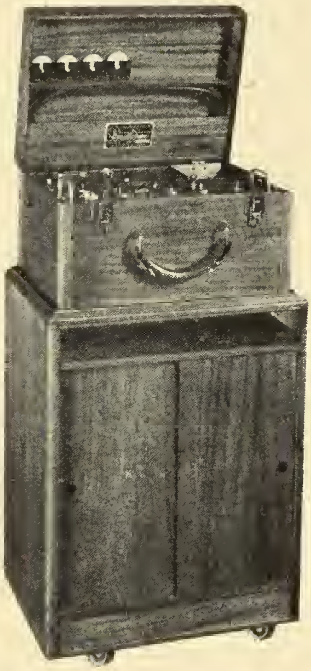
Modern ELECTRO-CARDIOGRAPHY



Direct-Recording **Cardiotron**



Portable, rugged, electrically operated without batteries. Cardiotron is available with or without stand.

The first successful

Direct-Recording

Electrocardiograph...

With more than 1200 now in use throughout the world, the Cardiotron has established the principle of instantaneous recording in general clinical electro-cardiography.

The Cardiotron is fast, accurate and sensitive. It makes an *immediate* black and white cardiogram—on *permanent* chart paper. It is free from skin resistance errors. It reveals more information than any other electrocardiograph instrument.

IMPORTANT: Factory-supervised installation and service are available in most parts of the world. Good deliveries are scheduled. Cardiotron is sensibly priced.

COMMUNITY-WIDE CHEST X-RAY SURVEYS AND THE GENERAL PRACTITIONER

By HERMAN E. HILLEBOE, M.D.,
Assistant Surgeon General, Associate Chief, Bureau of State Services,
United States Public Health Service
Washington, D. C.

IF tuberculosis is to be effectively controlled in the United States and finally rendered powerless to destroy thousands of American lives, the practicing physician must increasingly lend his knowledge and skills to the concentrated action of organized agencies that now are engaged in a total assault on this community and family disease. The health department, even when its performance is activated by a systematized plan for tuberculosis control, cannot succeed alone. The vigilance, the insight, the proximity to the people, which uniquely the private physician possesses, must be drawn upon for the invigoration and enhancement of current resources.

Any carefully planned program of control recognizes and uses the important talents and the strategic community position of the general practitioner. Indeed, it must be said that the physician in private practice is the principal force in the control of tuberculosis; and, certainly, in case finding, as exemplified by city-wide x-ray surveys, there can be no question of the individual practitioner's significant contribution. Such surveys bring into prominence the true role of each participating group—the health department, the tuberculosis association, and the local medical society. The members of this last group largely determine the success or failure of any survey anywhere in the country. Leadership in such a community enterprise must come from them. The driving force behind all action to find and treat and cure tuberculous persons must arise from a unanimity of professional purpose and must be implemented by the experience and brains of the local medical society members.

In a few communities, there has been expressed occasionally a certain apprehension concerning the effect of community-wide mass radiography projects on private practice. Experience, however, has demonstrated that newly discovered tuberculous patients and their families go to their family physicians for supervision, advice, and care. Mass x-ray surveys disclose a surprising number of early cases that, though asymptomatic, require long-term follow-up and guidance.

Increased knowledge of the epidemiology of tuberculosis impels us to direct our attention not only to the individual tuberculous person, but to the community as a whole. Unless surveys are done, relatively few tuberculous persons in any community are discovered before symptoms develop, and fewer still come under the care of physicians experienced in diseases of the chest. One cannot tell how many other infectious persons are never seen by physicians. During lifetimes they are spreaders of disease. It must be emphasized that the community, in which hidden cases of tuberculosis are positive disease entities, is of greater moment than is the person who spontaneously comes under care. There can be no control worthy of our respect if, in any given city, over half of the cases, especially early ones, are hidden from our view.

Not only must such a program to find hidden infectious cases be extensive, but it also must be intensive in action and limited in time. Indeed,

---

Thirteenth Annual John W. Bell Tuberculosis Lecture sponsored by the Hennepin County Tuberculosis Association and delivered before the Hennepin County Medical Society, April 28, 1947.

one of the most interesting aspects of mass radiography programs is the time element.

It has been emphasized in recent years that the most effective method of controlling tuberculosis is by means of chest x-ray examinations of the adult population in a definite period of time. In an attempt to achieve this objective, the U. S. Public Health Service is assisting state and local health departments with equipment, personnel, and consultation. Indeed, through demonstration of the effectiveness of community-wide mass x-ray surveys, the people of the nation now realize more fully the seriousness of the tuberculosis problem in their communities and are initiating action to stamp out the disease.

The action prompted by this new technique has often been interrupted by confusion of public health principles, a condition occasioned by varying approaches to tuberculosis control.

One group believes that the single technique of examining contacts of known tuberculous persons will discover all the new cases in the community. Another group advocates an annual tuberculin test of every person as the sole means of discovering all people with tuberculosis. A third group, mostly epidemiologists, emphasizes the damage done by people with hidden tuberculosis and by their many unknown contacts, and urges a total assault on the disease by means of (1) community-wide x-ray surveys done within a deliberately limited period of time; (2) the concurrent establishment of adequate follow-up facilities and the examination of contacts of previously known and newly discovered tuberculous persons, and (3) tuberculin testing of samples of the population at stated intervals.

Family studies and careful follow-up work in some of the best health departments in the country have shown that examination of contacts discovers as little as 25 per cent of new cases reported each year. In other words, only one out of four new cases may be found by examining contacts of previously known patients. Three out of four are new cases from the apparently healthy population, about whom there has been no previous record. Moreover, the principle of examining the adult population in a limited time, which is so important in the control of tuberculosis, cannot be effectively applied in a program which examines the contacts of known tuberculous persons only. Too large a portion of the population is not reached at all. Unless contact examination is reinforced by other case-finding services, intense and continuous exposure of the public to hidden cases will occur. In addition, this method, if used alone, is prodigal of time, personnel, and money, and can at best be only partially effective.

Annual tuberculin testing of the entire population of the United States, accompanied by x-ray examination of reactors, has been shown to be impracticable. Particularly in large cities the major portion of the adults are reactors to tuberculin, and little is gained by tuberculin testing before x-ray examination. Tuberculin testing of sample groups of the community at intervals is useful in determining changes in the infection rate from year to year. After the spreaders of the disease have been identified, treated, and isolated, and contacts supervised, it might be desirable to test those whole communities where the infection rate is low. The tuberculin test, moreover, is a most efficient tool in the differential diagnosis of tuberculosis after the screening x-ray examination.

With full use of resources heretofore unrealized and with a resolute determination to wipe out tuberculosis as a social and individual problem, the large and small communities of the entire United States could be covered by mass radiography teams in less than five years' time.

These modern methods, combined with efficient clinical and laboratory procedures for exact diagnosis, will give communities a precise knowledge of the local tuberculosis problem and will form the basis for realistic plans to remove the danger of tuberculous infection and disease. Adequately aided by money, trained personnel, and medical facilities, every aroused community can bring about the defeat of tuberculosis among its citizens.

Tuberculosis presents at once a challenge and an opportunity to the general practitioner. Thousands of persons who have tuberculosis go to private physicians for other illnesses, and no official agency ever sees them. Although the physician deals directly with the source material of tuberculosis, he often does not recognize the early stages of the disease because he does not constantly search for tuberculosis with the tools at his command.

Too often it is assumed that the control of tuberculosis is solely the health department's domain of action. This is not true, nor can it ever be true, so long as men practice the ancient art of medicine. The family doctor in the city, the country doctor going about from farm to farm, the village doctor in his office over the drug store know the people, have their trust, and guide their physical destinies. The educational pamphlets of a hundred organizations cannot have the enduring effect nor the permeating persuasiveness of the doctor's personal advice. Tuberculosis is so deeply a personal disease that news of its tragic onset or advance can be more calmly accepted when its source is the family doctor and not a stranger from a distant agency.

Participation by the private physician in the control of tuberculosis need be no trouble in terms of time or technique. There are many ways in which the private physician can contribute his talents as a professional man and his influence as a community leader in any integrated program of control. The use of the intracutaneous tuberculin test of chest x-ray film on every new patient who has not been recently examined for tuberculosis should be a fundamental routine; this is a continuing and essential part of the community-wide plan. Reactors to tuberculin should have chest x-ray films made and interpreted by physicians with training in chest diseases. The general practitioner can get expert help from sanatorium physicians, chest specialists, and radiologists in his area on all routine chest films. Regularity of such conferences with more highly specialized colleagues will provide many opportunities to develop skills in the interpretation of films. Local health departments and tuberculosis associations can make special consultation service available for films of indigent patients.

It has been estimated that nearly 4 per cent of all persons who visit physicians' offices complain of cough or expectoration. The alert physician will insist upon a sputum examination of all such patients. Such practice will be rewarded by the discovery of tubercle bacilli in three or four out of every 100 specimens examined. The family doctor will fairly often discover to his astonishment that a patient with slowly resolving pneumonia has an acid-fast reason for prolonged convalescence.

In less populous areas the general practitioner is required to carry on case finding and follow-up almost singlehanded. He must give advice and encouragement to his tuberculous patients and their families. Indeed, it is at this time that the practical philosophy of the private practitioner is of great moment—at the height of that crisis which often occurs upon the announcement of tuberculosis. It is at this time that the general practitioner can bring all his talents into play. He is aware of the whole person. He knows the patient's background, habits, aspirations, and desires. He does not think of his patient merely as a pair of lungs; he thinks of a man of spirit as well as of body, who for a time has come, through tuberculosis, upon disaster.

Through the utilization of modern methods of case finding, the general physician can extend the frontiers of medicine. Those physicians who have not had actual experience with these new techniques should be provided with training by the county medical society, the medical school, the health department and the tuberculosis association. Postgraduate training and continuation study should be provided, so that practitioners who are removed from centers of medical knowledge may take advantage of the latest information. By means of such training, the case finding of the general practitioner can be integrated with the case finding of official and voluntary agencies. The private physician has a vital part to play in the campaign against tuberculosis; the success of the whole movement may well be determined by the efforts and leadership of general practitioners.

The private physician's interest and enthusiasm will be increased and, as a result, his effectiveness as a worker in the community-wide program of tuberculosis control will grow if he takes the time to learn about some of the latest advances in the field. A few of the more noteworthy developments merit your attention.

Within recent years some significant contributions have been made to our understanding of the tuberculin test and chest x-ray film. These developments should enable us to understand better how and why the tubercle bacillus invades the human body. Studies by Furcolow and coworkers have shown that there are great variations in human sensitivity to tuberculin and its products, depending upon the dosage used and the characteristics of the population groups tested. It was demonstrated that effective contact with the tubercle bacillus appears markedly to increase sensitivity to tuberculin (very small doses give typical reactions); on the other hand, almost all persons tested will be reactors if sufficiently large doses are given. (However, as the size of the dose increases, the proportion of typical reactions increases also, that is, reactions that often appear early and disappear early and are soft and spongy in appearance.) Consequently, proper interpretation of tuberculin tests requires a knowledge of the size of the dose and the type of product used.

It appears that the tuberculin sensitivity of patients suffering from active tuberculosis is at such a high level that the infection in these persons may be detected by the use of an exceedingly small dose of old tuberculin (OT) or of PPD (purified protein derivative). The authors point out that an intermediate dosage of approximately 1/10,000 mg. of the particular PPD used in their studies was sufficient to pick up a high proportion of infected persons. It is significant from the point of view of usefulness of tuberculin testing for determining infection rates and for differential diagnosis that both children and adults with active tuberculosis almost always are reactors to tuberculin, except in the terminal stages of the disease.

Palmer and his co-workers have pointed out that one of the significant problems in tuberculosis involves the marked variations, in different parts of the country, of the frequency of pulmonary calcification observed in x-ray films of the chest, especially among nonreactors to the tuberculin test. This is striking in view of the fact that pulmonary calcification is generally interpreted as evidence of healed tuberculosis. There is incomplete epidemiological evidence that tuberculosis is the only important cause of such findings. Early in 1940 Palmer and his co-workers were puzzled by the high correlation between nonreactors to tuberculin and pulmonary calcification. They began to search for other causes of calcification; coccidioidin reactions were studied in relation to pulmonary calcification and failed to show any correlation on a geographic basis. It was natural to search for other fungi as one of the offending factors.

About this time Christie and his group in Tennessee were concerned with the same problem. Christie had some children under his care who were nonreactors to tuberculin and had pulmonary calcifications. The patients reacted to histoplasmin, the testing material prepared from the fungus *Histoplasma capsulatum*. This relationship suggested to Palmer the desirability of testing a large number of student nurses throughout the country, in order to determine the relationship of histoplasmin sensitivity to tuberculin sensitivity and pulmonary calcification. Preliminary reports from Palmer and his group indicate that (1) a mild, probably subclinical, infection with Histoplasma capsulatum (or immunologically related organisms) is widely prevalent in certain states and relatively infrequent in others, (2) that in general those states in which the frequency of reaction to histoplasmin is high are those in which pulmonary calcification is also high, but reaction to tuberculin is low, and (3) that a high proportion of the pulmonary calcification observed in x-ray films of nonreactors to tuberculin is not due to tuberculosis.

A recent study, based on an analysis of skin tests of siblings found among children who were lifetime residents of the metropolitan area of Kansas City, Missouri, is extremely interesting because it demonstrates that there is a similarity of histoplasmin reactions among children of the same family. The percentage of reactors is higher among children whose older sibling does not react.

The similarity grows less marked as the children grow older: the difference in the percentage of reactors between children with an older sibling who reacts and children with an older sibling who does not, increases with increasing age of the older child.

The closeness in age of siblings influences the degree of similarity, as shown by the fact that the differences in percentage of reactors among siblings of a reactor and of a nonreactor are greater when there is no more than two years' difference in age between the two children.

After the similarity between siblings produced by the known factors affecting the frequency of histoplasmin reactors (geography, age, sex, and race) has been eliminated, there is still present some factor which makes siblings of a reactor more likely to react to histoplasmin than siblings of a nonreactor.

The epidemiological evidence indicates that a very high proportion of the pulmonary calcification observed in individuals living in these states may be due to infection with Histoplasma capsulatum or related organisms and not to tuberculosis. The epidemiological studies are being pursued vigorously by several groups throughout the country. Many of the old concepts of primary and reinfection tuberculosis will have to be reconsidered in the light of these recent findings.

It was in the decade between 1935 and 1945 that students of epidemiology were provided with an important new instrument to assist them in their field investigations—the photofluorograph. Mass radiography made possible the examination of hundreds of thousands of people—in fact, whole communities—in a short period of time and at a reasonable cost. The experience of Davies and his co-workers in St. Louis County, Minnesota, demonstrated that over 90 per cent of the population of communities of fair size could be examined within a surprisingly short period. All open cases, clinical cases, and suspects were detected and later identified. Facilities were available for the isolation of open cases and the medical supervision of the subclinical cases and suspects. If the standards of living of the citizens of the community can be raised to a higher level and kept there, eradication for the first time becomes possible.

Such community studies have not been followed up for a long enough period of time to measure the various risks of different population groups in the community. Within the next few years following the war, it should be possible to answer some of the pressing questions regarding the natural history of the disease in the community. Certainly it has been demonstrated that rather complete community examinations are practicable and can become a precise tool in the study of the epidemiology of the disease as well as an important weapon in the fight against tuberculosis.

Now that the x-ray machine goes to the people, and examines them in large groups, it discovers tuberculosis in its minimal stage in a high proportion of the cases found. The importance of this finding in controlling the disease is made clear by the fact that in recent years only 10 to 15 per cent of admissions to tuberculosis hospitals have been minimal cases. Today, with new mass radiographic techniques, 65 to 70 per cent of all cases found have x-ray evidence of minimal disease. Tuberculosis is at last being found when it can be relatively easily arrested; even infectious cases can be detected earlier and prevented from spreading their disease.

Scientific accomplishments during wartime have clearly revealed the value of planned co-ordinated research in arriving speedily at the solution of trying problems in tuberculosis control. Strangely enough not the least repercussion of atomic fission is the stimulus it has given to group activity in research. Certainly this is true in the study of variations in the interpretations of x-ray films of the chest. Mass radiography brought in its wake some troubling problems in film interpretation. Studies of Morgan and his co-workers have demonstrated that various film techniques, 35 mm., 70 mm., 4 by 5, 14 by 17 paper, and finally 14 by 17 celluloid film, are equally efficient in detecting practically all of the significant pathologic conditions present on x-ray films of the chest. Group work is now going forward to determine the human error in the interpretation of chest x-ray films.

The ingenious technique developed by Yerushalmy for making comparative studies of various types of films read by several interpreters is worthy of further use in other fields of science and public health. It avoids the use of one film and one reader as standards because either of these may have considerable variation. If five readers use four different sized films (one to twenty positives plus all twenty negatives) twenty-one combinations are possible. Yerushalmy uses eleven positives out of twenty readings as a standard.

Prior to the widespread use of photofluorography in chest examinations, radiologists and chest specialists were firmly convinced that x-ray examination was one of the most precise laboratory tools at our disposal. The first comparative studies appeared and astonished all radiologists who formerly had assumed that roentgenological diagnosis was synonymous with high accuracy. The failure of an individual reader to be consistent with other readers presents a problem of considerable magnitude in the simple procedure of determining the presence or absence of a shadow "characteristic" of tuberculosis of the lungs. The variation of one person's separate interpretation of the same films at two different times, is even more astonishing. Discrepancies in the determination of activity and morphology of lesions among several expert interpreters were so great that the toss of a coin would have given about the same results.

Birkelo, Chamberlain and co-workers have demonstrated that the human error is great and that new techniques will have to be developed for the uniform detection of pulmonary lesions and that better classification will have to be devised to describe shadows on x-ray films. The variation in the determination of activity of tuberculous lesions on x-ray films is so great that in the modern clinics throughout the United States this differentiation is not made without careful laboratory, clinical, and serial x-ray examinations. All findings must be interpreted in their entirety by a competent clinician who considers subjective variations as well as objective findings. As these investigations in x-ray diagnosis go forward, still sharper tools will become available for the study of the meaning of various types of pulmonary lesions demonstrated on the x-ray film.

The error is of great moment in the epidemiology of tuberculosis, because the roentgenogram of the chest is the principal tool in diagnosis and follow-up of tuberculous persons. Great care must be exercised in making comparisons of epidemiological studies done by different investigators. Variations in results based solely on interpretations of x-ray films may be more apparent than real. For the present, if results are to be meaningful, comparative studies should include provision for interpretation of all chest films by two or more well-trained interpreters, with careful evaluation of their independent readings. Such self-examination in the complex field of roentgenography of the chest is essential if fundamental research is to contribute the additional knowledge that is so urgently needed.

Another subject which has attracted the attention of scientific investigators in the field of tuberculosis has been vaccination with the bacillus of Calmette and Guerin (BCG). Careful review of the extensive literature on this subject fails to reveal irrefutable epidemiologic evidence of the permanent effectiveness of this vaccine. Studies by competent workers in the Scandinavian countries and reports from the South American investigators demonstrate a relationship between vaccination and decreased incidence of the disease among children and some adults over limited periods of time. In the United States the relative abundance of sanatoria and low mortality rates in certain areas has minimized the need for an immunizing campaign. Furthermore, there has been a strong objection on the part of some of the tuberculosis clinicians in this country to infect children who may have the chance of going through life without ever becoming infected. The full effect of the vaccine on tuberculosis in human beings must wait until carefully controlled studies precisely measure a reduction in morbidity and mortality in various age groups for long periods of time. Where there is inadequacy or complete absence of isolation, lack of personnel and facilities for control, and where persons, particularly children and susceptible racial groups, are subject to massive exposures to tuberculosis, with little likelihood of any change, BCG vaccination should be given immediate consideration. BGG vaccine, and possibly other similar vaccines being developed, would appear to hold more promise for the reduction and control of tuberculosis than streptomycin, even though the results of the latter in individual cases impress the public and the profession as more spectacular. The epidemiologist must still convince the clinician that prevention will contribute far more than treatment in the control of tuberculosis.

The brilliant discovery by Waksman in 1944 of the antibiotic, streptomycin, however, offers hope for suppressing pulmonary tuberculosis in human beings. It appears to have a definite but limited effect upon clinical progress of the disease; this includes retrogressive changes on the x-ray film, but only occasional changes from positive to negative sputum. Although the drug is too new to have permitted careful study of its effect over a long period of time, some interesting implications immediately become apparent. The use of this new antibiotic for advanced cases of tuberculosis is of limited value because of the irreversible pathological processes that have already taken place. In most sanatoria throughout the country, from 70 per cent to 90 per cent of first admissions have advanced disease. It is for this reason that Dr. Hinshaw of the Mayo Clinic estimates that not more than 10 per cent of patients now in sanatoria in this country would be likely to benefit by treatment with streptomycin, and then only if cases were carefully selected by experts in diseases of the chest. Yet for the first time, both children and adults with tuberculous meningitis have recovered. The Veterans Administration has treated over fifty cases with the remarkable record of one recovery out of every five cases. It is true that many of these had serious complications. The follow-up experience of these cases is awaited with interest. This contribution in meningitis is of great importance because of the case-fatality rate of almost 100 per cent before the use of streptomycin.

Among experimental animals it has been demonstrated that the use of streptomycin can cause a tuberculin reactor to become a nonreactor. Similar experiences have not yet been reported in human beings. Excessive cost of the drug has prohibited its wide use up to the present time; furthermore, no adequately controlled studies of patients treated with streptomycin have been presented. Greatly expanded clinical and laboratory research is urgently needed.

Several questions about streptomycin merit consideration. Investigators find that after a four months' period of treatment with recommended doses of streptomycin, the sputum still contains virulent tubercle bacilli in a considerable number of patients with advanced tuberculosis, even though there is some clinical improvement and retrogression of tuberculous lesions on x-ray films. Patients who are still infectious may wish to leave the hospital because they feel better, although their disease is not arrested. In this instance, streptomycin plays the dubiously beneficial role of temporarily helping the individual but permanently harming the community by causing the spread of the disease to uninfected contacts. Furthermore, laboratory studies have shown that persons kept on treatment with streptomycin for even short periods of time, develop strains of tubercle bacilli that become resistant to streptomycin but still retain their virulence. The longer the patients are treated the more likely this is to occur. Epidemiologically, a dangerous situation could be created that would retard rather than hasten the control of this disease. The nonhospitalized infectious patient, whose disease is not arrested completely, would spread a streptomycin-resistant strain of tubercle bacilli capable of causing disease in susceptible contacts, who, upon entering the hospital for care, would not be amenable to streptomycin treatment because their tubercle bacilli would be already resistant to the drug. Careful study will have to be made of these factors before such a drug is used widely throughout the nation. Extensive use of any antibiotic in the treatment of a chronic disease like tuberculosis makes necessary plans for the substitution of new antibiotics when resistant strains become sufficiently prevalent in the affected groups of the population to restrict treatment possibilities. As Dr. Hart of England points out, there is, at present, insufficient evidence concerning the use of chemotherapeutic agents in tuberculosis to warrant any cessation of the successful campaign to provide more beds for the isolation and treatment of persons with infectious and remediable disease. Actually, when a successful therapeutic agent emerges, as it undoubtedly will, additional personnel, beds and other facilities must be available for the most effective use of such an agent.

Laboratory examinations for tubercle bacilli are in somewhat the same untenable position in the United States today that serological tests for syphilis were at the beginning of the venereal disease control program over a decade ago. There is no general agreement of the most effective media for culture of tubercle bacilli in the routine or research laboratory. There is great diversity of opinion on the relative value of culture methods versus guinea pig inoculation in the identification of virulent organisms. Prolonged discussions are a common occurrence at meetings when professional men debate merits of the direct smear, the concentrated specimen, and the examination of gastric lavage in laboratory detection of tubercle bacilli. Recently the technique of pulmonary lavage has been popularly acclaimed, only to complicate the problem further. Yet no subject is of greater significance in the epidemiology of tuberculosis than the detection of virulent tubercle bacilli in persons suspected of or having the disease. Sputum examination is essential for exact diagnosis; prognosis rests largely on its accuracy; infectiousness is determined solely by the presence or absence of infecting organisms in bodily discharges. Much of our present knowledge of epidemiology has come from combined clinical and laboratory investigations. Without the results of laboratory tests, the clinician would find it difficult to diagnose accurately, predict realistically, and treat effectively a high proportion of his patients.

Too many persons have been labeled tuberculous on the basis of a single x-ray examination of the chest; laboratory diagnosis of tuberculosis has been too often neglected. The pathologist insists that he find tubercle bacilli before he can assign tuberculosis as the cause of disease. This is not always possible in office practice or in field investigations. Yet before final diagnosis every effort should be made to take careful histories, to perform tuberculin tests, to make repeated sputum or gastric lavage examinations, to repeat x-ray examinations. It is clear that scientific medicine cannot be practiced without laboratories for the performance of scrupulous examinations for tubercle bacilli.

To determine the effect of sanatorium care or surgery on the natural history of tuberculosis in a given population group, high standards of laboratory diagnosis must be observed; otherwise such studies are likely to become a series of unassociated case histories. Many of the reports of the results of surgical treatment of tuberculosis of the lungs suffer from a paucity of evidence concerning reversion of positive to negative sputum because of lack of laboratory controls.

The easily performed procedure of pneumothorax is often initiated before tubercle bacilli are demonstrated in the pulmonary discharges or the pleural fluid. Epidemiology teaches us that all shadows on the x-ray film are not tuberculosis. All the wisdom and judgment of an experienced chest clinician must be utilized before interfering with the normal physiology of the respiratory system. The possible advantages of surgery must be carefully weighed against the dangers of interference with restoration of normal function by the body itself.

From the x-ray film alone even the experts cannot consistently distinguish the fibroid from the exudative type of pulmonary lesion. Prolonged study in a hospital by experts offers the only solution to this difficult diagnostic problem. Yet the truth is, there are not sufficient beds in the United States to hospitalize all the minimal cases now being discovered in increasing numbers by mass radiography of the adult population. Furthermore, there probably will not be enough beds for some time, in spite of concentrated efforts of powerful and influential agencies and citizens. What is to be done in the meantime? Supervise the minimal cases that cannot be labeled active clinically, and use the hospital beds for those minimal cases of uncertain or active status and for the more advanced infectious cases. The goal of a sound tuberculosis control program is to prevent spread of disease. Therefore we must make the best use of existing beds for known spreaders and known active cases, which will become spreaders. We must care also for all those who have suspicious x-ray lesions to prevent their breaking down. We must mobilize all resources at our command until we get sufficient beds or learn more about the relative benefits of ambulatory and bed treatment of all types of minimal cases.

The problem of proper disposition of a person with a minimal lesion requires further appraisal and research. Long-range studies of random groups of the tuberculous population with minimal disease are urgently needed. In the meantime, caution is required in hospitalizing every asymptomatic person with a minimal lesion, especially if known cases with infectious or remediable disease are awaiting admission to the sanatorium. At the same time, there must be close supervision of ambulatory persons with asymptomatic minimal lesions. Frequent repetition of x-ray and laboratory examination should be the rule. Abnormal pulmonary findings of any kind that appear on serial study, should be carefully scrutinized in the doctor's office or public clinic so that even the slightest signs may be studied for possible evidence of activity.

If such a practice is generally followed, chest physicians will gain in skill of diagnosis; limited hospital resources will be conserved for urgent cases; and epidemiology will assume added significance. Judgments based on positive and complete evidence will give a final verdict that preserves the health and productivity of the individual and at the same time protects the public health.

The unsolved problem of hospitalization of the tuberculous in this country poses many questions. In recent years over one-third of all deaths from pulmonary tuberculosis occurred outside of hospitals and institutions. There are many areas in the country which cannot find the means to provide hospital care for their tuberculous citizens. Recent studies of mortality in nine populous southern states reveal that from 55 to 77 per cent of deaths from tuberculosis occurred outside of institutions and sanatoria. The opportunity for spread of the infection from the family member who died at home to the family associates must have been tremendous, especially where poverty and overcrowding existed in areas of severe economic distress. Control of the disease will be impeded until a more realistic distribution of hospital facilities is accomplished. Tuberculosis does not respect state lines, color, race, or creed. The real value of case finding is measured by the number of infectious cases that are given isolation care and thereby prevented from spreading infection to others.

In any community, there are specific epidemiological data which must be analyzed and evaluated before a sound program of efficient bed utilization can be instituted and maintained. The morbidity and mortality rates are of great importance in determining the extent of the local problem. A knowledge of the quantity and availability of hospital beds, clinics, nursing, medical, social, and other professional services for the care and supervision of the tuberculous is equally important. The number and distribution of physicians trained in chest diseases constitute fundamental factors in the management of ambulatory cases and in economy of bed usage.

Such critical studies provide the answers to certain questions that leaders in tuberculosis control in every community must answer before they can develop and operate an effective hospital program.

1. What is the fundamental purpose of hospitalization of the tuberculous—isolation or treatment? The answer to the first question is unequivocal: the protection of the health of all the individuals in the community takes precedence over the health of any one individual. Of course, in the handling of individual patients, the physician must stress individual needs and the benefits derived from hospitalization by the person concerned.

2. Does the community, with a scarcity of beds, benefit more through the hospitalization of minimal cases with no sysmptoms or of advanced infectious cases? The answer to this question inevitably follows: the positive sputum case must be hospitalized to prevent spread of the disease; the earlier the case is found the better.

3. Should communities develop preventoria for children who are heavily exposed and certain to become infected, but do not yet have clinical disease? Study of family contacts has provided the answer to the third question: hospitalize the infectious adult source and thereby remove the danger of infecting children in the home. It is easier and more economical to hospitalize one parent than three or more children.

There is a known shortage of over 50,000 beds for the tuberculous in the United States in 1947. This condition appreciably affects the quantity and quality of care that can be given. It is not uncommon for a large area to have only 200 beds and a register of more than 400 positive sputum advanced cases and over 1,000 with minimal disease.

How can the limited number of beds be used to greatest advantage? It is suggested that positive sputum cases be separated into two groups:

(1) the positive sputum patient with remedial disease, and (2) the positive sputum patient who has little hope of recovery. Hospitalize first the remediable positive sputum group. In this way both isolation and treatment are accomplished. The irremediable positive sputum case might be isolated in a single room in a general hospital during the terminal episode. In the event that such arrangements are impracticable, the hopeless case must be cared for in the home under the best possible isolation technique, with home instruction and contact follow-up by public health nurses. Such a practice protects the community and provides the opportunity to restore the health of at least some whose disease is not yet beyond repair.

We must think of the community first and the individual next when hospital beds are limited. We must guard the health of all the known tuberculous in the community and not just the individuals who, often by chance, fall into the hands of the expert in chest diseases. Available beds should be used principally for the spreaders of tuberculosis whose lesions can be arrested, and for proved minimal cases with definite clinical or laboratory evidence of active disease. This is in accord with changing social views on illness. It is becoming more and more widely recognized that a tuberculous patient is not only a private patient under the care of a doctor but also a carrier of a disease in the community. Therefore, the physician has a certain public as well as private responsibility. The private physician must report all his tuberculous cases to the health department, so that the number and whereabouts of the cases will be known. If a patient does not return for supervision, the physician has the further responsibility of reporting this fact to the health department, so that the department can take immediate action and bring the patient under medical care and isolation. In this respect he is an agent of the health department and is an extremely important factor in the promotion of community health.

In spite of the increase in knowledge of the epidemiology of tuberculosis since the time of Pasteur and Koch, the principal question that remains unanswered is, "Why do some people develop tuberculosis and others fail to do so?" We have yet to determine the total and inter-related effect of time, intensity, frequency, and duration of exposure. We must evaluate the effects of unfavorable environmental conditions in the family, community, and geographical area. Such complex factors as sex, age, color, and many racial stocks with complex hereditary and constitutional attributes must be analyzed.

There are fields without number awaiting exploration. Many guideposts are unmistakably present, in the form of accurate and complete statistics on tuberculosis. Unfortunately, the number of scientific explorers is small. Each year the group of trained epidemiologists is further reduced to supply the need for public health administrators for state and local health departments. Indeed, a basic problem of epidemiology is that of recruiting and training an adequate body of capable investigators. Our only hope is for medical schools and general practice to provide some worthy candidates.

Many questions in the epidemiology of tuberculosis remain unsolved because of the lack of efficient tuberculosis record systems in otherwise effective health departments. Better records, and time for their analysis, could reduce the number of past mistakes and enable us to determine if what we have proposed and carried out has accomplished the desired end. In areas that have established tuberculosis control programs, case registers can be used both for case management and as current sources of valuable data for epidemiologic investigation. A perpetual inventory of the case load, with interval evaluation of the effectiveness of activities, in relation to their cost, provides a realistic appraisal of the extent of the problem. Smoothly functioning record systems are essential tools for successful administration of a tuberculosis program, and create the opportunity for the discovery of new knowledge and for improved methods of control. Carefully devised record systems make the practice of public health, as applied to tuberculosis, a science and not just empirical guesswork. Long-range planning, based on predictions derived from analysis of reliable epidemiologic data, promotes economy of program operation and definitive results.

Summary

Much could be learned about the epidemiology of tuberculosis if we could encourage the participation of more general practitioners in our field studies throughout the country. Although the general physician deals directly with the source material of tuberculosis, he infrequently recognizes the disease in its early stages, because he does not constantly search for it with the tools at his command. The routine use of the tuberculin test on every person who visits the rural doctor's office would uncover a surprising number of hidden and unsuspected cases of tuberculosis. The examination of family contacts and a search for the original spreader leads the family physician away from his relentless daily routine into exciting by-paths of epidemiologic investigations. Through the utilization of modern methods of diagnosis and follow-up, the rural physician extends the frontiers of knowledge in this puzzling disease.

In spite of the great amount of knowledge that still remains hidden from us, the study of epidemiology, as Chapin has aptly pointed out, has profoundly modified our methods of dealing with contagious diseases. The discovery of the cause of tuberculosis and some knowledge of its mode of spread are fundamental to an effective control program. As our knowledge increases it becomes the province of epidemiology to plan and try out new and more efficient methods of control. Knowledge includes more than morbidity and mortality statistics. The epidemiologist who studies the intricacies of the changing pattern of the spread of tuberculosis must be familiar with statistical methods in order to avoid losing his way in a maze of figures. As scientific investigations go forward, and as accurate and complete data accumulate, the best safeguards for sound inferences are: (1) proper selection of data; (2) judicious use of controls; and (3) the orderly array of facts in their proper relation to present information about the disease. Conclusions based upon such interpretations of data will be sound and should increase the efficiency of our methods of controlling tuberculosis.

The deadly quarrel between microbe and man will continue unabated unless we apply all the measures at our command to insure the protection of the whole population within a short

THE MEEKER COUNTY TUBERCULOSIS CONTROL PROJECT

KARL A. DANIELSON, M.D.
Litchfield, Minnesota

EARLY in August, 1940, a telephone call was received from the Committee on Tuberculosis of the Minnesota State Medical Association requesting that a few of its members be permitted to meet with the physicians of Meeker County. A luncheon meeting was arranged on August 19, and we were informed that in February, 1940, the state committee had determined to recommend a statewide tuberculosis control program to be initiated and conducted by the State Medical Association. On March 26, 1940, this committee decided to select a county in which an ideal tuberculosis control program would be developed by local physicians and that this area would serve as a demonstration for the remaining eighty-six counties of the state. At subsequent meetings, numerous counties were considered, and on August first the members of the committee voted unanimously to ask the physicians of Meeker County to undertake the countywide proposed demonstration. This county was selected because:

1. The first tuberculosis survey among humans in Minnesota was conducted here by Dr. Lampson in 1912.
2. When the county area plan of controlling tuberculosis among cattle was undertaken by the State of Minnesota in 1923, Meeker County was selected for the beginning of this work. In other words, this was the testing ground for the state program.
3. The committee had determined that all physicians practicing in Meeker County had a modern viewpoint on tuberculosis control and would work in harmony on a countywide project.

After all of this was explained on August 19, our members agreed to give the project most careful consideration. In November, 1940, and for several months thereafter, the state committee held practically all of its regular meetings in Litchfield, our county seat, and the physicians of the county as well as a few from adjacent counties regularly attended these meetings. Presidents of the state association, including B. S. Adams and B. J. Branton, as well as members of the council, including Carl Johnson, E. J. Simons and C. A. Stewart, were present on several occasions to assist in formulating our program. In these evening meetings, which often lasted for hours, various phases of the proposed project were discussed. Meetings were also held for the leaders of lay organizations and for the general public, in order that everyone might have an opportunity not only to know about the proposed project but also to offer suggestions for its execution. In the early spring of 1941 it appeared that the necessary preparations had been made, and the physicians were ready to proceed with the examinations the first of May. It had been agreed that the procedure should consist of testing the entire county population with tuberculin in order to find all who were infected with tubercle bacilli. This was to be followed by x-ray film inspection of the chests of reactors, and those with shadows indicating the presence of pulmonary disease were to be completely examined in order to ensure accurate diagnoses.

At first no funds were available to pay for materials or any phase of the work. However, it was not long before the Minnesota State Medical Association, the American Medical Association, the National Tuberculosis Association, the State Public Health Association and the local tuberculosis society contributed adequate funds. Our physicians agreed to administer the tuberculin test, interpret all x-ray films and do all necessary phases of the examination without charge. The State Department of Health agreed to furnish the tuberculin and to deliver it weekly in dilutions ready for administration. Our physicians decided to use x-ray films which were purchased and delivered to us by the state committee. From the same funds x-ray technicians were paid a small amount for exposing and developing the films and for purchasing necessary materials for keeping records, postage, et cetera. Every detail of the project was to be conducted by the citizens of Meeker County.

Saint Paul and Minneapolis newspapers gave wide publicity to the project, even publishing articles concerning it in Sunday editions. *Everybody's Health* supported and publicized the project in a wholehearted manner. Fine editorials

---

Dr. Danielson is chairman of the Meeker County project.

and articles were published in MINNESOTA MEDICINE. The Meeker County newspapers were exceedingly generous with space, urging everyone to co-operate. We received help from the pastors of various churches, superintendents of schools, and very substantial aid from the Farm Bureau. *Collier's* published an article with colored illustrations on May 2, 1942, entitled, "Worth More than a Cow." The Minnesota Public Health Association lent us motion picture films pertaining to tuberculosis which were shown in the rural district schools and at parent-teacher association meetings. At some of these sessions, talks were given by local physicians.

Postcards were prepared containing the following message: "You and your family are invited to come to your doctor's office for a tuberculin test, and if a reaction occurs, an x-ray film will be made of your chest for which there will be no charge. Signed: The Meeker County Medical Society." These cards were mailed at two-week intervals, first to the towns and villages and then one township at a time, until the entire county had been circularized. It was planned to follow up this volunteer program with one or two public health nurses arranging meetings in outlying districts and, if necessary, going from home to home.

With the declaration and prosecution of war, resulting in rationing of gasoline and restriction of travel because of rubber shortage, it became difficult for the farmers to respond to the invitation as they did before these restrictions were instituted.

Moreover, enlistment of physicians and nurses, the removal from the county of so many persons who were supporting the campaign, resulted in marked retardation of our tuberculosis activities. In fact, they came almost to a standstill for reasons beyond our control. The population, which was approximately 19,000 before the war, was reduced to slightly more than 16,000 by Selective Service and removal of defense workers. Efforts made to procure workers nearly always ended in failure.

Under the circumstances it seemed futile to continue the project as a demonstration. Therefore, it was closed when approximately two-thirds of the citizens had been examined. Most of the 10,733 persons who were examined reported early in the campaign. No objection was voiced at that time to the tuberculin test or any other phase of the examination. The citizens were enthusiastic, and had it not been for the war, we believe that not less than 90 to 95 per cent of our citizens would have been examined.

Among the 10,733 who reported, 2,445 (22.8 per cent) reacted to tuberculin. Of the total number of tuberculin reactors, 2,031 reported for x-ray inspection of the chest. The failure of the remaining 414 was largely due to travel difficulties during the war. Among the 2,031 persons who reacted to tuberculin and had x-ray film inspection of the chest, there were sixteen who presented x-ray shadows that were definitely proved by other phases of the examination to represent clinical tuberculous lesions. Thirteen of the sixteen were sent to sanatoriums, and the remaining three were treated by private physicians.

Our physicians are greatly pleased with the results of this campaign, despite the fact that the project had to be discontinued after approximately two-thirds of our citizens had been examined. It resulted in the removal from society of sixteen active cases of the reinfection type of tuberculosis. Of great importance to us is the information obtained with reference to tuberculous infection. We know that only approximately 23 per cent of our citizens carry living tubercle bacilli in their bodies. In other words, the tuberculosis work previously done in Meeker County has been effective, since 77 per cent of our population have apparently been protected against tubercle bacilli. The present 23 per cent represent such a limited group of the population that it is possible to institute and maintain an intensive education campaign among them so that they may be on guard with reference to the subsequent development of clinical lesions. The 77 per cent of uninfected persons have been advised to be retested from time to time and, if infection occurs, to be periodically examined for clinical lesions.

There was so much publicity throughout the county concerning this project that there probably are few, if any, citizens who did not learn something about tuberculosis. Therefore, we are of the opinion that many of our citizens whom the project did not reach will request adequate examination for tuberculosis. Although the project as such has been discontinued, many persons, particularly since the end of the war, have requested special examinations for tuberculosis.

TOXOPLASMOSIS

PAUL KABLER, M.D., M.P.H., and MARION COONEY, B.A.
Minneapolis, Minnesota

TYPICAL toxoplasmosis occurring in a fourteen-year-old female resident of Minnesota was reported by Adams, Horns and Eklund[1] in 1946. Neutralizing antibodies for the toxoplasma organism were present in the blood of the patient as well as in that of the mother and in eight of nine siblings tested. The mother and siblings showed no clinical signs or symptoms of the disease by physical or roentgenologic examinations.

The first case of human infection with toxoplasma was reported in an infant in 1923 by Janku,[3] who described the organism but did not identify it. The second case was reported in an infant by Torres in 1927. Wolf and Cowen[10] in 1937 described another infantile infection, giving full clinical and pathological findings, and in 1939 Wolf, Cowen and Paige[11] described a similar case from which the toxoplasma organism was recovered by intracerebral inoculations of rabbits and mice with brain tissue taken at autopsy. Identity of this organism with a strain of toxoplasma isolated from laboratory animals was shown by cross-immunity tests, thus definitely establishing the etiological agent. Since 1940, cases of fatal toxoplasmic infections in adults[4,5] and in children[7] as well as several nonfatal cases have been recorded.

The toxoplasma organism is regarded as a protozoan parasite and has at times been confused with other protozoan parasites such as Leishmania, Encephalitozoon and avian malaria. Identification is definitely determined by animal inoculation; however, the presence of characteristic organisms in the tissues is now generally considered diagnostic.

Although the parasites have more frequently been demonstrated in nerve tissue— meninges, cerebral cortex, basal ganglia, pons, medulla, spinal cord and retina—they have also been found in alveolar epithelium of the lung, myocardium, adrenals, reticuloendothelial and parenchymal cells of the liver, kidney, bone marrow, endothelium of arterioles and venules, skeletal muscle, skin and subcutaneous tissue.

Spontaneous infection in animals is widespread and has been recorded in the dog, cat, rat, mouse, guinea pig, mole, sheep, baboon, chimpanzee and numerous kinds of birds. Instances of human infection have been observed in Australia, Europe, South America, and in several states of the United States of America. At present the routes of infection and other epidemiological factors are unknown.

Human toxoplasmic infections may present several types of clinical manifestation. Sabin[9] has summarized six clinical forms. Callahan, Russel and Smith[2] in a recent comprehensive review of the disease described infantile and adult toxoplasmosis with subtypes of each.

The infantile form is frequently fatal, the disease being present at birth or appearing a few days or weeks thereafter. The outstanding signs and symptoms of these cases are internal hydrocephalus, convulsions, muscular twitchings, chorioretinitis, ocular palsies, spasticity, jaundice, intracerebral calcifications, hepatosplenomegaly and respiratory disturbances. Usually this type of infection is acquired *in utero,* and the mother has neutralizing antibodies for toxoplasma in her blood.

The juvenile form may or may not result fatally, and although it is most frequently of acute encephalitic form, it may exhibit predominantly the symptoms of acute exanthematic disease and/or atypical pneumonia. It is not always evident whether juvenile toxoplasmosis is the result of acquired infection or of a reactivation of latent intra-uterine infection.

Adult toxoplasmic infections have been observed in two main types. In one type, the clinical signs and symptoms are variable but in general are characterized by sudden onset, elevation of temperature, maculopapular eruption and pulmonary involvement. The signs and symptoms referable to the central nervous system may be relatively insignificant. There is more tendency for widespread involvement of the viscera than in the infantile disease.

The other type of adult infection appears as a chronic disease and may show no signs or symptoms of the process except that neutralizing anti-

---

bodies are present in the blood. This type of disease has been observed in mothers of infants dead of intra-uterine infection.

"Neutralizing antibodies against toxoplasma are formed by the host, and their demonstration is the most reliable method available for clinical diagnosis of the disease."[2] Sabin[8] has shown that, in monkeys, neutralizing antibodies for toxoplasma persists after the organisms are no longer demonstrable in the tissues, and that the presence of antibodies alone is not indicative of active infection; however, it does show that the individual has been exposed to the antigen substance of toxoplasma at some time.

TABLE I. RESULTS OF NEUTRALIZATION TESTS FOR TOXOPLASMA FOR THE YEARS 1944 TO 1946, INCLUSIVE

Year	Results of Examination							
	Positive		Negative		Unsatisfactory		Totals	
	Patients	Spec.	Patients	Spec.	Patients	Spec.	Patients	Spec.
1944	22	29	30	33	0	0	52	62
1945	46	56	184	196	2	2	232	254
1946	95	112	376	397	6	7	477	516
Totals	163	197	590	626	8	9	761	832

The neutralizing antibodies are quite labile and may disappear in a day or two at room temperature, or in two weeks at ice box (5° C.) temperature. For this reason specimens of blood to be examined for toxoplasmic antibodies must be sent to the laboratory without delay. During warm weather, or at any time when more than twenty-four hours are required for the specimen to reach the laboratory, the serum should be separated from the cells and forwarded in a package containing dry ice (solid CO_2).

Because of the growing interest in these infections, the Minnesota Department of Health Laboratories began the neutralization tests* for the toxoplasma organisms in January of 1944, and have continued this service to date. The technique of the test is essentially that described by Sabin[6] in which patients' blood serums are mixed with suspensions of the organism and inoculated into the skin of white rabbits.

The blood specimens usually were collected from individuals showing one or more of the following: chorioretinitis, convulsions, hydrocephalus, cerebral calcifications, mental retardation, and encephalitis; or from the parents and siblings of individuals who had previously shown a positive neutralization for toxoplasma. The series reported includes patients from public and private institutions as well as from general practice throughout the state.

In the years 1944 to 1946, inclusive, 832 specimens were examined from 761 patients who were residents of sixty-three Minnesota counties, and twenty-two other states. The results of the tests are summarized in Table I.

Sufficient data are not available to determine the exact number of active infections represented by the positive tests; however, the relatively high percentages—42.3 in 1944, 19.8 in 1945 and 18.4 in 1946—probably reflect the judicious choice of patients on clinical grounds rather than the overall incidence of toxoplasmic infection in Minnesota. A sufficient number of apparently normal individuals have not been examined as yet to determine the incidence in the population at large. Neutralizing antibodies were demonstrated in residents of twenty-five counties in the state, which indicates that the infection is widespread. Neutralizing antibodies were also demonstrated in residents of seventeen other states.

During the three years' experience, ninety-three pairs of serums from mother and child were tested, with the following results:

Mother positive—child positive	19
Mother positive—child negative	13
Mother negative—child positive	9
Mother negative—child negative	52

The results of the tests for mother and child agreed in seventy-one (76.3 per cent) pairs of the specimens. The combination "mother positive—child negative" occurred a little more frequently than the combination "mother negative—child positive." Conclusions relative to acquired infection versus intra-uterine infection are not apparent from these data.

---

*The neutralization tests were originally conducted by Dr. Carl Eklund whose present address is U.S.P.H.S., Rocky Mountain Laboratory, Hamilton, Montana.

Physicians who submitted blood specimens for the neutralization tests were asked to supply a short history for each patient. A part of this information is summarized in Table II.

febrile disease with extensive maculopapular rash involving nearly the entire body. A second type of adult infection appears as a chronic process and presents no signs or symptoms of the disease except for neutralizing antibodies in the blood.

TABLE II. ASSOCIATION OF CHORIORETINITIS, CONVULSIONS, HYDROCEPHALUS AND CEREBRAL CALCIFICATIONS WITH POSITIVE AND NEGATIVE NEUTRALIZATION TESTS FOR TOXOPLASMA

	Positive Neutralization				Negative Neutralization			
	Present	Absent	Not Stated	Total	Present	Absent	Not Stated	Total
Chorioretinitis	19	33	30	82	10	66	24	100
Convulsions	18	32	32	82	23	46	31	100
Hydrocephalus	7	37	38	82	16	51	33	100
Cerebral calcifications	4	36	42	82	1	64	35	100

In these groups of patients, chorioretinitis was associated with postive neutralization tests (23.2 per cent) more than twice as often as with negative neutralizations (10 per cent). The incidence of convulsion was about the same in the two

Toxoplasmic infections are probably widespread in Minnesota as indicated by the presence of neutralizing antibodies in the blood of individuals from twenty-five counties in the state.

bodies are present in the blood. This type of disease has been observed in mothers of infants dead of intra-uterine infection.

"Neutralizing antibodies against toxoplasma are formed by the host, and their demonstration is the most reliable method available for clinical diagnosis of the disease."[2] Sabin[8] has shown that, in monkeys, neutralizing antibodies for toxoplasma persists after the organisms are no longer demonstrable in the tissues, and that the presence of antibodies alone is not indicative of act fection; however, it does show that the indi has been exposed to the antigen substa toxoplasma at some time.

The neutralizing antibodies are quite lab may disappear in a day or two at room te ture, or in two weeks at ice box (5° C.) te ture. For this reason specimens of blood examined for toxoplasmic antibodies must to the laboratory without delay. During weather, or at any time when more than t four hours are required for the specimen t the laboratory, the serum should be se from the cells and forwarded in a packa taining dry ice (solid CO_2).

Because of the growing interest in thes tions, the Minnesota Department of Heal oratories began the neutralization tests* toxoplasma organisms in January of 19 have continued this service to date. Th nique of the test is essentially that descr Sabin[6] in which patients' blood serums ar with suspensions of the organism and in into the skin of white rabbits.

The blood specimens usually were from individuals showing one or more of lowing: chorioretinitis, convulsions, hydr lus, cerebral calcifications, mental retardat encephalitis; or from the parents and siblings of individuals who had previously shown a positive neutralization for toxoplasma. The series reported includes patients from public and private institutions as well as from general practice throughout the state.

TABLE I. RESULTS OF NEUTRALIZATION TESTS FOR TOXOPLASMA FOR THE YEARS 1944 TO 1946, INCLUSIVE

Year	Results of Examination						Totals	
	Positive		Negative		Unsatisfactory			
	Patients	Spec.	Patients	Spec.	Patients	Spec.	Patients	Spec.
1944	22	29	30	33	0	0	52	62
1945	46	56	184	196	2	2	232	254
1946	95	112	376	397	6	7	477	516
Totals	163	197	590	626	8	9	761	832

In the years 1944 to 1946, inclusive, 832 specimens were examined from 761 patients who were residents of sixty-three Minnesota counties, and twenty-two other states. The results of the tests

---

*The neutralization tests were originally conduct Carl Eklund whose present address is U.S.P.H. Mountain Laboratory, Hamilton, Montana.

versus intra-uterine infection are not apparent from these data.

Physicians who submitted blood specimens for the neutralization tests were asked to supply a short history for each patient. A part of this information is summarized in Table II.

TABLE II. ASSOCIATION OF CHORIORETINITIS, CONVULSIONS, HYDROCEPHALUS AND CEREBRAL CALCIFICATIONS WITH POSITIVE AND NEGATIVE NEUTRALIZATION TESTS FOR TOXOPLASMA

	Positive Neutralization				Negative Neutralization			
	Present	Absent	Not Stated	Total	Present	Absent	Not Stated	Total
Chorioretinitis	19	33	30	82	10	66	24	100
Convulsions	18	32	32	82	23	46	31	100
Hydrocephalus	7	37	38	82	16	51	33	100
Cerebral calcifications	4	36	42	82	1	64	35	100

In these groups of patients, chorioretinitis was associated with postive neutralization tests (23.2 per cent) more than twice as often as with negative neutralizations (10 per cent). The incidence of convulsion was about the same in the two groups, while hydrocephalus was associated with negative neutralization tests (16 per cent) more frequently than with positive neutralizations (8.5 per cent). The number of cerebral calcifications was probably too small to permit a valid comparison.

Summary

Toxoplasmosis is a disease resulting from infection with the protozoan parasite toxoplasma. Infection may occur *in utero* or be acquired at any age. Infantile toxoplasmosis is usually characterized by widespread destruction of the central nervous system, and, in surviving cases, residuals such as hydrocephalus, convulsions, chorioretinitis and mental retardation are frequent.

The symptoms of adult toxoplasmosis may be extremely variable, with a greater tendency to widespread involvement of the viscera than in infantile infections. It may occur as an acute febrile disease with extensive maculopapular rash involving nearly the entire body. A second type of adult infection appears as a chronic process and presents no signs or symptoms of the disease except for neutralizing antibodies in the blood.

Toxoplasmic infections are probably widespread in Minnesota as indicated by the presence of neutralizing antibodies in the blood of individuals from twenty-five counties in the state.

There is no doubt that the most important of all case-finding agencies in the fight against tuberculosis are its practicing physicians. It is almost always true that the family physician has the first opportunity not only to ascertain the presence of tuberculosis among the people, but also to give battle for the cure of the afflicted and to safeguard the other members of the family from the tubercle bacillus. It is the family physician to whom most people go when troubled by signs of ill health.

The records in the chest diagnosis clinics prove that the physicians, if they are determined to do so, can perform a better job of suspecting and discovering active tuberculosis cases, year in and year out, than any other agency. Report of Comm. on Tbc. N. H. Med. Soc., *New England J. Med.*, Sept. 26, 1946.

TRICHINOSIS IN MINNESOTA

C. B. NELSON, M.D., M.P.H.
Minneapolis, Minnesota

SINCE 1913, when reporting of communicable diseases in Minnesota was made mandatory by legislation, there have been 157 cases of trichinosis with fourteen deaths reported to the Minnesota Department of Health. The largest number, forty-two cases and one death, was reported in 1934. In the ten-year period from 1937 to 1946, there were thirty-two cases with two deaths. The cases have occurred sporadically and in small family outbreaks and have been scattered throughout the entire state. The largest outbreak in Minnesota was in 1934, when twenty-three cases, including one death, occurred in one family and its relatives.

In a report of an outbreak of eighty-four cases in New York City in 1945, Shookhoff, Birnkrant and Greenberg[8] reviewed outbreaks involving twenty or more cases reported in the literature since 1900, and found twenty-one such outbreaks ranging from twenty-one to 617 cases. Riley and Scheifley,[6] in examining material from 117 cadavers from the dissecting room, found 17.9 per cent infected with trichinosis. Nolan and Bozicevich[4] report that 174 (17.4 per cent) of diaphragms of 1,000 autopsy cases were found to be infested with trichinae. Evidently there are many subclinical cases and others that are not recognized clinically, and perhaps some that are not reported.

On January 29, 1947, the possibility of an outbreak of trichinosis was brought to the attention of the Minnesota Department of Health. On investigation, a total of thirty-seven clinical cases of trichinosis, with dates of onset of symptoms between January 10 and January 29, were disclosed. Thirty-three of the cases occurred in one community, a small village whose inhabitants are predominantly of Central European stock, accustomed to eating sausage frequently and often raw. Two cases occurred in Chicago and one each in Minneapolis and Saint Paul. There were twenty-three males and fourteen females affected, the ages ranging from fifteen to sixty years. Clinical histories were obtained in twenty-two of the thirty-seven cases, with symptoms as summarized.

	Number	*Per Cent*
Edema of eyelids	18	82
Muscle pain	18	82
Fever	12	55
Malaise	10	46
Diarrhea	8	36
Weakness	5	23

The usual incubation period is six or seven days, but may be as short as eighteen hours in heavy infections, or as long as twenty-eight days. The history of classical, initial diarrhea was obtained in only three cases, though eight individuals complained of diarrhea. The usual presenting symptoms were itching and redness of the eyes with edema of the lids, and muscle pains, especially of the extremities. Other frequent symptoms were fever, malaise, and weakness. Sore throat, edema of face, nausea and vomiting, abdominal cramps, pain in chest, and sweating were other complaints. Some of the individuals appeared critically ill and very toxic, but there were no fatalities, a situation which seems characteristic of larger-scale outbreaks in recent years.

Differential leukocyte counts obtained in twenty-three of the cases, January 30-31, 1947, showed an eosinophilia ranging from 7 to 49 per cent. In three of the cases there was a leukocytosis ranging from 12,450 to 20,000.

Eosinophil Count (per cent)	*Number Cases*
7 to 10	1
10 to 19	3
20 to 29	8
30 to 39	7
40 to 49	3

In two cases, *Trichinella spiralis* was demonstrated in muscle biopsies, one from a specimen submitted to the Section of Medical Laboratories, Minnesota Department of Health, and one reported from the Veterans Administration. Two pathological specimens reported by private physicians showed a concentration of eosinophils present in the muscle.

Of thirty cases in which an epidemiological history was obtained, all gave a history of having consumed smoked country sausage. In twenty-four of the cases the sausage was eaten raw, in two fried, and in four cases it was not determined whether the sausage was consumed raw or cooked. The two afflicted individuals in Chi-

---

From the Division of Epidemiology, Section of Preventable Diseases, Minnesota Department of Health, University of Minnesota campus.

cago had ordered the sausage by mail from relatives living in the community. The Minneapolis resident purchased sausage when passing through the village and shared it with the Saint Paulite. The sausage was prepared for public sale by a local butcher from trimmings of freshly slaughtered pork, ground, seasoned, and smoked for twenty-four hours at a temperature that would not cause the sausage to shrink. The sausage was then refrigerated at 36° F. for one week. According to the butcher, patrons were advised to eat the sausage only after cooking. Only pork from hogs purchased and slaughtered locally was used. As no record was kept on hogs slaughtered, and trimmings from several hogs were used in making approximately 100 pounds of sausage weekly, it was impossible to determine the origin of the pork used. No samples of the suspected sausage were available for laboratory examination.

According to Ober[5] and Gould,[1] only 60 to 70 per cent of hogs slaughtered in this country are slaughtered in Federally inspected slaughter houses. The incidence of infection with live trichinae among hogs is estimated by Gould[2] as between 1 and 2 per cent. Under Federal inspection, no attempt is made to examine pork for the larvae of *Trichinella spiralis,* as the examination is considered time-consuming, expensive, and impractical. Therefore, all pork or pork products that are likely to be eaten raw are considered infectious, and according to Federal meat inspection regulation are processed either by heating to 137° F. or by storing for twenty days at a temperature of 5° F.[7] In Minnesota, as well as most other states, this regulation does not apply to local butchers or abattoirs not engaged in interstate shipment of pork or pork products. Trichinous meat can be rendered non-infective either by heating to 55° C. or freezing at temperatures sustained long enough to kill the larvae.

Pork has been involved in all cases in Minnesota where a source of trichinosis has been suspected or found. Westphal[9] reports a case of trichinosis in which the apparent source was bear meat from a bear killed in New York State. Westphal also cites a report of Geiger and Holmaier involving twenty-nine cases with three deaths occurring between 1930 and 1935 in California, due to eating bear meat. These authors maintained also the "possibility of the infection of rats, wild hogs, cats, foxes, coyotes, badgers and ferrets." Hall[3] states that two or three cases have been reported from eating beef, and one from dog meat, but he points out that these are not important in the control of trichinosis, which is essentially concerned with pork, "the customary source of trichinosis."

At present the prevention of trichinosis is the concern of the consumer. No fresh pork should be eaten "pink." When pork has been changed by cooking to a whitish color, it has reached a temperature of at least 137° F., which destroys the viable trichinae. The publication *The Control of Communicable Diseases,* published in 1945 by the American Public Health Association, recommends a temperature of 150° F. Pork products processed under Federal regulations are considered safe, but the consumer does not always know when such products actually have been processed at a Federally inspected plant. Therefore, the only safe rule for the consumer is to cook pork and pork products adequately.

Many measures have been advocated for the control of trichinosis. These measures are principally the following: (1) microscopic inspection of pork; (2) cooking of all garbage used for hog feeding; and (3) processing of all pork prior to sale to the consumer. Each method has its advocates and points to recommend it, and each method has its drawbacks.

Summary

An outbreak of trichinosis involving thirty-seven known clinical cases is reported in order to call the attention of physicians in this state to the fact that trichinosis is a serious problem and an ever-present threat to the public. Prevention of trichinosis is at present the concern of the consumer, and the only safe advice is to be sure that all pork is thoroughly cooked or adequately processed before consumption.

DEAFNESS, A THERAPEUTIC PROBLEM

A. C. HILDING, M.D.
Duluth, Minnesota

We maintain contact with our environment chiefly through two senses—vision and hearing. Many people lose one of these senses more or less completely, and occasionally some unfortunate individual loses both. Patients who lose their vision generally seem to make a satisfactory adjustment to their handicap and live on confidently and happily. On the other hand, people who lose their hearing are prone to become depressed, diffident, and uncertain. For this and other reasons deafness is a therapeutic problem of utmost importance.

Deafness may be divided roughly into three groups: The first group includes those cases which are due to mechanical interference with the vibrating parts (conduction deafness). The second group includes those which have suffered damage within the cochlea (nerve deafness). The third group includes miscellaneous intracranial conditions such as tumor, meningitis, certain rare bone diseases and probably also cerebral arteriosclerosis.

This discussion is concerned with the first two groups. These do not usually occur as separate entities, but are generally combined, with one type or the other predominating. Deafness from acute otitis media is an example, however, of pure mechanical deafness, whereas deafness from mumps furnishes an example of pure nerve deafness.

Middle ear or conduction deafness has a number of causes, prominent among which are acute and chronic otitis media, mastoiditis, pathologic changes of Eustachian tube and otosclerosis.

Acute otitis media interferes with vibration of the drum head and the ossicles because of swelling and exudation. It is usually self-limited and leaves no permanent hearing loss, unless neglected.

Chronic otitis media causes some deterioration of hearing as long as it exists and is prone to make permanent pathologic changes in the middle ear which cause permanent loss of hearing. These sequelae include thickening of the drum and epithelium, adhesions, retraction and perforation of the drum.

Chronic mastoiditis may be on a basis of osteitis, but is more often due to a cholesteotoma in the attic and antrum. There is continuous discharge with continuous low-grade inflammation which interferes with vibration of the drum and ossicles and eventually causes permanent changes in these structures.

Inflammatory changes and hypertrophies in the Eustachian tube or at its pharyngeal extremity, cause hearing loss by cutting off the middle ear from atmospheric pressure. The air pressure on both sides of the drum head must be equal in order to permit free vibration. Normally the pressure is equalized frequently through the Eustachian tube during swallowing and yawning. When the tube does not thus open, because of swelling, or for some other reason, a partial vacuum results in the middle ear together with some impairment of hearing. In children, this is often due to lymphoid hypertrophy at the pharyngeal end. Many adults have slit-like Eustachian openings in the pharynx instead of round ones. These people are prone to have ear discomfort and impaired hearing following marked changes in barometric pressure. A new type of ear disease related to the Eustachian tube has developed as a result of aviation and of submarine warfare known as aero-otitis media or aerotitis. It has been reported (Schilling[1]) that 30 per cent of the men undergoing submarine escape training have aural difficulty leading to loss of auditory acuity.

Otosclerosis is an inherited disease of the bony capsule which surrounds the internal ear. It is thought to be harmless except for its mechanical effect. It causes an overgrowth of the bony margin of the oval window thus impinging upon the vibrating footplate of the stapes. When the footplate of the stapes becomes fixed and ceases to vibrate in response to the sound waves playing against the drum membrane, the hearing acuity becomes very seriously reduced (Fig. 1). The hearing organ otherwise may remain more or less normal, but it becomes separated from the vibrating portions of the ear mechanism by a wall of bone, so to speak.

Read before the Upper Mississippi Valley Medical Association, February, 1946.

Treatment.—The treatment of acute otitis media and the deafness incidental to it is largely preventive. If colds can be prevented, and when they occur, if they are treated by bed rest and isolation, otitis media ordinarily does not occur. When otitis media does occur, it can usually be cleared up fairly promptly with standard procedures such as dry wiping, instillation of antiseptic solutions, free drainage, diathermy, and, when necessary, bed rest, sulfonamides or penicillin. Reduction in hearing acuity may persist for a week or two after drainage ceases, but soon returns to normal without any permanent effects.

Chronic otitis media is not nearly as prevalent as it used to be because of the better care given to acute otitis media and upper respiratory infections in general. When it does occur, it is much more of a problem than the acute, but this also can usually be cleared up with or without surgery, and practical conversational hearing preserved. Any loss will depend upon the permanent pathologic changes in the middle ear. A generation ago, there was much enthusiasm about dividing adhesions in the middle ear resulting from chronic otitis media and freeing the malleus and drum by stretching adhesions. One does not hear much about this at present. Dividing adhesions whether in the ear or peritoneal cavity, is not highly successful.

Perforations in the pars tensa (sequelae of chronic otitis media) are more amenable to treatment. They can sometimes be induced to close up by gently cauterizing the margins and thus encouraging scar formation. These scars tend to contract and to close the hole. Patches placed over perforations are successful in two ways: They encourage closure of the opening by new tissue and at the same time make the patients hear better while the patch is worn. For instance, we have a young housewife as a patient at present, who has a large perforation in the left drum. We have been treating her by placing a patch cut from cigarette paper and soaked in glycerine over the perforation. She hears very much better as soon as this is in place. It must be renewed every two or three weeks.

The hearing is often improved, or at least conserved by radical mastoid operation if a chronic otitis or mastoiditis does not respond to more conservative treatment. This is especially true if the pathologic condition consists chiefly of a cholesteatoma in the antrum and if the middle ear is reasonably intact. If, on the other hand, there is osteitis in the wall of the middle ear, then the middle ear and its contents must often be sacrificed to effect a cure of a dangerous infection, and the hearing may be further reduced.

There is another type of middle ear deafness which is connected with infantile or undeveloped mastoids. It is probably not essentially different from the chronic adhesive process which follows the healing of an extensively damaged middle ear. However, there is nothing abnormal to be found upon examination except reduced hearing and an infantile mastoid. The latter usually means that there has been otitis media in infancy. For this deafness, there is not much that can be done directly. But it is important to find children who suffer from this handicap through screening tests in school and to see that they get proper aids to hearing, such as special seating in the class room, special classes or even hearing instruments. Much good is being accomplished now by hearing tests in school and through the educational programs of such organizations as the American Hearing Society.

The success in treating a pathologic condition in the Eustachian tube depends upon its nature. If it is a true stenosis of the tube, treatment will probably accomplish nothing. On the other hand, as not infrequently happens, there may be hypertrophied lymphoid tissue in the cushion and pharyngeal orifice. This can be treated successfully by radium used in proper applicators or by deep x-ray therapy.

Aero-otitis media can be largely avoided by eliminating such young men from the air and submarine service who have slit-like Eustachian orifices and who develop ear discomfort under an increased atmospheric pressure of ten or eleven pounds. Those who cannot inflate the middle ears by holding the nose and mouth closed during attempted expiration, should also be eliminated.

Blast injuries may damage the drum and middle ear as well as the cochlea, but these will be discussed later.

The surgical treatment of otosclerosis is one of the encouraging bright spots in otology. It has been met by a wave of enthusiasm among otologists similar to that which swept the internists with the advent of insulin.

There is no other treatment than surgery which has been of any avail. Until the operation of fenestration was developed, these patients experienced a steadily progressive loss of hearing.

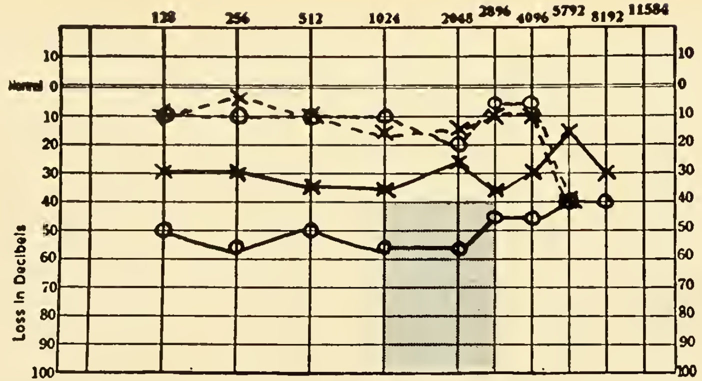

Fig. 1. Audiogram of a case of clinical otosclerosis. The solid lines show hearing by air conduction, and the dotted lines, hearing by bone conduction. The circles (o) indicate the right ear and the crosses (x) indicate the left ear. If this patient were to have a fenestration performed, the right ear would be selected because this is her worse ear. The bone conduction remains good and the prognosis for serviceable hearing in this ear without a hearing aid would be good. Operation was not advised, however, because the hearing of the left ear is already at this level of practical hearing, and the hearing acuity of the right ear might not exceed that of the left ear even after successful operation.

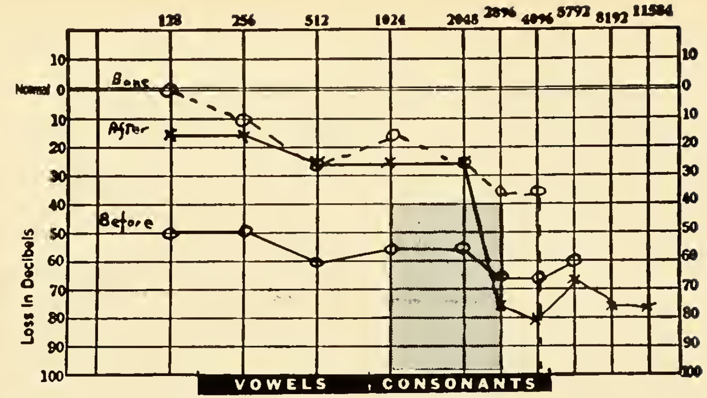

Fig. 2. Audiogram of one ear before and after successful operation in a case of otosclerosis. The dotted line represents hearing by bone conduction and the solid lines, by air conduction, before and after operation. The most important tones in conversation are those below and including 2048 vibrations (high C). This patient received an average improvement of about 30 decibels which brought her hearing acuity above the threshold of practical hearing, and the result was excellent. The threshold for practical hearing is considered to be at about 30 decibel loss.

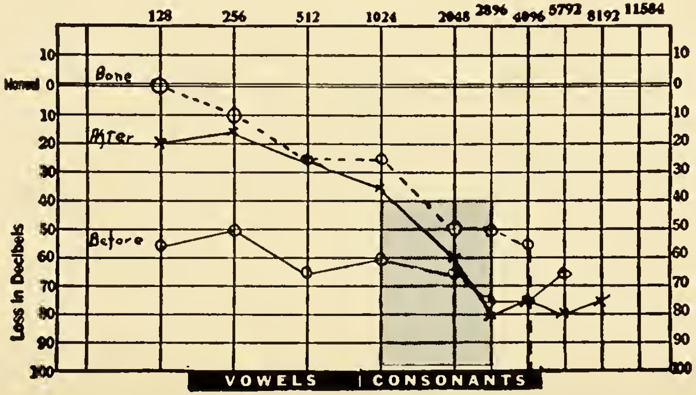

Fig. 3. Audiogram from an ear in which the bone conduction loss at the 2048 tone was considerable. This loss lay in the range of consonant sounds. The operation was successful in raising the hearing level by air up to or above the serviceable 30 decibel level in the tonal range below 2048 vibrations, but the patient still had some trouble in conversation because some of the consonant sounds were not heard on account of the loss of nerve function (bone conduction) in this high-pitched register.

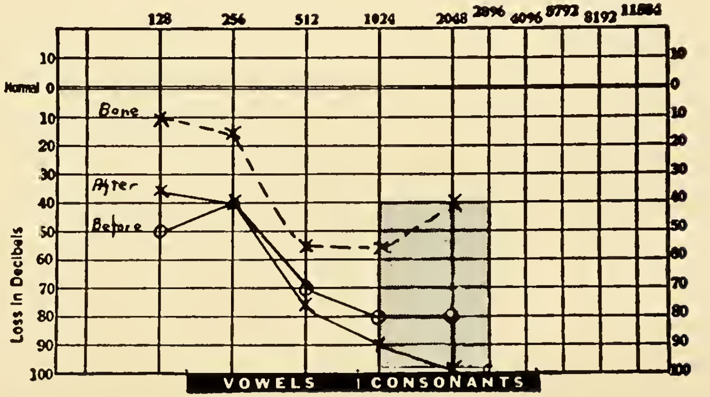

Fig. 4. Audiogram from an advanced case of otosclerosis before and after operation. The nerve degeneration as indicated by bone conduction was great. The patient was informed that the prognosis for servicable hearing was very poor, but he wanted to "take a chance." There was no improvement.

The operation consists essentially in making a new artificial window to replace the one which has become ankylosed by the otosclerotic process. It is technically difficult and time-consuming, and the results are by no means perfect. Only a selected group is suitable for operation—about one-third of all the patients showing clinical otosclerosis—and of those operated, none regain normal hearing. Most are greatly improved, some are not improved and a few are made worse. Nevertheless, the results are most gratifying compared with the former hopeless outlook, and both the otologists and their patients are very enthusiastic.. The patients whose hearing is restored to a practical level vary from 70 to 90 per cent of those operated upon. The percentage depends upon the care with which the cases are selected, and the boldness with which the surgeon undertakes to operate upon the less favorable cases.

Very briefly, omitting details, the operation is done as follows: The approach is made endaurally through the mastoid. The body of the mastoid is exenterated and the antrum and attic exposed to view. This brings into view the short process of the incus as it lies upon the bulge of the horizontal semicircular canal where the fenestrum is to be made. The posterior bony canal wall is largely removed, exposing the entire incus and the head of the malleus which must also be removed. The site of the horizontal semicircular canal is now well exposed but the canal itself is largely covered by bone and is brought clearly into view only after the latter has been removed by means of dental burrs used under magnification. The fenestrum is made at the anterior ampullated end of the semicircular canal close to the facial nerve. The fenestrum and surrounding bone must be so prepared that the skin flap which is to cover it will heal down tightly and smoothly before the bone gets a chance to regenerate. Unless the fenestrum remains open the operation is of no avail.

A skin flap is made from the thin skin of the deepest portion of the external ear canal in such a way that it remains attached to the upper margin of the drum and yet completely covers the fenestrum with a generous margin to spare on all sides. The flap is packed smoothly over the fenestrum and held snugly in place. An epithelial membrane of that sort has a mysterious power of preventing bone growth, and, if the flap heals quickly into place, there is little or no regeneration of bone.

This operation of fenestration is not new. However, its successful execution is new. It had been tried many times in Vienna twenty or twenty-five years ago, as well as elsewhere in Europe, but it was not permanently successful because the opening in the bone healed up. Several futile devices, including metal plugs, have been used in attempts to prevent closure. Holmgren, of Stockholm, was one of the first who was really successful in procuring permanent results. For the operation as it now stands, we are, however, largely indebted to Lempert (Figs. 2, 3, and 4).

Nerve Deafness.—There are many types of pathologic changes in the cochlea which are all grouped under this term. The ordinary senile type of nerve deafness is the most common. A large percentage of all people in the latter half of life are afflicted by it. I do not mean to imply that it is a sign of senility—it often begins in the fourth decade of otherwise vigorous people—but use that term for want of a better one. The disease is characterized by tinnitus and reduced bone and air conduction, especially of the high tone frequencies. Reduction of bone conduction is due to the fact that the hearing organ itself is damaged, in contrast to conduction deafness in which there is some derangement of the mechanism for conducting sound vibrations to the internal ear. The pathologic change is found in the organ of Corti where the sense cells disappear and the afferent nerve fibers atrophy. The effect, as far as the patient is concerned, is the loss of consonant sounds which are high pitched tones carried by vibration frequencies in the upper register. With the consonant sounds lost from speech, it seems to the patient that everyone with whom he converses speaks indistinctly. He hears the sound of the voice without any difficulty, but cannot distinguish the words. He is apt to burst forth, especially if talking to some of his own family, "Stop mumbling and speak out so that a body can understand what you're saying." To the otologist he will complain that in a group he can understand only that part of the conversation which is spoken directly to him. He can easily "hear" everything that is said otherwise, but cannot distinguish the words.

A very similar type of deafness is caused by noisy occupations, such as boiler making, shipbuilding, and rock crushing. It is very difficult to study these things experimentally with any degree of satisfaction. Pathologic changes can be produced readily in animals by subjecting them to loud continuous noise. But it is difficult to conceive of a method for determining the hearing loss. The changes, whatever they may be, are reversible up to a point, beyond which they become irreversible and the hearing loss is permanent. It is possible experimentally to produce temporary hearing loss and tinnitus in man under controlled conditions, but there is no way of determining the pathologic changes.

Blast injuries, such as those incident to war, may cause both middle ear damage and cochlear injury. An elderly Finnish gentleman came to me during the hunting season, stating that a hunting companion had shot at a deer over the patient's shoulder, and had hurt his ear terribly. Investigation revealed that the drum had been ruptured and badly lacerated. This does not usually happen with gun fire, but the internal ear may suffer damage from which it may or may not recover. Gunnery instructors may lose hearing acuity. Hearing acuity has been measured at varying intervals after exposure. Recovery takes place gradually after days, weeks, or months, depending upon the degree of injury and the individual's susceptibility to ear damage. The latter varies widely. If damage has been sufficiently severe, the process is not reversible, and hearing loss is permanent.

Toxic nerve deafness occurs following administration of various drugs and after certain infections. Quinine, salicylates and salol are examples of the former. Again, there are wide variations in susceptibility. Some individuals can take quinine in considerable dosage over long periods of time, whereas others cannot take small single doses without developing tinnitus.

Treatment.—The cause of the ordinary spontaneous senile nerve deafness is unknown. There is no known effective therapy. The hearing cannot be restored, nor can the progress of loss be stopped. Treatment is psychological and substitutional. The patient must accept his handicap and learn lip reading, or use a hearing aid. Treatment at present is a problem for teachers, psychologists, and producers of hearing aids, rather than for the otologist.

Occupational deafness is treated best by prevention. If it is impossible to reduce the noise in a factory, then those who are susceptible to noise should be screened out and urged to take other occupation. One individual may be able to work at a noisy job for years without injury to his hearing, while another may begin to lose hearing promptly. A shipyard worker of this type consulted me last summer. He was told, after examination, that he would suffer permanent damage to his hearing unless he quit his job. Since the shipyards were closing after sixty days, he elected to chance it that much longer. We have another patient at present who has been a telephone operator for twenty-four years. She has a marked loss of hearing which may be from her work. She is only a year from retirement and pension, and is, therefore, also loathe to quit.

The treatment of toxic nerve deafness is, of course, the removal of the cause. If damage by disease such as mumps or meningitis is sufficiently severe, deafness will be permanent.

Summary

Deafness is a health problem of first magnitude. That which is caused by infections can be very largely prevented by proper treatment of the infections. Sequelae of middle ear infection cannot always be successfully treated; however, much can be accomplished, especially in schools, in determining the presence of the handicap and giving the individual appropriate consideration in class work.

Otosclerosis is an inherited disease of unknown etiology. No cure is known. However, through the fenestration operation many victims can have hearing restored to a practical useful level and can be rehabilitated.

Nerve deafness of the usual type is a difficult problem. Cause and cure are both unknown. For the present, the patient must be satisfied with a hearing aid and lip reading. Occupational and toxic nerve deafness can be largely prevented.

CLINICAL-PATHOLOGICAL CONFERENCE

INFLUENZAL MENINGITIS

Report of Five Cases

S. N. LITMAN, M.D., R. P. BUCKLEY, M.D., and A. H. WELLS, M.D.
Duluth, Minnesota

Dr. A. H. Wells: The remarkable effectiveness of streptomycin, particularly when supported by rabbit antiserum and sulfonamide therapy in the treatment of Hemophilus influenzae meningitis, and the desirability of certain laboratory controls over this therapy, make this a very appropriate and timely subject for our conference. There are five case studies of this disease from our two hospitals to be described.

Case Reports

Dr. S. N. Litman: M.S., a two-year-old white girl, was first seen by me on the day she was admitted to the hospital, December 15, 1946. She had been having a head cold for several days, but she was not considered ill. On the night before admission, she became quite fretful and appeared to be running a fever. She was awakened at 2 A.M. by vomiting. This symptom was repeated several times during the night; and, on the following day when I first saw her, there was an associated fever reaching 105.2° F. She was distinctly listless and somewhat dehydrated. Her breathing was shallow and her pulse rapid. There was no rigidity of the neck or spine, and the cause of the fever was not apparent. She was given Hartman's solution and 5 per cent glucose, cold sponge baths, 10,000 units of penicillin every three hours, and aspirin, grains 2. A flat x-ray plate of the chest revealed slight increased markings consistent with bronchitis. The white blood cell count was 8,600 with 73 per cent neutrophils, 23 per cent lymphocytes, and 3 per cent monocytes. The hemoglobin was 11.1 grams and the red blood cell count 3,800,000. Her temperature fell to 100° F. and ranged up to 101° F., occasionally reaching 102° F. On the second hospital day, she was very listless and ground her teeth continuously. Again there were no positive signs of meningeal infection. However, on the third hospital day (December 17, 1946) there was definite neck rigidity as well as stiffness of the spine. An immediate spinal fluid examination revealed a cell count of 2,111 with 100 per cent neutrophils present, sugar 15 milligrams per cent, protein 55 milligrams per cent, and chlorides 750 milligrams per cent. Many Gram-negative bacilli morphologically and tinctorially typical of H. influenzae were found in the direct smears. Later cultures substantiated the organism identification. Two hundred milligrams of streptomycin were given intrathecally once daily and 225 milligrams were injected every three hours intramuscularly. She was also given 5 grains of sulfadiazine every four hours. The daily spinal taps remained positive for H. influenzae until a culture of the spinal fluid on February 21, 1947, was sterile. A total of 1,400 milligrams of streptomycin were given intrathecally and 12,600 milligrams intramuscularly. It was discontinued on the seventh hospital day. On February 20, 1947, the patient was given 10 c.c. of Hemophilus influenzae type B rabbit antiserum in 100 c.c. of normal saline intravenously. She had a severe chill, and her fever reached 105.2° F. There was also cyanosis for which 0.4 c.c. of adrenalin was given. The 10 c.c. of antiserum was repeated the following day without a reaction. The patient followed a turbulent course from marked stupor to severe restlessness, to a state of extreme negativism. Feeding was very difficult at times. However, the intake of fluids was maintained, and the child was given 250 c.c. of blood. The penicillin therapy was discontinued after four days, and the sulfadiazine was discontinued on February 29. It had reached a level of 10 to 21 milligrams per cent in the blood. Her rather low-grade fever returned to normal on February 20, and remained there. Her recovery was complete, and she had no residual symptoms some months after her illness.

Dr. R. P. Buckley: My first patient, W. M., was admitted to the hospital on June 16, 1946, and expired on June 19, 1946. This five-year-old boy had ridden in a car from Saint Paul to Duluth on the day before admission with his head constantly held out of the car window. He was ill that evening with a frontal headache and a temperature of 102° F. The following morning he had a sudden chill, and his fever reached 106° F. He was delirious and his neck muscles were stiff. He vomited twice and complained of headache over the forehead. The physical examination revealed a rigid neck and back muscles, cervical lymph adenopathy, a few râles in the bases of the lungs, and a positive Kernig's sign. Twenty-five cubic centimeters of spinal fluid were opalescent, and a cell count showed 1,121 neutrophils and 23 lymphocytes. The spinal fluid sugar was 90 milligrams per cent, protein 350 milligrams per cent and chlorides 806 milligrams per cent. A few Gram-negative bacilli were found in direct smears which were later proved culturally to be H. influenzae. He was given 50,000 units of penicillin immediately and 20,000 units every three hours, together with sulfadiazine, grains 15 immediately and grains 7.5 every four hours. As soon as the pleomorphic Gram-negative bacilli were found in the spinal fluid, 25,000 micrograms

From the Clinical-Pathological Conference of the Duluth Pediatric Society, Dr. E. E. Barrett, president.
Clerical Assistance by Miss Faith A. Gugler.

of streptomycin were given intrathecally and 125,000 micrograms were given every three hours intramuscularly. There followed a convulsion, cyanosis, and a fall in blood pressure to 82/60 following the intrathecal injection. No more streptomycin was available the following day (June 17). The patient was given H. influenzae type B rabbit antiserum in divided doses during this day, and the streptomycin therapy was resumed in the evening. On the third hospital day (June 18), he was given a blood transfusion. The spinal fluid contained H. influenzae, and there were 40 milligrams per cent sulfadiazine present. His temperature was ranging between 100° and 103° F. It fell off to 102° F. on June 19, and his spinal fluid became sterile. However, he expired rather suddenly and unexpectedly. The postmortem examination, performed by Dr. William Knoll, revealed a purulent exudate throughout the meninges and a small amount of clotted blood in the meninges at the base of the brain.

My second patient was not so ill fated. She, K.T., was an eleven-month-old infant who was admitted to St. Mary's Hospital on February 27, 1947, and was discharged on March 23, 1947, in good health. She had become ill on February 23 with a fever, some vomiting, and one loose stool. These symptoms persisted for two days when they disappeared except for some listlessness. On February 26 there was a temperature elevation of 103° F. She took very little liquid food during the day. On February 27 she was admitted to the hospital with a rectal temperature of 107° F., a moderately stiff neck, soft fontanels, rolling eyeballs, extreme dehydration, listlessness, and was obviously acutely and seriously ill. An immediate smear of the spinal fluid revealed typical plemorphic Gram negative bacilli permitting the immediate use of 12,500 micrograms of streptomycin intrathecally and 1 gram every twenty-four hours in divided doses of approximately 125,000 micrograms per dose. The spinal fluid had a white blood cell count of 6,388 with 91 per cent neutrophils and 9 per cent lymphocytes, sugar 15 milligrams per cent, and chlorides 790 milligrams per cent. There was 75 per cent hemoglobin and a white blood cell count of 13,600 with 55 per cent neutrophils, 36 per cent lymphocytes, and 6 per cent monocytes. The infant was also given sulfadiazine, grains 7.5 every eight hours subcutaenously. Daily spinal fluid examinations revealed a rapid disappearance of the organisms and a return of the spinal fluid sugar to normal in six days. The severe fever had subsided on the second hospital day, after which it ranged from 99° to 103° F. for two weeks, following which it fell gradually to normal. The fever and the cell count in the spinal fluid both remained elevated during the administration of the streptomycin. There was, however, a gradual shift of the cells in the spinal fluid from a neutrophil preponderance to ultimately 90 per cent lymphocyte preponderance. The infant was sent home on March 23, almost a month after admission, without residuals.

Case Reports

Dr. R. E. Nutting: My three-and-a-half-year-old girl patient, P.L.P., was admitted to the hospital on November 21, 1946, and discharged as cured on December 18, 1946. She was apparently in good health until three days before admission when she developed a high fever, nausea, vomiting, apathy, and listlessness. On the day before admission her neck became stiff. The physical examination on admission revealed an acutely ill, well-nourished child with a stiff extended neck, who cried out whenever moved. There was opisthotonos, painful flexion of the rigid neck, congested throat, cold sores about the nose, and a painful bilateral positive Kernig's sign. The spinal fluid revealed 8,100 neutrophils and Gram-negative rods which on culture proved to be H. influenzae. There were 12.5 milligrams per cent sugar and 400 milligrams per cent protein in the spinal fluid. The infant was given 200 milligrams of streptomycin intrathecally and 2 grams intramuscularly in eight divided doses. She was also given penicillin, 30,000 units immediately and 20,000 units every three hours, as well as sulfadiazine, grains 20. The streptomycin was given daily intrathecally and intramuscularly until its discontinuance on November 28. The sulfadiazine was discontinued on December 3. The patient suffered from pains in her legs and feet and had a peculiar difficulty in holding her head up. There were shaky, jerky movements of the head which gradually subsided. Her temperature gradually rose during the first five days to 104.5° F. and then subsided during the following five days to 99.5° F. and remained normal after three weeks in the hospital. The spinal fluid became negative for H. influenzae on November 30, when the sugar was 40 milligrams per cent and the protein 45 milligrams per cent. There were no residuals at the time of discharge.

Dr. C. H. Schroeder: My patient, T.A.B., a nine-month-old boy infant, was admitted to St. Luke's Hospital on January 21, 1947, and discharged "well" on February 2, 1947. This infant had been ill for about two weeks before admission. The principal symptoms were nausea and vomiting, associated with cough and rhinopharyngitis. Other children in the family had similar infections. I had seen him once at the residence about a week before admission. He had received some sulfadiazine before admission.

For some days before he came in, the mother had noticed pain and soreness in the muscles of the back and especially of the left shoulder. There also seemed to be pain in the legs, in fact, generalized tenderness on handling.

He was very listless on admission, held his legs flexed and abducted, while his hands clutched his head. The neck and back were extremely rigid and the Kernig strongly positive. The heart and lungs were negative. There was some diffuse tenderness of the abdominal wall but no rigidity. He was immediately placed on penicillin (20,000 units every three hours) and also was given sulfadiazine by mouth.

A lumbar puncture (January 21, 1947) showed a pressure of 270 millimeters of water. Queckenstedt test was negative. The fluid was just noticeably turbid. There were 248 red blood cells, 87 white blood cells, 62 per cent lymphocytes, and 38 per cent neutrophils. Sugar was 97.6 milligrams per cent and the protein 80.4 milligrams per cent. A direct smear revealed numerous Gram-negative bacilli morphologically suggestive of H. influenzae. A culture was made. On January 22, he was given streptomycin intrathecally. The intended dose was 100 milligrams but through error 200 milligrams was given.

That evening the baby seemed a little brighter and was less rigid. Direct typing revealed typical capsular swelling with anti-H. influenzae type B rabbit typing serum. He was given a second intrathecal injection of 100 milligrams streptomycin. He was also given a small dose of influenza virus vaccine intradermally (0.1 c.c.). On January 23, the baby passed a good night and took feedings well. A lumbar puncture that morning showed a less turbid fluid. The pressure was not measured but apparently was lower. The white blood cell count of the spinal fluid was 309; the red blood cell count was 14; chlorides were 700 milligrams per cent. With some misgivings a third dose of streptomycin was given intrathecally. A couple of hours later the baby had a severe and almost fatal reaction. He became unresponsive, and the respirations became very slow and irregular. Oxygen was given and a small dose of coramine was injected subcutaneously. He did not improve and the respirations dropped to 6 or 8 per minute. At 3 P.M. artificial respiration had to be given. At 4 P.M. an attempt was made to pass an intrathecal catheter after a small dose of alpha lobeline was given. We did not succeed in passing the catheter, but the stimulation aroused the baby. He became more conscious, the respirations picked up, and thereafter he steadily improved. After this ordeal, it was noted that his skin presented a blotchy appearance and that a definite exophthalmos was present.

The following day (January 24) he was taking his feedings well and playing with a rattle. Opisthotonus was still marked and a peculiar chorea-like muscular activity was noted. No further intrathecal therapy was given but streptomycin was resumed intramuscularly, alternated with penicillin. This was continued for one week. The temperature became normal on the seventh hospital day, and the baby was discharged on the thirteenth day, perfectly well. To this date (April 5, 1947) he has remained well.

I would like to add that he owes his recovery to the painstaking and persistent efforts of Dr. R. A. MacDonald, intern. I feel that our intrathecal doses were somewhat too large and that the third one should not have been given. On January 24 no organisms were seen. The concentration test revealed 20 milligrams of streptomycin per cubic centimeter of spinal fluid.

Clinical Manifestations

Dr. R. P. Buckley: Influenzal meningitis ranks among the first three causes of suppurative meningitis in children, the other two being meningococcus and pneumococcus meningitis. The clinical manifestations of H. Influenzae meningitis do not differ significantly from the other types of suppurative meningitis, although there may be less evidence pointing to meningeal involvement. There are fulminating cases, fatal within forty-eight to seventy-two hours, and at the other extreme there are infections of very low grade nature lasting for weeks. These are frequently difficult to diagnose because of their incipient nature. The condition is particularly difficult to recognize in infants under seven months since the meningeal signs frequently do not develop in this group until late. The disease tends to be seasonal, occurring in the first half of the winter,[12] mainly during November, December, and January. About 50 per cent of the cases of influenzal meningitis are associated with otitis media, and 10 per cent have an arthritis. Laryngotracheitis, pneumonia, and eighth nerve deafness[8] have also been noted in association with influenzal infections.

Laboratory Aids

Dr. A. H. Wells: Where other facilities are not available, the simple demonstration of a Gram-negative, delicate, small, pleomorphic bacillus is sufficient evidence to start streptomycin therapy. There are, however, additional laboratory procedures which are considered of the utmost importance by the best authorities.

1. The Gram-negative rods must be tinctorially and morphologically distinguished from pneumococcus, meningococcus, and streptococcus since the organism is pleomorphic and frequently occurs as a diplococcus. Good Gram stains are essential.
2. The immediate identification of H. influenzae type B is possible by the capsular swelling test with rabbit anti-influenzal serum mixed directly with the spinal fluid. This Neufeld-quelung reaction is identical with that for pneumococcus typing. Since the great majority of influenzal meningitis is due to type B of Pittman, the test is quite useful. The types A, C, D, E, and F are uncommon and specific antiserum therapy is not so efficacious as that for type B infection.
3. The specific soluble capsular substance can be demonstrated in the spinal fluid at the interface over one cubic centimeter of diagnostic anti-B serum.[1]
4. The organism can be identified as H. influenzae by its growth requirements of hemoglobin.
5. The sensitivity to streptomycin of the strain of organisms isolated can be tested with varying concentrations of the drug, so that the concentration of streptomycin necessary to kill the organism can be determined. This generally runs from 1.2 to 12.5 units per cubic centimeter.
6. The spinal fluid levels of streptomycin during therapy can be determined and should be maintained between 25 and 130 units per cubic centimeter.[4]
7. Similarly the sensitivity of the strain of H. influenzae to sulfonamides, antisera type B, and even penicillin can be determined to advantage. Also, the titers of these antibiotics in blood or spinal fluid can be determined without much difficulty.
8. Blood cultures are positive in approximately 70 per cent of the cases.[14]
9. Daily spinal fluid studies for the organism, chemical analyses, and cellular reactions are considered essential to the proper therapy of this disease, whereas in meningococcic meningitis one spinal tap may prove adequate.
10. Alexander considers the determination of spinal fluid sugar of fundamental importance in the treatment.[2] She feels that this is an indicator of the severity of the infection and gauges the intensity of antiserum and antibiotic therapy by this test.

The daily spinal fluid tests should continue until the cultures are negative for several days and the sugar levels return to normal. One should be alert to the occasional complication of secondary invaders, especially Staphylococcus aureus, in the meninges and blood stream.[14] The intrathecal streptomycin may result in an elevation of cell count and protein possibly as the result of irritation of the meninges due to this drug, and this pleocytosis may persist in spite of the disappearance of the bacteria.

Therapy

Dr. S. N. Litman: It is interesting to review the effectiveness of various forms of therapy of influenzal meningitis advocated during the last decade. Without therapy, H. influenzae meningitis is considered from 92 to 100 per cent fatal in all age groups. Infants and younger children are particularly susceptible to the disease. Anti-influenzal horse serum was thought to reduce the mortality slightly. Alexander's rabbit serum proved to be the first of the more practical forms of therapy in that it reduced the mortality as much as 26 per cent.[14] When the sulfonamides were introduced, there was another efficacious agent which when combined with rabbit antiserum reduced the mortality another 20 per cent.[2,12] There are a few reports of the use of 10 milligrams of heparin intrathecally in cases resistant to therapy, on the theory that the fibrinous exudate may be partially dissolved, permitting entrance of the drugs. With the discovery of streptomycin, it was soon learned that this drug was the most efficacious of any thus far advocated for H. influenzae meningitis, reducing the mortality to approximately 20 per cent. Streptomycin alone in the case of average severity is considered adequate.[1,2] However, in cases of greater severity the therapy should also include rabbit antiserum and sulfadiazine. Some strains of H. influenzae are sensitive to penicillin.[2] However, this antibiotic generally fails and is not to be considered unless the more efficacious forms of therapy are in use. Antiserum alone has been curative in seven out of eight cases.[3]

In the use of streptomycin, it is essential to use large initial doses to avoid producing a drug-resistant strain in an otherwise sensitive strain. An organism inhibited by 3.9 units of streptomycin can suddenly become resistant to 250 units per cubic centimeter if permitted to be exposed to nonlethal doses of the drug. For this reason a repeat of the laboratory test of sensitivity of the organism to streptomycin may be indicated on occasions in a patient not responding properly. Alexander et al[1,2] used approximately 20,000 units per pound for twenty-four hours, given continuously intramuscularly in sodium chloride or interruptedly intermuscularly every three hours at 50,000 units or less per injection. A daily intrathecal dose of 25,000 to 50,000 units is considered necessary. Toxic reactions to streptomycin include erythema, urticaria, augmentation of meningeal signs, persistence of phlebocytosis, local pain in injection, and mild shock on initial administration. As described above, two of our presented cases had rather severe shock reactions from which they recovered.

Summary

We have presented five cases of Hemophilus influenzae meningitis, in four of which there was recovery. In all cases streptomycin and sulfadiazine were used, and in some anti-influenzal type B rabbit serum and penicillin were used. It would seem that we now have a means of combating this disease which not so long ago represented one of the hopeless types of infection.

There is a brief discussion of clinical recognition, laboratory controls, and therapy.

BABIES POISONED BY WELL WATER

Minnesota physicians are warned of the possibility of poisoning in young infants by nitrates in well water. Two cases of such poisoning have recently been reported to the Department of Health by physicians in western Minnesota.

In one case, a 14-day-old girl died after a two-day illness. The other case was that of a newborn infant who was in good health when discharged from the hospital but became very cyanotic ten days later. The physician stated that the findings in the case indicated a methemoglobinemia possibly due to the nitrate content of the well water used in preparing the baby's food. At the request of the doctor, the Health Department investigated the well and found that the water contained a high concentration of nitrate nitrogen.

The poisoned infants are described as being cyanotic and lethargic, and chemical analysis of their blood showed a markedly increased concentration of methemoglobin. The treatment given was a one-per-cent solution of methylene blue.

Poisoning caused by nitrates in well water seems most likely to occur if the water comes from shallow wells not properly located and constructed and therefore subject to contamination by products of organic decomposition. The Minnesota Department of Health wishes to determine the incidence of nitrate poisoning and the situations in which water of high nitrate content occurs. Any physician having a case in which poisoning from nitrates in well water appears likely may ask for a field investigation by the Health Department.

Case Report

CHRONIC ULCERS OF THE LEG ASSOCIATED WITH CONGENITAL HEMOLYTIC JAUNDICE

H. O. SKINNER, M.D.
Saint Paul, Minnesota

THE occurrence of chronic ulceration of the legs complicating congenital hemolytic jaundice is still of sufficient rarity and interest to justify reporting. Taylor[5] reported, in 1939, the first case of such an ulcer at the Presbyterian Hospital, New York, among forty-three patients suffering from this disease who had been carefully observed for a number of years. Meulengracht, in his careful study of thirty-four cases, makes no mention of it.

A specific relationship between these two conditions has not been generally recognized. Standard medical textbooks and special articles either make very little reference to the ulceration as a possible complication to the hemolytic jaundice or ignore it altogether. Thus Brenizer[1] in a presentation of six cases of the jaundice with a very thorough analysis and discussion of them, says of one of them merely, that the patient "had two ulcers of the left leg that healed after splenectomy."

Gännsslen[2] was one of the first to note this complication and its permanent recovery after splenectomy, although he claimed no priority in this, and most of the cases reported are from German or Scandinavian countries.

Taylor's report[5] gives an excellent summary and he has found reports of "at least seventeen cases" with ulceration.

Since then I have found in the literature only one additional case. This was reported by Lowe[4] who stated that the patient's past history disclosed an ulcer which required three months for healing, before the hemolytic jaundice was recognized. Krueger[3] reported five cases of hemolytic jaundice with no ulcerations but in his comments recognized the rare occurrence of them and their resistance to all treatment until splenectomy is done.

The reasons for accepting a specific relationship rests on three grounds:

1. The ulcers are characteristic. They occur about the malleolar areas. They are usually single, though multiple ulcers are found in cases of long standing. Trauma may or may not be an etiological factor but they begin with a bluish discoloration which breaks down in the center forming eventually an ulcer 3 to 5 cm. in diameter with punched-out but not undermined edges; with a yellowish slough in the center and circumscribed by a zone of bluish cyanosis. There is usually much pain. They are indolent and respond very poorly to all the usual treatments for ulcers.

2. They are not found in other states of severe anemia, secondary or primary, excepting in sickle cell anemia which, incidentally, bears some resemblance to that of hemolytic jaundice.

3. They heal with startling rapidity, and permanently, after the spleen is removed.

Case Report

Mrs. J. W., aged twenty-four, a housewife, was in the third month of her first pregnancy when I first saw her in March, 1944. The diagnosis of congenital hemolytic jaundice was suggested by her pallor and enlarged spleen; confirmed by her blood examination and history; and proved by her very complete recovery after splenectomy.

Family History.—Her mother and one brother have always been anemic. The mother has an enlarged spleen which has never been removed although she has been advised repeatedly to submit to this operation.

Past History.—This is irrelevant except that the patient has always been anemic and her spleen was found to be enlarged when she had pneumonia at the age of twelve. She has had spells of weakness, abdominal pain and slight jaundice which may have been mild attacks of hemoclastic crises. At these times, she thinks she has been helped by liver. Also she has had three bouts with indolent ulcers about her ankles. The first one came in 1937 over the internal malleolus of her left leg, as the result of scratching some mosquito bites. In spite of various treatments and surgical closure, this did not heal for eight months. In 1941 a similar ulcer occurred over the external malleolus of the same leg. This she attributed to the same cause, though similar scratches elsewhere healed without infection. With bed rest, elevation, and hot packs, this ulcer was made to heal in two months. In September, 1943, after a bicycle trip, the old area over the left internal malleolus broke down and a new one appeared over the external malleolus of the other leg. This did not heal for over three months. The patient had been urged frequently to submit to splenectomy but had always refused to do so.

Physical Findings.—These were essentially normal except as follows: The spleen was enlarged and extended 3 inches below the costal arch; it was firm and not tender. The liver was not enlarged. The sclera showed occasionally a slight tinge of yellow. There were scars on both ankles from the ulcers referred to.

Blood Findings.—Wassermann test, negative; Group IV; Rh positive; hemoglobin 9.8 gm.; red blood cells, 2,950,000; white blood cells, 14,800; differential count, polymorphonuclears 68, lymphocytes 20, monocytes 4, eosinophiles 8, microcytosis (spherical type) 4 plus (hyperchromic), polychromatophilia 2 plus, anisocytosis 1 plus.

The fragility test showed increased fragility: hemolysis began below .50 with complete hemolysis at .30; control hemolysis began at .44, with complete hemolysis at .34. Recticulocyte count was 4.1 per cent.

Presented before the Southern Minnesota Medical Association, Manakto, Minnesota, September, 1946. Dr. Skinner received the SMMA bronze medal award for this contribution.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from May issue)

Luke Miller, who was to become a prominent pioneer physician and citizen in two communities of Fillmore County, Chatfield and Lanesboro, was born at Peterborough, New Hampshire, on August 18, 1815. Presumably his early education was obtained in Peterborough; in 1841 he was graduated from the University of Vermont, at Burlington, and in 1844 he received his medical degree from the Vermont Medical College, at Woodstock, Vermont.

Early displaying political acumen and ability, in the year of his graduation from medical school Dr. Miller was elected to the House of Representative from his native district and, postponing the beginning of his professional career, he served two years in the state legislature. On completion of this term, in 1847, he began the practice of medicine in the county of his birth. After ten years, in which he achieved a reputation as a good physician and surgeon, he moved to the Middle West and in 1857 settled in Chatfield. There, according to Andreas' *Historical Atlas of Minnesota* of 1874, "he soon found himself overrun with business, as a physician and surgeon, and he gave himself up to the demands of his profession," conducting his own practice and co-operating with his fellow physicians, among whom were Dr. Isaac S. Cole, Dr. Refine W. Twitchell, Dr. Nelson W. Allen and Dr. Augustus H. Trow.

Dr. Miller's professional interests extended beyond the actual care of the sick. Soon after his arrival in Chatfield he began lecturing on anatomy, physiology and hygiene to the students at the Chatfield Academy, an excellent institution which had been founded in 1856, and he presumably continued this work until the academy was superseded after a few years by the schools of the state.

In 1862, in Minnesota, the problem of institutional care for the insane first was considered officially, and in 1866, in Governor William R. Marshall's administration, legislation provided for a hospital for insane, which was established that year at St. Peter, at first in temporary, rented buildings. Of the board of trustees of six members, Dr. Luke Miller (listed as of Rushford) was one of the three who were appointed to serve six years. The *Preston Republican* of January 4, 1867, carried the following pertinent item:

> Twenty-one lunatics, ten males and eleven females, passed through Rochester on Thursday of last week, says the *Post,* en route for the temporary State Asylum at St. Peter. They were closely guarded by several officers from this state, Dr. Miller of Chatfield and others, and were being removed from the Iowa State Asylum, where they have been temporarily kept during the last year.

And further, as regards his office as trustee, at the third semi-annual meeting of the Minnesota State Medical Society, held in Minneapolis on June 13 and 14, 1871, "Dr. Luke Miller of Lanesboro extended a cordial invitation to the society to visit the Insane Asylum at St. Peter, on the occasion of the next annual meeting. Accepted."

When the Fillmore County Medical Society was founded in 1866 (sometimes given 1862) "for mutual benefit, and particularly to increase the medical knowledge and skill of the members," Dr. Miller was a charter member and he thereafter was active in the organization. In 1868 his name appeared in the news of the society, to the effect that the president, Dr. R. W. Twitchell, would give an address at the regular annual meeting to be held at Preston on June 8 and that Dr. Luke Miller would give an essay "after the regular business of the society has been attended to." In 1869 he was one of the delegates to the annual meeting of the Minnesota State Medical Society.

Busy as he was professionally, Dr. Miller was not so engrossed that he could not become closely concerned with civic and political affairs. A man of such definite personality and ability could not avoid some degree of enmity, and his changing political affiliations made him a target for acrimonious comment, since, it has been said, he was a Democrat, a Republican, a member of the People's Party, and again a Republican in rapid succession. Shortly after his arrival in Chatfield, he was defeated, on the Democratic ticket, for the office of state senator, and also for membership on the local board of supervisors. In 1858 he was elected a trustee of the school board of Chatfield, to serve one term, and later, from 1860 to 1861 and from 1864 to 1867, inclusive, he again held the office. In the meantime, in 1860, he once more knew defeat, on the Republican ticket, in the village as candidate for the office of justice of the peace and in the state as senator. In 1861, however, still a Republican, he was elected state senator and so well did he fill the office that he was returned on three successive elections.

In the early period of the Civil War Dr. Miller's declaration that he was in favor of fighting until every Negro should be free, even if all whites were annihilated, drew down on his head the expressed wrath of the *Chatfield Democrat* (issue of September 21, 1861). During the war Dr. Miller served as medical examiner for the draft board. The *Preston Republican* of September 12, 1862, carried the following item:

> Exemption: Dr. Miller, surgeon for the county, finished his labors Tuesday of last week and left the remainder of the applicants in the hands of Dr. Lafayette Redmon. We understand that a good many persons of foreign birth are still coming forward to make oath to the effect that they have never declared their intention of becoming citizens of the United States. No examinations to date.

Later he was appointed state agent to care for sick and wounded soldiers, a duty that he performed skillfully and kindly. In the issue of the *Republican* for June 17, 1864, it was stated that Dr. Miller was going south to visit the sick and wounded soldiers from Minnesota, and in August, 1864, there appeared further comment: Dr. Miller had been appointed by the Governor to go on this visit, he had had access to military hospitals, and had brought back with him, for the information and comfort of the soldiers' families, lists of the men he had seen.

With other public-spirited citizens of Fillmore County, Dr. Miller was influential in the building of the Root River and Southern Minnesota Railroad (later called the "Southern Minnesota"), between La Crosse, Wisconsin, and St. Peter, Minnesota, originally planned to run through Chatfield, and for three years he held the office of treasurer and vice president of the road. Although the railway company first was incorporated in 1855, the work of construction proceeded slowly. In the chapter devoted to railroads in the History of Fillmore County of 1882 appears the sentence: "As to the last land grant from Congress in 1866, without which the road could not or would not have been extended west of Houston, perhaps the most credit should be given to Charles D. Sherwood, Dr. Luke Miller, C. G. Wykoff, and D. B. Sprague, who joined their fortunes with the enterprise at the reorganization in 1865. The village of Lanesboro, which originated in consequence of this railroad, was platted in 1868."

The founding of Lanesboro, a railroad enterprise of which Col. Thomas R. Brayton was agent, about forty miles west of the Mississippi River, perhaps represented a new challenge to Dr. Miller, for he moved to that village in 1869 and thereafter devoted himself to promoting the welfare and prosperity of the community. It seems probable, however, that his long-continued interest in the railroad, the fact that he was still serving as one of its officers, and his disappointment that Chatfield did not realize its hopes from the road, took him to Lanesboro. Possibly it was in anticipation of this change that Dr. Miller, in 1867 or earlier, established an office in Rushford (ten miles northeast of Lanesboro), which, until 1869, was the western terminus of the railroad; his name appears in the *Minnesota Railroad and River* Guide for 1867-1868, in the portion devoted to physicians of Rushford: "Luke Miller, South Side." Apparently a man of some substance financially, Dr. Miller was cashier of the Chatfield bank in the early sixties and was rated by a commercial agency, in 1872, as a good risk (the possessor of $20,000 or more). In fact, a distinguished resident of the county, who was a young man when Dr. Miller was at the height of his career, has recalled that "Dr. Miller was doubtless a good physician and he certainly was a capable financier; in those times if one had a little money and knew how to handle it he could get along. The rate of interest then was 3 per cent a month." And the doctor knew how to handle his money, if the experience of a certain pioneer settler, a Maine Yankee, was typical, for this man once borrowed $100 from Dr. Miller and, it has been said, "it cost him a yoke of steers and forty acres of good timber land before he got rid of the debt."

After his removal to Lanesboro Dr. Miller continued his activities for nearly twelve years. From time to time, in various connections, civic, social, political and professional, his name appeared in the newspapers and an occasional item has been preserved in histories of Fillmore County, as thus: "In August, 1877, Dr. D. F. Powell [he who was called by the Indians 'White Beaver'] was bitten by a rattlesnake at the Big Spring, two miles from Lanesboro. On his return, Dr. Luke Miller prescribed the formula which has kept in fashion so long as a panacea in such cases, R. spiritus frumenti, ad lib., and the doctor recovered." Notes are found that at one time Dr. Miller served as village constable; as postmaster; as treasurer of the local order of Odd Fellows; that on the organization of the Old Settlers of the Southern Tier of Counties of the State of Minnesota, on October 21, 1878, he served on the program committee.

When Dr. Miller arrived in Chatfield in 1857, he was accompanied by his wife, Abbie D. Miller, of his own age, a native of Vermont, and their two children, Luke L. and Jennie A., both of whom were born in Vermont. Although Dr. Miller's year of birth has come down in various accounts as 1815, a census of 1857-1860, taken at Chatfield, listed both him and Mrs. Miller as forty-seven years old; the son Luke was eight years old and Jennie was four. Luke L. Miller, for many years, throughout his adult life, was a resident of Chatfield. Jennie A. Miller became the wife of Professor Gorman of St. Cloud.

Dr. Miller died in Lanesboro on July 12, 1881, and was buried with Masonic rites and honors. There follows an excerpt from an obituary included in the *History of Fillmore County* of 1882:

> His final earthly home was at Lanesboro, but he belonged quite as much perhaps in Chatfield or in New Hampshire, the scene of his early triumphs, and in the county and state which he loved and served so well. He was an upright man, an officer above corruption and of good business qualities; and as a skilled surgeon and physician he had a wide reputation.

Russell Lucretius Moore was a native of northeastern Ohio, born at Montville, Geauga County, on December 31, 1843. When he was nine years old his parents moved with him to Michigan and soon after to Grant County, Wisconsin. In the graded schools of this community he completed his early education before entering the Platteville (Wisconsin) Academy. At the opening of the Civil War he enlisted in the Seventh Wisconsin Volunteer Regiment of Infantry, which was part of the well-known Iron Brigade of the Army of the Potomac, and served with it four years, until after the end of the war. He achieved the rank of adjutant. At the Battle of Spotsylvania Court House, on May 12, 1864, he received wounds that incapacitated him and confined him to a hospital in Philadelphia for four months.

On receiving his final discharge from the army, Russell Moore returned to Platteville and there began the study of medicine under the preceptorship of George W. Eastman, M.D., in preparation for entering Rush Medical College in Chicago. During this period, on October 7, 1867, he was married to Elizabeth Howdle; in 1869, immediately after receiving his degree from Rush, Dr. Moore brought his wife to the village of Forestville, in the township of that name in Fillmore County, where he began his professional life. His card appeared regularly in *Western Progress,* the newspaper of Spring Valley, and in the *Preston Republican.* In 1869 also, on June 23, Dr. Moore joined the Masonic Blue Lodge of Preston; he formerly had belonged to the Masons of Plattevile. In February, 1871, he settled in Spring Valley and by December 25, 1872, his card announced him as physician, surgeon and obstetrician, "office and residence in brown house, Griswold's Addition, north of the depot."

It has been stressed that pioneer physicians, at all hours and in all seasons, faced the hazards of poor roads. Dr. Moore was one who sustained a serious accident in the course of a professional drive at midnight in June of 1870. On the narrow road that rounded the bluff just west of Forestville he met a team that crowded him off the edge so that he, his horses and vehicle rolled over and over down to the bottom of a steep incline, a distance of about twenty-five feet, all three receiving considerable damage. "Dr. Redmon" said the describing reporter "is attending his professional brother and says it will be some weeks before he will be able to resume practice."

Dr. Moore, from all records, was a well-trained, intelligent, conscientious physician who served his community in various professional capacities and who gave his patients the best medical and surgical treatment available and sought for better. That he was sued, in 1881, for malpractice, through malice, apparently, did him no great harm and it was announced pointedly, editorially in the *National Republican* of Preston in the following summer, that Dr. R. L. Moore of Spring Valley would not move to another field of usefulness as rumor had reported; that his practice was large and increasing; and that uterine surgery was one of his specialties in which he was well posted and reliable.

From January 6, 1870, to March 26, 1872, Dr. Moore was county coroner. He early became a member of the Fillmore County Medical Society (organized in 1866) and was its president when, in 1879, the group suspended activity, the officers holding over; in a record of 1882 Dr. Moore was mentioned as the last president of the society. It is interesting that in October, 1882, he called a meeting for the purpose of reviving the organization.

Soon after he arrived in Minnesota, Dr. Moore became a member of the Minnesota State Medical Society and the record of his work with the organization from 1870 to 1889, inclusive, is to his credit. He attended meetings regularly and he held office: for several terms, beginning in 1878, as corresponding secretary, and, in 1883, as third vice president; in this year also he was one of the delegates to the annual meeting of the American Medical Association. He served on many different committees, on some of them more than once: ethics, gynecology, medical education, practical medicine, obstetrics, surgery, the use and abuse of alcohol, diseases of the nervous system, diseases of children, epidemics, membership, orthopedic surgery, nominations for chairmen of sections, and medical jurisprudence (its chairman). The reports that he sent in reply to questionnaires from committees of the state society on the treatment of specified diseases or surgical conditions were concise and sound; and the occasional letters asking for advice and help that he wrote to men of special experience and knowledge were intelligent and modest. One worthy of note is that written in April, 1883, to A. Blitz, M.D., of Minneapolis, chairman of the Committee on Ophthalmology, for it concerns a field in which Dr. Moore had increasing interest:

> In response to your circular I have the pleasure to say that as a country surgeon and physician I am quite often called to treat diseases of the eye. During the year last past I have not seen a single case of ophthalmia neo-natorum. I have seen a few cases in my field in other years past. It certainly is of rare occurrence in this locality. I look upon it as an aggravated form of purulent conjunctivitis. Am I right? I see a considerable number of catarrhal, purulent and granular conjunctivitis (trachoma). Next in frequency is iritis, and phlegu-tenular conjunctivitis. Keratitis is seen almost as frequently as the last two. I try to make a correct diagnosis of each case as it presents itself. I try to treat each case properly. I try to *see* more than simply "sore eyes," for which the same unvarying nitrate of silver "eye water" is given, as is the manner of some "medicine men." What do you think of the treatment of some of these diseases by the "dry method?" I have found it of great benefit. A powder something like the following I have found very useful: Iodoform: Hydrang. chlor. Nietis; Sach Alba . . . equal parts. (Formula as printed in Transactions.)
>
> Triturate long and well in a wedgewood mortar. Sift a little into the eye off a camel's hair brush two or three times a day. Perhaps you will smile at my idea of these things. I am aware that many specialists have a thought that the general practitioner knows but little or nothing of the diseases which fall into his special line, but from sheer necessity the said general man of all work, the "country doctor," often treats some of these cases with as fine results as are ever achieved by the specialist. In all our small towns and villages there are always people who cannot afford to go from home to consult gentlemen of your class. These people some of us *must* treat. We wish to do it well. Give us all the light you can upon these common diseases of the eye in your forthcoming report.

An ardent advocate of measures promoting sanitation and public health, Dr. Moore co-operated actively and faithfully with the State Board of Health, as a private physician and, in the middle eighties, as local health officer. It speaks well for him and for his townsmen that they gave him willing support in this work. Excerpts from his reports on diphtheria were used in the notes on medical history in Fillmore County which preceded the present series of biographical sketches.

In 1883, after the "Diploma Law" to regulate medical practice in the state was passed, Dr. Moore received license No. 149 (R) on October 13 and filed it in the county on October 19.

Not by inclination a politician, but evidently willing to serve the state as well as the community, Dr. Moore was a candidate for the state legislature, according to a county history, in 1875 and 1878. On a Republican ticket in a Democratic district, it was not surprising that he was defeated both times, first by a Democrat and next by a Greenbacker, and that he thereupon decided that he had had enough of politics.

After practicing in Spring Valley for twenty-nine years, in 1889 Dr. Moore moved to Lincoln, Nebraska; in the early or the middle nineties he returned, however, to devote the remainder of his active life to specialization in diseases of the eye and ear. He died in Spring Valley on August 13, 1902; his wife's death had occurred earlier; there were no children.

J. J. Morey (sometimes Morrey), an eclectic practitioner, is known to have been in Fillmore County from the late sixties into the early seventies, and it is likely that he practiced in the county over a longer period, beginning perhaps in the fifties.

In 1869, when eclecticism became established in Minnesota (the Minnesota State Eclectic Medical Society was organized on May 26; the Southern Minnesota Eclectic Medical Society on November 14), a small group of Fillmore County practitioners organized the Fillmore County Eclectic Medical Society, as has been described, and of this group J. J. Morey (Morrey) was a member and an officer. If Dr. Morey was a resident of Preston in 1869, he soon moved to Spring Valley where, early in 1870, he had become established in association with Dr. M. G. Pingree, with offices in the Rogers Drug Store. The partnership was short-lived, for in August, 1870, J. J. Morey, physician and surgeon, had settled in Etna, a village in the southeastern corner of Bloomfield Township, which adjoins Spring Valley Township on the south. Dr. Morey was still practicing in Etna in the spring of 1871.

W. (?) Morrison, an herb doctor, was early in Chatfield and vicinity, part of the time on a near-by farm south of town, part of the time, in the eighties, a resident of the village, in the "Durgan-Halloran" house. He is remembered as a contemporary of Dr. Augustus H. Trow ("Old Doc Trow"), who was in Chatfield from 1856 to 1887, inclusive. It is said that sometimes the two men were called on cases together, and that occasionally Dr. Morrison was summoned in the absence of Dr. Trow. One venerable citizen has recollected in detail the treatment, as it appeared to him, administered to him by Dr. Morrison for lung fever; namely, the giving of herb medicine "to draw the poison out of the lungs to the legs," and the care of the supposedly resultant lesions of those members by washing with more herb medicine; also of his curing Bright's disease when the patient, a young girl, had been given up by other physicians. Other senior residents of the village, however, have recalled Dr. Morrison with faint praise; "but none of them (medical practitioners) knew much in those days."

That for many years, however, this practitioner played a part in the life of the community, as a "doctor" and as a participant in civic affairs, notably at the proceeding at town meetings, is unquestioned. There is still quoted with delight his retort to the village atheist, at an important civic gathering at which the location of the new Elmira town hall was to be decided. This atheist had been contending belligerently that the hall must be placed within the borders of the village of Chatfield rather than a mile or more north of the settlement as some of the Elmira farmers wished, and he declared loudly into Dr. Morrison's somewhat deaf ears his intention of leaving the community forever unless the new hall were placed according to his desire. Dr. Morrison inquired gently, "*Where* will you be going, sir?" which to his hearers savored of subtle humor as referring to destination in the hereafter.

On February 26, 1886, there died in Elmira Township, Olmsted County, in which part of the village of Chatfield lies, William Morrison, "doctor," married, native of New Hampshire, at the age of seventy-eight years.

In a business directory of 1896-1897 a Dr. W. A. Morrison was listed as in Chatfield. It appears likely that this entry referred to Dr. W. S. Morrison, of Fremont, Winona County, some fifteen miles to the northwest of Chatfield, who over a period of years maintained an office in Chatfield and practiced in the village two days a week, driving back and forth between the two towns.

(Because of his practice in Fillmore County and because through an apparent inadvertence, only a few lines about Dr. William Shaw Morrison appeared in the notes on medical history in Winona County that were published in MINNESOTA MEDICINE *in 1940, a brief sketch of this interesting and well-qualified physician follows.)*

William Shaw Morrison, although usually remembered as a pioneer physician of Winona County, where the greater part of his life was spent, is claimed by Fillmore County also as a practicing physician of the early days. So large and so far distant did his following become in Fillmore County that he found it well, as has been stated, because those were literally horse and buggy days, to maintain offices in Chatfield, a village of both Fillmore and Olmsted Counties.

William S. Morrison was born in Waddington, New York, in 1840, the son of The Reverend and Mrs. John Dow Morrison, both of whom were natives of Keith, Scotland; John Dow Morrison came to this country in 1838 to become pastor of the United Presbyterian Church of Waddington. There were three other children in the family: John, who became a physician of Winnipeg, Canada; James Dow, doctor of divinity and doctor of laws, Bishop of the Protestant Episcopal Church, with residence at Ogdensburg, New York; and Maria Jane, a teacher of piano in Waddington.

William Morrison received his early education in the schools of Waddington and later attended Huntington Academy, in Canada. His formal medical training he obtained at McGill University, Montreal, from which he was graduated in 1865. In the following two years he served an internship at the Montreal Hospital and began his practice of medicine in Waddington.

Some years previous to his graduation in medicine, a group of his father's parishioners had gone into the Middle West, to settle at Fremont, Winona County, Minnesota, and in 1867, when the community was in need of a physician, Dr. Morrison at the urging of these old friends joined the community, to devote his care and skill to them and to the settlers of a widespread surrounding territory. He drove from Waddington, New York, to a port on Lake Michigan, where he embarked for Milwaukee, Wisconsin, shipping his Morgan mare on the boat; from Milwaukee he drove to Fremont over almost impassable roads.

In 1884 Dr. Morrison opened an office in the village of Lewiston, Winona County, a few miles north of Fremont, and it is remembered well by residents of

Chatfield, that over a considerable period in the eighties and nineties he had an office in that village and observed there a regular consulting schedule two days a week. But whatever the conditions of his medical practice, he always resided at his farm home a mile from Fremont. After the enactment of the "Diploma Law" of 1883 he practiced under an exemption certificate and was listed in the official register of physicians of the state as a member of the regular school of medicine.

Among the physicians of a later generation who remember Dr. Morrison well are Dr. Conrad A. Neumann, of Winona, and Dr. George B. Eusterman, of Rochester, both of whom were residents of Lewiston when Dr. Morrison was in his prime. Dr. Eusterman has described Dr. Morrison as a dark-complexioned, short, stocky man; energetic, vigorous to the point of being athletic; of fine personal and professional appearance; of a genuine, cordial kindness that won him friends and kept them; a man who during his sixty years of service to his neighbors and friends became a vital factor in the well-being and growth of his community.

In 1869 William S. Morrison was married to Margaret Ferguson of Fremont; Mrs. Morrison died in 1909. Of the marriage there were eight children, six boys and two girls. Two of the sons died in early childhood. When Dr. Morrison's death occurred in July, 1928, there were six living children: John, of Witoka; Kenneth Reid, of Minneapolis; James Dow, of Winona; William Shaw, of Evanston, Illinois, and Maria Morrison Henry and Harriet Morrison, both of Fremont; and one brother, The Right Reverend James Dow Morrison, of Ogdensburg, New York. In 1943 all of this group were living except Bishop Morrison, who had died in January, 1934.

William Shaw Morrison died at the age of eighty-eight years, after a life filled with service; although age forced him to retire from active practice a few years before his death, up to his last year many of his old patients still came to his home for advice and medical attention. Dr. Morrison was a life-long member of the Masonic Lodge of Lewiston. He was buried from the Scotch Presbyterian Church of Fremont with Masonic rites at the grave. The whole community mourned the passing of an able physician whose professional activities had spanned the years from 1867 to 1928.

(To be continued in the July issue)

President's Letter

THE ANNUAL MEETING

The acquisition of knowledge is accomplished only by great labor. It must be sought before it can be acquired and only individuals who are willing to exercise sufficient effort to gain knowledge can become the authors of new ideas. Often such ideas or discoveries possess an importance which it is impossible to exaggerate. However, unless and until such ideas are accepted and such discoveries are adopted, they can exercise small influence and can accomplish little benefit. Believing in this doctrine, the physicians of Minnesota hold a scientific meeting each year. This great traditional assemblage brings together the physicians of Minnesota and other states in order that they may continue their efforts to advance medical knowledge and medical science. Opportunity is provided for discussion which may eventuate in solution of certain of the perplexing problems of organized medicine and possibly in a more capable medical profession.

A high ideal has been maintained by the Committee on Scientific Assembly. An earnest attempt has been made to provide a program which will prove attractive and beneficial to members of the Association and its guests. The scientific program includes papers and lectures of superlative quality on important, vibrant topics. Those who will participate in the program are members of our own Association and well-known authorities from other states.

In addition to the general assembly, special sectional meetings will be held on the morning of each of the three convention days and on Monday and Tuesday afternoons. On Monday morning the Minnesota Academy of Ophthalmology and Otolaryngology is sponsoring a program, and in the afternoon there will be a special symposium on rheumatic fever. Tuesday morning features discussions on the subject of orthopedic surgery, and the American College of Chest Physicians meets on Tuesday afternoon. A special symposium on research problems is scheduled for Wednesday morning.

A program of demonstrations has been arranged for each intermission and immediately preceding and following each scientific session. These include gross pathologic specimens, presented by the Minnesota Society of Clinical Pathologists; roentgenologic diagnosis and interpretation by members of the Minnesota Radiological Society; obstetric manikin demonstrations, and, in addition, a demonstration on Rh blood-testing procedures and blood-compatibility testing in connection with one of the scientific exhibits. Other scientific exhibits will be provided by Association committees, hospitals, societies and governmental departments. These exhibits will provide information on the various services available and the progress which is being made.

Round-table luncheons have always provided an excellent opportunity for an exchange of ideas and opinions. This year they will occupy a prominent place in the program of the second and third days of the meeting.

The commercial exhibits will attract and deserve your attention; well-informed representatives will be present to discuss with physicians the latest developments in their particular fields.

Wednesday afternoon has been set aside for consideration of the problem of medical service in rural areas. Members of allied health organizations, social welfare workers, school authorities, representatives of farm, professional, and civic groups have been invited to this part of the meeting, and we hope that they as well as others interested in this problem will attend this informative portion of the program.

In these confusing years there is great need for the sort of opportunity which this annual meeting affords. As usual, the meeting will mark the climax of another year's work. Those who participate in the program have worked diligently and will present their reports, hoping that they may provide information which will be of assistance to other members of the profession. Every member of the Association is urged to participate in the deliberations of the meeting. Only by discussion can our experience be interpreted properly and a wide understanding of its application be attained.

Louis A. Buie

President, Minnesota State Medical Association

STATE MEETING

As a state medical association we are acquiring age and dignity. This year's meeting in Duluth will be the ninety-fourth annual get-together, and according to the advance registrations will be a large gathering. The program which has been mailed to each member and which also appears in this issue speaks for itself.

The annual meeting of our state medical association serves as a real stimulus to the members of the profession of the state, not only to those who listen but perhaps more to those who present the scientific program. The meeting also affords an opportunity for everyone to talk shop in off hours, to meet others with common interests and to renew acquaintanceships. The out-of-state speakers who are recognized in their special fields serve to prevent too much provincialism in our scientific thought. That the medical profession appreciates the value of our annual meeting is shown by the yearly attendance.

Our Duluth hosts have arranged an informal entertainment for members and their wives for Monday night. The annual banquet Tuesday night will be addressed by Mr. Tom Collins of Kansas City, who has a reputation as an eminent speaker on public affairs, and by Dr. Louis A. Buie, president of our association.

Remember the date—Monday, June 30.

MINNESOTA MEDICAL SERVICE, INC.

Over $85,000 has been paid to Minnesota Medical Service, Inc. This is a sufficient amount to develop and carry on the Medical Service Program.

The Board of Directors decided at the last meeting held May 27, 1947, that no further contribution will be accepted after July 1, 1947, and that all members of the Minnesota State Medical Association who have not sent in their check by that date are honorably relieved of remitting their pledge.

Minnesota Medical Service, Inc., will have a booth at the state meeting in Duluth where all information can be obtained. Acceptance agreements will be available whereby physicians agree to provide medical service according to contract.

A complete report of the progress of Minnesota Medical Service, Inc., will be given on Sunday, June 29, at the meeting of the House of Delegates.

THE BELL LECTURESHIP AND THE MINNEAPOLIS X-RAY SURVEY

The Bell lecture by Dr. Herman E. Hilleboe was the opening gun which started the Minneapolis community-wide chest x-ray survey. Our lecturer was a distinguished Minnesotan who received his common school and medical education and much of his training in tuberculosis while in this state. That he came back to his home state to launch the first community-wide chest x-ray survey in any large city in the country, was especially appropriate. But the greatest import of the occasion was that from his comprehensive knowledge of the tuberculosis problem he was enabled to give unexcelled guidance to us, and to all who contemplate mass attacks against chest diseases.

He also brilliantly represented one of the chief participants in the Minneapolis survey, the United States Public Health Service. He was for some years the Director of Tuberculosis Services of this bureau, and is now the Assistant Surgeon General and Associate Chief of the Bureau.

Dr. Hilleboe's discussion of recent evaluations of the accuracy of roentgenographic diagnosis of chest plates will startle most doctors. It is evident from this study that chest films, both large and small, are after all only a part of the process of complete chest and heart diagnosis. One might best consider the filming process with the small film to be only a crude first sifting process. Only through this medium, however, can we separate from the general population that small percentage of individuals upon whom it is feasible to con-

---

Dr. Hilleboe's address, entitled "Community-Wide Chest X-Ray Surveys and the General Practitioner," appears in this issue.

centrate our clinical and laboratory efforts, including the use of larger x-ray film.

In a recent editorial on chest surveys in this Journal, there was a timely admonition that many cases in this smaller group will have healed tuberculosis and should not be subjected to active treatment. It might well have been said also that until the true seriousness of the lesion has been proven, intelligent and gentle handling of such apprehensive patients should be the aim of all of us. It is equally true that earliest diagnosis of lung tumors and early appraisal of activity and contagiousness of active tuberculosis cases, followed by active treatment and isolation, are of tremendous importance, both to the patient and to the public at large.

Dr. Hilleboe has attempted to answer one of the problems most disturbing to us who planned the Minneapolis survey, and that is the probability of swamping our excellent and up-to-this-time adequate county sanatorium facilities. Some of his suggestions as to selection of patients for sanatorium care have been planned and adopted by E. S. Mariette, Superintendent of Glen Lake Sanatorium. Increase of facilities, medical service, and nursing personnel await more adequate financing by the governmental units involved, and, at best, will not be available when first needed.

In view of the inability of the sanatorium to carry on its customary study of x-ray positive cases, much of this follow-up work will have to be done by the medical profession and outpatient clinics. Even many active cases will have to be treated by home care and home isolation until sanatorium shortages can be corrected.

Dr. Hilleboe has stressed the importance of tuberculin testing, sputum and gastric washing cultures of those who show lesions on the large film, suggesting active tuberculosis.

The Medical Technical Committee of the survey, in close co-operation with Dr. Hilbert Mark of the State Board of Health, Dr. Frank Hill, City Health Commissioner, and Dr. E. S. Mariette, Superintendent of Glen Lake Sanatorium, have planned for increased laboratory facilities to provide smears and cultures of sputum and gastric washings. Limited facilities for overnight hospitalization and gastric lavage at Glen Lake Sanatorium are offered by its management. All arrangements for gastric washings by the doctors of private patients can also be made by calling the City Health Department tuberculosis control office.

The committee appeals to the profession for co-operation in reporting their findings and diagnoses, not only in tuberculous cases as required by law, but in all chest and heart lesions. These statistics will be of important scientific medical interest only if most reports are received.

The success of any chest survey depends to a great extent upon the percentage of the population that responds to the appeal to have a chest x-ray. The intelligent use of the latest laboratory procedures for diagnosis and determination of activity is also of great importance. However, most of us realize that gentleness, ability, and persistence of the doctor in handling patients, plus his clinical skill in interpreting symptoms, physical findings, and laboratory procedures, and, most of all, his diagnostic ability, are still the most important part of any x-ray chest survey. One could only wish that all of us might be possessed to some degree at least of these excellent qualities that were so often exhibited by our great teachers and physicians of the past generation—which qualities were so truly exemplified by Dr. J. W. Bell, in whose honor Dr. Hilleboe presented his momentous address.

Charles E. Merkert, M.D.
Chairman, Medical Technical Committee,
Minneapolis Chest X-ray Survey

RESEARCH PROFESSORSHIP IN RHEUMATIC FEVER

The American Legion of the State of Minnesota is embarking on a campaign which it has termed the "Minnesota Project." According to this plan, it is proposed to give aid to those who study heart disease and rheumatic fever of children.

A committee of prominent legionnaires has met with the dean of the medical school and the president of the University of Minnesota. Together they have formulated plans to establish at the University of Minnesota, a professional chair, the occupant of which will direct research in heart disease and rheumatic fever of children. To maintain this chair in perpetuity, as a memorial to veterans of World Wars I and II, the committee expects to secure a half million dollars from members of the American Legion of the State of Minnesota.

This undertaking deserves the support of the Minnesota State Medical Association. Every physician, with the knowledge which he possesses concerning rheumatic fever and its relationship to heart disease, can offer his services to Legion posts and can assist in stimulating the interest of legionnaires and other citizens in his community.

L.A.B.

MEDICAL ETHICS IN VETERANS PROGRAM

INSTANCES of unethical or questionable practices by physicians have recently come to light in connection with the Minnesota Veterans Medical Service program. These practices were the subject of discussion at a meeting May 14 of the Operating Committee of the Veterans Medical Service Division of the Minnesota State Medical Association.

Inasmuch as the veterans medical service program was inaugurated in this state to provide veterans with the same high quality medical care that private patients receive, it is indeed unfortunate when veterans are over-treated or carelessly treated. This practice of over-treating is making neurotics out of many veterans.

Cases have been found by the Committee where certain doctors have reported and claimed payment for medical care never rendered and have falsified records to show nonservice-connected disabilities as being service-connected.

The procedure of the Operating Committee in each instance of a breach or suspected breach of ethics is first of all to notify the physician by letter in order to give him a chance to clear himself. If this warning is ignored, the Committee then refers the case to the Councilor in the doctor's particular district. The Operating Committee has been given unlimited policing power by the Council of the State Medical Association.

The Committee recommends that doctors in treating veterans should conduct themselves at all times so that they will not in any way lay themselves open to criticism later. Reports submitted should always be complete, accurate and truthful. Upon this good faith depends the success of the entire program.

Honesty is one of the most important qualities of human character, and is an essential in a member of the medical profession. A strange quirk in human make-up lies in the fact that a man who is quite honest in other human relations will be as crooked as a dog's hind leg in dealing with his government. Honesty is a quality which is not limited in its application.

It is our humble opinion that medicine, and organized medicine in particular, has no place for crooks. In the interest of maintaining the fair name of our organization, members who are guilty of these dishonest practices as disclosed by our Operating Committee should be deprived of membership in their county societies.

CHRONIC ULCERS OF THE LEG

(Continued from Page 651)

This constituted a typical picture of congenital hemolytic jaundice.

Possibly pregnancy in such a case also is rare; at least I could find nothing on this subject in the medical literature. Apparently there is nothing more to be done than to be prepared for a hemoclastic crisis and remember that these patients do not take kindly to transfusions of whole blood. Accordingly, I carried this patient on expectantly, giving first the liver which she had been taking with no obvious benefit, and then stopping it, with no untoward results, but continuing the routine calcium and the vitamins. The pregnancy was uneventful.

Labor occurred on the two hundred and eighty-fifth day and was normal. There was no crisis or other complication and only a moderate perineal laceration, which healed without difficulty. The patient went home on the tenth day. She led a very active life with varying icterus but her red cell count continued under three million and her hemoglobin ran about 8 gm.

About March 1, 1945, she developed another ulcer, this time over the right external malleolus, from causes unknown. She treated it herself for three weeks before calling on me. By then the ulcer was 2 cm. in diameter, was punched out but the edges were not elevated or undermined. There was a yellowish gray base and a purplish surrounding areola. There was little discharge and little pain. My treatment was no more successful than that of my predecessors but I was more successful than they in persuading her to have the spleen removed.

This was done on May 11, 1945. The spleen was found to weigh 900 gm. Surgical recovery was excellent and the patient went home on the ninth day.

The response of the blood picture and ulcer was spectacular. From the day before the operation to that of her discharge, nine days later, the red blood cells jumped from 2,950,000 to 3,990,000, and the hemoglobin from 7.9 gm. to 12.7 gm. The ulcer, covered only with vasoline, took on a healthy appearance at once, was nearly healed at the end of her hospital stay and the last scab dropped off in less than a month.

The patient has enjoyed exuberant health ever since then, has had another baby (born August 26, 1946) and has had no trouble of any kind at the site of her ulcers.

Conclusions

Chronic ulcerations about the malleoli seem to bear a specific relationship to chronic hemolytic jaundice and are healed very rapidly and permanently by splenectomy.

Minnesota State Medical Association
George Earl, M.D., Chairman

COUNCIL APPROVES ADDITIONAL ORTHOPEDIC CLINICS

In order to provide more adequately for the 1,800 rural Minnesota indigent poliomyelitis patients who are known to need follow-up care, it has been found necessary to set up more orthopedic clinics in the state.

Dr. Edwin J. Simons, chief of the medical service unit of the Division of Social Welfare, has appeared before the Council of the Minnesota State Medical Association and has received its approval for holding four additional orthopedic clinics each spring and fall and permission to ask patients to come to the centers for follow-up examinations when necessary.

All of these clinics are held only with the approval of the local medical society of the particular district, and only those patients are seen at the clinic who are referred by their family physicians.

In a survey made some time ago, Dr. Simons reported, it was found that one out of 138 patients was able to pay. The Social Welfare division investigates each case, and those that are able to pay in whole or in part for their care, are asked to do so.

Physicians Request Clinics

In asking approval for the additional clinics, Dr. Simons said that physicians of the state in the different districts have asked for these clinics and the approval of the medical societies concerned will be secured before the clinics are held. Reporting plans for these additional clinics, Dr. Simons said that it is very desirable to have a clinic at Virginia because of the considerable number of polio cases on the Range; one at Faribault is in prospect in order to have some disposition in the southern part of the state. It is also expected to hold one in Cambridge and one in Thief River Falls, Dr. Simons said.

The Sister Kenny method has prolonged the follow-up care of polio patients, Dr. Simons reported; where patients used to go to the hospitals during the entire period until they were discharged some months later, he said, they are now kept under physiotherapy for months and years, and the hospital costs are much higher.

In Dr. Simons' opinion, it is necessary to establish these additional clinics to solve this problem. Dr. Simons assures the medical profession that the work is being done in each instance for the improvement of medical practice. It is impossible to get enough physiotherapists, he says; therefore, it is necessary to ask patients to come to the centers. This involves less expense and less trouble; the National Foundation for Infantile Paralysis will help cover the cost.

COUNTY SOCIETY OFFICERS PLAN NATIONAL CONFERENCE

In an effort to make the American Medical Association the working partner of every individual physician, the AMA is planning a National Conference of County Medical Society Officers, to be held Sunday, June 8, at 2:30 p.m., in Hotel Traymore, Atlantic City, just prior to the opening of the AMA Centennial Convention.

Dr. B. O. Mork, Jr., of Worthington, secretary of the Southwestern Minnesota Medical Society, is a member of a special committee which was appointed to arrange for the conference.

This is the first conference of this type ever attempted, and it is hoped that a permanent organization may grow out of it, an organization through which it will be possible for all members of the medical profession to work more easily together in solving common problems and which will bring the AMA closer to every member.

It has been decided that this first conference should concentrate on local problems, that it should last three hours and that, insofar as possible, everyone present should have opportunity to find out just what goes on and how the facilities of medical organization—national, state and local—may be made available to the individual doctor.

Question and Answer Plan

The committee hit upon the workshop question and answer conference as the most effective type of program. According to preliminary plans, here is how the program has been set up:

On stage will be a panel of twelve persons familiar with subjects under consideration, to answer questions. Also available will be the officers and heads of the AMA's various departments. Questions will come from the floor in regard to any subject having to do with medical organization problems. All questions must be written and may be submitted before or during the meeting. Members of the committee will process the questions, and the moderator will designate the person or persons who can throw light upon the particular subject under discussion. To allow for discussion on a variety of subjects and answers on as many questions as possible, each speaker will be limited to three minutes for discussing the question put to him.

Suggested topics for discussion are professional relations, which includes such problems as the functions and duties of county society officers, hospital staff problems and the doctor in relation to specialty boards, postgraduate education and legislation; medical service, including prepayment plans, rural health, labor union programs, et cetera, and public relations, including relations between the doctor and the individual patient and the doctor and the general public.

PERSONAL DEBTS PERIL PATIENTS' BUDGETS

American consumers are going into debt twice as fast as in any other period in history, according to a recent bulletin from the Institute of Life Insurance. Goods are being bought on credit at an all-time record rate.

This is perhaps only natural, the bulletin notes, since people have waited a long time to buy some of the items that are just beginning to come back on the market since the end of the war.

However natural the trend is, it is well worth taking note of it. For the extent of the increased use of credit raises the question of whether some people may not be undermining their own well-being and financial security by going into debt too heavily in relation to their prospective income. It also points to the fact that budgets and paying abilities of each individual doctor's patients are being STRETCHED TO THE BREAKING POINT!

Total Debt Nears 1929 Peak

At the end of 1946, the total personal debt in this country had reached an estimated high of 39.6 billion. That is only 1.1 billion from the peak of 40.7 billion in 1929, just before the crash came.

That means that this country is nearing a dangerous breaking point, that the time has come for caution in not extending credit too freely and not letting accounts slide. Laxity now in making collections may mean a loss of a good share of income. Physicians everywhere would do well to watch this trend closely for their own protection.

$3,000,000 MAYO MEMORIAL VIRTUALLY ASSURED

If Minnesota residents will subscribe a final $350,000 needed toward a total of $3,000,000, the construction of an outstanding medical center at the University of Minnesota, dedicated to the memory of the late Drs. Will and Charles Mayo, will be assured.

Recent action by the State Legislature in granting an appropriation of $750,000 practically assures the fact that a Mayo Memorial research center will materialize. Funds already raised include $750,000 granted by the 1945 Legislature and $1,162,000 subscribed by more than 3,000 corporations and individuals.

Plans for the memorial provide for a central 19-story tower unit. The building will be connected with the medical sciences building by a four-story extension, which will house the Mayo Memorial auditorium, with a seating capacity of six hundred.

The main building will also be connected with the students' health service, the outpatient department and Elliot and Todd sections of the hospital.

To Contain School of Public Health

According to an announcement by the Committee of Founders, the Mayo Memorial will contain the school of public health and the medical library, and enough hospital beds to help lighten the load on University Hospitals and to contribute to research and training.

The Committee of Founders, authorized by resolution of the 1943 Legislature, includes the following: James F. Bell, Earle Brown, Walter Burdick, Mrs. George Chase Christian, Frank T. Heffelfinger, Jay C. Hormel, Raymond J. Julkowski, George W. Lawson, Ward Lucas, Leo D. Madden, Archbishop John Gregory Murray, Charles N. Orr, I. A. O'Shaughnessy, Mrs. Mabeth Hurd Paige, Dr. Edward L. Tuohy, Dr. Donald J. Cowling, chairman, and Dr. George Earl, secretary.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul, Minnesota

Julian F. Dubois, M.D., Secretary

LICENSE OF MINNEAPOLIS PHYSICIAN REVOKED FOLLOWING PLEA OF GUILTY TO MANSLAUGHTER CHARGE

Re State of Minnesota vs. Harry Gilbert, M.D.

On April 23, 1947, Harry Gilbert, M.D., forty-nine years of age, with offices at 547 Medical Arts Bldg., Minneapolis, entered a plea of guilty in the District Court of Hennepin County to an information charging him with the crime of manslaughter in the first degree. Dr. Gilbert was arrested on March 14, 1947, following the death of a twenty-two-year-old unmarried Minneapolis girl at a Minneapolis hospital. Dr. Gilbert had performed a criminal abortion on the decedent on March 4, 1947, for which he was paid the sum of $300. The abortion was performed by the use of a catheter. The patient became critically ill but was not removed to a hospital until March 12, at which time the defendant had the patient admitted as a patient of his brother, Dr. Maurice Gilbert, 330 W. Broadway, Minneapolis. Neither the hospital nor the legal authorities were notified by the defendant or his brother. However, on the date of the decedent's death the Minneapolis Police Department was notified of the facts and the body was removed from a Minneapolis mortuary to the Hennepin County morgue where a postmortem examination disclosed the true facts. Dr. Harry Gilbert was immediately arrested and signed a confession admitting the abortion on the decedent, and also admitting that he had performed numerous other criminal abortions.

The Hon. Levi M. Hall, Judge of the District Court, ordered the defendant to surrender his basic science certificate to the Basic Science Board for cancellation and his medical license to the State Board of Medical Examiners for permanent revocation. Dr. Gilbert surrendered both documents in open court, with a signed authorization for their cancellation and revocation, respectively, endorsed on the back of each instrument. Thereupon, Judge Hall sentenced the defendant to a term of not to exceed five years at hard labor in the State Prison, stayed the sentence and placed the defendant on probation for the same length of time. Judge Hall warned the defendant that notwithstanding the punishment of the permanent loss of his medical license and basic science certificate, that if there was any further violation of the laws of this State, the Court would make a further order revoking the stay of sentence and committing the defendant to the State Prison.

At the regular meeting of the Minnesota State Board of Medical Examiners held on May 16, 1947, Dr. Gilbert's medical license was formally revoked. Dr. Gilbert's basic science certificate has been delivered to the Basic Science Board for cancellation by that Board.

MANKATO DENTIST AND ACCOMPLICE PLEAD GUILTY TO ABORTION CHARGE

Re State of Minnesota vs. W. A. Groebner

Re State of Minnesota vs. Raymond E. Older

On May 24, 1947, Dr. Willard A. Groebner, twenty-four years of age, licensed to practice dentistry in the State of Minnesota, entered a plea of guilty in the District Court of Blue Earth County, Minnesota, to an information charging him with the crime of abortion. Groebner, who maintained a dental office in the City of Mankato, was arrested on March 25, 1947, on a complaint issued in the Municipal Court of Mankato, charging him with the crime of abortion. The complaint charged Groebner with performing a criminal abortion on a twenty-four-year-old unmarried Fairmont girl on March 21, 1947. The patient died three days later after the attempted abortion. Groebner was arraigned in the Municipal Court at Mankato on March 27, 1947, at which time he demanded a preliminary hearing and was released on $1500 bond. The preliminary hearing was continued to await a report from pathologists at the University of Minnesota. The report showed the cause of death to be "acute endometritis and hemorrhagic pneumonia due to an attempted induced abortion." On May 2, 1947, Groebner waived his preliminary hearing and was held to the District Court where he was arraigned on May 13 at which time he entered a plea of not guilty and the case was set for trial. However, on May 24, Groebner withdrew his plea of not guilty and entered a plea of guilty to an information charging him with the crime of abortion. Groebner was sentenced by the Hon. Harry A. Johnson, Judge of the District Court, to a term of not to exceed four years in the State Reformatory at St. Cloud, which sentence was suspended upon several conditions, one of which forbids Groebner to practice dentistry either in Mankato or North Mankato.

The Minnesota State Board of Dental Examiners has announced that proceedings are being instituted to require the defendant to show cause why his dental license should not be revoked. Groebner graduated from the School of Dentistry at the University of Minnesota, in 1944, and was licensed to practice the same year.

On June 2, 1947, Raymond E. Older, thirty-nine years of age, Granada, Minnesota, was sentenced by Judge Harry A. Johnson to a term of not to exceed three years in the State Reformatory, which sentence was suspended and the defendant placed on probation. Older had entered a plea of guilty on May 19, 1947, to an information charging him with the crime of abortion in the same case involving Groebner. Older admitted to the Court that he made the arrangements with Groebner for the criminal abortion and paid Groebner the sum of $75.00. The patient became unconscious in Groebner's dental office and was removed by Older to a filling station at Granada where she was kept over night. The following day she was taken to a hospital at Fairmont where she died the next evening.

MINNESOTA STATE MEDICAL ASSOCIATION

Ninety-Fourth Annual Session

Duluth Armory, Duluth, Minnesota
June 30, July 1 and 2, 1947

ANNOUNCEMENTS

Sectional Program—This year's program is again divided into two sections to be conducted simultaneously in the St. Louis and Duluth Rooms, respectively. The St. Louis Room, where the general scientific assembly will convene each day, is located on the second floor of the Armory, and the Duluth Room, where special sectional meetings will be held, is off the main arena.

Scientific Cinema—Scientific motion pictures will be shown in the East arena before each morning and afternoon session, at the conclusion of the Monday and Tuesday sessions, and at each intermission. Provided by the courtesy of the Medical Film Guild, these films, developed under the guidance of outstanding authorities associated with medical schools or national medical societies, are authentic scientific reports on research which has been conducted for many years.

Luncheons—Twenty Round Table Discussion Luncheons have been arranged for Tuesday and Wednesday, July 1 and 2, at the Duluth, Spalding and Holland Hotels. Tickets must be purchased in advance. Lists of subjects and discussion leaders are printed in the programs, and reservation cards are being mailed out with the program. Attendance at each luncheon is limited to thirty; late comers are accommodated according to their choice if limits have not already been reached. Tickets are $1.50.

Annual Banquet—The annual dinner for members, guests and wives, will be held at Hotel Duluth, Tuesday evening, July 1, at 7 p.m. Mr. Tom Collins, prominent Kansas City businessman and eminent speaker on public affairs, and Louis A. Buie, Rochester, President of the Minnesota State Medical Association, are speakers. Tickets are $3.00.

"Variety Night"—All convention visitors and their wives will be guests of the State Association and the St. Louis County Medical Society at an informal party, 7:30 p.m., Monday, June 30, Hotel Duluth. There will be special music, entertainment and refreshments.

Guest Speakers—We are indebted to the following organizations for guest speakers at this meeting:

The Minnesota Society of Clinical Pathologists is inaugurating the *Arthur H. Sanford Lectureship in Pathology* at this year's meeting, to become a feature of all future annual meetings. Speaker, Elexious T. Bell, Professor of Pathology, University of Minnesota.

The Northern Minnesota Medical Association—Speaker, Robert E. Gross, who is Wm. E. Ladd Professor of Children's Surgery, Harvard Medical School and Surgeon in Chief, Children's Hospital, Boston.

The Minnesota Radiological Society—Speaker, Marcy L. Sussman, Director, Department of Roentgen Diagnosis, Mount Sinai Hospital, New York City, who will deliver the annual *Russell D. Carman Memorial Lecture in Radiology.*

The Northwestern Pediatrics Society—Speaker, Benjamin Spock, Section on Pediatrics, Mayo Clinic, Rochester.

The Minnesota Academy of Ophthalmology and Otolaryngology—Speakers, George E. Shambaugh, Jr., Assistant Professor of Otolaryngology, Northwestern University, Chicago; and Frederick A. Davis, Chairman, Department of Ophthalmology, University of Wisconsin, Madison.

The American College of Chest Physicians—Speaker, William Roemmich, S. A. Surgeon, United States Public Health Service, acting Tuberculosis Control Officer, Minneapolis Health Department.

The National Foundation for Infantile Paralysis, Inc.—Speaker, Joseph G. Molner, Medical Consultant, National Foundation for Infantile Paralysis, Wayne University, Detroit.

The Minnesota Department of Health—Obstetric Manikin Demonstrations by Willis E. Brown, Associate Professor of Obstetrics and Gynecology, University of Iowa Medical School, Iowa City; Ralph E. Campbell, Associate Professor of Obstetrics and Gynecology, University of Wisconsin Medical School, Madison; and Mancel T. Mitchell, Clinical Assistant Professor, Obstetrics and Gynecology, University of Minnesota Medical School.

Other visiting speakers at this meeting:

Benedict F. Massell, Associate Research Director, House of Good Samaritan, Boston.

Haven Emerson, School of Public Health, Columbia University, New York.

Roy H. Turner, Professor of Medicine, Tulane University, New Orleans, and Chairman, Committee on Diseases of the Liver, National Research Council.

Mrs. Charles W. Sewell, Administrative Director, American Farm Women's Division, American Farm Bureau Federation, Chicago.

Dean F. Smiley and Fred V. Hein, Ph.D., Consultants in Health and Physical Fitness, Bureau of Health Education, American Medical Association, Chicago.

Hiram E. Essex, Ph.D., and Alfonso Graña, Mayo Clinic, Rochester.

Medical Women's Luncheon—The American Medical Women's Association, Minnesota Branch, will hold a luncheon meeting at the Kitchi Gammi Club, Duluth, Monday, June 30, at 12:15 p.m. All women physicians are invited. Make reservations in advance through Marie K. Bepko, Cloquet, Minnesota.

Nu Sigma Nu Get-Together—On Monday, June 30, at 5:30 p.m. there will be a reunion of members of the Nu Sigma Nu fraternity at the Duluth Athletic Club for cocktails, dinner and a social evening. Notify Charles N. Hensel, 613 Lowry Medical Arts Building, St. Paul, if you plan to attend.

Minnesota Academy of Ophthalmology and Otolaryngology Luncheon—The Academy is holding a luncheon meeting at 12:30 p.m. Monday, June 30, at The Flame. Make reservations in advance through Archie Olson, 815 Medical Arts Building, Duluth.

American College of Chest Physicians Luncheon—Tuesday, July 1, at 12:30 p.m. chest physicians will hold a luncheon meeting in the Tally-ho Room, Hotel Holland. Reservations should be made with G. A. Hedberg, Nopeming Sanatorium, Nopeming.

Minnesota Surgical Society Luncheon—At 12:30 p.m. Tuesday, July 1, the Minnesota Surgical Society is having a luncheon meeting at The Flame. All members may attend if they make reservations in advance through M. G. Gillespie, 205 W. Second Street, Duluth.

Medical Veterans Meeting—All doctors who served in World War II are invited to a luncheon meeting at 12:30 p.m. Monday, June 30, in the Tally-ho Room of the Holland Hotel, sponsored by the Society of Medical Veterans in Duluth. Purpose of the meeting is to give returned medical officers opportunity to offer constructive criticism as to the way medical departments of the army and navy were administered during the war. It is hoped to prepare definite suggestions or recommendations for better utilization of medical resources in this country in the event of another national emergency.

Medal—The Southern Minnesota Medical Association will present its annual medal for the best scientific exhibit presented by an individual physician at this meeting. Presentation will be made at the banquet Tuesday evening, July 1, Hotel Duluth.

Fifty Club—This year's candidates for election to Minnesota's "Fifty Club" will be honor guests of the Association at the banquet. Presentation of lapel buttons and certificates to candidates who have practiced medicine for fifty years in Minnesota will be a feature of the banquet program.

Technical Exhibits—One of the largest technical exhibits in the history of the Minnesota State Medical Association meetings will be on display in the Armory Arena at Duluth. This exhibit plays an important part in the interest and value of every state meeting. Also, the revenue from sale of exhibit space makes possible the high quality of scientific program and events which characterizes our Minnesota meetings. Every convention visitor should make a special point of visiting the technical exhibits.

Woman's Auxiliary—Wives of physicians attending the meeting may secure programs of the business and social sessions of the Woman's Auxiliary at the Women's Registration Desk in the lobby of the Hotel Duluth. All visiting women are cordially invited to attend the special events arranged by hostesses of the St. Louis County Medical Auxiliary. Among these is a tea Monday, 3 p.m., at the home of Mrs. Anthony J. Bianco. The Annual Meeting and Luncheon to be held Tuesday, July 1, at Hotel Duluth are open to all Auxiliary members. Out-of-town members will be guests of the St. Louis County Medical Auxiliary at a Round-up Breakfast to be held Wednesday, July 2, at 10 a.m. at Hotel Duluth.

Golf—The annual Golf Tournament of the Minnesota State Medical Association will be held Sunday, June 29, at 1 p.m. at the Northland Country Club. All medical golfers are invited to enter competition for the attractive prizes that have been donated. Advance registration must be made through R. L. Nelson, Duluth.

Fishing—Deep sea fishing excursions along the North Shore of beautiful Lake Superior are being arranged by Karl E. Johnson, Duluth. All that is needed is appropriate fishing togs, no equipment or license necessary. Price is $3.00 per person for a party of four or more. Reservations must be made in advance.

SPECIAL SESSIONS

In addition to the general sessions to be held on Monday, Tuesday and Wednesday in the St. Louis Room of the Armory, there will be five special sessions in the *Duluth Room.* These will be held during the morning of each of the three convention days and Monday and Tuesday afternoons, with a special conference on Rural Health on Wednesday afternoon in the St. Louis Room. Special sessions are open to all convention visitors. Details are given in the program listings.

Monday, June 30

9 a.m.—Minnesota Academy of Ophthalmology and Otolaryngology

2 p.m.—Symposium on Rheumatic Fever

Tuesday, July 1

9 a.m.—Special program on Orthopedic and Fracture Surgery

2 p.m.—American College of Chest Physicians

Wednesday, July 2

9 a.m.—Symposium on Research Problems

2 p.m.—"Rural Health—A Joint Responsibility," a special conference on the timely subject of rural health concludes the convention program. Nationally known authorities will discuss various phases of the local and national problem. Invited are members of allied health organizations, social welfare workers, school authorities and representatives from various farm, professional and civic groups.

DEMONSTRATIONS

A program of demonstrations has been arranged for each intermission period and immediately preceding and following each general session on Monday, Tuesday and Wednesday, and to be held in Rooms D-1, D-2, D-3 and D-4 in the Armory Arena. A series of five *obstetric manikin demonstrations* will be held this year, arranged by the Committee on Maternal Health and sponsored by the Minnesota Department of Health. Three of these will be given in the Armory; two will be given at Hotel Duluth.

D-1 *Obstetric Manikin Demonstration*
1 p.m. and 5 p.m. Monday, June 30, by Willis E. Brown, Associate Professor of Obstetrics and Gynecology, University of Iowa.
5 p.m. Tuesday, July 1, Ralph E. Campbell, Associate Professor of Obstetrics and Gynecology, University of Wisconsin.

D-2 *"Rh Blood Testing Procedures and Blood Compatibility Testing,"* given by D. R. Mathieson, daily, 8:30 and 10:15 a.m. and 3:15 and 5 p.m., sponsored by the Mayo Foundation and Mayo Clinic in connection with an extensive scientific exhibit, details of which are listed under Scientific Exhibits.

D-3 *X-Ray Diagnosis and Interpretation*
Sponsored by the Minnesota Radiological Society, daily at 8:30 and 10:15 a.m. and 3:15 and 5 p.m.

D-4 *Gross Pathological Specimens*
Sponsored by the Minnesota Society of Clinical Pathologists, to be held before each scientific session, at intermission periods and at the close of Monday and Tuesday sessions.

In addition, on Tuesday, July 1, Dr. Campbell will give an obstetric manikin demonstration at 12:15 p.m. in the Arrowhead Room, Hotel Duluth; and on Wednesday, July 2, Mancel T. Mitchell, Clinical Assistant Professor of Obstetrics and Gynecology, University of Minnesota, will give an obstetric demonstration at 12:15 p.m. in the Arrowhead Room, Hotel Duluth.

SCIENTIFIC PROGRAM

Monday, June 30

SECTION I—GENERAL SESSION

A.M.
8:00 Scientific Cinema .... East Arena
Visit Scientific and Technical Exhibits .... Mezzanine Arena
8:30 Demonstrations—Rooms D-2, D-3 and D-4

9:00 *Hypertension* .... St. Louis Room
Classification of Hypertension—Howard Kaliher, Pelican Rapids
Medical Treatment—William D. Coventry, Duluth
Surgical Treatment—Harold F. Buchstein, Minneapolis

10:15 *Intermission*

Scientific Cinema .... East Arena
Visit Scientific and Technical Exhibits .... Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Management of Heart Disease* .... St. Louis Room
Treatment of Congestive Heart Failure—Ben Sommers, St. Paul
Diagnosis and Treatment of Cardiac Emergencies—Wilburn O. B. Nelson, Fergus Falls
Recent Advances in the Treatment of Cardiovascular Diseases—Charles Naumann McCloud, Jr., St. Paul

11:30 *Surgery for Congenital Cardiovascular Diseases*—Robert E. Gross, Chief of Surgery, Children's Hospital, and Wm. E. Ladd Professor of Children's Surgery, Harvard Medical School, Boston

P.M. *Afternoon*

1:00 Scientific Cinema .... East Arena
Visit Scientific and Technical Exhibits .... Mezzanine Arena
Obstetric Manikin Demonstration—Room D-1
Willis E. Brown, Associate Professor of Obstetrics and Gynecology, University of Iowa, Iowa City

2:00 *Gastrointestinal Ulcerative Disease* .... St. Louis Room
Medical Therapy in Ulcerative Colitis—Paul G. Boman, Duluth
Medical Therapy in Peptic Ulcer—J. Allen Wilson, St. Paul
Vagotomy in Peptic Ulcer—Waltman Walters, Rochester

2:45 *Fenestration Operation for Otosclerosis*—George E. Shambaugh, Jr., Assistant Professor of Otolaryngology, Northwestern University, Chicago

3:15 *Intermission*

Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

4:00 *Russell D. Carman Memorial Lecture*....................St. Louis Room
A Physiologic Approach to Cardiovascular Roentgenology—Marcy L. Sussman, Director, Department of Roentgen Diagnosis, Mount Sinai Hospital, New York City
Presentation of Speaker by Robert E. Fricke, Rochester, President, Minnesota Radiological Society

5:00 Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Demonstrations—Rooms D-1, D-2, D-3 and D-4

7:30 "Variety Night"....................Ballroom, Hotel Duluth
All convention visitors and wives will be guests of the Minnesota State Medical Association and the St. Louis County Medical Society for an evening of music and special entertainment, Monday, at 7:30 p.m. Refreshments will be served throughout the evening in the Arrowhead Room. Everybody is invited.

Monday, June 30

Section II—Special Session

A.M.

9:00 *Minnesota Academy of Ophthalmology and Otolaryngology*....................Duluth Room
Case Reports—Frank N. Knapp, David L. Tilderquist, Alvin G. Athens and Orien B. Patch, Duluth

10:15 *Intermission*

Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Minnesota Academy of Ophthalmology and Otolaryngology,* Continued. Duluth Room
The Incision and Closure of the Wound in Cataract Extraction—Frederick A. Davis, Chairman, Department of Ophthalmology, University of Wisconsin, Madison

P.M. *Afternoon*

1:00 Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Obstetric Manikin Demonstration—Room D-1
Willis E. Brown, Associate Professor of Obstetrics and Gynecology, University of Iowa, Iowa City

2:00 *Symposium on Rheumatic Fever*....................Duluth Room
Paul F. Dwan, Minneapolis, Chairman
Genesis of Rheumatic Fever—Wesley W. Spink, University of Minnesota, Minneapolis
Diagnosis of Rheumatic Fever—Morse J. Shapiro, Minneapolis

3:15 *Intermission*

Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

4:00 *Symposium on Rheumatic Fever,* (Continued)....................Duluth Room
Management of Rheumatic Fever and Rheumatic Heart Disease—Benedict F. Massell, Associate Research Director, House of Good Samaritan, Boston

Discussion Period

5:00 Scientific Cinema....................East Arena
Visit Scientific and Technical Exhibits....................Mezzanine Arena
Demonstrations—Rooms D-1, D-2, D-3 and D-4

7:30 "Variety Night"....................Ballroom, Hotel Duluth
(Listed under Section I, General Session)

Tuesday, July 1

Section I—General Session

A.M.

8:00 Scientific Cinema....East Arena
Visit Scientific and Technical Exhibits....Mezzanine Arena

8:30 Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Obstetrics in General Practice*....St. Louis Room
Prolonged Labor with Special Reference to Postpartum Hemorrhage—Alexander M. Watson, Royalton
Management of Obstetric Emergencies—Frederick L. Schade, Worthington
General Problem of Anesthesia in Obstetrics—Edward B. Tuohy, Rochester

P.M.

12:15 *Round Table Luncheons*
(Listed under Section II, Special Session)

Afternoon

1:00 Scientific Cinema....East Arena
Visit Scientific and Technical Exhibits....Mezzanine Arena

2:00 *New Trends in Infant Care*—Benjamin Spock, Rochester....St. Louis Room
Presentation of Speaker by Irvine McQuarrie, Minneapolis, representing the Northwestern Pediatrics Society

3:00 *Fifteen-minute discussion period*

3:15 *Intermission*
Scientific Cinema....East Arena
Visit Scientific and Technical Exhibits....Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

4:00 *Arthur H. Sanford Lectureship in Pathology*....St. Louis Room
Pathology of Diabetes Mellitus—Elexious T. Bell, Professor of Pathology, University of Minnesota, Minneapolis
Dedication of Lectureship and Presentation of Speaker by Kano Ikeda, St. Paul, President, Minnesota Society of Clinical Pathologists

5:00 Scientific Cinema....East Arena
Visit Scientific and Technical Exhibits....Mezzanine Arena
Demonstrations—Rooms D-1, D-2, D-3 and D-4

7:00 *Annual Banquet*....Hotel Duluth
(Listed under Section II, Special Session)

Tuesday, July 1

Section II—Special Session

A.M.

9:00 *Orthopedic and Fracture Surgery*....Duluth Room
Edward T. Evans, Minneapolis, Chairman
Congenital Dislocation of the Hip Before Walking Begins—Vernon L. Hart, Minneapolis
Treatment of Fractures of the Patella, S. Sverre Houkom, Duluth

10:15 *Intermission*
Scientific Cinema....East Arena
Visit Scientific and Technical Exhibits....Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Orthopedic and Fracture Surgery* (Continued)....Duluth Room
Recurrent Dislocations of the Shoulder—Edward H. Juers, Red Wing
Differential Diagnosis of Painful Feet—Mark B. Coventry, Rochester

P.M.

12:15 *Round Table Luncheons*
Obstetric Manikin Demonstration—Ralph E. Campbell, Associate Professor, Obstetrics and Gynecology, University of Wisconsin, Madison
Newer Drugs and Therapeutic Methods—Raymond N. Bieter, University of Minnesota
Common Foot Ailments—Edward T. Evans, Minneapolis
Trends in Pediatric Practice—Frank G. Hedenstrom, St. Paul
Management of Sinusitis—Jerome A. Hilger, St. Paul
Parenteral Fluids—John J. Boehrer, Jr., Minneapolis
Urological Procedures in General Practice—Waldo N. Graves, Duluth
Use of Digitalis and Quinidine—Ben Sommers, St. Paul
Dermatology in General Practice—Frederick T. Becker, Duluth
Diabetes—Archibald E. Cardle, Minneapolis

2:00 *American College of Chest Physicians*.......Duluth Room
J. Arthur Myers, Minneapolis, Chairman
Follow-up Diagnostic Procedures of Roentgen Lesions Found by Survey Methods—William Roemmich, S. A. Surgeon, United States Public Health Service, Acting Tuberculosis Control Officer, Minneapolis Health Department
Discussion by Dr. Myers
More Common Intrathoracic Tumors—Thomas J. Kinsella, Minneapolis

3:15 *Intermission*

Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

4:00 *American College of Chest Physicians* (Continued).......Duluth Room
Roentgenologic Diagnosis of Early Carcinoma of the Lung—Leo G. Rigler, University of Minnesota, Minneapolis
Discussion by Sumner S. Cohen, Glen Lake Sanatorium, Oak Terrace
Streptomycin in the Treatment of Tuberculosis—Karl H. Pfuetze, Cannon Falls
Discussion by G. Arvid Hedberg, Nopeming, and Dexter Lufkin, Veterans Hospital, Minneapolis

5:00 Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena
Demonstrations—Rooms D-1, D-2, D-3 and D-4

7:00 *Annual Banquet*.......Hotel Duluth
Presiding: Daniel W. Wheeler, Duluth, President, St. Louis County Medical Society
Introduction of Mrs. John A. Thabes, Sr., Brainerd, President, Woman's Auxiliary
Presentation of Fifty Club Certificates
Presentation of Southern Minnesota Medical Association Medal
Presentation of Distinguished Service Medal
President's Address: "For Manners Are Not Idle"—Louis A. Buie, Rochester, President, Minnesota State Medical Association
Address: "Price Tags on Progress"—Mr. Tom Collins, Kansas City, Missouri

Wednesday, July 2

SECTION I—GENERAL SESSION

A.M.

8:00 Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena

8:30 Demonstrations—Rooms D-2, D-3 and D-4

9:00 *Chemotherapy of Venereal Disease*.......St. Louis Room
Treatment of Gonorrhea—Walter E. Hatch, Duluth
Treatment of Syphilis—Paul A. O'Leary, Rochester

9:45 *Serum Hepatitis*—Roy H. Turner, Professor of Medicine, Tulane University, New Orleans, and Chairman, Committee on Diseases of the Liver, National Research Council

10:15 *Intermission*

Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Management of Poliomyelitis*.......St. Louis Room
Epidemiology and Recent Developments—Joseph G. Molner, Medical Consultant, National Foundation for Infantile Paralysis, Inc., Wayne University, Detroit
Treatment of the Sick Child—Erling S. Platou, Minneapolis
Treatment of the Paralysis—Miland E. Knapp, Minneapolis

P.M.

12:15 *Round Table Luncheons*
(Listed under Section II, Special Session)

Afternoon

1:00 Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena

2:00 *Rural Health—A Joint Responsibility*.......St. Louis Room
Louis A. Buie, Rochester, Chairman
The Plan of Action for Farm Communities—Mrs. Charles W. Sewell, Administrative Director, American Farm Women's Division, American Farm Bureau Federation, Chicago
A Sound Public Health Program—Haven Emerson, School of Public Health, Columbia University, New York City
The Health Program in Rural Schools—Dean F. Smiley, Consultant in Health and Physical Fitness, Bureau of Health Education, American Medical Association, Chicago
Physical Education in Rural Schools—Fred V. Hein, Ph.D., Consultant in Health and Physical Fitness, Bureau of Health Education, American Medical Association, Chicago
Hospital Facilities for All—Viktor O. Wilson, Director, Minnesota Hospital Survey and Planning Program, Director, Division of Hospital Services, Minnesota Department of Health
Medical Services—Frank J. Hirschboeck, Duluth

Wednesday, July 2

SECTION II—SPECIAL SESSION

A.M.

9:00 *Symposium on Research Problems*.......Duluth Room
James T. Priestley, Rochester, Chairman
Intravenous Protein Therapy—Arnold J. Kremen, University of Minnesota
Evaluation of the Short Proximal Loop in Gastric Resection—Fred Kolouch, Jr., University of Minnesota
Drainage of Liver and Thoracic Duct Lymph—John H. Grindlay, Rochester
Experimental Study of Lymph from Liver and Thoracic Duct—James C. Cain, Rochester
Idiopathic Degeneration of the Meningeal Dura, A New Pathological Entity—Arthur H. Wells, Duluth

(A five-minute discussion period will follow each talk)

10:15 *Intermission*

Scientific Cinema.......East Arena
Visit Scientific and Technical Exhibits.......Mezzanine Arena
Demonstrations—Rooms D-2, D-3 and D-4

11:00 *Symposium on Research Problems* (Continued).......Duluth Room
The Mechanism of Transient Leukopenia: A Motion Picture—Hiram E. Essex, Ph.D., and Alfonso Graña, Rochester
The Rôle of Chronic Portal Thrombosis in Splenic Anemia—Mavis P. Kelsey, Rochester
Hemolytic and Non-hemolytic Transfusion Reactions—Edmund B. Flink, University of Minnesota
The Present Status of the Relation of Cholesterol to Arteriosclerosis—E. Russell Hayes, University of Minnesota

(A five-minute discussion period will follow each talk)

P.M.

12:15 *Round Table Luncheons*

Obstetric Manikin Demonstration—Mancel T. Mitchell, Minneapolis
Meningitis and Its Treatment—Erling S. Platou, Minneapolis
The Anemias—Walter S. Neff, Virginia
Management of Hepatic Disease—Roy H. Turner, Professor of Medicine, Tulane University, New Orleans
Pelvic Pain—Anatomic and Physiologic Aspects—Philip N. Bray, Duluth
Chemotherapy in Wound Management—David P. Anderson, Jr., Austin
Diagnosis of Obscure Fevers in General Practice—Daniel W. Wheeler, Duluth
Management of Patients with Chronic Headaches—Bayard T. Horton, Rochester
Office Practice in Ano-rectal Diseases—William C. Bernstein, St. Paul
Dermatology and Syphilology—Paul A. O'Leary, Rochester

constipation

in Ulcer Management . . .

"Constipation is not an important **symptom** of ulcer, but is often the outstanding **complaint.** Many patients either disregard the 'indigestion,' distress or pain . . . Such patients frequently become established cathartic addicts, with resultant bowel dysfunction and abdominal discomfort to confuse the distress picture."

—Portis, S. A.: Diseases of the Digestive System, ed. 2, Philadelphia, Lea & Febiger, 1944, p. 199.

Without disturbing the healing process or precipitating complications, "smoothage," as provided by Metamucil, initiates bowel evacuation by promoting reflex peristalsis through gentle distention.

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

METAMUCIL . . . is the highly refined mucilloid of Plantago ovata (50%), a seed of the psyllium group, combined with dextrose (50%), as a dispersing agent.

Metamucil is the registered trademark of G. D. Searle & Co., Chicago 80, Illinois.

SEARLE *RESEARCH IN THE SERVICE OF MEDICINE*

THE AMERICAN BOARD OF ORTHOPAEDIC SURGERY

Any candidate applying for Part I of the examination of the American Board of Orthopaedic Surgery after January 1, 1951, must have the following general qualifications:

1. He must be a citizen of the United States or Canada.
2. He must be a graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association. In the case of an applicant whose training has been received outside the United States or Canada, his credentials must be satisfactory to the Council on Medical Education and Hospitals of the American Medical Association and to the National Board of Medical Examiners; he must have been engaged in the practice of orthopedic surgery in the United States or Canada for at least three years prior to submission of his application.
3. He must have served an internship of twelve months in a general hospital acceptable to the Board.
4. *He must have spent a year on an approved surgical residency subsequent to the completion of his internship.*

NOTE: This change consists of an additional required year of surgical training before entering on special work in orthopedic surgery.

No individual may apply for Part I of the examination of the American Board of Orthopaedic Surgery who has not completed at least one year in special orthopedic training in addition to meeting the general requirements.

The special qualifications to fulfill the requirements for eligibility to both Part I and Part II of the examination will be furnished on request to the secretary of the American Board of Orthopaedic Surgery, Dr. Francis M. McKeever, 1136 West 6th Street, Los Angeles 14, California.

AMERICAN COLLEGE OF PHYSICIANS AND SURGEONS

The Southern Minnesota Chapter of the American College of Physicians and Surgeons was formed on April 8 at a meeting held in Mankato.

Elected president of the chapter at the meeting, which was attended by thirty physicians from the city and surrounding area, was Dr. L. Gordon Samuelson of Mankato. Other officers named were Dr. Roger Hassett, Mankato, president-elect; Dr. E. A. Thayer, Fairmont, first vice president; Dr. O. J. Swenson, Waseca, second vice president, and Dr. C. F. Wohlrabe, North Mankato, secretary-treasurer. Elected to the board of directors were Dr. M. E. Lenander, St. Peter, and Dr. F. W. Franchere, Lake Crystal.

PHYSICIANS' LIABILITY INSURANCE

1. We suggest every Doctor consider increased Liability limits at this time.

10/20,000 limits cost $30.00—25/50,000 limits cost $35.31

2. Be sure you notify your insurance agent or broker of any existing business relationship such as co-partnerships, corporation, clinic, or joint office arrangements, so adequate coverage can be arranged for in addition to your individual coverage.

TRULY A "Must-See" WHEN IN DULUTH

Principal speakers at the meeting included Dr. F. G. Benn, Minneapolis, president of the state chapter; Dr. O. A. Lenz, secretary-treasurer of the Minneapolis regional chapter, and R. H. Muehlberg, executive-secretary of the state chapter.

In his talk Dr. Benn announced that the board of directors of the organization is considering a plan to award scholarships to a number of first-year medical students, on a competitive basis, if the students agree to study to become general practitioners. The directors feel that the plan would benefit rural communities throughout the state by providing an additional supply of family doctors in small towns and farming areas, Dr. Benn stated.

AMERICAN RADIUM SOCIETY

Dr. Robert S. Stone, professor of radiology at the University of California Medical School, San Francisco, who was closely associated with atomic research during World War II, was selected to deliver the Janeway lecture at the twenty-ninth annual meeting of the American Radium Society held at the Seaside Hotel in Atlantic City on June 9 and 10.

The lecture carried the Janeway medal which was awarded to Dr. Stone at a dinner June 9. Dr. Stone's lecture, entitled "Neutron Therapy and Specific Ionization," was delivered that afternoon.

The Janeway lecturer is selected annually by a committee of six members of the American Radium Society, which is composed of many of the country's leading cancer specialists. The award was established in 1933 in memory of Henry Harrington Janeway for his pioneer work in the field of radium therapy.

The society's two-day convention this year was held in connection with the centennial meeting of the American Medical Association in Atlantic City, June 9-13. Among those taking part in the scientific program was Dr. Eugene T. Leddy, Rochester, Minnesota.

COLLEGE OF AMERICAN PATHOLOGISTS

At a meeting held at the Drake Hotel in Chicago on December 13, 1946, which was attended by 130 pathologists from almost every state in the union and from Canada, a constitution and by-laws of the College of American Pathologists were adopted and the following officers were elected: Dr. Frank W. Hartman, Detroit, president; Dr. Granville A. Bennett, Chicago, vice president, and Dr. Tracy B. Mallory, Boston, secretary-treasurer.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty-fifth annual scientific and clinical session September 2 to 6, at the Hotel Radisson, Minneapolis. Scientific and clinical sessions will be given the days of September 3, 4, 5 and 6. All sessions will be open to members of the medical profession in good standing with the American Medical Association. In addition to the scientific sessions, the annual instruction courses will be held September 2, 3, 4 and 5. These courses will be open to physicians and the therapists registered with the American Registry of Physical Therapy Technicians. For information concerning the convention and the instruction course, address the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois.

SOCIETY OF CLINICAL SURGERY

The seventy-sixth semi-annual session of the Society of Clinical Surgery was held in Rochester on May 9 and 10. Members of the Mayo Clinic staff provided the program for the two-day meeting, with operative clinics in the mornings and presentation of papers in the afternoons.

President of the society is Dr. Daniel C. Elkin of Emory University in Atlanta, Georgia. Other officers are Dr. Leland S. McKittrick, Boston, vice president; Dr. Howard K. Gray, Rochester, secretary, and Dr. Warren H. Cole, Chicago, treasurer. Dr. Waltman Walters, Rochester, is a member of the committee on admissions.

HEARING AID FIRM OFFERS FELLOWSHIP

L. A. Watson, president of the Maico Company, Inc., of Minneapolis, has announced a $500 graduate fellowship to the University of Minnesota for research in the field of deafness and hearing. The Board of Regents of the University has accepted the $500 stipend, and a graduate student in the department of speech will be given an opportunity to pursue original research and investigation in the field of hearing and deafness.

Among the many unsolved problems of deafness and hearing which offer promising fields of research are: the effects of fatigue and distortion on speech intelligibility, the value of selective frequency emphasis in speech intelligibility for hard-of-hearing persons, and how deafened persons hear at intense loudness levels.

HENNEPIN COUNTY SOCIETY

A symposium on "Bowel Obstruction" was presented at the meeting of the Hennepin County Medical Society held in Minneapolis on May 5. Participants in the symposium were members of the department of surgery of the University of Minnesota Medical School, and included Dr. Clarence Dennis, Dr. Fred Kolouch, Jr., Dr. Arnold Kremen, and Dr. Christian Bruusgaard. Dr. Bruusgaard, who is from Oslo, Norway, is a traveling Fellow in Surgery.

RED RIVER VALLEY SOCIETY

At the quarterly meeting of the Red River Valley Medical Society, held in Crookston on April 15, a discussion of "Psychosomatic Medicine" was presented by Dr. O. L. Norman Nelson of Minneapolis. Dr. Nelson, who is associated with the department of medicine at the University of Minnesota Hospitals and Minneap-

WOMAN'S AUXILIARY

Hennepin County

The annual meeting of the Hennepin County Medical Auxiliary was held at the Curtis Hotel, Minneapolis, on Friday, May 2, 1947.

After a one o'clock luncheon, the following officers were elected for 1947-1948:

President—Mrs. Frederick H. K. Schaaf.
President-elect—Mrs. Reuben F. Erickson.
First Vice President—Mrs. L. R. Boies.
Recording Secretary—Mrs. Frank R. Hirshfield.
Corresponding Secretary—Mrs. Frank T. Cavanor.
Treasurer—Mrs. Arthur W. Russeth.
Auditor—Mrs. Johannes K. Moen.
Custodian—Mrs. Leo W. Fink.

Ramsey County

The April meeting of the Ramsey County Medical Auxiliary was a tea at the home of Mrs. L. W. Barry, 2193 Sargent Avenue, Saint Paul. Miss Etta Lubbert, Superintendent of Nurses at Ancker Hospital, presented a program for recruiting nurses.

Mrs. Lyle Fisher of Saint Paul sang a group of children's songs which she has composed.

Red River Valley

Election of officers featured the meeting of the Red River Valley Medical Auxiliary which was held April 15 at the home of Mrs. M. O. Oppegaard.

The meeting immediately followed the dinner meeting at the Hotel Crookston which was attended by members of the medical association and its auxiliary.

All officers were re-elected for the coming year. They are Mrs. Oppegaard, president; Mrs. O. K. Behr, vice president; Mrs. A. R. Reff, secretary, and Mrs. C. L. Oppegaard, treasurer.

The office of social secretary was added to the slate and Mrs. R. O. Sather was elected to that office. Sixteen members attended the meeting.

In Memoriam

FRANCIS E. HARRINGTON

Dr. Francis E. Harrington, for twenty-four years health commissioner of Minneapolis until his retirement in 1944, died at West Palm Beach, Florida, on May 10, 1947.

Born in Norfolk, Virginia, on June 19, 1879, the son of a brigadier general in the U. S. Marine Corps, Dr. Harrington later attended public schools in Boston and Washington, D. C. He received a B.Sc. degree from Gonzaga College, Washington, in 1899 and an M.D. degree from Columbia University, Washington, now known as George Washington University, in 1904. After interning at the Casualty Hospital, Washington, he practiced in Washington from 1904 until 1910 and at Cumberland, Maryland, from 1910 to 1914. He then joined the U. S. Public Health Service and had assignments in nine different states between the years 1914 and 1920.

In 1920 Dr. Harrington was called to be commissioner of health in Minneapolis, in which capacity he served until he resigned in 1944. In addition to this full-time job, he acted as superintendent of Minneapolis General Hospital from 1937 to 1939 and again from 1942 until 1944. In 1945 he was appointed superintendent of the Elizabeth Kenny Institute.

In addition, he was director of Lymanhurst Health Center, clinical professor of preventive medicine and public health at the University of Minnesota, and a member of the Glen Lake Sanatorium Commission of Hennepin County.

Dr. Harrington was a charter member and first president of the International Society of Medical Health Officers in 1928. He was also a past secretary and treasurer of the society.

He was a member of many organizations, including the Association of Military Surgeons of the United States, the Military Order of Carabao, the National Tuberculosis Association; a Fellow of the American College of Physicians; a past president of the Minnesota Trudeau Society, the Minnesota Sons of the Revolution, the National Society of the Sons of the American Revolution, the Knights of Columbus, and the St. Thomas Catholic Church.

Dr. Harrington is survived by his wife, two sons and five daughters.

One of Dr. Harrington's outstanding characteristics was his executive ability. His energy and honesty and his pleasing personality enabled him to accomplish much in his chosen field of public health.

PETER M. HOLL

Dr. Peter M. Holl, Minneapolis, died April 13, 1947, at the age of eighty-four.

Dr. Holl was born in Lake Prairie Township, Nicollet County, on August 19, 1862. He obtained his medical education at the Minnesota Hospital College, Minneapo-

THE CLINITEST PLASTIC POCKET-SIZE SET

for Quick

URINE-SUGAR TESTING

Simple—Speedy—

Clinitest is a copper reduction test with reagents compressed in a single tablet. Heat is generated by the reaction of the tablet dropped in a fixed amount of diluted specimen.

No. 2106 Clinitest Plastic Set contains necessary apparatus and 36 tablets for determining sugar in urine.

lis, from which he graduated in 1887 and at Bellevue Medical College, New York. Postgraduate work was taken in pediatrics at the New York Polyclinic.

Dr. Holl was a city physician from 1907 to 1909. He was a member of the Hennepin Lodge, A.F. and A.M., and of the Hennepin County Medical Society, and the Minnesota State and American Medical Associations.

Dr. Holl's wife, the former Annie May Fillmore, passed away in 1931.

THOMAS M. JOYCE

Dr. Thomas M. Joyce, of Portland, Oregon, died on April 18, 1947.

Dr. Joyce was born January 28, 1885, at Emmetsburg, Iowa; attended Notre Dame University from 1903 to 1906; received the degree of M.D. in 1910 from the University of Michigan, and was an intern at the University Hospital, Ann Arbor, from 1910 to 1911. He entered the Mayo Clinic in June, 1911, and was an intern at St. Mary's Hospital for twenty-five months and a surgical assistant for nine months. He left the Mayo Clinic in April, 1914.

During World War I he was chief surgeon at Base Hospital 46, and was with the AEF for nine months. At the time of his death he was head of the department of surgery at the University of Oregon Medical School and head of the department of surgery at the Multnomah Hospital and Portland Clinic. He also was attending surgeon at St. Vincent's Hospital.

Dr. Joyce was a member of the American College of Surgeons, the American Medical, the American Surgical, and the Pacific Coast Surgical Associations, was president of the Alumni Association of the Mayo Foundation in 1923-24 and a member of Alpha Omega Alpha.

RED RIVER VALLEY SOCIETY

(Continued from Page 678)

olis General Hospital, was introduced by the president of the society, Dr. C. G. Uhley, Crookston.

Another feature of the meeting was a talk by Dr. J. F. Norman, Crookston, on the development of plans for pre-paid medical service by the state medical association.

WASHINGTON COUNTY SOCIETY

At the regular session of the Washington County Medical Society in Stillwater on May 13, Dr. Wade R. Humphrey, Stillwater, was in charge of a discussion of plans for the enlargement and improvement of Lake View Memorial Hospital in Stillwater. To clarify the discussion, Dr. Humphrey showed enlarged photographs of the hospital as it is at the present time, and pointed out just where additions could be made. He then showed the group a colored drawing to demonstrate how the suggested changes would appear from a scenic point of view. After the presentation a committee was appointed to investigate the possibility of carrying out such a project.

◆ Of General Interest ◆

MOWER COUNTY HONORS THREE FIFTY-YEAR PHYSICIANS

On March 26, 1947, the members of the Mower County Medical Society gave a dinner in honor of three Mower County physicians, each of whom has served his community continuously for over fifty years.

The recipients of the tributes were Dr. A. E. Henslin, eighty-one, who has practiced at LeRoy for fifty-six years; Dr. O. H. Hegge, seventy-five, who has been a physician in Austin for fifty-four years; and Dr. G. J. Schottler, seventy-six, who has practiced at Dexter for fifty-one years.

Each of the three deans of Mower County medicine has a son who is a physician. At the honor dinner, biographies of their fathers were read by Dr. M. E. Henslin, Leroy, and Dr. R. S. Hegge, Austin. Dr. Max Schottler, Minneapolis, was unable to attend the dinner, but he prepared a biography of his father which was read by Dr. Paul Leck, president of the Mower County Medical Society, who was master of ceremonies.

A highlight of the program was the reminiscing done by the three guests of honor, who recalled vivid episodes, both humorous and grim, from their days of horse-and-buggy medicine—nerve-wracking journeys through mud-covered country, on-the-spot amputations in farm shanties, struggles with x-ray machines that had hand-cranked generators and plate glass films.

From left to right: Dr. G. J. Schottler, Dexter; Dr. A. E. Henslin, LeRoy, and Dr. O. H. Hegge, Austin, Minnesota.

At the dinner which was attended by members of the medical society and their wives, Dr. Henslin was also honored for his thirty years of continuous service as treasurer of the society.

Dr. R. L. J. Kennedy, Rochester, district counselor for the Minnesota State Medical Association, paid tribute

to the three physicians on behalf of the state organization. Dr. L. A. Buie, Rochester, president of the state association, spoke on "Present Trends in Medical Practice and Social Legislation Affecting Medicine."

DR. WENDELL GRINNELL HONORED

A record of forty-seven years in the practice of medicine belongs to Dr. Wendell Grinnell who recently celebrated a birthday in Preston, Minnesota. On Sunday, April 20, 1947, he was honored and feted by hundreds of his townspeople as well as by patients throughout the surrounding country.

To do honor to his forty-seven years of faithful service, a general homecoming was held in Preston's town hall. There his countless friends and patients gathered to wish him well.

Dr. Grinnell came to Fillmore County in 1900, located in Wykoff for one year, then moved to Preston, the county seat. In those early days the horse and buggy provided the general means of travel for a country doctor. He kept several driving horses, along with a driver to transport him to the outlying towns. For many years he owned and operated his own hospital in Preston but this since has been closed.

Many a night he would keep vigil at the bedside of a patient, only to find an urgent case waiting when he returned home, necessitating perhaps another long drive before he could snatch a few hours of sleep.

At this birthday celebration a program was presented with Charles V. Michener acting as master of cere-

monies. Rev. Allen W. Flohr gave the invocation. Musical selections consisted of vocal solos by Rev. Donald Roesti and Mrs. M. Anderson and group singing by Mrs. Claude Cutter and daughters Fauntie and Doris. Rev. P. J. Nestande of Lanesboro and Rev. Gaede spoke in tribute to Dr. Grinnell, following which the audience sang "Happy Birthday" to the honor guest.

At this time a tray with hundreds of birthday cards was presented to Dr. Grinnell, who in turn responded with a short talk of appreciation and thanks for the gifts. He stressed the fact that his many good friends meant more to him than all the honors he might receive. He compared Preston and the township to a garden which he claimed as his own, with his numerous friends and patients as the flowers in that garden.

Many out-of-town guests attended the function; in fact, the hall was overflowing. The demonstration of good fellowship and friendship must have been a source of great satisfaction to Dr. Grinnell after his faithful service for almost half a century.

* * *

Dr. M. M. Loucks has installed a new x-ray machine in his offices at Kelliher.

* * *

Dr. E. V. Allen, Rochester, has been re-elected governor of the American College of Physicians for a term of three years.

* * *

ing Without Gas in the Bowel" by Dr. W. C. Alvarez, Rochester. From Atlantic City Dr. Alvarez went to Charleston, West Virginia, to speak on "Puzzling Types of Abdominal Pain" at a meeting of the West Virginia State Medical Association. By May 16 he was in Toronto, Canada, where he addressed the Toronto Medical Association on the subject, "What Is Wrong with the Dyspeptic Whose Findings Are All Negative."

* * *

In Lake City, on May 1, Dr. Robert N. Bowers announced that Dr. William P. Gjerde, formerly of Saint Paul, had joined him in a partnership medical practice.

Dr. Gjerde, a native of Staples before entering the University of Minnesota, received his medical degree in 1939 and then joined the staff of the Northern Pacific Hospital in Saint Paul. During the war he served in the army for four years, spending two of the years in China. Following his discharge from miltary service, he returned to Saint Paul. For the last six months before he joined Dr. Bowers in Lake City, Dr. Gjerde took postgraduate work at the University of Minnesota Hospitals.

Dr. Harry E. Bowers, father of Dr. Robert N. Bowers, announced his retirement at the same time. He has practiced at Lake City since 1919.

* * *

The man who invented a workable external "artificial kidney," Dr. W. J. Kolff of Holland, was in Minneapolis on May 17 to inspect a model of his invention constructed by Dr. Roger M. Reinecke, assistant professor of physiology at the University of Minnesota.

While Dr. Kolff's device has been used on patients, and Dr. Reinecke's has been used only in animal experiments, both machines work on the same principle: the removal of urea from the blood by passing the blood through 30 to 40 yards of cellophane tubing stretched on a mesh-covered cylinder which is rotated through a salt solution.

Dr. Reinecke first heard of Dr. Kolff's machine in September, 1944, when as an army medical corps officer he landed in Holland with the 82nd Airborne Division. From various reports of the original device—he never actually saw it himself—Dr. Reinecke later was able to construct his own model after he joined the staff of the University of Minnesota last fall.

"Doctor to a Million" was the title conferred on Dr. William A. O'Brien, University of Minnesota director of postgraduate medical education, in the May issue of *Radio Mirror* magazine. The title-bestowing article commented on Dr. O'Brien's public health programs which have been broadcast on station WCCO since 1928.

During the last two weeks of April, extracurricular speaking assignments for Dr. O'Brien included (1) comments on patent medicines at the Minnesota State Pharmaceutical Association convention in Minneapolis, (2) a talk on "Social Organizations for Health Maintenance," one of a series of lectures on "Our World and Our Times" sponsored by the general extension division of the University of Minnesota at the Center for Continuation Study, and (3) an address in Stillwater at a dinner marking the completion of the first year of county nurse work in Washington County.

* * *

Principal speakers at the annual meeting of the Group Health Association, held in Minneapolis in April, were Dr. Frederick W. Jackson, deputy public health minister of Manitoba, Canada, and Dr. M. W. Shadid, Elk City, Oklahoma.

Dr. Jackson described a government-sponsored medical program to attract physicians from cities into the rural areas of Manitoba. Dr. Shadid, founder of the first rural co-operative hospital in the United States, stated that medicine has become "so complex that the individual doctor is not able to render adequate care," and asserted that medical care must be based on group work to be effective. During the weeks following the association meeting, Dr. Shadid advocated his ideas on community co-operative hospitals in speeches delivered at various cities in Minnesota, including Benson, Bagley and Duluth.

Domesticated radar may become a valuable therapeutic aid in the future.

Experiments being conducted by the Mayo Foundation for Medical Education and Research have suggested that ultrahigh-frequency radio waves, similar to those used in wartime radar, may produce better results than the short-wave diathermy machines now being used in physical medicine.

The basic unit of both radar and the portable micro-

wave-producing units being tested by the Mayo Foundation experimenters is a small vacuum tube called the cavity magnetron, which emits a beam of ultrahigh-frequency radio waves that can be focused or even bent around a corner. The frequency of such waves is 2,450 megacycles (close to two and one-half billion cycles per second).

It is hoped that the experiments will show that these microwaves will penetrate more deeply and produce longer-lasting heat than the waves emitted by present-day short-wave diathermy machines.

HOSPITAL NEWS

Work was begun in late April on alterations and additions to a building in Forest Lake which will become the new Forest Lake Clinic Hospital. The hospital when completed will consist of three floors, each 30 by 60 feet in area.

Complete equipment has already been purchased and is ready for installation as soon as the structure is finished. Much of the equipment, which includes a new x-ray machine, sterilizers, and mechanical beds with inner-spring mattresses, was obtained from war surplus material.

The hospital is being planned as a twelve-bed unit but will be able to take care of additional patients on an emergency basis. Kitchen and dining room facilities will be located in the basement, with a dumb-waiter arrangement for conveying food to the upper floors. An emergency room, x-ray room, laboratory, waiting room and two wards will be located on the first floor, while second floor will be devoted to a maternity department, with a delivery room, nursery, two wards and two private rooms. Two graduate nurses will be employed by the hospital.

Dr. E. C. Burseth, recently discharged from army service, will be associated with Dr. G. M. Ruggles, of the Forest Lake Clinic, in the operation of the new hospital.

* * *

On April 1 the board of directors of the Kittson War Veterans' Memorial Hospital in Hallock provided permanent unified living quarters for the hospital nursing staff by purchasing a private residence near the hospital to serve as a nurses home.

* * *

Dr. Henry Hutchinson, former assistant superintendent at Moose Lake State Hospital, has been appointed acting superintendent to succeed Dr. M. W. Kemp who resigned several months ago. During the war Dr. Hutchinson served as acting superintendent of the Hastings State Hospital while its superintendent, Dr. Ralph Rossen, was in the navy.

At a meeting of the Commercial Club of Cannon Falls in late March, Dr. Viktor O. Wilson, of the Minnesota State Department of Health, discussed the building of a local hospital and the expense involved in the construction of such a structure. He also described the Federal aid plan to assist communities in the financing of needed local hospitals, under a state administration.

* * *

The new board of directors of Sanford Hospital in Farmington met during April and named Lawrence Thorson, Northfield, as the new hospital manager. Elected to office at the meeting were Dr. J. A. Sanford, Farmington, president; L. A. Godby, vice president, and Helen Kakac, secretary-treasurer.

Plans for refinancing the hospital were left for further discussion at the next meeting. The institution is now handling an average of 500 patients per year.

dent of the Duluth Chamber of Commerce and general chairman of the campaign.

Leaders of the public subscription campaign hope to raise $750,000 to insure erection of a proposed 141-bed addition to the hospital, with expanded laboratory, pathological and other technical facilities.

* * *

The annual convention of the Minnesota Hospital Association was held in Minneapolis at Hotel Radisson on May 15, 16, and 17, with President Earl C. Wolf, Rochester, presiding.

One of the featured speakers at the meeting was George Bugbee, executive director of the American Hospital Association, who discussd "National Problems Confronting Hospitals" and also spoke on "Hospital Accounting and Its Relationship to Reimbursable Formula."

Other speakers on the three-day program were Miss Nellie Gorgas, administrator of St. Barnabas Hospital, Minneapolis, and president-elect of the Minnesota Hospital Association; Hubert Humphrey, mayor of Minneapolis; Dr. Malcolm MacEachern, associate director of the American College of Surgeons; and Miss Lucille Pietry, nursing consultor of the U. S. Public Health Service.

* * *

At a meeting held on May 6, citizens of Anoka and the surrounding area began preliminary organization to start a drive for the construction of a hospital in the community. It was voted at the general meeting to elect a board of directors, to incorporate, and to have a large public relations committee with representatives from each township, rural Hennepin county and each ward in Anoka.

* * *

Recent speakers at the monthly staff meetings of St. Luke's Hospital in Duluth have been Dr. L. N. Leven, Saint Paul (Skin Transplants); Dr. Norman Johnson, Minneapolis (Neuropyschiatric *Dis*-eases); Dr. Mark B. Coventry, Rochester (The Surgical Treatment of Arthritis); and Dr. E. Gordon, Madison, Wisconsin (Amino Acids).

Staff members of St. Luke's Hospital have recently participated in several regional medical meetings:

Rice Lake (Wis.) County Medical Society meeting—Papers were presented by Dr. A. H. Wells, Dr. Harold Joffe, and Dr. E. E. Barrett.

Tricounty Medical Society meeting—Papers presented by Dr. S. H. Boyer, Jr., Dr. F. C. Jacobson, Dr. A. L. Abraham, and Dr. C. H. Mead.

Interurban Academy of Medicine meeting—Papers presented by Dr. Harold R. Joffe, Dr. P. B. Boman, and Dr. C. H. Mead.

Douglas County Medical Society meeting—Papers presented by Dr. F. C. Jacobson and Dr. C. H. Mead.

MEEKER COUNTY TUBERCULOSIS CONTROL PROJECT

(Continued from Page 636)

A considerable number from adjacent counties who have heard of the Meeker County physicians' interest in tuberculosis are requesting examinations. At present, all patients entering the Litchfield hospital have the tuberculin test administered, and the reactors are completely examined for clinical disease. Moreover, each physician in the county continues to administer as many tuberculin tests as possible in his office each week. Thus, our tuberculosis activities are being perpetuated, and when normal conditions have been restored throughout the county, we plan to resume an even more vigorous campaign against this disease.

Through the demonstration project, our physicians have become well informed on all phases of tuberculosis work. Their present capabilities in this field probably never would have been achieved without the demonstration. Inasmuch as the physicians donated their time and work, and no outside equipment or personnel was introduced, the general public has a kindly feeling toward the medical profession, as well as confidence in its integrity and ability to provide them with all that is necessary to control disease. Our satisfaction in the accomplishment to date is such that we feel justified in recommending an identical program to the physicians of all other counties of the State of Minnesota.

COMMUNITY-WIDE CHEST X-RAY SURVEYS

(Continued from Page 634)

enough span of time to prevent the disease from spreading to a new generation of contacts. Five years should be the maximum time in which to examine and follow up the majority of the adult population in the entire United States.

Such rapidity of program expansion will be costly as a short-time expenditure, but inexpensive when compared to the cost of control over a period of several decades. The savings in sickness and death, although not easily demonstrated in the coldly impersonal columns of balance sheets, are the real accomplishments of such a plan. Prevention is cheap, compared to the cost of redemption after the damage is done. The common rights of humanity call for such a course of action.

Poverty remains, however, as the principal obstacle still standing in the path of national efforts to banish tuberculosis from among the people of the United States. We cannot conquer this disease until the standard of living improves greatly, especially among many of the nonwhite groups of our population. Their death rates from tuberculosis are unnaturally high, exposure is intense and continuous, and living conditions are often deplorable.

The effective strength of a broad program of control, based on sound epidemiological principles, will develop it only in proportion to its public acceptance and support. When the people demand a total assault on tuberculosis, we are prepared to measure the problem, plan the offensive and destroy the tubercle bacillus within a measurable time.

The ubiquity of tuberculosis and the magnitude of its harmful effect on the health and happiness of the American people are at last arousing the public conscience and stimulating the people into nation-wide action.

COUNCIL-ACCEPTED

AMIGEN

for parenteral administration of amino acids

The function of Amigen and Protolysate is to supply the amino acids essential for nutrition. Both can be given in place of protein when protein cannot be eaten or digested, or in addition to protein when the protein intake is insufficient. Administered in adequate amounts, they prevent wastage of protein, restore previous losses, or build up new body protein.

COUNCIL-ACCEPTED

PROTOLYSATE

for oral and tube feeding of amino acids

1 LB. NET (454 GM.)
MEADS
PROTOLYSATE
For Oral Administration
A dry enzymic digest of casein containing amino acids and polypeptides, useful as a source of readily absorbed food nitrogen when given orally or by tube. Protolysate is designed for administration in cases requiring predigested protein. The mode of administration and the amount to be given should be prescribed by the physician.
MEAD JOHNSON & CO.
EVANSVILLE, IND., U.S.A.

Like Amigen, Protolysate is an enzymic digest of casein and consists of amino acids and polypeptides. Like Amigen, Protolysate supplies the nitrogen essential for maintenance, repair and growth.

Unlike Amigen, which may be employed both orally and parenterally, Protolysate is designed only for oral use.

1 lb. cans at drug stores

MEAD JOHNSON & CO., EVANSVILLE 21, INDIANA

There is no shortage now of AMIGEN for parenteral use. There is no shortage now of PROTOLYSATE for oral use.

83% of petit mal cases improve with Tridione

Here's new evidence of the effectiveness of Tridione in the treatment of petit mal. In a recent study, Tridione was given to 166 patients suffering from petit mal (pyknoepilepsy), myoclonic jerks or akinetic seizures.[13] This group as a whole had received but mediocre benefits from other medicaments. With Tridione, 31% of the 166 became free of seizures; 32% had fewer than one-fourth of the previous number of seizures; 20% improved to a lesser extent; 13% remained unchanged, and only 4% became worse. *Thus 83% showed improvement.* In some cases the seizures *did not return* after Tridione was discontinued, the longest seizure-free period thus far being 18 months. Studies also have shown that Tridione is of benefit to certain psychomotor patients when given in conjunction with other antiepileptic drugs.[12] Tridione is available through your pharmacy in 0.3-Gm. capsules and in pleasant-tasting aqueous solution containing 0.15 Gm. per fluidrachm. Capsules in bottles of 100 and 1000; solution in 1-pint and 1-gallon bottles. If you wish to know more about Tridione, just write to ABBOTT LABORATORIES, North Chicago, Illinois.

Formulac—

a modern

infant food

FORMULAC Infant Food is a concentrated milk in liquid form, fortified with all vitamins known to be necessary to adequate infant nutrition. No supplementary vitamin administration is required.

By incorporating the vitamins into the milk itself, the risk of human error or oversight is reduced. FORMULAC contains sufficient B complex, Vitamin C in stabilized form, Vitamin D (800 U.S.P. units), copper, manganese and easily assimilated ferric lactate—rendering it a flexible formula basis both for normal and difficult feeding cases. The only carbohydrate in FORMULAC is the natural lactose found in cow's milk. *No carbohydrate has been added.*

FORMULAC, a product of National Dairy research, has been tested clinically, and proved satisfactory. It is promoted to the medical profession alone. FORMULAC is on sale at grocery and drug stores nationally.

of the American Medical Association . . .

IN TRIBUTE TO THE

“. . . for services

WHO shall measure devotion, or put a price
on sacrifice?
Who shall assess the long war against
the power of Death?
Or set a sum upon the gift of Life?

There is a service beyond the measure of a fee.
A cause above remuneration.
An ideal for which there is no price.
This is the service...the cause...the ideal...of the American doctor.

How shall we reckon it, and by what formulae?
How much for the laughter of a little child rescued out of crisis?
What's the cost of discouragement?
Who can pay for a sleepless night?
Name the price of a cure!

AMERICAN DOCTOR

rendered"...

There is no algebra for it, no scribble of figures, no proper value.
For this is a service as large as life, and as manifold.
It is a soldier crying in agony on a thousand battlefields.
It is the terrible word "Why?" under the surgeon's probe.
It is the end of pain.
It is Hope.
It is the lonely, unending quest for knowledge.
It is the fight against ignorance, sloth, superstition.
It is the dumb, unspeakable joy in the eyes of a parent.
It is the rock of grief.
It is cold rain and pounding storm and bone-weariness and the
new-born babe gasping its first breath in the grey dawn.
It is all this, and the quiet glory of the job done,
Dedicated to service—in the name of Mercy
And the common brotherhood of man.

PHILIP MORRIS & COMPANY

The First Operation....

The First Surgical Operation was performed with a sharp stone and firebrand in Neolithic Egypt. A skull was pierced to let out evil spirits. The patient survived. Modern trephining was on the way.

The First Dental Operation, in the era of the Pharaohs, was extraction by an instrument shaped like a goat's foot. Replacements were of wood, ivory, metal buttons and ox teeth. Modern dentures were on the way. But the modern concept of the doctor's *responsibility*, as set forth in malpractice law, was *not* yet on the way.

A First Operation Today is wisely avoided by most doctors until they have secured their Medical Protective policy—providing, as it does, *complete* coverage and *confidential* preventive counsel.

Like expelling water from a sponge

Urinary Stimulation

Stimulation of urinary secretion with Salyrgan-Theophylline appears to be due chiefly to its renal action consisting of depression of tubular reabsorption. In addition, there is a direct influence on edematous tissue, mobilizing sodium chloride and water.

Salyrgan-Theophylline is indicated primarily in congestive heart failure when edema and dyspnea persist after rest and adequate digitalization. Gratifying diuresis usually sets in promptly and often totals from 3000 to 4000 cc. in twenty-four hours.

Injections at about weekly intervals help to insure circulatory balance for long periods of time.

Good results may also be obtained in chronic nephritis and nephrosis.

Menopausal
Relief...
Plus
A General
Sense of
Well-Being

There is usually a "plus" in the treatment of the menopause when "Premarin" is employed. The "plus" is the gratifying "sense of well-being" so many women experience following orally active "Premarin" therapy. It is the intangible factor which, added to relief of distressing symptoms, enables the middle-aged woman to resume her normal routine of useful and enjoyable occupations.

To permit flexibility of dosage and enable the physician to adapt oral estrogenic therapy to the particular needs of the patient, "Premarin" is supplied in three potencies:

Tablets of 2.5 mg.	bottles of 20 and 100.
Tablets of 1.25 mg.	bottles of 20, 100 and 1000.
Tablets of 0.625 mg.	bottles of 100 and 1000.

Liquid, containing 0.625 mg. in each 4 cc. (1 teaspoonful)—bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present as water soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract.

On the Plus Values In Variety Meats

Variety meats—as the meat industry terms liver, kidney, heart, thymus (sweetbreads), and tongue—are at least as nutritionally desirable as muscle meat. In fact, in some respects certain organ meats are superior.

They provide the indispensable amino acids in the same advantageous complete assortment as muscle meat. Hence their protein is of the same high biologic value, capable of meeting every protein need of the organism. Quantitatively their protein content is approximately equal to that of muscle meat.

For hemoglobin synthesis, liver and kidney have been found superior not only to all other protein sources so far studied but also to muscle meat itself.

All organ meats are good sources of the B-complex vitamins. Some of them, such as liver and kidney, are especially rich in niacin. Liver is also an excellent source of vitamin A.

Apparently the vital role these organs play in the functioning of the animal body is reflected in the valuable contribution they can make to human nutrition. Their frequent inclusion in the human dietary—during disease as well as in health—is amply justified.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

DO YOU KNOW WHAT THESE SYMBOLS STAND FOR?

In medieval times, the dragon was the symbol of the chemist and apothecary. Ancient alchemists were said to use dragon's blood in their potions, and the dragon came to mean certain chemical actions. An apothecary advertised his wares to the world by painting a dragon on a drug pot, and hanging it over his door.

Today it is the familiar Rexall sign which assures you of superior and dependable pharmacal service. Displayed over more than 10,000 independent drug stores throughout the country, the Rexall symbol on drugs means pure, potent and uniform drugs, laboratory tested under the rigid Rexall system of controls. It means unexcelled pharmacal skill in compounding them.

Kinney
COLUMBUS, INDIANA, U. S. A.

EASE AND ECONOMY OF USE

Specification of CARTOSE* as the mixed carbohydrate for infant feeding formulas provides ease and economy of use. The liquid form of this milk modifier permits rapid, accurate measurement, thereby avoiding waste.

Double protection against contamination is afforded by: (1) the narrow neck of the bottle, preventing spoon insertion, and (2) the press-on cap, assuring effective resealing.

CARTOSE supplies nonfermentable dextrins in association with maltose and dextrose . . . a combination providing spaced absorption that minimizes gastrointestinal distress due to fermentation.

Available in clear glass bottles containing 1 pt. • Two tablespoonfuls (1 fl. oz.) provide 120 calories.

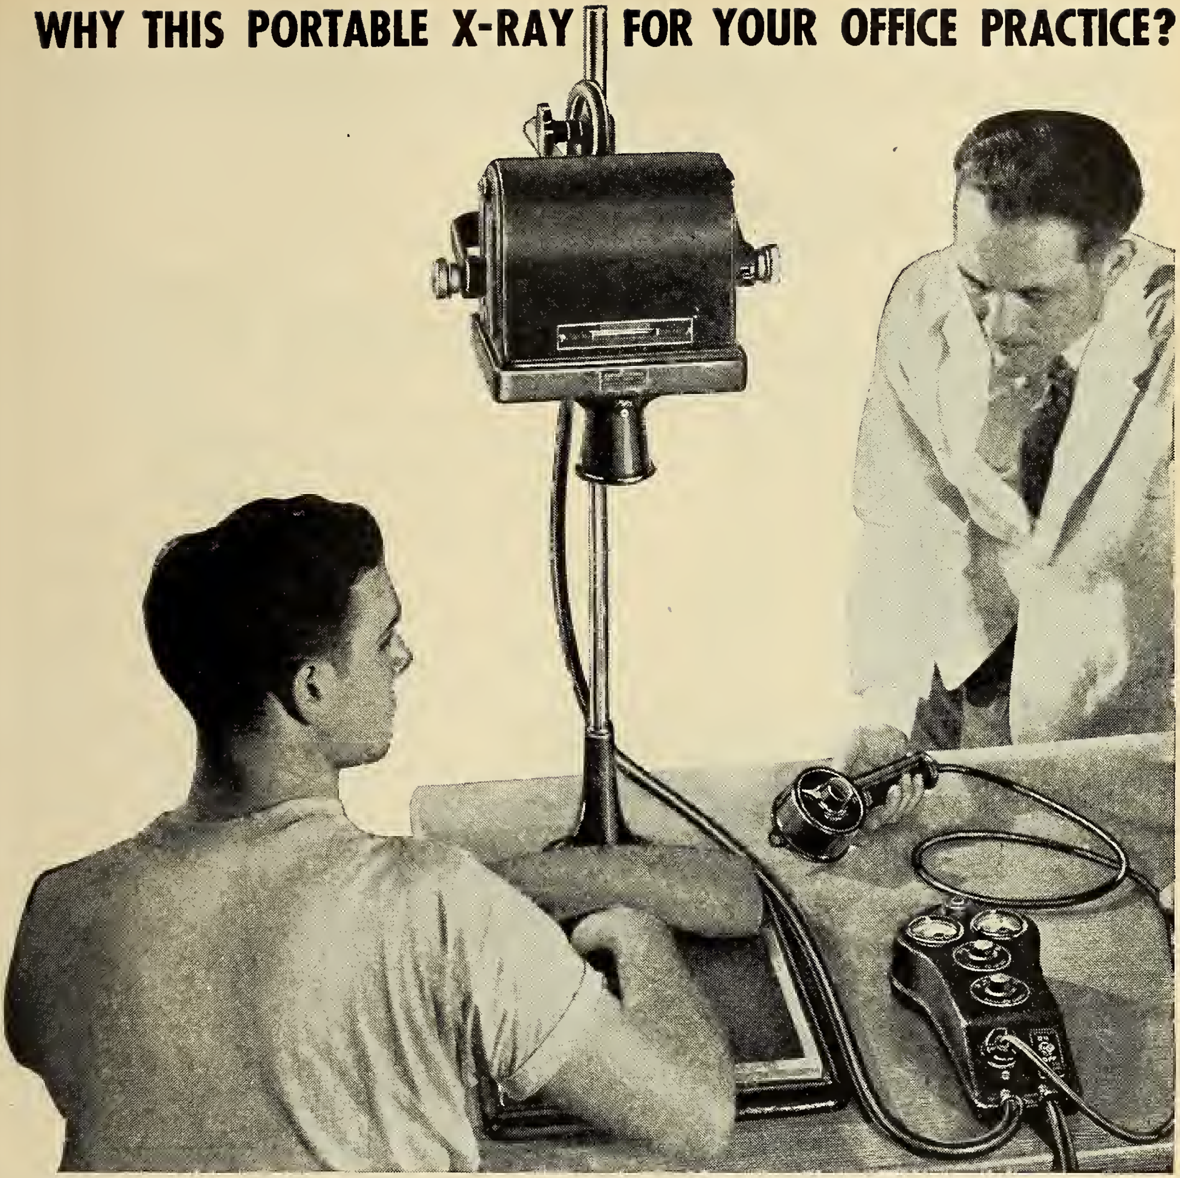
WHY THIS PORTABLE X-RAY FOR YOUR OFFICE PRACTICE?



The fact that thousands of physicians are today using G-E X-Ray's *Model F Portable* is perhaps the most convincing evidence of its recognized value.

You too, would soon conclude that for office x-ray examinations, the *Model F Portable* atop your desk or table greatly simplifies matters; also that the inambulant patient is grateful for this service right in his home.

Within the practical range of service for which this unit is intended, the quality of radiographs it is capable of producing is second to none, regardless of price. You'll also appreciate the high standard of workmanship throughout.

The moderate investment required, and the potential value of a *Model F* in your practice, assuredly justify your investigation. Mail this coupon today.

When soft, smooth foods are indicated in a high-protein diet...

SWIFT'S STRAINED MEATS

**provide complete,
high-quality proteins,
plus desirable palatability**

When surgery, injury or disease indicates chemically and physically non-irritating foods in a high-protein, low-residue diet, Swift's Strained Meats offer a highly *palatable*, *natural* source of proteins, B vitamins and minerals in easily assimilated form.

The six kinds of Swift's Strained Meats: beef, lamb, pork, veal, liver and heart, provide a tempting variety that appeals to patients, even when normal appetite is impaired.

**Finely strained lean meats—
prepared for infant feeding**

Designed to be fed to young infants, these all-meat products are soft, smooth and moist—Swift's Strained Meats are actually fine enough to pass through the nipple of a nursing bottle. They are well adapted to use by patients who cannot eat meat prepared in the ordinary manner . . . may easily be used in tube-feeding. These products are prepared from selected, lean U. S. Government Inspected Meats, carefully trimmed to reduce fat content to a minimum. Swift's Strained Meats are slightly salted to enhance the natural meat flavor. They require no cooking—come all ready to heat and serve.

Each vacuum-sealed tin contains 3½ ounces of Strained Meat.

Swift's Meats
FOR BABIES
Strained BEEF
WITH BEEF BROTH ADDED

Swift's Diced Meats

For the patient requiring soft, lean meat, in a form less fine than strained, Swift's Diced Meats provide variety and convenience. They are tender, juicy pieces of meat, easily mashed into smaller particles if desired.

Swift's Diced Meats also offer six appetizing kinds: beef, lamb, pork, veal, liver and heart. 5 ounces per tin.

Write for complete information about Swift's Strained and Diced Meats with samples, to: Swift & Company, Dept. BF, Chicago 9, Ill.

You Can Speak with Conviction

When You Choose Dorsey

Constantly aware of the responsibility to your patient, your profession and yourself, you and every careful physician will think twice--or a dozen times--before prescribing the products of a given pharmaceutical manufacturer.

When you do name a manufacturer, you speak with conviction.

Many doctors are prescribing Dorsey pharmaceuticals routinely, confidently. Their confidence is justified because Dorsey products are made according to rigidly standardized procedures . . . in fully equipped modern laboratories . . . under the supervision of capable chemists and technicians.

Whenever a Dorsey product will serve your purpose, you can prescribe with conviction: "Dorsey."

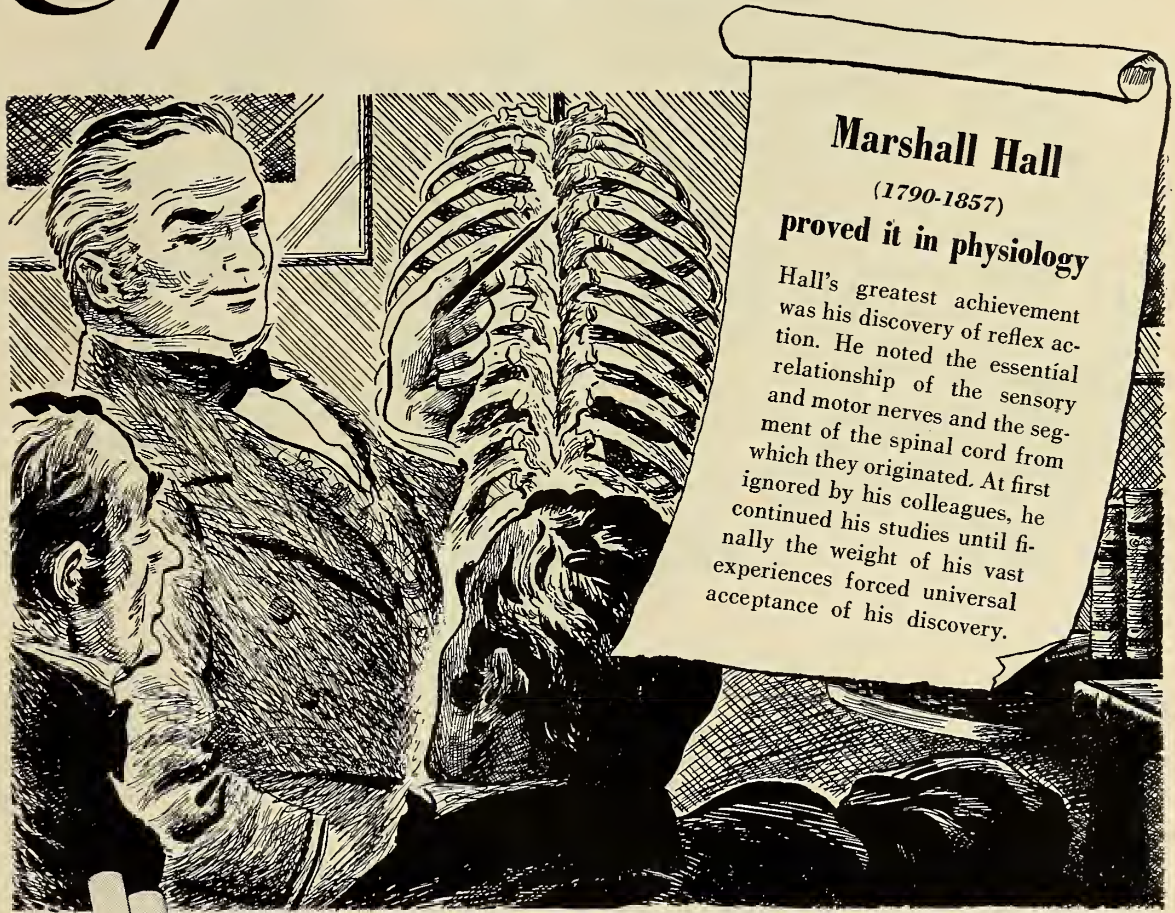
MARK OF Ramses DEPENDABILITY

Experience is the Best Teacher



Marshall Hall

(1790-1857)

proved it in physiology

Hall's greatest achievement was his discovery of reflex action. He noted the essential relationship of the sensory and motor nerves and the segment of the spinal cord from which they originated. At first ignored by his colleagues, he continued his studies until finally the weight of his vast experiences forced universal acceptance of his discovery.

CAMEL
CHOICE QUALITY
TURKISH & DOMESTIC BLEND CIGARETTES

Yes, experience is the best teacher in smoking too!

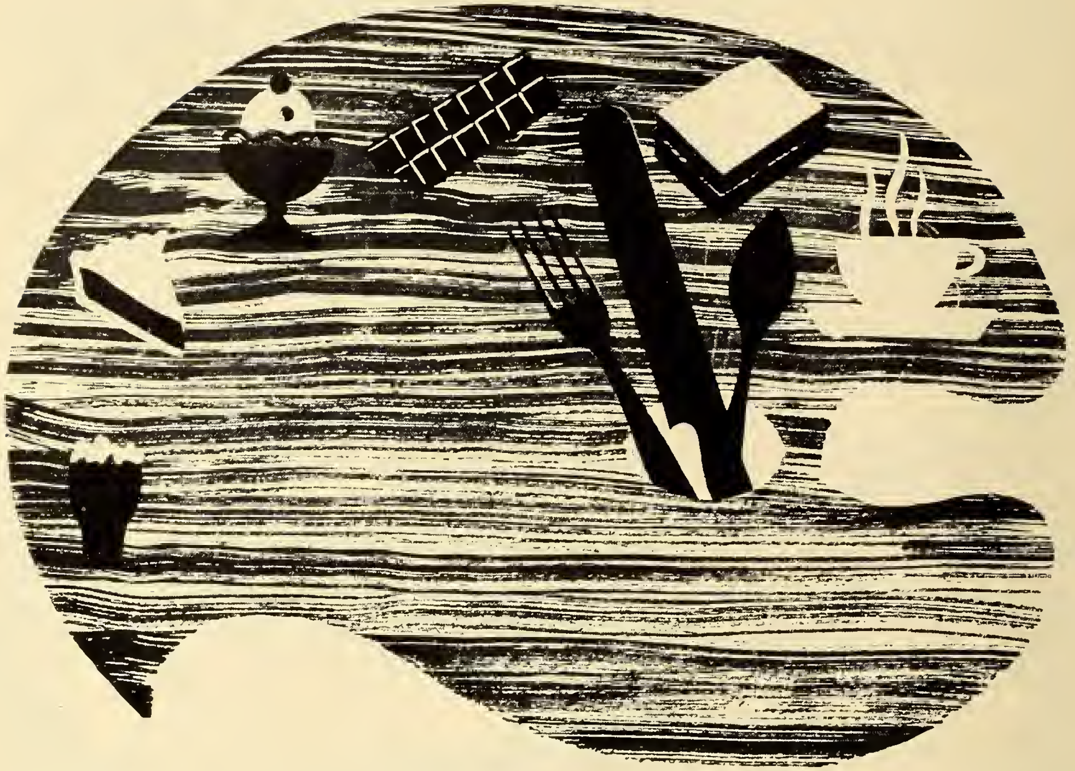
It was their experience during the wartime shortage of cigarettes which taught people the big differences in cigarette quality. People smoked many different brands then—whatever brand was available. And so many more smokers came to prefer Camels as a result of that experience that now more people are smoking Camels than ever before. However, no matter how great the demand, *we don't tamper with Camel quality. Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.*

According to a recent Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.



the art of eating

Too many people "seem to feel that the art of eating consists of filling the stomach to capacity three times a day."[1] They ignore the fact that "calories alone do not make a balanced diet."[1] They need, therefore, and will continue to need, support of vitamin supplements. To better reconcile the science of nutrition with the "art of eating," Upjohn provides a full range of potent, balanced vitamin preparations. In a variety of dosage forms, Upjohn vitamins help paint a better nutritional picture for all age groups by obviating deficiencies or providing for their treatment in the practice of medicine and surgery.

"Better Call the Doctor"

A familiar phrase in these United States. Self sacrificing, and willing to help at all times, the doctor has indeed earned his high place in our social esteem.

Right now we're "calling the doctor." Physicians and hospitals across the country are seriously concerned over the shortage of trained nurses available. We feel that in this case, too—**the doctor is best able to solve the problem.** A well trained corps of nurses is vitally necessary to insure the high standard of medicine as we now know it.

Glenwood Hills Hospital—through its school of nursing—is anxious to cooperate with you in your effort to increase the number of nurses in your community. A student from your locality will result in increased nursing assistance to you in the near future. Your help is greatly needed in recruiting candidates for this profession. For full information write Miss Margaret Chase, R.N., B.S., Director, School of Nursing.

SCHOOL OF PSYCHIATRIC NURSING

•

FALL CLASS will start in September

•

Candidates for the September class should make reservations at once . . . School and health record must be reviewed and correspondence completed prior to acceptance.

"Hospital administrators and doctors throughout the country are seriously concerned over the dangerously inadequate nursing care available. Results of a recent survey indicate that 55 to 60 per cent of the required amount is obtainable . . .

" '. . . approved hospitals should provide training for such vocational nurses by means of short courses.'

"The doctor is responsible for the care of the patient. In order to meet this obligation, the medical staff together with the hospital and nursing administrators, are urged to undertake the development and execution of this program."[1]

"It is time that some of the present-day advantages of a nursing career be made known to young women."[2]

ONE YEAR NURSING COURSE

Glenwood Hills Hospitals are currently offering to qualified applicants a one year course in psychiatric nursing. All phases of the subject are skillfully presented by a capable and experienced faculty. TUITION IS FREE. Regular classes begin in January, June, and September.

Some things you should know about epilepsy

No. 205 in a series of messages from Parke, Davis & Co. on the importance of prompt and proper medical care.

EPILEPSY is one of the most widely misunderstood of all diseases.

Many people believe that there's no effective treatment for it, that it's a kind of feeble-mindedness, that it always becomes worse as the patient grows older, and that he has no chance of leading a normal life.

Your doctor, however, will tell you these ideas are false.

The truth is that medical science has accomplished a great deal in its attempt to control epilepsy, and today the outlook for most persons who have the disease is distinctly hopeful.

What is epilepsy?

In broad and simple terms, epilepsy is a disorder in which the patient suffers recurrent nervous seizures. These seizures—usually characterized by muscular convulsions and sometimes by the loss of consciousness—vary greatly in frequency, duration, and intensity.

The fundamental cause of epilepsy is unknown, although a variety of contributing causes have been established.

Contrary to popular belief, heredity as a rule does *not* play the major role in epilepsy. The chances that an epileptic will have an epileptic child are only about one in forty.

Can epilepsy be controlled?

Epilepsy most often begins in childhood or adolescence. In times gone by, a diagnosis of epilepsy was a dreadfully heavy blow. But today the doctor can usually give the parents—and the child—much encouragement and hope. The following figures explain why this is so:

In approximately one out of six cases, the disease eventually disappears—and disappears completely.

Where the disease does not disappear, nearly 50 per cent of the patients are—with proper medical care—entirely free of seizures. Another 25 per cent or so can be almost entirely free, and can lead a virtually normal life.

The treatment of epilepsy

In most cases, modern drugs are the doctor's chief weapon. *Only the doctor knows which drug or drugs should be used, and in what dosage.*

Using these medicines, the doctor has been able to give epileptics a new lease on life. Once haunted by the threat of seizures and the danger of gradual mental deterioration, they often spent their days in tragic seclusion. But now most of them can lead normal lives. They can work, swim, dance, and play golf or other games. Children can go to regular schools and are able to study and play on a par with their schoolmates.

SEE YOUR DOCTOR! If you or your children ever experience a seizure—however mild—*see your physician promptly.* With epilepsy, as with any other disease, he can be of greatest help when you give him a chance to fight the ailment in its *earliest* stage.

a switch in time

A SWITCH to 'Wellcome' Globin Insulin with Zinc can often save the annoyance of a second or third daily insulin injection—for in many cases the patient's needs can be supplied with *only one injection a day* of this unique intermediate-acting insulin. Three distinct steps provide the welcomed change-over:

1. THE INITIAL CHANGE-OVER DOSAGE: The first day, 30 minutes or more before breakfast, give a single dose of Globin Insulin, equal to ½ the total previous daily dose of protamine zinc insulin or of protamine zinc insulin combined with regular insulin. The next day, dose may be increased to ⅔ former total.

2. ADJUSTMENT TO 24-HOUR CONTROL: Gradually adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fasting blood sugar level of less than 150 mgm. or sugar-free urine in the fasting sample.

3. ADJUSTMENT OF DIET: Simultaneously adjust carbohydrate distribution of diet to balance insulin activity; initially 2/10, 4/10 and 4/10. Any midafternoon hypoglycemia may usually be offset by 10 to 20 grams carbohydrate at 3 to 4 p.m. Base final carbohydrate adjustment on fractional urinalyses.

Most mild and many moderately severe cases may be controlled by *one daily injection of 'Wellcome' Globin Insulin with Zinc.* Vials of 10 cc.; 40 and 80 units per cc. Developed in The Wellcome Research Laboratories, Tuckahoe, New York. U.S. Pat. 2,161,198. Literature on request.

ACUTE POLIOMYELITIS IN PREGNANCY

Report of Thirty Cases

MILTON E. BAKER, M.D., and ILENE GODFREY BAKER, R.N., B.S.
Minneapolis, Minnesota

During the Minnesota poliomyelitis epidemic in the summer of 1946, a total of 695 patients with acute poliomyelitis were admitted to the Minneapolis General Hospital on the contagion service between July 29 and September 21. Of this group, 115 were women between the ages of fifteen and forty-five years, and of this last group, thirty were pregnant. The ages of these pregnant women varied between seventeen and thirty-two years. Stages of gestation at the time of admission varied between six weeks and nine lunar months. Seven women were admitted during the first trimester of pregnancy, sixteen during the second trimester, and seven during the third trimester. Determination of the length of gestation was based on history, physical findings, and in case of abortion, on fetal and placental findings. There were seven cases of spontaneous abortion which occurred in patients with various types of poliomyelitis, and at various periods of gestation, as is shown in Table I. Three women had signs of threatened abortion, such as low abdominal cramping pain and vaginal spotting, but did not go on to abort. One woman with bulbar poliomyelitis, who aborted on the third day following admission, expired as a result of respiratory failure on the seventh day.

Four patients were delivered in the Minneapolis General Hospital during their admission for poliomyelitis. One of these was a spontaneous delivery, and two were low forceps deliveries. Two of these infants were apparently normal, but one of those delivered with low forceps had an occipital-frontal diameter of 36.5 centimeters. One living fetus of seven lunar months' gestation was surgically removed from the mother immediately after her death.

Twelve deliveries were carried out by private physicians after discharge of the mother from the Minneapolis General Hospital. Seven of these deliveries were spontaneous or by outlet forceps extraction, and the infants were normal and full-term. Patient No. 6 was delivered by cesarean section. This mother had had a previous difficult delivery, pelvic measurements of questionable adequacy, and a history of rickets. Patient No. 8 was delivered spontaneously of a 2,174 gram infant which was normal aside from prematurity, the length of gestation being thirty-six weeks. Patient No. 7 was delivered of an 1,812 gram infant by breech extraction. This last infant was a footling, and the length of gestation was approximately thirty-six weeks. The present diagnosis of this infant is osteogenesis imperfecta, and it has bilateral fractures of the femurs. Patient No. 19 was delivered spontaneously of a macerated stillborn fetus. The estimated length of gestation was thirty-six weeks, despite the small estimated weight of 900 to 1,350 grams and the relatively underdeveloped state of the fetus.

Patient No. 3 spent twelve days in a respirator, and on the fifth day of this period went into labor spontaneously and was delivered of a slightly macerated fetus by low forceps extraction. The fetus weighed 3,130 grams, measured 52 centimeters, crown-heel length, and was found to have a horseshoe kidney. During the mother's stay in the res-

TABLE II. PREGNANT BULBAR AND SPINAL PARALYTIC POLIOMYELITIS ADMISSIONS TO MINNEAPOLIS GENERAL HOSPITAL, JULY 29 TO SEPTEMBER 21, 1946

Case No.	Admission Date	Age	Parity	Admission Length of Gestation	Termination of Pregnancy	Poliomyelitis Status on March 15, 1947
2	8- 2-46	30	1	20 weeks	Death of mother 8-4-46	Bulbar and spinal paralytic types. Respiratory death.
3	7-29-46	20	1	36 weeks	Low forceps extraction of a slightly macerated fetus 8-12-46	Spinal paralytic type. Death 8-17-46. Probable pulmonary embolus
4	7-31-46	17	0	6 weeks	Spontaneous incomplete abortion 8-2-46	Bulbar type. Respiratory death 8-5-46
11	8-13-46	23	1	37 weeks	Normal spontaneous delivery 9-7-46	Spinal paralytic type. Minimal stiffness of legs 9-20-46
12	9- 7-46	22	0	18 weeks	Normal spontaneous delivery	Spinal paralytic type. No residual paralysis
13	9- 9-46	26	1	18 weeks	Normal spontaneous delivery	Bulbar type. No residual paralysis
15	8-30-46	17	0	20 weeks	Death of mother 8-31-46	Bulbar type. Respiratory death
17	8-11-46	25	1	20 weeks	Death of mother 8-11-46	Bulbar type. Respiratory death
19	9-21-46	28	3	12 weeks	Spontaneous delivery of a macerated premature fetus 3-4-47	Bulbar and spinal paralytic types. Difficulty holding body erect
20	9-21-46	26	0	10 weeks	Spontaneous incomplete abortion 9-24-46	Spinal paralytic type. Weakness of both legs 11-1-47
24	8-26-46	22	1	26 weeks	Outlet forceps extraction	Spinal paralytic type. Weakness of leg muscles, left side and back
25	8-28-46	29	3	30 weeks	Post-mortem hysterotomy 8-29-46. Baby expired 5 minutes after delivery	Bulbar type. Respiratory death.
30	8-30-46	24	1	38 weeks	Low forceps extraction	Spinal paralytic type. No residual paralysis

pirator, she had had many episodes of marked cyanosis, and on several occasions it was feared that she would not survive. Fetal heart tones were heard three days before delivery. Spontaneous onset of labor occurred at nine lunar months' gestation. After a labor of nine hours, low forceps were applied because the patient was having respiratory embarrassment. She had to be replaced in and out of the respirator several times during the delivery and repair of the episiotomy. After the delivery, the patient improved markedly. She was removed from the respirator and was transferred to a convalescent ward five days postpartum, where she continued to improve until the sixth day postpartum when she suddenly developed symptoms and signs of a pulmonary embolus and expired. Permission for autopsy was not granted.

Patient No. 25 was admitted with a diagnosis of bulbar poliomyelitis. On the day following admission, her condition was critical. She had been in a respirator more than twenty-four hours when she expired. The gestation was estimated to be at seven lunar months. The fetal heart was frequently heard up to one hour before death, at which time the patient became so cyanotic that it was considered necessary to keep her in the respirator continuously. After she had been pronounced dead by three doctors, an immediate post-mortem hysterotomy was performed and the infant delivered. The fetal heart continued for five minutes after delivery, and the infant took one gasp. Its weight was 1,812 grams and the crown-heel length was 43 centimeters.

Patient No. 16 was delivered by low forceps on September 12. She was a primigravida with normal pelvic measurements who was diagnosed as acute poliomyelitis, nonparalytic, and was considered a noninfectious patient at the time of delivery. Labor progressed normally until the late second stage when progress stopped with full dilatation of the cervix and the head at a 2+ station. Sterile vaginal examination revealed the presenting part to be the brow. The head was large despite the fact that abdominal examination had not revealed an abnormally large baby. A manual conversion to an occiput posterior position was carried out and the head delivered in this position by Tucker-McLane forceps. The extraction was difficult, but no apparent maternal injury resulted. The occipital-frontal circumference of the fetal head was 36.5 centimeters. The mother had a normal post-partum course except for relatively slow involution of the uterus, a finding noted in three poliomyelitis patients delivered at Minneapolis General Hospital.

The discharge diagnosis was nonparalytic acute poliomyelitis in seventeen patients, spinal paralytic in six patients, bulbar in five patients, and a combination of bulbar and spinal paralytic in two patients. In the series, there were six deaths. Of these, five occurred in patients with bulbar lesions, one of whom had a combination of bulbar and spinal involvement. One death occurred in a patient with spinal involvement only and was probably the result of a pulmonary embolus. This followed delivery of a macerated fetus of nine lunar months' gestation. An autopsy was carried out on only one of these patients. Death was due to respiratory failure. Autopsies were performed on the fetuses from patients No. 3 and No. 25. The spinal cords were soft but this could not be determined to be due to poliomyelitis.

Discussion

Most of the current literature dealing with the association of pregnancy and poliomyelitis seems to be concerned with these four major questions:

1. What effect has pregnancy on susceptibility to, or resistance against poliomyelitis?
2. What effect has pregnancy on the course of the disease in the poliomyelitis patient?
3. What effect has poliomyelitis on the course of the pregnancy?
4. Can the fetus contract poliomyelitis in utero from a diseased mother?

TABLE III. PERCENTAGE OF PREGNANT POLIO CASES TO CASES OF POLIO IN WOMEN OF CHILD-BEARING AGE

Author	Locality	Women of Approximately Child-bearing Age	Number of Cases in Pregnancy	Percentage of Pregnant Cases Among Women of Child-bearing Age
Aycock (Vaughn)	Detroit 1939	11	3	27.3
Brahdy and Lenarsky	New York	15	3	20.0
Fox and Sennett	Milwaukee 1943	6	4	66.7
Aycock	Duluth	8	1	12.5
Aycock	Dist. of Columbia 1944	18	4	22.0
Aycock (Waaler)	Bergen, Norway 1941	18	7	30.0
Aycock	Massachusetts 1945	54	10	18.5
Baker and Baker	Mpls. Gen. Hosp. 1946	115	30	26.0
	Total	245	62	25.3

There is, apparently, a diversity of opinion as to the frequency of the coincidental occurrence of poliomyelitis and pregnancy. Berg[4] states that "in the many years in which poliomyelitis has been a problem, doctors had remarked on the small incidence in women who were pregnant" (p. 148). McGoogan[13] likewise speaks of the occurrence of poliomyelitis in pregnancy as being rare. Aycock,[3] who believes pregnant women are more susceptible to poliomyelitis than nonpregnant women, has calculated the chance coincidence of the two conditions to be less than once for every 1,000 cases of poliomyelitis. Since thirty of the 695 cases of poliomyelitis admitted to the Minneapolis General Hospital were pregnant (a ratio of approximately 43 pregnancies per 1,000 cases of poliomyelitis), it would appear that factors other than chance were operating.

In the Detroit epidemic of 1939, Aycock[3] reports (from a personal communication from Vaughan) eleven cases of poliomyelitis in women over twenty-one years of age. Three of them (27.3 per cent) were pregnant. In the New York epidemic, as reported by Brahdy and Lenarsky,[7] fifteen patients were women over nineteen years of age; three of these (20 per cent) were pregnant. Fox and Sennett[8] summarized the above data, and added to them their own findings reported in Wisconsin in 1943: four pregnant poliomyelitis patients out of a total of six female cases (66.7 per cent). Totaling the three reports showed that 31.3 per cent of the female poliomyelitis patients in the child-bearing age were pregnant. Four additions to these reports were made by Aycock[2] in a later study: (1) Duluth, Minnesota, series, where one of eight female patients was pregnant; (2) District of Columbia, where in 1944, of eighteen female patients twenty to forty-five years of age, four (22 per cent) were pregnant; (3) Waaler's report of twenty-three female patients over eighteen years of age (Bergen, Norway, 1941), seven of whom (30 per cent) were pregnant, and (4) Massachusetts, 1945, where ten out of fifty-four female patients between the ages of fifteen and forty-five were found to be pregnant. To these reports, we add those for the Minneapolis General Hospital during the two-month period covered by this study. Of 115 cases of poliomyelitis in women fifteen to forty-five years of age, 30 (26 per cent) were pregnant. Combining these findings with those of the above-mentioned investigators, it is found that 25.3 per cent of the women in the child-bearing age in these eight studies were pregnant. (These reports are reasonably comparable, although the definition of child-bearing age differs slightly in each report.) According to calculations based on data obtained from the Statistical Abstract of the United States Census Bureau for 1946,[16] approximately 6 per cent of the female population of child-bearing age are pregnant at any one time.* Since the percentage of pregnant women among female poliomyelitis patients of the child-bearing age (as determined in these studies) is more than four times that of pregnant women among the corresponding group of the population at large, it would appear that pregnant women are more susceptible to poliomyelitis than nonpregnant women.

Some investigators find evidence to support the conclusion that the pregnant female is somewhat more resistant to poliomyelitis during the first trimester of pregnancy. The International Committee for the Study of Infantile Paralysis[11] reports that "there is a general impression that, although the disease is likely to occur in the late months of pregnancy, it does not occur in the early months. We have met with no instances of the disease occurring in early pregnancy" (p. 416). Weaver and Steiner,[17] using pregnant cotton rats experimentally inoculated with poliomyelitis virus, found rats in the first trimester of pregnancy were more resistant than those in more advanced stages of pregnancy, but all pregnant rats were somewhat more resistant than virgin rats. Brahdy and Lenarsky[7] conclude from their study of three patients and a review of eight cases from literature, that poliomyelitis can occur in early pregnancy as well as in late. Aycock,[17] in a survey of seventy-five pregnant poliomyelitis cases from the literature and from his personal records, found 17.1 per cent of these infections to have occurred in the first trimester of pregnancy, 34.3 per cent in the second, and 48.8 per cent in the last. He expresses the belief in a later study,[2] however, that "there is no indication of a tendency of the disease to occur at any specific period of pregnancy" and that the apparent dearth of infections in early pregnancy is probably due to "discrepancy in the data." Of the thirty pregnant women with poliomyelitis at the Minneapolis General Hospital, 23.3 per cent were in the first trimester, 53.3 per cent in the second, and 23.3 per cent in the last. This would tend to support Aycock's views.

Pregnancy has little influence on the course of poliomyelitis or the extent of paralysis in the mother, according to Harmon and Hoyne.[10] McGoogan,[13] on the other hand, believes that pregnancy may be a factor in the severity and outcome of poliomyelitis, in that such complications as cystitis and respiratory paralysis are aggravated by pregnancy, and that recovery seems to occur more rapidly after its termination. Brahdy and Lenarsky[7] imply that respiratory paralysis is the only indication for the termination of pregnancy in a patient with poliomyelitis. Gillespie[9] reports a patient who improved markedly after a cesarean section was performed in a respirator. A similar patient, described by Spishakoff et al,[15] appeared to be so seriously ill that post-mortem cesarean was considered. However, after spontaneous delivery occurred, the patient's respirations improved immediately, she became afebrile within twenty-four hours, and was removed from the respirator a week later. They offer this as the only reported case of full-term pregnancy complicated by ascending poliomyelitis and respiratory paralysis. To this, we can add case No. 3 of our study, as described above, which closely resembles it. Due to the capricious nature of the disease itself, however, it is difficult to determine how much of its course can be attributed to the influence of pregnancy or to its termination. The present study showed that 20 per cent of the pregnant poliomyelitis patients expired, while 14.1 per cent of the nonpregnant female patients of child-bearing age expired. Although this is too slight a difference to warrant any conclusions as to the influence of pregnancy on the prognosis of the patient with poliomyelitis, it is, perhaps, worthy of mention.

---

*This figure was computed by taking 9/12 (period of gestation) of the ratio of births during 1944 to female population fifteen to forty-five years of age for that same year.

* This infant was also premature and is listed again in the "premature" column.

Will the pregnant poliomyelitis patient go to term and if so, what are her chances for a normal delivery? The various investigators are quite well agreed on the answer to this question. Blair et al[6] found that deliveries were normal despite paralysis. Brahdy and Lenarsky[7] take the stand that uncomplicated poliomyelitis (exclusive of respiratory paralysis) is no indication for interruption of pregnancy. Harmon and Hoyne[10] conclude that "a normal issue assisted by a minimum of operative intervention which is of the same type as required in nonparalyzed gravid patients" may be expected. Kleinberg and Horwitz[12] summarize sixteen cases from the literature and thirteen hitherto unreported cases and conclude that "notwithstanding severe paralysis involving the abdominal and extremity muscles, and occurring during gestation, a normal course of pregnancy and labor, and normal offspring may be anticipated." They further state that there is the same proportion of complications and of indications for operative interference as for those who do not have poliomyelitis, and that cesarean section is not indicated because of poliomyelitis alone. McGoogan[13] states that poliomyelitis has no effect on pregnancy and that normal spontaneous delivery may be expected. Fox and Sennett[8] also observed that poliomyelitis in the mother did not hamper spontaneous delivery. Spishakoff et al,[15] on the other hand, attribute their case of premature delivery to poliomyelitis. Gillespie[9] likewise describes a case in which cesarean section was performed after a three-day labor left the patient exhausted and the maternal outlook grave. (The cases reported by these authors are tabulated in Table IV. The authors reporting the therapeutic abortion and one of the therapeutic cesarean sections, respectively, seemed to feel that the procedures had not actually been indicated.) Our study showed that 30.4 per cent of the pregnant poliomyelitis patients aborted at periods varying from six weeks to six months. According to Allen,[1] 18 per cent of all pregnant women abort. This would seem to indicate that pregnant poliomyelitis patients have an excessive tendency to abort. Of the nineteen surviving poliomyelitis patients who did not abort, we were able to follow sixteen. Of these, twelve had normal spontaneous deliveries, or low forceps extractions at term. There were one cesarean section and three premature deliveries (one of these being a breech extraction). There was no evidence that the effects of poliomyelitis influenced the type of delivery in any of these patients, with the exception of one low forceps extraction on a patient in a respirator.

There is no convincing evidence that intrauterine transmission of poliomyelitis occurs. Weaver and Steiner[17] examined records from the literature, of six cases of alleged prenatal infection of the fetus with anterior poliomyelitis and expressed the opinion that the data did not justify such a conclusion. Bierman and Piszczek[5] report a case of poliomyelitis in an eleven-day-old infant, but acknowledge the possibility of other avenues of infection, including postnatal contact with the mother who expired on the fourth postpartum day with bulbar poliomyelitis. Fox and Sennett,[8] after examining two normal offspring from mothers with poliomyelitis and one fetus in a dead mother, concluded that poliomyelitis in the mother did not affect the fetus. Blair et al[6] found no evidence of the infection occurring *in utero* in four infants examined by them. Brahdy and Lenarsky[7] could find no effect on the newborn which could be attributed to poliomyelitis in the mother. According to McGoogan,[13] "intra-uterine transmission, if it occurs, is rare." He seems to imply that it can occur, but admits that the evidence is inconclusive. Harmon and Hoyne[10] also speak of it as "rare." They present one case in which inoculation of a Macacus rhesus monkey with preserved fetal spinal cord failed to produce clinical or microscopic evidence of poliomyelitis. Kleinberg and Horwitz[12] have been quoted above as believing that normal offspring may be expected from mothers who have had poliomyelitis during their pregnancy. None of the offspring of the pregnant poliomyelitis patients who make up the material of this study has shown any evidence of having acquired the infection. Autopsies on the one infant and on one of the stillborn were inconclusive as to poliomyelitis, but showed that death of the infant was due to anoxemia. There was no autopsy on the other stillborn which was a premature infant.

Summary

During the period of July 29 to September 21, 1946, 695 cases of acute anterior poliomyelitis were admitted to the Minneapolis General Hospital. Of this number, 115 were females in the child-bearing age of fifteen to forty-five years, and of these, thirty were pregnant. There were seven in the first trimester of pregnancy, seventeen in the second, and seven in the third. Fifteen live babies had been delivered by March 15, 1947. Eight of these deliveries were spontaneous, and the infants were full-term. One was a cesarean section; two were simple low forceps extractions; one was carried out by conversion of a brow to an occiput posterior position and a low forceps extraction; one was a breech extraction of a premature infant with osteogenesis imperfecta; one was a normal spontaneous delivery of a premature infant; and one was a postmortem hysterotomy which produced an infant of seven lunar months' gestation which lived only five minutes. Seven spontaneous abortions and six deaths occurred among the thirty pregnant patients.

Conclusions

1. Acute anterior poliomyelitis occurs in all three trimesters of pregnancy. It occurs in the pregnant woman more frequently than can be attributed to mere chance.

2. In general, pregnancy has little influence on the course of poliomyelitis or the extent of paralysis.

3. There is a relatively high percentage of abortion (30.4 per cent) among pregnant patients with poliomyelitis.

4. This study produced no evidence to show that the fetus can or cannot contract poliomyelitis *in utero*.

A REVIEW OF 174 CASES OF CANCER WITH NECROPSIES

HAROLD H. JOFFE, M.D., and ARTHUR H. WELLS, M.D.
Duluth, Minnesota

THIS review of 174 cancer deaths with necropsies over a five-year period from 1940 through 1944 is divided into two parts. The first section is a broad statistical study as to incidence with a comparison to national and state figures. The second part consists of a more detailed discussion with reference to the various more common sites of cancer and their signs and symptoms.

Statistical Review

The United States Census Bureau for 1944[7] revealed that 171,171 (12.1 per cent) of 1,411-338 deaths were due to cancer. In Minnesota the figures released by the Minnesota Department of Health for 1945[7] showed 27,336 deaths from all causes, with 4,096 deaths (14.9 per cent) due to cancer.

TABLE I. ADMISSION MALIGNANCY DEATH RATE

Year	Admissions*	Number of Cancer Deaths**	Necropsy Number	Malignancy Percentage

Total	37,889	198	174	.97

* Admissions exclusive of newborns.
** Deaths due to cancer without confirmation of necropsy.

At St. Luke's Hospital, Duluth, Minnesota, 0.97 per cent of all admissions (Table I) over a five-year period resulted in death by cancer. The important role which cancer deaths play in our hospitals is further illustrated by Table II in which 16.49 per cent, or one-sixth, of the necropsies performed over the five-year period were diagnosed cancer.

In Minnesota deaths from cancer in 1945,[7] among residents, showed a sex distribution of 1,942 (51.3 per cent) men and 1,843 (48.7 per cent) women. These were reversed in the nation as a whole, with 89,781 (52.4 per cent) women and 81,390 (47.6 per cent) men for the year of 1944.[7] Over a five-year period the cases diagnosed as cancer on necropsy at this hospital totaled 101 (58 per cent) men and 73 (41.9 per cent) women (Table III).

91–100	1	.57

The age-specific death rate per 100,000 estimated population in the United States in 1940[5] bears out the fact that cancer becomes an increasing menace from the fifth decade on. In the State of Minnesota 3,059 (80.8 per cent) of a total of 3,785 deaths from cancer among residents in 1945 occurred in the age group between forty to eighty years. In our series 150 (86 per cent) of the cancer deaths (Table IV) occurred between the ages of forty-one to eighty years. The percentage of people in the nation reaching the cancer age group, between forty-five to sixty-four years, has increased from 11.9 per cent in 1870 to 19.7 per cent in 1940 and from 3.0 per cent to 6.8 per cent in the age group of sixty-five and over dur-

ing the same period of time.[5] The increase in longevity and the actual increase in population does not entirely account for the higher national incidence.

The proportion of deaths from cancer by age groups is 0.4 per cent under the age of ten, increasing to 14.7 per cent in the age group between fifty to seventy, and dropping to 4.8 per cent in the age group of ninety and over.[4] In our series the percentage varied from 1.10 per cent in the age group under ten to 27 per cent in the age group between fifty-one and sixty, and dropping to 0.57 per cent in the age group of ninety and over (Table IV).

In spite of the small number of cases, the five-year total percentage of cancer mortality at this hospital in terms of organs primarily affected (Table V) closely parallels the figures of the United States Census of 1942.[5] An attempt to correlate our figures with those of the State of Minnesota for 1945 is rather difficult owing to the difference of classification.

The percentage frequency with reference to primary sites in each sex is illustrated by Figure 1. The percentages corroborate the national sex specific cancer mortality of 1942[5] in that it is generally higher in males, except in those sites due to difference in physiology and anatomy. In our series, the percentage of malignancies of the lymphatic system and bone marrow were also higher in males. The mean age with reference to organs or systems varied from 49.6 years in cancer of the kidney to 71.6 years in cancer of the prostate (Table VI).

The time interval from the onset of symptoms to death is tabulated in Table VII with shortest time interval being in the digestive, respiratory, and lymphatic systems and also in the bone marrow. One plausible explanation may be the silent features of malignancies in these sites plus the comparatively large surface over which to spread.

Review of Clinical Manifestations

The systemic effect of emaciation as evidenced by weight loss of 15 pounds or more was encountered in a total of sixty-seven cases (38.5 per cent), of which forty-four (65.6 per cent) occurred with malignancies of the digestive system and twenty-three (34.3 per cent) with malignancies in other sites (Table VIII). The question as to whether emaciation is due to impaired metabolism or inanition is debatable.

The causes of anemia in malignancies can be summarized under blood loss, absorption of toxic products, and deficient nutrition. Approximately one-half of the cases of moderate and one-third of the cases of severe anemia occurred with

malignancies of the digestive tract (Table IX). This may strengthen the theory of hidden, recurrent bleeding as a causative factor. Although albuminuria occurs in a high percentage of cancer patients, the cause is unknown and in our series occurred in forty-five (28.5 per cent) cases.

Cancer of the stomach is most deadly, causing about 25,000 deaths every year in the United States.[5] The unfortunate aspect is that 50 per cent of all gastric cancers metastasize even before the appearance of initial symptoms.[5] Thus, it becomes obvious that persistent digestive disturbances in anyone beyond forty years of age should be thoroughly investigated. Loss of appetite, belching, and perhaps mild abdominal pain may be the only signs. However, anorexia is usually one of the first symptoms, and in our series (Table X) occurred in twenty-four out of twenty-seven cases (88 per cent). Anorexia, chronic dyspepsia, nausea, loss of weight and vomiting constituted the five outstanding symptoms (Table X). Achlorhydria, occult blood in the stools, anemia, weakness, hematemesis, palpable epigastric mass and dysphagia occurred with significant frequency so as not to be overlooked as possible symptoms and signs of carcinoma of the stomach. Dysphagia may be a relatively early sign of cancer involving the cardiac end of the stomach. According to Wangensteen and associates,[2] the absence of free hydrochloric acid in the stomach may be a good screening test for detection of cancer of the stomach. Unfortunately, in our series of twenty-seven cases, gastric analysis was done only in nine cases, all of which showed an achlorhydria. Carcinoma has been known to respond to ulcer therapy and here may lie the danger of confusing a malignancy with that of peptic ulcer. The difficulties encountered in early detection of cancer of the stomach are many and well known. Even after application of all available diagnostic means at our disposal, the results are often disappointing. As Rigler states,[2] "It is easy to detect a change on x-ray examination, but the nature of such may be difficult to determine."

A large percentage of cancer of the intestines occurs in the sigmoid and rectum which in our series (Table V) constituted nineteen cases (61.0 per cent) of thirty-one cases involving the colon. It has been estimated that approximately 50,000 persons in the United States harbor cancer of the colon or rectum in the presymptomatic state.[5] The great majority (90 to 95 per cent) of cancers in the sigmoid and rectum are within easy reach of the examining finger or instruments.[5] In spite of the accessibility of these lesions for early diagnosis and the fact that they metastasize rather late, about 10 per cent of all cancer deaths annually are attributable to cancer in these locations.[5] The symptoms of fatigue, weight loss, increasing constipation, change in bowel habits, vague indigestion and anemia are all important warning signs. Cancer in the right half of the colon may give no symptoms; and, since these tumors bleed easily, the first symptoms may be those resulting from anemia.[3] In our series of ten cases of carcinoma involving the right half of the colon, anemia occurred in eight (80 per cent) (Table XI). Carcinoma of the left half of the colon usually produces colicky lower abdominal pain due to a slowly developing obstruction.[3] However, blood

Retraction of nipple	2	16.6
Dimpling of skin	2	16.6

and mucus are commonly found in the stools. In our series (Table XII), the three outstanding symptoms in order of frequency were: occult blood in the stools (57.1 per cent), colicky abdominal pains (52.3 per cent), and change in bowel habits (47.6 per cent). Since 90 to 95 per cent of cancers in the sigmoid and rectum are within reach of the finger or instruments, the routine procedure of rectal examination will undoubtedly uncover many more early lesions.

There are usually no physical findings in the early stage of carcinoma of the pancreas.[5] The complaint of epigastric pain radiating to the back is a common early sign and occurred in seven (70 per cent) of our cases. The presence of a palpable mass is a late manifestation. The traditional symptom of painless jaundice occurred in six (60 per cent) of our cases (Table XIII). The law of Courvoisier applies here also, according to which the presence of obstructive jaundice and distention of the gall bladder is likely to be due to carcinoma. Weight loss was encountered in 50 per cent, palpable tumor mass in 40 per cent, and anemia in 30 per cent of these cases.

Early cancer of the prostate is only usually discovered as an incidental finding in routine rectal examinations.[5] Unfortunately, the cancer is usually far advanced before symptoms are distressing enough for the patient to seek medical attention. The first symptoms, though unfortunately not early, are usually frequency and burning. In our series (Table XIV) nocturia occurred in fifteen out of eighteen cases (83.3 per cent) with frequency and burning occurring in 72.2 and 55.5 per cent, respectively. The diagnosis of early cancer of the prostate by digital examination should be confirmed by microscopic studies. The failure to do a cystoscopic examination is often the reason for missing carcinoma of the urinary bladder. The elevation of alkaline phosphatase is nonspecific, but the additional finding of an elevated acid phosphatase above 10 King-Armstrong units establishes the diagnosis of bony metastases. In our series, only seven out of eighteen cases had an acid phosphatase determination, four of which had elevated levels ranging from 24.8 up to 205 King-Armstrong units, and all had bony metastases as evidenced by x-ray examinations.

In 1945, of the total cancer deaths, 85,000 were women and 15,000 of these died of cancer of the breast.[1] The percentage of malignancy of the breast closely parallels the full maturity of the organ, and therefore the highest incidence occurs in the age group of forty-five to fifty-five. There are many diagnostic signs of breast cancer, of which pain, discharge, lump, retraction of nipple, puckering of the skin, and palpable lymph nodes are the outstanding. Pain usually indicates a benign lesion, especially if it increases in severity at the menstrual period. However, its nature should be carefully scrutinized. Retraction of the nipple may be an early or late sign. A bloody, serous or white fluid discharge is suggestive; a single lump should always be considered cancer until proved otherwise by biopsy.

In our series (Table XV), the presence of a single lump occurred in 91.6 per cent, serous discharge in 41.5 per cent, nodes in the axilla and bloody discharge in 33.3 per cent each. The presence of anemia and weight loss occurred in 25 per cent each, with signs of retraction of the

Nocturia	1	20.0
Frequency	1	20.0

nipple and dimpling of the skin in 16.6 per cent each.

Unfortunately, cancer of the ovary is symptomless in its early stage. Backache which is a rather common complaint of women occurred in 40 per cent of the cases and should arouse suspicion for a thorough examination. Abdominal discomfort and a palpable tumor mass occurred in 60 per cent each and were the two outstanding symptoms (Table XVI). Peritoneoscopy with biopsy may eventually prove of great value in the diagnosis of cancer involving many of the abdominal organs. The most reliable signs are still: (1) a palpable abdominal mass or enlargement of an ovary and (2) visible increase in the size of the abdomen with or without ascites. Unfortunately, the foregoing are late signs and may explain why ovarian cancer is not diagnosed early and is often an incidental finding during a surgical exploration of the pelvis.

A biopsy of the cervix which is usually an office procedure should make early diagnosis the rule. However, the early symptoms of irregular bleeding and leukorrhea are usually lightly regarded by women, and early diagnosis is the exception rather than the rule. In about one third of the cases, abnormal bleeding is a late symptom. Biopsy should be done routinely on all cervices showing a small erosion or cervicitis. In our series (Table XVII), irregular bleeding and leukorrhea were encountered in 71.4 and 57.1 per cent, respectively.

TABLE XIX. LUNG—TEN CASES

Symptom	Number	Percentage
Pain in chest	8	80
Blood tinged cough	6	60
Pleural exudate	6	60
Loss of weight	5	50
Wheezing	3	30
Anemia	2	20

Irregular bleeding, during or after menopause, should be considered as due to cancer of the uterus unless proven otherwise by microscopic examination. Here again, by a relatively simple procedure, we are able to make an early diagnosis. In our series (Table XVIII), post menopausal bleeding occurred in 80 per cent of the cases.

In our series, cancer of the lung accounted for ten out of 174 patients (5.6 per cent). There appears to be a definite predilection for males (Fig. 1), and whether this is due to smoking habits is debatable.[5] The most common symptom is cough which may be persistent or may occur in paroxysms and is usually associated with blood tinged, mucoid or purulent expectoration. Pain is not a constant symptom, the location depending upon the part of the pleura involved. However, in our series (Table XIX) pain in the chest occurred in eight (80 per cent) with blood-tinged cough in six (60 per cent). Pleural exudation *per se* is not a diagnostic sign of cancer and occurred in six (60 per cent) of our cases. All had examination of the pleural fluid, and four (66.6 per cent) revealed cancer cells. This brings up the efficacy of routine examination of all fluid accumulations for the presence of carcinoma cells. This procedure in the hands of an experienced pathologist is undoubtedly a reliable adjunct and often makes the diagnosis in obscure cases. The importance of x-ray examinations cannot be overemphasized. Fluoroscopy and chest films in various positions as well as at the height of inspiration and expiration is of importance.[2] A localized area of atelectasis or emphysema should make one suspicious of carcinoma. In addition, bronchoscopy and biopsy are important adjuncts.

Conclusions

1. Approximately 1 per cent of all admissions to this hospital over a five-year period resulted in death by cancer.

2. Over one-sixth of the necropsies performed over a five-year period were diagnosed cancer.

3. The sex percentage was 58 per cent men and 41.9 per cent women.

4. With reference to age groups, out of 174 cases, 12 per cent occurred in the age group forty-one to fifty, 27 per cent in fifty-one to sixty, 21.8 per cent in sixty-one to seventy, and 25 per cent in seventy-one to eighty. A total of 150 out of 174 cases (86 per cent) occurred in the age group between forty-one to eighty.

5. In terms of organs primarily affected, the digestive tract accounted for a total of 45.9 per cent; the reproductive system, 17.0 per cent; the genito-urinary system, 14.9 per cent; the lymphatic system and bone marrow, 10.9 per cent; and the respiratory system, 7.4 per cent, of which 5.6 per cent occurred in the bronchi.

6. The sex specific cancer mortality with reference to primary sites was generally higher in males, except in the reproductive system.

7. The average mean age with reference to organs varied from 49.6 years with cancer of the kidney to 71.6 years with cancer of the prostate.

8. The total average time interval in months from the onset of symptoms to death was 5.98 with cancer of the digestive tract; 5.6 in the bronchi; 10.8 in the lymphatic system and bone marrow; 16.4 in the genito-urinary system; and 29.4 in the reproductive system.

9. The systemic effect of emaciation occurred in a total of sixty-seven (38.5 per cent) of the cases, in which group forty-four (65.6 per cent) occurred with malignancies of the digestive tract.

10. Approximately one-half of the cases of moderate anemia and one-third of those with severe anemia occurred with malignancies of the digestive tract.

11. Albuminuria occurred in forty-five (25.8 per cent) of the cases.

12. The five outstanding symptoms of cancer of the stomach were: anorexia in 88 per cent, chronic dyspepsia in 77.7 per cent, nausea in 70 per cent, loss of weight in 51.8 per cent, and vomiting in 47.7 per cent.

13. Gastric analysis was done only in nine out of twenty-seven cases of cancer of the stomach, and all showed an achlorhydria.

14. In our series, 61 per cent of cancer involving the colon occurred in the sigmoid and rectum.

15. Anemia which is usually a prominent symptom of cancer of the right half of the colon occurred in 80 per cent of our cases in this half of the colon.

16. Colicky abdominal pain which is usually a prominent symptom of cancer of the left half of the colon occurred in 52.3 per cent of these cases.

17. In our series, only seven out of eighteen cases of cancer of the prostate had acid phosphatase determination, four of which showed elevated levels and evidence of bony metastases by x-ray.

18. A single lump in the breast was the outstanding finding in eleven out of twelve cases of cancer of the breast.

19. Irregular bleeding occurred in 71.4 per cent of cancer of the cervix and postmenopausal bleeding in 80 per cent of cancer of the fundus of the uterus.

20. Examination of pleural fluid for cancer cells was done on all cases of bronchogenic carcinoma with pleural effusion, and was positive in four (66.6 per cent) of the cases.

TONSILLECTOMY AND POLIOMYELITIS

The mode of transmission and the portal of entry of the virus of poliomyelitis remain unknown. Without this knowledge we are forced to theorize on the relationship between tonsillectomy and poliomyelitis.

A statistical survey indicates that poliomyelitis is relatively infrequent following tonsillectomy. The study carried out at Manhattan Eye, Ear and Throat Hospital on 11,204 tonsillectomy patients over a seven-year period revealed but four cases of poliomyelitis following tonsillectomy. None was of the bulbar type.

The widespread alarm on the part of the public, shared by doctors in some communities, is unfounded on the basis of our statistics.

Cunning, Daniel S.: Tonsillectomy and Poliomyelitis. Ann. Otol., Rhin. & Laryng., 55:583-591, (Sept.) 1946.

GENERAL PRINCIPLES IN THE TREATMENT OF PEPTIC ULCER

JOSEPH M. RYAN, M.D.
Saint Paul, Minnesota

PEPTIC ulcer is perhaps one of the greatest obstacles in our efforts to practice medicine scientifically. It readily fits into a category occupied by hypertension and arthritis, so placed because of the cloud of confusion that is associated with them.

The little substantial information that we have has been given to us by the physiologist who, thus far, has done the most practical investigative studies. Even that is insufficient knowledge to enable the clinician to treat the individual who has a peptic ulcer with anything but symptomatic management.

Although the etiology of peptic ulcer is not known, the pathogenesis should be discussed. Konjetzny demonstrated that an ulcer begins in the mucosa and has a penetrative tendency. Mann and others have shown that the experimental ulcer in animals also tends to penetrate and is identical in pathological appearance and in behavior with peptic ulcer as seen in human beings.

It has been proved satisfactorily that the production of these ulcers is impossible unless acid gastric juice is present. Cade, Varco, Wangensteen and coworkers were able to produce typical chronic peptic ulcer in the dog and other animals by inducing a continued hypersecretion of gastric juice by the injection of a slowly absorbable mixture of histamine and beeswax. Mann produced experimental ulcer by allowing hydrochloric acid to drip continuously into the stomach.

Peptic ulcer occurs only in those portions of the human digestive tract exposed to the action of acid gastric juice, i.e., the lower esophagus, the stomach, the first and second portions of the duodenum and stomal areas after gastroenterostomy. The observation of Brown and Pemberton, that a primary ulcer of Meckel's diverticulum occurred adjacent to aberrant acid-secreting gastric mucosa, stresses the importance of acid in the production of peptic ulcer.

In 2,500 cases of peptic ulcer, Palmer was unable to find a single case of active chronic peptic ulcer in the presence of complete and permanent anacidity. The importance of acid in the duodenum, or the lack of neutralization of the duodenal acid, in the formation of ulcer is suggested indirectly by the work of Berk, Rehfuss and Thomas. They pointed out that normal people exhibit a neutralizing ability in the first part of the duodenum which is inferior to that of normal dogs. These animals are notoriously resistant to peptic duodenal ulcer.

Other phenomena as hypermotility, hyperperistalsis, hypertonicity and hypersecretion play definite roles in the pathogenesis of peptic ulcer. These conditions obviously indicate that there is an increase in activity above normal.

Although the various treatments of peptic ulcer are far from ideal, it must be remembered that the chief principle to be followed is patterned by physiological changes in secretion occurring in this condition. Many of us fail to note this. In other words, individualization of treatment based on fundamental physiological facts should be our pattern of therapy.

There should be a thorough evaluation of the patient before a method of treatment is decided upon. The x-ray appearance of the ulcer will only aid in the plan of action to be used. The individual's nervous make-up is perhaps the greatest stumbling block in the management of most cases. We all recognize the fact that tension due to fear or anxiety will cause a quiescent ulcer to manifest symptoms. This is not only a characteristic of military personnel during the past war, but it is also true of civilians. If emotional forces are capable of producing symptoms, they must be dealt with accordingly. When this control is difficult, although the ulcer is an uncomplicated one, the phrase "intractable ulcer" creeps into our thoughts, and we may prematurely consider surgery as the treatment of choice. Here a psychiatric study of the patient should be made by the physician in most cases, but occasionally it will be necessary to have him consult a psychiatrist. At this point, good doctor-patient relationship is extremely important, in that it is absolutely necessary to allay the emotional factors present.

Dietotherapy is perhaps the most valuable

Presented on January 23, 1946, at a meeting of the Oak Ridge, Anderson County, Roane County, Knox County and Campbell County Medical Societies at Oak Ridge, Tennessee. At the time of presentation Dr. Ryan was chief of the Medical Service at Oak Ridge Hospital, Oak Ridge, Tennessee.

means we have to control the acidity of gastric secretion. Food in the stomach is much more comforting to the patient with a peptic ulcer than is an alkali medicament in the greater number of cases. Here again we should evaluate the patient as to the type of diet he requires, and individualization will be necessary. Diet with rest, provided the rest can be obtained without undue worry, really is the treatment to be strived for in the management of the uncomplicated duodenal ulcer. Less than three weeks of rest is seldom beneficial. I have had under my care patients whose discomfort was exaggerated by strict adherence to the Sippy diet. These same patients improved markedly when the diet was decreased in amount or the feedings were spaced differently. In dietary management one should not overlook the caloric requirement of the individual. This principle is especially true in care subsequent to hemorrhage. Bockus lists the principles upon which dietary management may be based: The diet should contain sufficient calories, absence of gastric secretagogues, absence of cellulose and meat fiber because of the danger of trauma to the ulcer site, and the diet should be liquid or semiliquid.

Alkalies are valuable adjuncts in the treatment of the uncomplicated peptic ulcer. However, they serve only a secondary purpose. Their use is perhaps more efficient in the treatment of the ambulatory patient who is unable to neutralize the gastric contents with frequent feedings. The proponents of various alkaline substances have succeeded in placing a cloak of mystery over the underlying principles of neutralization. Some individuals will respond to sodium bicarbonate and others are more comfortable while taking colloidal aluminum hydroxide. Even in the use of alkalies good judgment is needed. A serious ill effect of large doses of soluble alkalies is the systemic alkalization which may occur. This is especially true in the older patient with arteriosclerosis and renal changes, whose function of urea clearance may be disturbed. Colloidal aluminum hydroxide is less likely to produce such changes, as there is very little absorption of the drug. Investigators have shown that it has no effect on the evacuating time of the stomach when fed in large amounts to animals. Komarov points out that aluminum hydroxide aids in diminishing peptic digestion.

The advisability of using belladonna in attempt to block out impulses over vagal routes is very questionable. Gastric motility may be diminshed by using doses large enough to produce the side effects of blurring of vision and dryness of the mouth. In the majority of cases of uncomplicated ulcer, relief of symptoms with progress in healing can be attained without it.

Mild sedation is necessary, especially in the patient who has emotional upsets. Sedation is of great value in treating the ambulatory patient, whereas in the hospital, rest and relaxation are more easily obtained. Phenobarbital is the sedative of choice and can be given in doses ranging from ¼ to 1 grain three times daily.

The use of tobacco must be stopped at the onset of treatment. Patients are more likely to have earlier relief of pain when smoking has been discontinued. In our experience here, best results were obtained when alcohol was also eliminated.

Another more recent treatment of peptic ulcer deals with the hormone, enterogastrone, which was originally isolated by Kosaka and Linn, and has been purified by Ivy and his associates. They have now reported its use in fifteen clinical cases, with good response.

The internist and the surgeon should not disagree as to the management of the individual who has an ulcer. There should be close co-operation between them, and the time at which the patient should be transferred to surgery can be determined by the internist. There should be no procrastination nor should there be any attempt to get rid of the patient prematurely because he does not respond to medical treatment.

The indications for surgical care resolve themselves into the following classification:

1. Repeated hemorrhage.
2. Perforation of an ulcer.
3. Stenosis resulting in obstruction.
4. Ulcers on the greater curvature of the stomach, and a gastric ulcer that does not disappear completely in six weeks on adequate medical treatment without a resulting scar.
5. Intractable duodenal ulcer.

The term "intractable" is widely and loosely used. There is always the question of the time at which this term can be applied to the ulcer. The ideal management consists of proper rest, diet, and alkalization over a period not less than three months. By proper rest I mean hospitalization or satisfactory bed rest in the home. Every factor that might stimulate the ulcer symptoms should be investigated thoroughly before any thought should be given to surgical treatment. Of course there are many patients who cannot undergo strict management because of their temperament. There are also patients who will refuse to abstain from tobacco, and they will gladly submit to surgery rather than follow a strict regime. The financial question also enters into the picture. This is especially true of an individual who has a responsible position. It is difficult to explain to him why he should not have surgical treatment so that he can return to his employment at an earlier date. Many of us fail to discuss openly the possible results of operations for ulcer. An individual who has an intractable ulcer should be told of the possibilities of incomplete cure following surgical methods of treatment. Honest opinions given at this time will prevent much unnecessary explanation several years later. The patient often undergoes surgical treatment believing that his troubles will be over completely. This is not only the fault of the internist but of the surgeon as well. I have heard many surgeons tell their patients after leaving the hospital, following surgical gastric resection, that they would be able to eat everything and lead perfectly normal lives, only to have them return to the internist later for further management.

Excluding the acute emergencies, such as perforation, persistent bleeding, et cetera, the surgical treatment of peptic ulcer has now been narrowed to one popular procedure—resection of from two-thirds to three-quarters of the stomach in an attempt to diminish or to entirely abolish acid secretion. This operation has been more successful than gastroenterostomy or any other procedure used in the past. The basic principle is to abolish acid secretion. Because of the advances in anesthesia and physiological control of fluid balance, this operation carries a much lower mortality rate than it did several years ago.

Another surgical procedure that may become popular within the next few years is that of resection of the vagi in an attempt to reduce gastric secretion. Dragstedt has reported several cases with very satisfactory results. We have had under our observation here one case upon which this method of treatment was used with apparently good results. This case is not to be reported now as sufficient time has not elapsed since operation. However, the outstanding result noted so far has been the marked decrease in nocturnal gastric secretion.

The surgical treatment and the type of operation to be used should be left to the surgeon who is to operate. The internist should always bear in mind that the surgeon who does gastrointestinal surgery should be one who has had sufficient training and experience to take the responsibility of removing healthy tissue in order to bring about a good functional result. Again we may thank the physiologist for the advances he has achieved in the study of fluid balance, and the pharmacologist because he has furnished the surgeon with new anesthetics that permit better operative technique and a lower mortality.

Summary

The treatment of peptic ulcer resolves itself into a principle of "common sense." The patient should be treated as an individual and the ulcer should be remembered as being the property of that individual—not the individual the property of the ulcer. There has been little advancement in our knowledge of peptic ulcer within the past ten years. The methods and principles of treatment have remained practically at a standstill. This is, of course, the consequence of not knowing the etiology of the disease. Perhaps routine gastrointestinal studies on a series of normal individuals in the late teen ages will enable us to get some idea of the early formation of an ulcer in an individual who is susceptible to it.

CONGENITAL DIAPHRAGM OF THE DUODENUM

Case Report with Preoperative X-Ray Studies

WALLACE I. NELSON, M.D., F.A.C.S.
Minneapolis, Minnesota

CONGENITAL diaphragm of the duodenum is a developmental anomaly in which a membrane, formed by an infolding of the mucosa and submucosa, extends across the lumen of the duodenum. The diaphragm may be complete or it may present an aperture. It is to be differentiated from stenosis and atresia (Fig. 1). In the former, there is a marked local narrowing of the lumen, due to thickening and approximation of the walls. In the latter, there is a complete obliteration of the lumen, due to fusion of the walls. In reviewing the literature one finds these terms used interchangeably so that it is necessary to cover many irrelevant articles in order to be sure to include all cases of congenital diaphragm.

Those cases of a duodenal diaphragm without an aperture are, of course, instances of congenital high intestinal obstruction. Unless they are recognized and successfully operated upon, they die during the first few days of life. Those presenting small apertures in the diaphragm may have no symptoms, but they are, in fact, instances of chronic partial obstruction, and, as such, they are potential candidates for complete obstruction.

Incidence

No case is recorded in over 43,000 autopsies at the Department of Pathology, University of Minnesota. A review of the literature reveals thirty-five reported cases of congenital duodenal diaphragm. According to Krieg,[8] Robert Boyd, in 1845, was the first to report a case of obstruction of the duodenum due to a diaphragm (Table I).

Between 1845 and 1913 seventeen cases of congenital diaphragm of the duodenum were reported in the literature. None of these were operated upon, but all were discovered at autopsy. Then in 1916 Terry and Kilgore[21] operated upon a young adult in whom they found an obstruction of the duodenum and established a posterior gastroenterostomy. There was leakage from the suture line and the patient died on the fifth day. It was not until the autopsy that the true cause of the obstruction was discovered. However, this was the first reported case in which corrective surgery was attempted. Four of the next seven cases were operated upon, but it was only at the autopsy that the duodenal diaphragms were discovered.

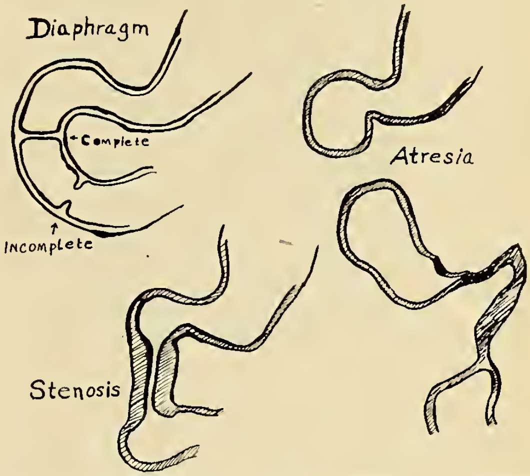

Fig. 1. Sketches to illustrate the fundamental differences between diaphragm, stenosis and atresia.

In 1925, Seidlin,[18] in describing his case, wrote, "Such a membrane, if diagnosed *intra vitam,* might be amenable to surgical treatment."

In 1933, Ladd[9] discovered a duodenal diaphragm while operating on an eight-year-old child and performed a duodeno-jejunostomy which resulted in the first surgical cure. In 1935, Morton[13] operated on his second case and was the first to remove such a diaphragm.

Krieg's case[8] had been missed by others at two previous explorations.

In Braun's second case[2] the x-ray showed an enlarged duodenum with obstruction in the third portion which was erroneously interpreted as an ileus due to mesenteric thrombosis, and no operation was done.

In Saunders and Lindner's case,[16] the true pathologic condition was missed at the first operation when the patient was fifteen months of age, but was recognized and successfully corrected at a second operation when the child was seven years of age.

Presented at a meeting of the Minneapolis Surgical Society, March 6, 1947.

TABLE I. REPORTED CASES OF CONGENITAL DUODENAL DIAPHRAGM

Author	Date	Age	Operation	Recognition	Proximal Dilation	Ring Constriction	Aperture	Result	Remarks
Boyd, R.	1845	Stillborn	None	Autopsy			None	Death	
Buchanan, G.	1861	18 mo.	None	Autopsy	Yes		2.5 mm.	Death	
Moore, N.	1884	40 yrs.	None	Autopsy			10-15 mm.	Death	Accidental death
Silcock	1885	34 yrs.	None	Autopsy			15 mm.	Death	Resembled finger of glove.
Galton, J.	1893	1½ days	None	Autopsy			None	Death	
C. Hampneys and Power	1897	5 days	None	Autopsy			None	Death	
Wyss, M. O.	1900	1½ days	None	Autopsy	Yes		None	Death	
Shaw and Baldorf	1907	13 days	None	Autopsy			Small	Death	
Weber	1910	10 days	None	Autopsy			None	Death	
Keith	1910	9 mo.	None	Autopsy			None (?)	Death	
Keith, A.	1910	Adult	None	Autopsy	Yes		5x3 mm.	Death	Diaphragm ballooned distally.
Roe and Shaw	1911	5 days	None	Autopsy			None	Death	
Spriggs	1912	9 mo.	None	Autopsy			?	Death	
Spriggs	1912	14 days	None	Autopsy	Yes		1-3 mm.	Death	
Wilkie	1913	Adult	None	Autopsy	Yes	Yes	Yes	Death	Proximal diverticulum.
Wilkie	1913	Adult	None	Autopsy	Yes	Yes	Yes	Death	
Wilkie	1913	Adult	None	Autopsy	Yes	Yes	Yes	Death	
Terry and Kilgore	1916	24 yrs.	Posterior gastro-enterostomy	Obstruction recognized at operation but cause not recognized	Yes	Yes	Yes	Death on fifth day	First attempt at corrective surgery. Leakage at suture line. Real pathologic condition discovered at autopsy.
Schroder, C.	1921	14 wks.	Exploratory and jejunostomy	Autopsy			3 mm.	Death	
Morton, J. J. First case	1923	1 day	Release paraduodenal hernia	Autopsy			None	Death	
Nagel, G.	1925	70 yrs.	Exploratory	Autopsy	Yes	No	8 mm.	Death	X-ray showed dilated stomach. At operation found intussception of stomach into espohagus.
Seidlin, S.	1925	2½ yrs.	None	Autopsy	Yes	Yes	7 mm.	Death	Septum dome-shaped. Obstruction precipitated by eating canned corn.
Thorndike, A.	1927	17 days	Exploratory and jejunostomy	Autopsy			1 mm.	Death	
Garvin, J.	1928	5 days	None	Autopsy			None	Death	
Cannon and Halpert	1929	8 yrs.	None	Autopsy	Yes		4 mm.	Death	Rupture of stomach after several enemas.
Ladd	1933	8 yrs.	Duodeno-jejunostomy	At operation			Yes	Cured	
Morton, J. J. Second case	1935	5 days	Electro-desiccation	At operation			None	Cured	
Kreig, E.	1936	32 yrs.	Posterior gastro enterostomy	Missed at two previous operations, discovered at third operation			8 mm.	Cured	Had operations in 1917 and 1927, and not recognized.
Braun, H.	1938	2 yrs.	None	Autopsy	Yes	?	8 mm.	Death	
Braun, H.	1938	49 yrs.	None	Autopsy. X-ray revealed an obstruction in distal duodenum but cause was not recognized	Yes	?	6 mm.	Death	X-ray showed megaduodenum and stenosis in lower third of duodenum. Suspected ileus due to mesenteric thrombosis.
Nagel, C. E.	1939	1 yr.	Duodeno-jejunostomy	By finger exploration through duodenotomy at operation	Yes	?	Admitted tip of little finger	Death	No autopsy.
Saunders and Lindner		15 mo.	Not noticed at first	Missed at first operation	Not recorded		Size not stated	Missed	Preoperative diagnosis was congenital stenosis of second and third portion.
	1940	7½ yrs.	Excision	X-ray predicted obstruction. Recognized at operation	Yes	Yes		Cured	At 7½ yrs., x-ray indicated obstructed second and third portion.
Brody	1940	Newborn	None	Autopsy	Yes	?	None	Death	Ruptured diverticulum of stomach.
White and Collins	1941	1 mo.	Gastro-jejunostomy	Obstruction recognized at operation but only at autopsy was true nature discovered.	Yes		Yes	Death	
Sumner and Morris	1945	5 days	Posterior gastro-enterostomy	Operation and x-ray	Probable		None	Cured	X-ray showed complete obstruction.
Nelson, W. I.	1944	26 yrs.	Duodenotomy and excision	Operation	Yes	Yes	10 mm.	Cured	Diagnosis predicted on basis of preoperative x-ray.

Of the thirty-five cases reported in the literature (Table I) twelve were operated upon. *In only six cases (8, 9, 13, 14, 16, 20) of the entire series was the true nature of the lesion discovered during life.* Of the six, only one was an adult. Five patients were cured by operation.

This paper is presented so as to call the attention of the profession again to this anomaly and to emphasize certain aids in diagnosis. In addition a case is reported herein which is believed to be the first in the literature in which preoperative x-ray studies revealed the presence of a congenital duodenal diaphragm.

Embryology

Most articles on this subject refer to Tandler's paper, published in 1900, which stated that the lumen of the duodenum became obliterated at about the fifth week of fetal life by the ingrowth of epithelial cells. He also stated that the lumen was re-established about the twelfth week by a process of vacuolization. According to his theory a diaphragm formed when a portion of the epithelial cord was not absorbed. According to Boyden[1] this explanation is erroneous. The lumen of the duodenum does not form and then become obliterated. Instead there are two rows of vacuoles which form in the region which is to become the duodenum. One row forms along the lesser curvature side and one along the greater curvature side. These vacuoles coalesce to form a lumen. Failure of complete coalescence can result in a variety of anomalies, including longitudinal or transverse septa. Transverse membranes occur most frequently in the region of the ampulla of Vater (Fig. 2).

Anatomy

The diaphragm is what its name implies, only a thin membrane stretching across the lumen of the duodenum. It varies in thickness from 0.5 mm. to 4 mm. In several instances it was stretched so as to project distalward in the lumen with its aboral surface convex. Silcock,[19] in 1885, wrote as follows in describing his case: "In the duodenum, six inches below the pylorus, is a congenital septum which barely admitted the tip of the little finger. A pouch formed of mucous and submucous tissue projects downward into the lumen of the gut and roughly may be likened in size and shape to the thumb of a glove."

In eight of the cases definite mention was made at operation or autopsy of a ring of constriction visible on the duodenum at the level of the diaphragm. In eighteen cases it was stated that the duodenum proximal to the lesion was dilated and hypertrophied. In several cases the stomach, pylorus, and proximal duodenum were dilated and hypertrophied. In a few of these a moderate relative narrowing at the pylorus gave the impression of an hour-glass stomach. Several reported that the stomach and duodenum were normal on external appearance.

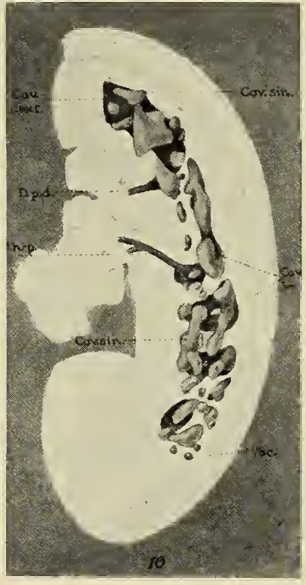

Fig. 2. Illustration from an article by R. A. Schwegler and E. A. Boyden in the *Anatomical Record,* volume 67, page 459. Note the two rows of vacuoles which are to become the duodenal lumen.

Histologically the diaphragm is made up of two layers of otherwise normal duodenal mucous membrane with some intervening submucosa. In Brody's case[3] some aberrant pancreatic tissue was found at the base and extending out between the layers of the diaphragm.

Although the membrane may be at any level of the duodenum, in the great majority of reported cases the diaphragm was found at or near the level of the ampulla of Vater. Both the common bile duct and the pancreatic duct have been reported traversing the diaphragm, and either or both ducts may empty into the bowel through either surface of the diaphragm (Fig. 3). This is to be borne in mind in planning the surgical management of such a case.

As is often the case, when one congenital anomaly is present, other anomalies may be present. This occurred in several of the reported cases and, by distracting the surgeon's attention, contributed to the failure to recognize the true pathologic condition in the duodenum. Among the associated anomalies may be mentioned such conditions as incomplete rotation, internal congenital hernia, abnormal fixation, diverticulum of the stomach, et cetera.

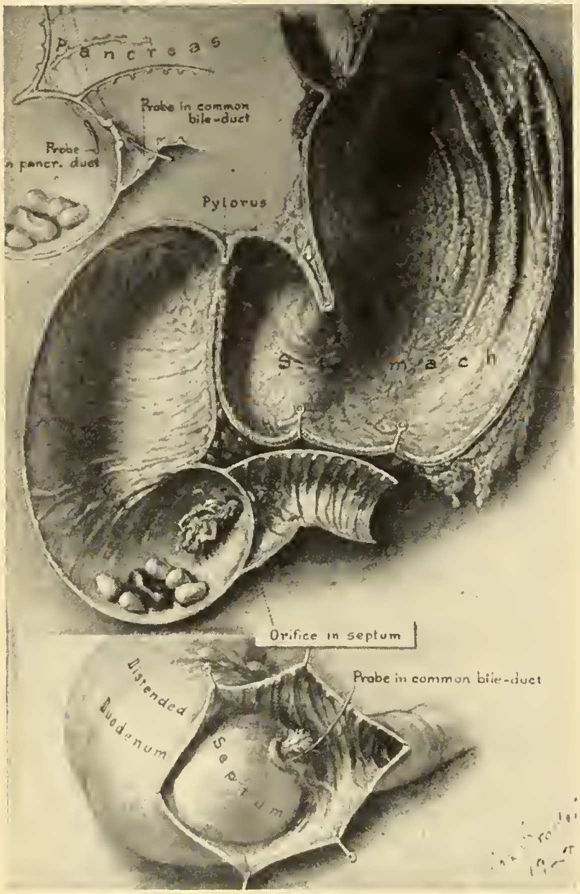

Fig. 3. Seidlin's case. Note the dome-shaped diaphragm with a central aperture, the proximal dilatation of the duodenum, and the relationship of the common bile duct to the diaphragm. *Upper sketch:* Esophagus, stomach and duodenum opened after fixation in formalin. *Lower sketch:* Duodenal lumen with septum shown from jejunal side. *Drawing in upper left corner:* Diagrammatic representation of the course of the biliary and pancreatic ducts in relation to the duodenal septum, its surfaces and orifice.

Clinical Manifestations

In cases of complete membrane without aperture, of course the obstruction is total. Persistent and recurrent vomiting appears in the first few days of life. Visible peristalsis and upper abdominal distention may be present. These patients all die unless the obstruction is recognized and relieved.

The age of onset and the severity of symptoms vary with the size of the aperture. These patients tolerate liquid nourishment, but begin to show obstructive symptoms when soft or solid foods are added to the diet. This is to be expected since the aperture in the group up to eight years of age did not exceed 8 millimeters (Table I) and could easily be blocked by food particles. Vegetables, with their high cellulose content, have been the most frequent cause of converting an incomplete chronic obstruction to an acute and complete obstruction. This is what occurred in Seidlin's case[18] (Fig. 3). In a few cases, acute obstructive symptoms did not appear but the nutrition was greatly impaired.

Morlock and Gray[11] stated that regardless of how long the first appearance of symptoms is delayed, these infants do not attain the development of normal children. However, in several cases there was no history of obstructive symptoms until adult life, and no mention was made of underdevelopment.

Right upper abdominal pain or discomfort was complained of by several nonobstructed patients. In a few cases the discovery of the condition was entirely accidental.

There was an equal distribution in the two sexes.

Referring to Table I, it is seen that the cases readily fall into three age groups. The first group includes fifteen infants under one month of age. Of these, eleven had no aperture in the diaphragm, while four did have a small aperture. Since complete obstruction is incompatible with life, those with an imperforate diaphragm came to be operated upon or died very early in life. Of the group under one month of age, all died except two,[13,20] both of whom were cured by operation on the fifth day of life. The second group of ten includes those from one month to eight years of age. The third group includes eleven adults.

Diagnosis

The most important factor in diagnosis is the ability to recognize the presence of an obstruction when it exists. Since the obstruction in these cases is high, there is no generalized abdominal distention. Visible peristalsis may be present in the epigastrium. If the vomitus contains bile, the obstruction is beyond the pylorus and the entrance of the common bile duct. Congenital pyloric stenosis does not have bile in the vomitus and is also more prone to appear about the third week of life. If the vomitus contains bile and the stools are acholic, then the obstruction is likely due to a congenital anomaly involving the duodenum. If the common duct is double, then one opening may be above and the other below the diaphragm. In such a case bile could be present in the vomitus and the stools and yet the obstruction could be complete.

The actual differential diagnosis between the various extrinsic and intrinsic causes of obstruction will often have to be made at operation. According to Morlock and Gray[11] the extrinsic factors to be considered are abnormal fixation of the duodenum, persistence of the hepatico-duodenal ligament, annular pancreas, and vascular anomalies. Intrinsic factors include atresia, stenosis, and congenital diaphragm. It is believed that more cases of the latter condition will be recognized as more doctors become aware of it as a possibility.

The literature gave no accurate study of the comparative blood laboratory tests in these cases. It is assumed that they would be the findings of any high intestinal obstruction.

In a few instances x-ray studies with and without contrast material were made. In Braun's case[2] the x-ray showed an enlarged duodenum with obstruction in the third portion which was erroneously interpreted as an ileus due to mesenteric thrombosis, and no operation was done. In Saunders and Lindner's case[16] a diagnosis of obstruction in the duodenum was made by x-ray. In G. W. Nagel's case[15] the x-ray showed a dilated stomach but no lesion. White and Collins[22] recognized an obstruction to the barium in the duodenum. As far as could be determined no recorded case was found in the literature where a preoperative diagnosis of congenital duodenal diaphragm was made by x-ray studies. In the absence of obstruction the symptoms and clinical findings are not diagnostic, so that such cases would only be diagnosed by x-ray or at operation. Attention is called to the x-ray findings in the case here reported so that both roentgenologists and clinicians will be conditioned to recognize this possibility.

At operation there may be a ring of constriction about the duodenum. At first this may suggest an adhesive band, but an attempt to remove or divide the "band," reveals that the constricting ring extends deeply into and is an integral part of the wall of the duodenum at this level.

There may be dilatation and hypertrophy of the duodenum proximal to the constricting ring. The duodenum may have the general appearance of a portion of the stomach. The dilatation may also involve the pylorus and stomach. Although greatly enlarged, these parts may be flaccid and show no distention if there is no obstruction present at the time.

It is believed that these findings (a constricting ring on the duodenum, and dilatation and hypertrophy of the proximal duodenum), when present, are so suggestive as to indicate the need for a meticulous examination of the mobilized duodenum for the presence of a congenital diaphragm within the lumen. Duodenotomy may be necessary to make the diagnosis, and should be done if there is a reasonable suspicion that a diaphragm exists.

Preoperative Management

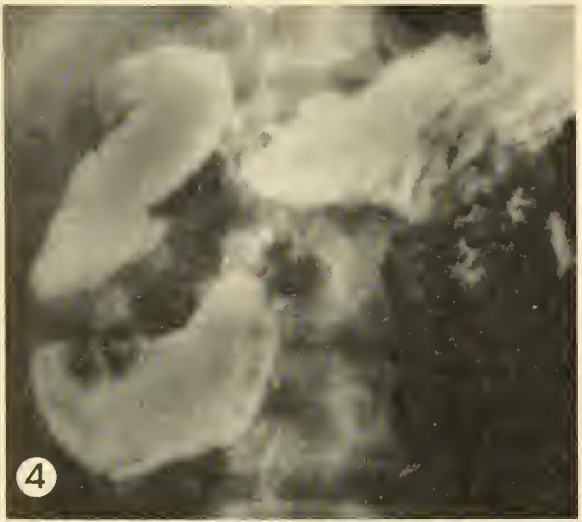
Cases with acute obstruction present the same problems as other patients with high intestinal obstruction, namely, dehydration, hypoproteinemia, loss of chlorides, et cetera. Corrective therapy should be instituted at once, but as White and Collins[22] have pointed out, if the patient is an infant, too much time cannot be spent in attempting to completely restore the body fluids and chemistry before operation.

In the absence of acute obstruction the operation can be done at a time of election, and more time can be given to preparing the patient for operation. Likewise at operation more time can be used to explore carefully for other anomalies and evaluate properly their relative clinical importance.

Management at Operation

Granted that a patient suspected of having a diaphragm in the duodenum is being operated upon, what shall the surgical procedure be? Short-circuiting operations such as gastro-jejunostomy and duodeno-jejunostomy have been employed. These procedures relieve the obstruction and at times may be the procedure of choice; however, they are not physiological. Mobilization of the duodenum, duodenotomy, and direct removal of the diaphragm is, however, the procedure which I would advocate wherever possible. Such a procedure requires a single short suture line and entails no greater risk than one of the short-circuiting procedures.

Attention is again directed to the fact that the bile or pancreatic ducts may open onto or traverse the diaphragm. Therefore, the diaphragm should be carefully examined by palpation and by transillumination so that if a duct is found it can be preserved during the excision of the diaphragm. There is no great harm done if a duct traversing the diaphragm be severed accidentally, but care must be taken so as not to occlude the duct in suturing the raw mucosal edges. Closure of the duodenum should include one row of fine nonabsorbable sutures.



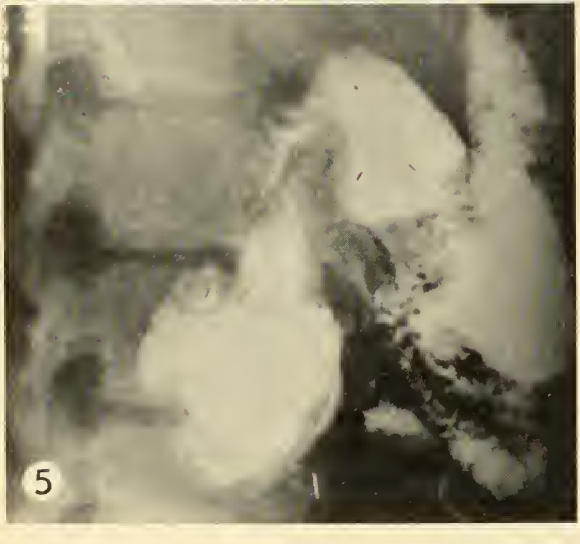


Fig. 4 *(above)* Author's case. X-ray shows narrowing in the second portion of the duodenum. Otherwise there is insufficient evidence in this film to warrant the diagnosis of duodenal diaphragm.

Fig. 5. *(below)* Author's case. Lateral view shows the third portion of the duodenum in cross section. There is a large mass of contrast material surrounded by a narrow band of barium, with a thin area of radiolucency intervening. This demonstrates that the larger accumulation is entirely within the lumen of the bowel and therefore not a diverticulum.

Case Report

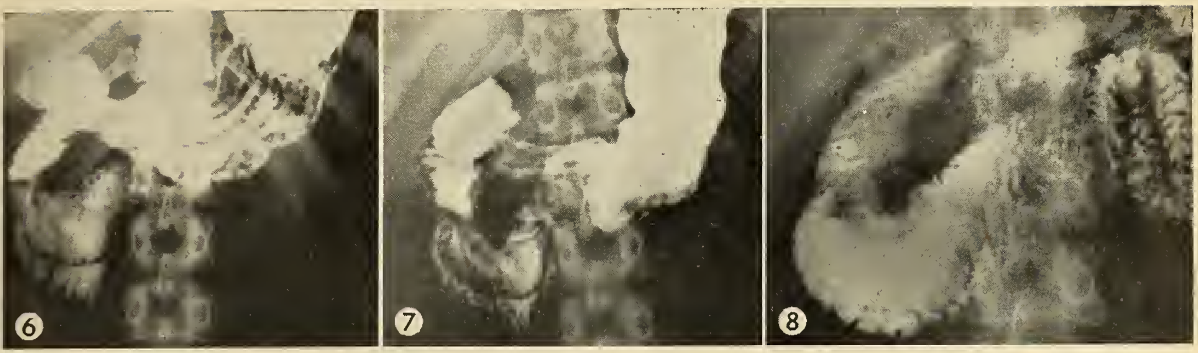
A twenty-six-year-old army nurse first noticed symptoms of her illness in March, 1944. There had been no feeding problem in infancy. A ruptured appendix had been removed in 1929. There was no history of any other gastrointestinal symptoms at any time. In 1942 she had sinusitis, joint pains, fever, and an increase in blood sedimentation rate, necessitating bed rest for six weeks.

While she was being treated in an army hospital for a severe sinus infection, she developed pain in the right flank with tenderness below the right costal margin, anteriorly and posteriorly. Pus in the urine disappeared after the administration of sulfonamides. Pain persisted, however, and she was transferred to an army general hospital where the right kidney was explored surgically on May 10, 1944. The only abnormal finding was a slight ptosis which the surgeon corrected. Pain in the right flank continued, and gradually pain in the right upper quadrant of the abdomen became more severe. In June, 1944, cholecystography indicated a normal gall bladder, and gastrointestinal x-rays showed an accumulation of barium in relation to the second and third portions of the duodeum which was diagnosed as a diverticulum.

In September, 1944, when the writer first saw her, the patient complained of persistent deep discomfort in the right upper abdomen and the right flank. There was no relation to food or meals; her appetite was fair. There was no vomiting. Bowel function was normal. She was taking as much as 90 grains of aspirin a day in order to obtain relief from the discomfort in the right upper abdomen. Physical examination at that time was negative, except for persistent tenderness in the right upper quadrant of the abdomen, with no muscle rigidity. The scars of the previous appendectomy and recent nephropexy were well healed. Laboratory studies of blood and urine were entirely normal except for blood sedimentation rate of 25 mm. per hour.

Between June and September a number of gastrointestinal x-ray studies were made (Fig. 4). The earlier diagnosis of large duodenal diverticulum was later changed to intussusception of the duodenum. A lateral film (Fig. 5) showed a profile of the third portion of the duodenum with a dense barium shadow surrounded by a narrow ring of barium (Figs. 6, 7 and 8). This proved conclusively that the accumulation was intralumenal and that we were not dealing with a diverticulum in the usual sense. The writer, having once seen a case with two diaphragms in the proximal jejunum and having read some of the literature at that time, was conditioned to include congenital diaphragm in the differential diagnosis, and went on record that the x-ray findings could be explained by a congenital diaphragm.

On September 26, 1944, the abdomen was explored. The entire duodenum and pyloric antrum of the stomach were dilated. In the second portion of the duo-



Figs. 6, 7 and 8. These views show a moderate dilatation of the entire duodenum with a zone of narrowing of the second portion of the duodenum. There is a thin area of radiolucency, within the confines of which there is an accumulation of barium. Surrounding this, mostly on the antimesenteric margin, there is a smaller amount of barium outlining the mucosal folds of the duodenum.

denum there was a fine ring-like indentation or infolding of the wall. The portion of the duodenum proximal to the ring was also thickened and redundant, so that at first sight, it resembled the pyloric antrum of the stomach. The entire descending duodenum was mobilized and turned medially to demonstrate that there was no diverticulum originating from the duodenum. A mobile thickening was palpable within the lumen of the second and third portions of the duodenum, resembling in feeling a soft, pedunclated polyp, attached in the region of the ring-like indentation previously mentioned.

The duodenum was opened by a linear incision, extending distally from the level of the constricting ring, exposing the inferior surface of a congenital diaphragm attached around the entire circumference of the duodenum at the level of the constriction (Fig. 9). Near the lateral or antimesenteric margin of the diaphragm, there was an eccentric aperture about 10 mm. in diameter. The mesial portion of the diaphragm was greatly stretched and formed a sac which extended distally within the lumen of the duodenum from its origin. The entire diaphragm and sac were covered with mucous membrane on both surfaces.

The sacculation was incised longitudinally to permit careful palpation and transillumination, and the diaphragm was excised at its base around the circumference of the lumen of the bowel. This was necessary in order to avoid injury to the common bile duct or pancreatic duct which often traverse a portion of such a diaphragm (Fig. 3). In this case, the papilla of Vater was found about one centimeter proximal to the diaphragm, on the posterior wall of the duodenum (Fig. 9). The cut edge of the diaphragm was sutured with fine chromic catgut. After closure of the duodenum by transverse suture, the lumen was adequate.

With the exception of a mild atelectasis which responded to therapy, the postoperative course was uneventful. The patient was relieved entirely of pain in the right upper quadrant and flank, and has had no recurrence of symptoms. Roentgenograms made in May, 1945, showed no abnormality of the duodenum except a slight enlargement of the cap.

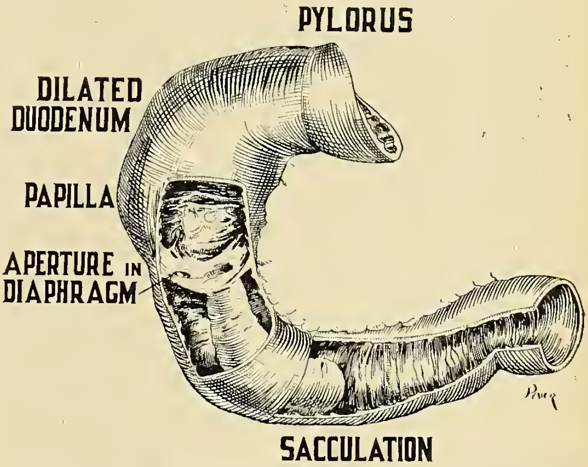


Fig. 9. Semi-diagrammatic sketch of the operative findings in the author's patient. Note the diaphragm forming a sacculation within the lumen of the duodenum, and the position of the papilla of Vater just proximal to the diaphragm. Barium or food entering the sac had no way of escape except by being ejected back into the duodenum proximal to the diaphragm and then passing through the aperture in the diaphragm.

Summary

1. Thirty-five cases of congenital diaphragm of the duodenum have been reported in the literature, only six of which were recognized during life; of these, five were cured.

2. One case is reported here of a twenty-six year-old woman in whom the x-ray studies permitted the preoperative diagnosis to be made. This patient has been cured by resection of the duodenal diaphragm.

3. Dilatation of the proximal duodenum demonstrable by x-ray has been reported in this condition by others. The x-rays of the case here reported clearly showed a congenital diaphragm forming a sacculation within the duodenum.

4. Duodenotomy and excision of the membrane is advocated rather than short-circuiting procedures.

5. The importance of making the correct diagnosis lies in the simplicity of the surgical procedure recommended and in the high mortality of untreated cases.

6. It is hoped that this demonstration of the x-ray appearance of a sacculated duodenal diaphragm will condition both surgeons and roentgenologists so that a higher percentage of cases will be recognized before or at operation.

Discussion

TAGUE C. CHISHOLM: It was a pleasure for me to listen to Dr. Nelson's presentation of this subject. It was a scholarly presentation as well as an excellent case report. The subject is quite close to my heart, as we see more stenoses with diaphragms of the duodenum in children than in adults. By children I am referring to the newborn period because we encounter this condition not a few times within the first few days or weeks of life with intestinal obstruction. I am sure this condition must occur more frequently in adults than is suggested by reports in the literature. Dr. Nelson's suggestion for treatment by local excision and suturing the cut mucous membrane is a good one. The problem presented in infants in the newborn period is a little different. At the Children's Hospital in Boston, Ladd and Gross have reported a number of cases. In the next edition of their book, a few more will no doubt be added. They have had more success with a side-tracking procedure than by local excision. I believe that it is probably more physiologically correct to excise the diaphragm, but the frequent involvement of the pancreatic and bile duct together with collapsed distal bowel in babies increases the technical problems in patients a few days old.

Another thought on the method of embryological development of these diaphragms is that it is associated with a faulty rotation of the head of the pancreas. During development, the dorsal and ventral anlage of the pancreas rotate to the medial and final position, but sometimes the orifices of the ducts do not rotate with them and form a constriction which may contribute to formation of such diaphragms in the duodenum.

JOHN R. PAINE: I would like to know why Dr. Chisholm thinks that in infants it would be more difficult technically to do as Dr. Nelson does than to make a short-circuit operation? I think this is the most unusual diaphragm of the duodenum that I have ever seen.

TAGUE C. CHISHOLM: My reasons for stating that Dr. Nelson's procedure is more difficult in the newborn period are the following. Probably in adults there usually is a fairly wide opening in the diaphragm, enabling such patients to reach adult life. In newborn babies, only pinpoint apertures are present, and flat films of the abdomen show practically no gas going beyond the diaphragm into the distal bowel. The distal bowel virtually is in a state of atresia. The distal bowel is smaller than the diameter of a cigarette while the proximate bowel is several centimeters in diameter. With these dimensions, technically it is usually more difficult to do a satisfactory excision with avoidance of the pancreatic and bile ducts than in adults.

WALLACE I. NELSON: I have nothing to add except that I appreciate Dr. Chisholm's remarks. My experience on this didn't take me into pediatrics.

One other thing to be considered is the presence of other anomalies. I found two cases where patients who had congenital diaphragms died from ruptured diverticulum of the stomach. The cause of death was rupture of the diverticulum in the stomach, associated with obstruction of the diaphragm.

THE MINNESOTA MULTIPHASIC PERSONALITY INVENTORY

An Evaluation of Its Use in Private Practice

A. E. WALCH, M.D. and ROBERT A. SCHNEIDER, M.D.
Minneapolis, Minnesota

WORLD WAR II has focused even more sharply the physician's attention on the widespread incidence of neurotic and psychosomatic illness. Both specialists and general practitioners realize that such cases are commonly neglected or given cursory treatment. They also realize that such cases cause more incapacitation and lost man-hours than does any other single group. Physicians agree that 50 per cent or more of their patients present psychogenic problems of varying magnitude, and that the general "aging" of the population will increase this percentage. Unfortunately, the average physician, already overburdened, rarely finds sufficient time to develop an adequate psychiatric evaluation of his patients.

In recent years, many personality tests have been devised, each aiming to evaluate the personality characteristics of the patient. These tests include the Rorschach Test,[7] the Cornell Index,[8] the Minnesota Multiphasic Personality Inventory[1-5] and several others. Each has advantages and limitations. The Rorschach Test is subjective in its analysis, time consuming, and requires the interpretation of a skilled psychologist or specially trained physician. The Cornell Index is chiefly concerned with the detection of borderline clinical states (the so-called psychosomatic disorders), and is less effective in screening hysteria, the pre-psychotic and early psychotic states. The Minnesota Multiphasic Personality Inventory has advantages not only for the psychiatrist, but for physicians in all fields of medicine: it covers a wide range of personality traits including the major psychoses; it may be graded and interpreted by the physician who has not had special training in psychiatry; it can be taken by patients of average intelligence; and it yields reproducible results.

In the course of studying this group of patients, the authors, whose practice is limited to internal medicine, have been able to investigate rather thoroughly the use of the Minnesota Multiphasic Personality Inventory as a means of evaluating further these cases. It is the purpose of this paper to describe briefly the procedure used and to illustrate the use of this test with several case studies. To date, this test has been applied to a total of 550 cases where further psychiatric evaluation seemed indicated.

The Minnesota Multiphasic Personality Inventory (hereafter referred to in this paper as the "MMPI") was originated at the University of Minnesota seven years ago by J. C. McKinley, M.D. (Division of Nervous and Mental Diseases) and S. R. Hathaway, Ph.D. (Department of Psychology). Its authors have attempted to identify and to measure the multiple phases of the subject's personality by using a series of statements to which the testee responds "true," "false," or "don't know." It is not the purpose of this paper to describe how the inventory was developed or to discuss its statistical validity. This information has been published in detail elsewhere by the authors of the test.[1-5]

The MMPI consists of a group of 550 simply worded positive statements, usually in the first person, of which the first 366 statements are routinely used. The test has been published in two forms.* The first form consists of 550 cards, each containing a statement. The patient takes the test by sorting out the cards and filing them into one of three boxes marked "true," "false," and "can't say." We have used only the second form of the test, in which the statements appear in a bound booklet (the so-called "group form"). Using a pencil or pen, the patient fills in the appropriate squares ("true" or "false") after each number representing the corresponding statement in the booklet. This is done on a separate answer sheet. If the patient is unable to decide "true" or "false," he leaves blank the corresponding number on the answer sheet. The average patient requires about ninety minutes to complete the test. Scoring can be done by either the physician or one of his office workers, and requires eight to ten minutes. Scoring is accomplished by

---

George E. Fahr, M.D., Donald R. Hastings, M.D., and Starke R. Hathaway, Ph.D., rendered valuable aid in the preparation of this paper.

*The test materials for both forms of the inventory are published by The Psychological Corporation, 522 Fifth Avenue, New York 18, N. Y.

making use of nine cardboard templates, one for each personality trait tested. The "raw scores" thus obtained are listed under the appropriate headings on a convenient permanent record card

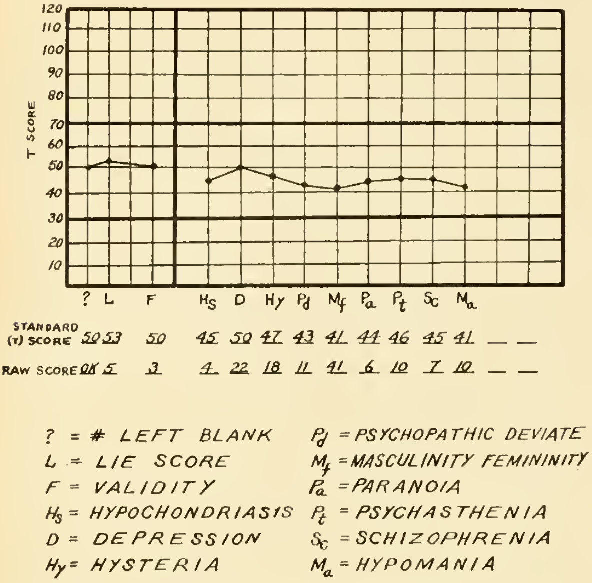

Fig. 1. A normal personality profile together with a key to the symbols used.

(size 5 x 8 in.). By making use of a series of tables in an accompanying instruction booklet, the examiner determines and records "standard scores." The standard scores are then charted graphically on the patient's record card. Figure 1 illustrates the appearance of "a normal" personality profile. The vertical co-ordinate in Figure 1 is made up of the standard score values, and the horizontal co-ordinate the personality traits evaluated. The average standard score values of each item in the profile is considered to be 50. Scores greater than 50 indicate deviation toward the abnormal, with a score of 70 taken as borderline. The first three scores on the horizontal coordinate beginning at the left (Fig. 1) are validating scores designed to indicate the reliability of the record. Should any one of the first three scores exceed 70, the validity of the patient's record should be questioned. Based on these criteria, the reliability of our series of profiles was approximately 90 per cent. The key to the symbols used in the test is shown in Figure 1.

Report of Cases

To illustrate the usefulness of the MMPI in private office practice, we present a series of case summaries with accompanying profiles, each case tending to point out the value of the inventory in the interpretation of a particular type of patient.

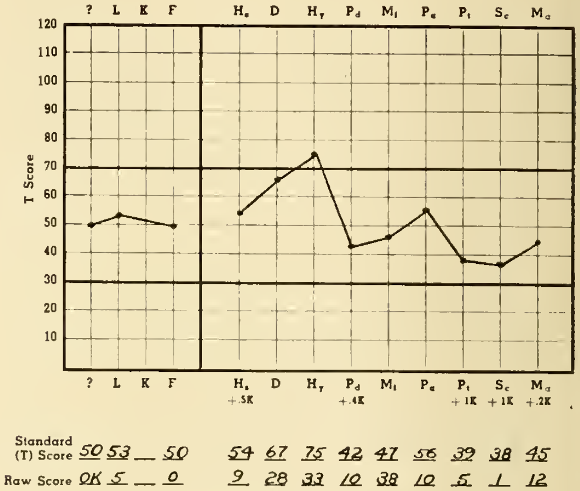

Fig. 2. (Case 1) The personality profile shows hysteria in a patient with essential hypertension and anginal syndrome.

Case 1.—Probably as important as any type of psychogenic problem seen by the practitioner is that of a patient with a definite pathologic condition (such as cardiovascular or gastrointestinal disease) in whom the symptoms are multiplied or accentuated by an added neurosis.

A married woman, aged forty-seven, was first seen on December 14, 1944. At that time her complaints included nervousness, a chronic nonproductive cough, fatigue, frontal headaches, and urinary frequency. Her past history included pulmonary tuberculosis in 1929, requiring eight months of bed rest, appendectomy in 1932, cholecystectomy in 1937, a right nephrectomy in 1940 because of hydronephrosis secondary to a kidney stone, and hysterectomy in 1943 for myomata with hemorrhage. Physical examination at that time showed a blood pressure of 210 mm. Hg systolic, 120 mm. Hg diastolic. X-ray studies showed definite left ventricular enlargement and healed fibroid tuberculosis of the right upper lobe and of the left apex. An electrocardiogram showed only left axis deviation. The pelvic floor was moderately relaxed. Sputum examinations and gastric washings for guinea pig inoculation were all negative for tuberculosis. The blood Wassermann reaction was negative. The impression at that time was one of old healed fibroid tuberculosis of the lung and essential hypertension. During November, 1946, following a period of emotional stress and anxiety over family problems, the patient developed several attacks characterized by syncope, marked agitation, fear of suffocation, and precordial pain. A series of electrocardiograms showed left axis deviation but no other significant changes over previous tracings. There were no measureable changes in the patient's previous cardiac status.

An MMPI was scored by the patient on January 14, 1947 (Fig. 2). This clearly showed hysteria (score 75) and a tendency toward symptomatic depression (score 68). The patient was reassured regarding her cardiovascular status, and the functional problem of hysteria was explained to her. The relationship was pointed out to her between her personal problems at home and her resultant anxiety and hysteria. The patient developed relatively good insight, and when she was seen on February 11 and again on April 1, 1947, she had been doing very well and had had no further attacks.

Fig. 3. (Case 2) A grossly abnormal personality curve in a young patient complaining of chronic backache.

Case 2.—By far the most frequently encountered situation is that of a patient with multiple complaints for which no organic basis can be found after a careful physical examination and appropriate laboratory and x-ray studies. Aside from an apparent hypochondriasis, other factors in the personality may escape the physician's attention. In such cases, the patient's MMPI profile may reveal valuable information which can then be used as a guide to further interview.

A boy, seventeen years old, was referred on February 5, 1947, for an evaluation of a chronic back complaint. He complained of "locking and catching" of the lower back and other vague symptoms referable to the entire spine. These symptoms began two years ago after the patient sustained a back strain while lifting a heavy object. He reported that his father had always had recurrent backaches. A previous diagnosis of spinal injury with subsequent manipulative treatment had been given by a nonmedical practitioner. Examination of this patient showed a tall, asthenic type of individual in whom no abnormalities of a physical nature could be found after a complete physical and neurologic examination and after pertinent x-ray and laboratory studies. An orthopedist, in consultation, confirmed the absence of physical findings in this patient. It was felt that this patient's symptoms were on a psychogenic basis, and the patient was asked to take an MMPI test.

The curve shown in Figure 3 indicated that the patient was not only suffering from hypochondriasis, but was hysterical and depressed. Because of the unexpected high scores for schizophrenia (score 83) and for hypomania (score 84), both of which were verified on subsequent interview, this patient was referred to a psychiatrist for treatment.

Fig. 4. (Case 3) A patient's personality profile which shows marked depression. The symptom was not obvious clinically.

Case 3.—On occasion an obviously neurotic patient is seen with excessive fatigue and multiple complaints but whose general affect is not that of depression. Such patients may actually be severly depressed (so-called "similing depression") and may be contemplating suicide. Not infrequently a routine history fails to elicit a state of depression which the MMPI may make obvious.

A thirty-eight-year-old man, a college graduate, was seen for the first time on May 6, 1946. His complaints were those of fatigue, nervousness, and palpitation. He was decidedly underweight and was troubled with what he called a "strain of the right groin." A complete physical examination and laboratory work were negative. He was placed on a high caloric diet and was advised to take additional periods of rest. He was seen again about eight months later on January 21, 1947. He had failed to gain weight, and showed no general improvement. The patient took an MMPI test (Fig. 4) at this time. A marked depression (score 101), which had been overlooked entirely clinically, was evident.

However, on questioning this patient in more detail, the depression became very apparent and was freely admitted. It may be further pointed out that this patient's MMPI record shows the "neurotic triad" of hypochondriasis, hysteria, and symptomatic depression which has been encountered frequently in other patients. This patient was referred to a psychiatrist for intensive psychotherapy. The psychiatrist has since reported considerable improvement in the patient's condition.

Case 4.—The "Test-Retest" technique has been used frequently for various reasons. For example, a patient having central nervous system syphilis can be studied in so far as the psychoneurotic and possible psychotic picture is concerned. Following therapy, such a patient can be rechecked with an MMPI test and any changes in the personality makeup noted. Thus the physician is aided in evaluating the efficacy of therapy.

Fig. 5. (Case 4) The personality profile of a patient with paresis, prior to malaria therapy (solid-line curve) and two months after malaria therapy (broken-line curve).

A forty-year-old housewife had asymptomatic paresis. She had received a two-year course of bismuth and mapharsen and had received 5,000,000 units of penicillin. Subsequently she had been given a total of 100 grams of tryparsamide. She was seen on October 8, 1946, at which time a neurologic examination was negative. A short time before she had been seen by a neuropsychiatrist and was pronounced normal except for a moderately severe anxiety state. Her symptoms and complaints at this time were largely those of depression and anxiety. An MMPI test was administered to the patient.

The profile (Fig. 5, solid-line curve) showed a high score of 88 for depression, a tendency toward psychopathic deviation, together with the picture of paranoid, schizoid, and psychasthenic traits. In view of the patient's symptoms and the findings on the MMPI test, a course of induced malarial fever was decided upon. The patient was inoculated with malaria and subsequently experienced fourteen paroxysms of fever in excess of 103 degrees. Two months after completion of the fever therapy, the patient was seen again. At this time she stated that she felt much improved both physically and mentally. The MMPI test was repeated and it showed an essentially normal profile (Fig. 5, broken-line curve) save for a borderline tendency to depression. The psychotic features in the patient's personality were no longer evident in the MMPI profile.

Case 5.—A second example of the "Test-Retest" technique is that of testing before and after operation in a patient with organic disease complicated by a definite emotional problem. It is instructive to note the marked psychic relief in such a patient after a change in the organic situation is brought about.

A twenty-six-year-old salesman was seen on October 17, 1946, complaining of abdominal cramps, diarrhea, and low-grade temperature elevations over a year's time. Physical examination and x-ray studies of the gastrointestinal tract revealed a classic picture of progressive regional ileitis with a palpable mass in the right lower quadrant. The patient was an overly conscientious, worrisome type of individual. He became extremely apprehensive when the situation was explained and operation advised. Prior to surgical treatment, the patient was asked to take an MMPI test (Fig. 6, solid-line curve).

	?	L	K	F	H_s +.5K	D	H_y	P_d +.4K	M_f	P_a	P_t +1K	S_c +1K	M_a +.2K
Standard (T) Score	50	50	__	64	81	101	69	75	53	65	85	80	66
Raw Score	OK	2	__	9	18	38	27	24	22	13	35	32	21

Fig. 6. (Case 5) The personality profile of a patient with regional ileitis, prior to surgical treatment (solid-line curve) and after operation (broken-line curve).

The profile before treatment showed a score of 101 for depression, a score of 80 for hypochondriasis, together with psychasthenic and schizoid tendencies of a moderate degree. A resection of the lower ileum and part of the cecum was successfully carried out two days later, and the postoperative course was uneventful. However, during his hospital stay, special precautions were used to avoid all possible emotional trauma. The patient was carefully followed, and when seen again on February 3, 1947, he stated he felt well, had gained weight, and his physical and mental symptoms had all but disappeared. The MMPI test was repeated at this time (Fig. 6, broken-line curve) and it showed an entirely normal profile.

Case 6.—The group of chronic alcoholics presents a problem in elevation. The differentiation between a "depressed" drinker and one who has an underlying psychopathic personality appears to be important.

A thirty-six-year-old man was first seen on February 25, 1947. He complained of intermittent localized precordial pain, marked tenseness, and nervousness. The patient freely admitted being an alcoholic of long standing. He had been known to disappear completely from home periodically. He had been a member of Alcoholics Anonymous for a period of six months but had given up the program. He had been successful in business, but would always "crack up" because of his alcohol habit. Further history revealed that the patient had been divorced and had remarried. His father had been a chronic alcoholic and was separated from the patient's mother. His mother had remarried. There was considerable hostility between the patient and both his mother and his stepfather. Physical examination and laboratory studies were normal. An electrocardiogram was negative. However the patient showed such motor overactivity as to suggest hypomania.

	?	L	K	F	Hs +.5K	D	Hy	Pd +.4K	Mf	Pa	Pt +1K	Sc +1K	Ma +.2K
Standard (T) Score	50	50	__	70	97	56	86	78	61	53	63	67	86
Raw Score	0K	1	__	12	25	19	36	25	26	9	19	22	30

Fig. 7. (Case 6) The personality profile of a chronic alcoholic shows an underlying psychopathic deviation.

The MMPI (Fig. 7) showed not only hysteria (score 86), hypochondriasis (score 97), but also a definite indication of psychopathic deviation ("psychopathic personality") (score 78) together with the anticipated hypomania (86). The patient was referred to a psychiatrist. He subsequently has rejoined the "AA" program.

Case 7.—On occasion, the physician is consulted by a patient who has "made the rounds" of many practitioners. That the patient seems to be a bit "odd" may be obvious, but the possibility of there being an underlying major psychiatric disorder is not always immediately evident.

The patient may be treated symptomatically, and the true fundamental condition could be overlooked. An MMPI could be quickly administered, and this in turn might clarify the problem in such a case.

A thirty-five-year-old saleslady was first seen on November 8, 1946, as a hospital patient. Her complaints were vague and multiple. She was troubled with backaches, indigestion, constipation, restlessness, and marked insomnia. She admitted the frequent use of sedative drugs. Her past history was significant. About eighteen months previously, she had fallen at her place of employment and had suffered a back injury. Much litigation had followed. She had been attended by no less than a dozen physicians in another city over a period of a year and a half, chiefly for complaints about the back, and for nervousness and insomnia. Apparently the possibility of a major psychiatric disorder had not been seriously entertained by the attending physicians. At this time, a complete physical examination, together with x-ray and laboratory studies, was negative, save for a transient glycosuria but with a normal fasting blood sugar. The patient was greatly agitated, depressed, and showed a ready tendency to weep. Careful questioning, together with an interview of the relatives, disclosed paranoid delusions, mendacious tendencies, and possible drug addiction. The patient was asked to take the MMPI test (Fig. 8); this she did without undue urging.

	?	L	K	F	Hs +.5K	D	Hy	Pd +.4K	Mf	Pa	Pt +1K	Sc +1K	Ma +.2K
Standard (T) Score	50	50	__	78	45	78	56	96	45	85	68	75	48

Fig. 8. (Case 7) The personality profile of a woman with a major psychosis which had been previously overlooked.

Although the reliability of the test was borderline, it readily confirmed the clinical impressions by showing depression (score 78), psychopathic deviation (score 96), paranoia (score 85), and schizophrenia (score 75). The patient is now under the care of a psychiatrist in a private sanitarium.

Comment

The Minnesota Multiphasic Personaltiy Inventory has proved to be a valuable aid in identifying and measuring personality deviations. Although the need for somatic treatment of the patient may be perfectly obvious, the need for psychiatric therapy is not always so apparent. Through the use of such a test, the physician is better able to know the relative needs of the patient for psychotherapy. Thus by making use of the balanced approach to the patient's problems, the physician is able to secure results. Oftentimes the test results will aid in the decision as to the need for referral of the patient to a psychiatrist.

Certain patients seem to derive benefit by merely going through the mechanics of taking the test. The finished profile can be shown to selected patients. The problem of explaining to the patient the relationship between symptoms and personality can be placed on a more concrete basis. Patients are often relieved to see that their scores are on the right-hand side of the profile (the major psychoses) are within normal limits.

It cannot be too strongly stressed that one must not go ahead on score findings alone. A complete physical examination together with the necessary laboratory aids is obviously important. The patient's background, from both a hereditary and a constitutional standpoint, must be considered. One must gain an impression of the patient's environment and of the patient's reaction to that environment. The careful elicitation of the medical and psychosomatic history is still of first importance. There is no shortcut for these time-consuming procedures.

As has been indicated, the booklet form of the inventory has been used exclusively by the authors of this paper, largely because of the greater ease of administration and scoring. The authors of the inventory point out that "for college, high school, or professional people, who are used to reading and writing, the results obtained by use of the booklet form are probably almost identical with those of the card form."[6] They strongly urge the use of the card form in testing older persons, disturbed or hospitalized patients, or those of low educational or intelligence levels.

For the most part, patients have no objection to taking the test when it is explained to them that it is merely a measurement of personality traits, that it is not a mental or intelligence test, and that the examiner is not interested in the answers to individual questions. While taking the test, the patient should be comfortably seated and should be alone if possible.

Summary

1. The Minnesota Multiphasic Personality Inventory has been administered by the authors to 550 patients selected from an internal medical practice.

2. The technique of giving and scoring the inventory is described in detail.

3. Seven case histories with accompanying profiles are included as a means of illustrating the use of the procedure.

4. The advantages of this procedure as a means of evaluating the psychogenic aspect of the patient's illness are discussed.

5. It is to be re-emphasized that this inventory is designed to supplement and not to replace a careful physical examination, laboratory workup, and a rather detailed medical and psychosomatic history.

RECONSTRUCTION OF THE EXTRAHEPATIC BILE DUCT

A Modification of the Allen Method

CHARLES E. REA, M.D.
Saint Paul, Minnesota

GIVEN a patient with a history of a previous cholecystectomy, recurrent or persistent attacks of cholangitis or jaundice, the diagnosis of stricture of the common bile duct should be considered. All surgeons agree that the best way to prevent these strictures is care in the performance of cholecystectomy, so that the extrahepatic bile duct is not injured.

In the treatment of strictures of the common bile duct, most surgeons try to anastomose the two cut ends of the common bile duct over a rubber T-tube. The use of vitallium or lucite tubes has to date provided no special advantage over the rubber tube. If the above procedure is not possible, due to difficulty in locating the distal portion of the duct or bringing the ends of the ducts together, a choledochoduodenostomy or choledochojejunostomy (preferably the latter) is usually performed.

In 1945, Allen described a method of anastamosing the open distal end of the transected jejunum to the liver around a tube placed in the short segment of the hepatic duct in the liver sulcus. The jejunum is transected approximately 30 cm. from the ligament of Treitz, and the intestinal continuity is re-established by implanting the proximal segment of the jejunum into the distal segment after the method of Roux. This results in a mechanical arrangement whereby the intestinal current is directed away from the liver. Cotton or silk sutures hold the end of the jejunum securely in the liver sulcus since the scar tissue around the duct opening is very firm and reliable. By inverting the end of the jejunum for a distance of 1.5 cm., two surfaces are placed in apposition which theoretically, at least, have healing properties. The use of the bell end of the rubber catheter is to lead all bile through such a tube and thus produce a water tight anastomosis. By making a vent in that segment of the catheter remaining for a time within the lumen of the gut, a complete external fistula can be prevented for as long as the catheter is left in place. The majority of tubes were removed at the end of twenty-one days.

The first patient treated by the author by Allen's method developed signs of cholangitis three days after operation, which subsided upon withdrawing the catheter on the seventh postoperative day. In Allen's own series three patients had one or two mild, transient episodes of pain, jaundice, chills and fever. At best, a rubber tube acts as an irritant in the bile duct, and it may be questioned if removing such a tube at the end of twenty-one days (or a longer interval) does much to prevent further stricture.

Accordingly, the following modification was used in the treatment of the next two patients with stricture of the common duct.

1. The cut end of the distal jejunum was anastamosed to the capsule of the liver around the proximal end of the common duct to act as a funnel to receive the bile.
2. No rubber tube was used in making the anastomosis.

The patients were explored through a right subcostal incision. In both instances the proximal end of the duct was a bulbous segment flush with the liver substance. This finding is not unusual in the more complete strictures occurring high in the common duct. Also, the amount of fibroserositis on the capsule of the liver in the region of the upper end of the duct is considerable and lends itself admirably for the placement of sutures. The cut distal end of the jejunum was sutured to the liver so as to form a funnel or cup over the upper end of the common duct. No rubber tubing was placed in the duct, as it was felt that even though this dilated duct should contract somewhat, there still would be no obstruction to the flow of bile. Interrupted sutures of No. 000 silk were used to make the anastmosis. The cut end of the jejunum was inverted by a mattress suture, so there was a small serosal cuff inside the lumen. Only two rows of silk sutures were used to make the anastamosis. A penrose drain was left in the subhepatic space of Morrison and brought out through a stab wound inferior to the incision. This was removed on the eighth postoperative day.

These two patients have been followed eight months and one year respectively since operation and have been well. In neither have there been jaundice or symptoms suggestive of cholangitis.

Summary

A modification of the Allen method for reconstruction of the common bile duct is presented. The cut end of the jejunum is sutured to the liver capsule to form a funnel over the upper end of the common duct. No tubes are used in making the anastamosis. Two patients so treated have been well eight months and one year since operation.

Probably no greater mental trauma is ever inflicted by a physician than when he first tells a patient that he or she has tuberculosis. Material and social problems combined with the psychological problems of separation from family, complete change of living routine, sudden cessation of all activity, ignorance of the disease and what it will mean to him and an unknown future is likely to create in the patient a mental turmoil which is a known detriment to his eventual recovery and return to a useful life.—C. J. Stringer, *Hospitals,* (Aug.) 1946.

CLINICAL-PATHOLOGICAL CONFERENCE

PARATHYROID ADENOMA

A Diagnostic Case Study

HAROLD H. JOFFE, M.D., F. H. MAGNEY, M.D., and ARTHUR H. WELLS, M.D.
Duluth, Minnesota

Dr. F. H. Magney: This fifty-one-year-old white female (Case No. 30757) was first admitted to this hospital on July 21, 1939, for a trigeminal neuralgia on the left side which was somewhat relieved by an alcohol injection. Shortly thereafter she underwent an operation on the Gasserian ganglion at the Mayo Clinic where, in addition, a cystic lesion of the right os calcis was curetted and a diagnosis of a giant cell tumor was made. The cyst was packed with bone chips from the left tibia.

The patient was readmitted on October 16, 1941, with a history of having been well since the operation two years before, except for a loss of sensation on the left side of the face. At this time she had noted intermittent pain for the past three months in the posterior aspect of the right lower thigh, especially when bending the knee. There had also been some occasional pain in the right heel. On the day of admission she stumbled down a step, falling and landing on the right knee. Her physical examination was essentially normal except for muscle spasm and swelling above the right knee. X-ray examination revealed a fracture of the lower end of the right femur with angulation, and at the same time a cystic lesion suggestive of a giant cell tumor of the bone was discovered at the site of the fracture. The patient was treated by extension, manipulation, and application of a plaster cast.

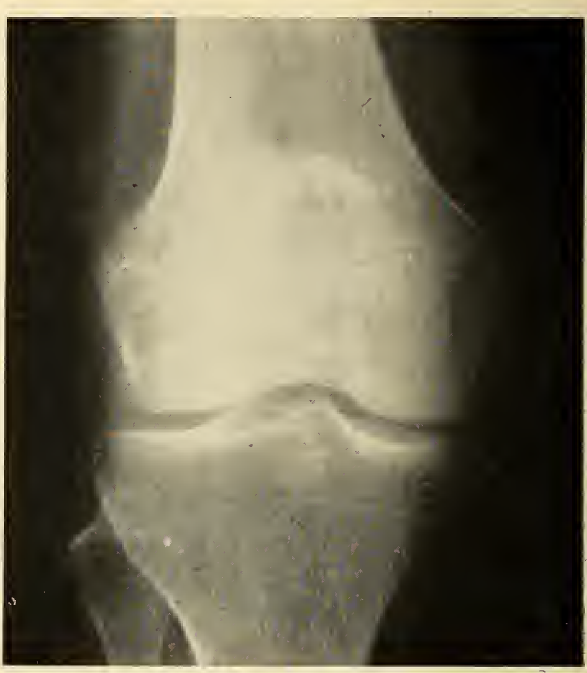

Fig. 1. Cyst in patella.

The chief complaint on the third admission (August 9, 1946) was a dull continuous pain in the left knee since the spring of that year. It had been getting progressively worse and was aggravated by weight bearing, but not relieved by rest. X-ray examination at this time revealed small calculi in the right kidney and areas of decreased density throughout the lumbar spine, pelvis, and ribs with cystic areas in the right ninth rib in the anterior axillary line and the left tenth rib in its posterior portion. There was also a cystic area in the left patella (Fig. 1), in the superior ramus of the right pubic bone, and in the left acetabulum. The alkaline phosphatase was 27.8 King-Armstrong units. The left patella was excised with the aid of Dr. M. H. Tibbetts. A diagnosis of benign giant cell tumor or osteitis fibrosa cystica was made by Dr. A. H. Wells who recommended serum calcium and phosphorus determinations to rule out hyperparathyroidism. Two serum calcium determinations revealed 15.02 and 16.62 mg. per 100 c.c., respectively. The serum phosphorus was normal. Apparently because of the many previous surgical procedures, including (1) tonsillectomy and adenoidectomy, (2) appendectomy, (3) perineorrhaphy, (4) drainage of a breast abscess, (5) hysterectomy, (6) resection of the Gasserian ganglion on the left side, (7) curettement of the right os calcis for supposedly a giant cell tumor and (8) treatment for a pathologic fracture of the lower end of the right femur, the patient refused an exploration for a parathyroid adenoma.

She was readmitted to this hospital for the fourth time on March 21, 1947. A parathyroid adenoma, the size of a large olive, was removed from the left superior parathyroid gland. Gross examination revealed an encapsulated mass measuring 3.5 by 2.5 by 1.7 cm. The cut surface had patchy yellowish gray mottling with an area of cystic degeneration and hemorrhage measuring 2 by 1.5 by 1.4 cm. (Fig. 2). Microscopically the tumor was encapsuplated and was made up of solid masses and cords of rather large, uniformly shaped epithelial cells with small rounded nuclei and abundance of clear cytoplasm with a well defined outer wall (Fig. 3). There was no evidence of malignancy and a diagnosis of parathyroid adenoma was made.

From the Department of Pathology, St. Luke's Hospital, Duluth, Minn., Arthur H. Wells, M.D., Pathologist.

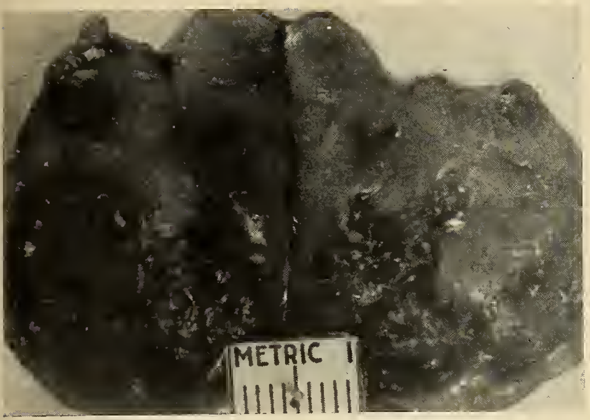

Fig. 2. Sectioned adenoma of parathyroid.

Following surgery, symptoms suggestive of tetany were relieved by the intravenous use of calcium. Postoperatively, the serum phosphorous was 2.61 mg. per 100 c.c. and the serum calcium on two occasions was 7.6 and 6.5 mg. per 100 c.c.

Incidence

Dr. H. H. Joffe: The alertness of the profession in recognizing the symptoms of hyperparathyroidism is the major reason for the increase in frequency of the disease. In recent collective review[23] 96.3 per cent of the twenty-seven reported cases in the literature between 1903 to 1925 were diagnosed at autopsy examinations, as compared to 3.7 per cent diagnosed at operations. During the period 1936 to 1945, of the 174 cases reported, 87.4 per cent were diagnosed at operations and only 12.6 per cent at necropsy examinations. The increasing diagnostic accurracy is further exemplified by the fact that twenty-four cases had been proved at operations at the Mayo Clinic from September 30, 1942, to January 30, 1945, in contrast to fourteen cases observed during the preceding fourteen years.

Norris,[23] in reviewing 322 cases of parathyroid adenomas reported in the literature, found that the location was specified in only 251 cases. The right side of the neck accounted for 132 (52.6 per cent) and the left side for 119 (47.4 per cent). The more specific location was defined in only 197 cases, with 42.7 per cent occurring in the right lower gland and 41.1 per cent in the left lower gland. The right upper and left upper glands accounted for 9.1 and 7.1 per cent respectively. Single adenomas in aberrant positions were recorded in thirty (10.7 per cent) of 281 cases, with nineteen (63.3 per cent) occurring in the mediastinum, nine (30 per cent) within the thyroid gland and two (6.7 per cent) behind the esophagus. Of 322 cases, more than one adenoma was found in twenty (6.2 per cent) of cases.

The age group between thirty to sixty years accounted for 70 per cent of 316 tabulated cases.[23] The incidence was found to be 3 to 1 in women for single adenomas and 4 to 1 in the group of multiple adenomas. The maximum incidence in men occurred a decade earlier than in women. The latter are divided into two phases which extended through and correspond to the child-bearing period, reaching a peak at forty-five years of age.

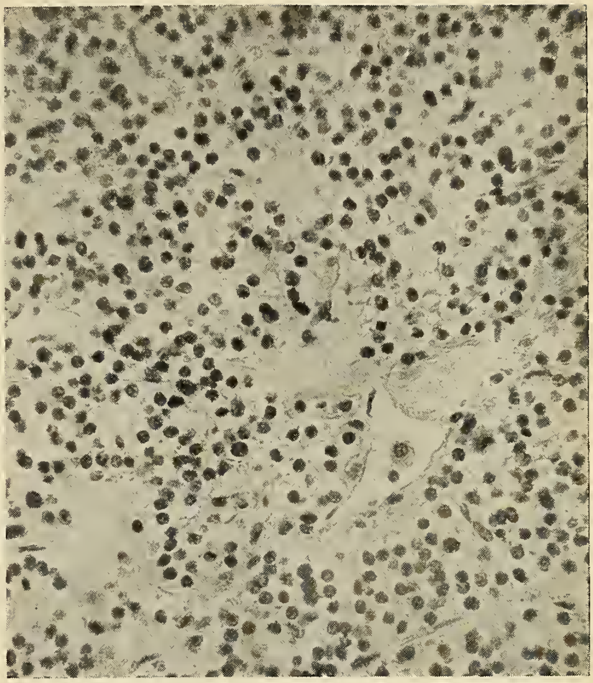

Fig. 3. High power view of parathyroid adenoma illustrating the water-clear type of cell.

Pathologic Physiology

The parathyroid hormone acts to increase the excretion of calcium, and if insufficient amount of calcium is being absorbed from the intestines, or if the output is greater than the intake, the chief reservoirs of calcium, namely the bones, are depleted.[23,30] Why generalized osteoporosis predominates in some patients and osteitis fibrosa cystica is most prominent in others is not clearly understood, but it has been postulated that the latter apparently develops in those in whom loss of calcium is more rapid.[23]

The terminal results of hyperparathyroidism are well known, but the mode of action still remains one of conjecture. At present the mechanism of action is thought to be initiated only by chemical or hormonal stimuli.[27] Prolonged stimulation of the sympathetic nerves to the glands failed to produce any change in the blood calcium.[27] The endocrine relationship to the pituitary gland is open to question. However, Perlman[25] reported a dog having an atypical eosinophilic adenoma of the pituitary gland and at postmortem examination was found to have a coincidental adenomatous hyperplasia of the parathyroid and severe chronic nephritis, together with fibrous osteopathy without brown cysts.

Collip[23,27] feels that the chief action of the parathyroid hormone is directly on solution of calcium salts from bone, while Albright[3,23,27] contends that its chief action is in promoting the renal excretion of phosphate. Recent experiments show that the hormone may act on both simultaneously.[27]

The parathyroids regulate the level of blood calcium, determine the rate of movement from the great calcium deposits, the bones, into the blood stream and tissues, and thence out into the urine.[8] Injection of parathormone causes excretion of phosphorous and calcium in the urine which is usually followed by an increase in the blood calcium with removal of calcium from the bones.[6] Collip showed that excess doses of parathormone in dogs resulted in death in a few days and was preceded by anuria and retention of nitrogenous products.[3] Hueper showed that such dogs dying of acute parathyroid poisoning had calcium deposits in the thyroid gland, mucous membrane of the stomach, lungs, and kidney.[3] It is, therefore, felt that the kidney lesions are only a part of a more generalized process.

The calcium is precipitated out as phosphate salt in alkaline urine or as calcium oxalate in acid urine. Calculi may form in any part of the urinary tract from the renal tubules to the bladder. Calcium may also be deposited in the renal parenchyma as well as the lungs and arteries. With progressive renal calcification or nephritis due to ascending sepsis, the kidney fails to excrete the excess calcium with which it is burdened by the overactive gland. The excess is excreted by the large bowel and the blood level of calcium remains as before.[23] Retention of phosphate, chlorides and nitrogenous products occurs with renal impairment.[23,24,27]

Phosphatase which is an important enzyme in regeneration of bone is also elevated in hyperparathyroidism because nature makes an attempt to form new bone where old bone is being removed.[29]

The order of events in the pathologic physiology of hyperparathyroidism may be briefly summarized as follows:[22] (1) excessive activity of the parathyroid, (2) extraction of minerals from soft tissues and their excretion, (3) mobilization and withdrawal of not only calcium, but earthy alkaline substances from bone, (4) proliferation of osteoclasts to phagocytize the decalcified matrix and proliferation of fibrous tissue to replace the bone.

Primary hyperplasia of the parathyroid glands is the result of adenoma with secretion of excessive amounts of parathormone and depletion of the calcium stores, resulting in generalized osteoporosis or osteitis fibrosa cystica. Secondary hyperplasia is a compensatory mechanism and can be due to such underlying conditions as:[13,20] chronic renal insufficency, severe rickets, osteomalacia, osteitis deformans, fragilitas ossium, multiple myeloma, metatstatic carcinoma of bones and nephrolithiasis.

The exact mechanism of parathyroid hyperplasia in chronic renal insufficiency or renal rickets is debatable; however, retention of phosphate is generally admitted to be the initial stimulus.[2,11,24] Drake, Albright and Castleman were able to produce parathyroid hyperplasia in rabbits by repeated injection of a neutral buffered isotonic solution of sodium phosphate.[11] In renal insufficiency the plasma phosphates tend to be high because the kidney cannot excrete them readily. The high phosphate level lowers the plasma calcium which acts as a stimulus to the parathyroids.[6]

Histology

The normal gland is generally considered to have three types of cells; the chief, water-clear and oxyphil cells. The first two are probably the same except for degree of maturation. Based on size and structure of the protoplasm, these cells are divided into four types; dark, clear, vesicular and water-clear.[6] The chief cells are small and possess dense cytoplasm in contradistinction to the water-clear cells which are large with vacuolated cytoplasm. The other cell types are considered transitional with the great majority of the cells belonging to the intermediate type, thus giving the impression of a progressive development from the dark chief cells through the intermediate types to the water-clear cells.[6] The oxyphil cells possess a dense acidophilic cytoplasm.

Welsh in 1898, in a study of normal glands from forty human autopsies, was the first to distinguish the oxyphil cell from the predominate chief cells and derivatives.[10] He believed that the least specialized cell was what is now called the "water-clear" or "wasserhelle" cell. The arrangement of both the oxyphil and chief cells varied from masses to anastomosing and branching columns and finally cords of a single cell width. True acini formation were only rarely found.

Histologic studies confirm the monophyletic theory of the origin of the various cells.[6,10] Surprisingly enough, little of fundamental importance has been added since the original description of Welsh. Kurokawa,[10] in studying 815 glands removed from 240 necropsies, ranging in age from a seven-month-old fetus up to eighty years of age, found that up to puberty the cells are all water-clear cells containing glycogen but no fat. At puberty these cells begin to decrease and the dark chief and oxyphil cells gradually appear. The dark chief cells contain fat but no glycogen and the oxyphil cell contains neither fat nor glycogen. When the cytoplasm in the chief cell is entirely absent (complete vacuolization) the cell is called "water-clear" or "wasserhelle" cell. At puberty or soon afterwards the pale oxyphil cells gradually appear, at first singly and then in pairs, increasing in number with advancing age, forming large islands after forty to fifty years of age. The dark oxyphil cells occur singly, are not present before puberty, and likewise do not contain fat or glycogen.[10]

Histologically the parathyroid neoplasias usually contain all of the types of cells common to the normal gland.[19] Castleman and Mallory[10] did not find pure tumors of either the oxyphil or water-clear type in their series of neoplasias. Numerous transition forms can always be demonstrated. They believe that the chief cell is the basic fundamental cell with the other cells regarded as degrees of differentiation or as involution forms. Hyperplasis of the parathyroid is characterized by diffuse involvement of all the glandular tissue and occurs in two forms, a more common water-clear cell type and a much rarer chief cell type.[10]

The cells may show a considerable degree of pleomorphism with mitosis, which has often led to an erroneous diagnosis of carcinoma. It is generally agreed that the great majority are clinically benign, rarely recur, invade or metastasize.[10,13,19,23] Burke[8] reported a case of recurrent adenoma apparently due to a transplanted fragment between the muscles of the neck.

Clinical Manifestations

Hyperparathyroidism is pleomorphic in its clinical manifestations. It may be suspected most often in three principal ways: (1) through its bone lesions, (2) its kidney complications and (3) its general somatic effects.

There are two types of bone lesions, a cystic form, osteitis fibrosa cystica, and a diffuse decalcification. Although osteitis fibrosa cystica is the classical form of the disease it is not as common as the form associated with urological symptoms.[12,13,27] Over a ten-year period in sixty-seven cases of hyperparathyroidism, Albright and associates[12] found the classical picture of osteitis fibrosa cystica in only one-third of the cases. Another one-third showed mild and often insignificant degrees of skeletal involvement, and the remainder showed no osseous disease. Norris[23] in a collective review of 322 cases found osteitis fibrosa generalisata in 191 (59.3 per cent). The symptoms resulting from involvement of the osseous system varies from vague aches of pains in the extremities and back, to a truly disabling condition with pathologic fractures, cysts, tumors and deformities.[19,20,23]

The renal complications are three: a diffuse calcinosis, calculus formation, and pyelonephritis complicating the calculi. Norris[23] found associated skeletal and renal lesions in 101 out of 322 cases (31.4 per cent) and renal lithiasis and or renal calcification alone in seventeen (5.3 per cent). Approximately 10 to 15 per cent of all patients with renal calculi have the calculi as a complication of primary hyperparathyroidism. The complication of renal calcification occurs in over 65 per cent of cases of hyperparathyroidism.[27] Keating and Cook[19] found renal calculi in eighteen out of twenty-four cases with bilateral calculi in seven cases. Fourteen of these cases had previously undergone a total of twenty surgical procedures for renal calculi.

The more general somatic symptoms as a result of biochemical changes in the blood and urine are too commonly present in other diseases to be of much diagnostic aid. They include: muscular atony, weakness, fatigue, constipation, anorexia, loss of weight, nausea, and vomiting, polyuria and polydpsia. The latter two occurred in eleven (46 per cent) of twenty-four cases.[19]

Diagnosis

The biochemical and roentgenologic studies and biopsy of the bone lesions are principal aids in the establishment of the diagnosis of hyperparathyroidism.

The demonstration of the biochemical changes is concerned with (1) an increased serum calcium, (2) a reduction of inorganic serum phosphorus, and (3) hypercalcinuria. To the foregoing may be added an increased alkaline phosphatase.

An elevated serum calcium above the normal of 9 to 11 mg. per 100 c.c. may be very slight, and repeated determinations may be necessary in order to establish a definite diagnosis. In twelve out of twenty-four cases at the Mayo Clinic,[19] the average concentration was less than 12.5 mg. per 100 c.c. The values were generally higher in those cases with classical bony changes.

The total calcium is made up of two fractions, calcium proteinate in which the calcium is bound to serum protein and ionic calcium. The former varies with changes in the protein concentration and is not primarily affected by the parathyroid hormone, whereas the ionic calcium is affected by parathormone.[19,21] It is therefore plausible that with a lowered serum protein and a normal total calcium, one may actually have an elevated ionic calcium[19,21] Neither of the calcium fractions can be measured directly; however, both apparently can be estimated from the concentration of total calcium and total protein by the use of the nomogram of McLean and Hastings.[21] Certain conditions such as multiple myeloma and sarcordosis are frequently accompanied by an increased total serum protein and by hypercalcemia secondary to the elevated protein. However, in the experience at the Mayo Clinic,[19] a reduction in serum protein to sufficiently mask hypercalcemia was rarely encountered as a diagnostic problem in hyperparathyroidism. Conversely an elevated total serum protein was a relatively frequent means of avoiding an erroneous diagnosis of parathyroid disease.

The reduction of inorganic serum phosphorus from the normal of 3 to 4 mg. per 100 c.c. is usually slight. In 25 per cent of cases, one or more determinations fell within the normal range, and 17 per cent of cases the level was at the lower limit of normal.[19]

Hypercalcinuria was demonstrated in fourteen of fifteen patients with renal lithiasis in whom hyperparathyroidism was excluded.[26] In 50 per cent of these cases there was evidence of renal damage which may demonstrate that moderately diseased kidneys may excrete calcium in the urine in the absence of other explainable causes. A low level of calcium in the urine, in a concentrated specimen, in the absence of renal disease, as indicated by the Sulkowitch test, practically rules out hyperparathyroidism.[19]

An elevated alkaline phosphatase does occur with hyperparathyroidism and is more commonly seen in the group with classical bone changes. It is believed to be the result of osteoblastic activity and therefore, not pathognomonic of the disease itself.[4,19,23,29]

Roentgenologic examination of the bones in the early stages reveals the trabeculae to be thin and delicate with the cortex so thin that the bone has a ground glass appearance.[23,30] This is best seen in the flat bones such as the calvarium. In advanced cases there is wide spread demineralization with multiple cysts, pathologic fractures,[19,30] expanding tumors and a variety of skeletal deformities. The common sites of the cystic lesions are the jaw, pelvis, long bones, ribs, metatarsal and metacarpal bones.[30] Strock,[28] in reporting the dental roentgenologic findings in forty-five out of fifty-one cases, found that one-half of the cases showed cystic-like cavities in the jaw, malocculsion, osteoporosis and absence of lamina dura.

The diagnosis of giant cell tumor of bone on biopsy or x-ray without further laboratory and metabolic studies should be made with reservation. Goldman[16] reported a brother and sister erroneously diagnosed as giant cell tumors by x-ray in one and by biopsy in the other.

Both were treated successfully by surgical removal of parathyroid adenomata. At present we do not feel that giant cell tumor of bone can be histologically differentiated from osteitis fibrosa cystica.

In summary, the possibility of hyperparathyroidism should be considered in: (1) all cases of neophrolithiasis or nephrocalcinosis, (2) all cases in which there is x-ray evidence of generalized demineralization, (3) all cases of cysts or bone tumors, (4) all cases of giant cell tumors so diagnosed by biopsy, (5) all cases in which there are symptoms referable to the skeleton, especially pathologic fractures.[1,19,23]

The secondary or compensatory hyperplasia of the parathyroids due to some underlying disease must be differentiated from primary hyperplasia (adenoma) of the parathyroid gland. In the former, surgical removal will not cure the underlying pathologic process.

Treatment

The treatment of primary hyperplasia is surgical excision, and it may occasionally challenge the ingenuity of the surgeon to locate the erring gland or glands. Following surgical removal, the serum calcium falls rapidly to normal in a day or two with the inorganic phosphorous returning to normal more gradually.[19] Postoperative tetany is usually not so severe that it cannot be controlled by the usual means.[19] However, Albright[2] stated that severe tetany usually only occurred in patients in whom the level of alkaline phosphatase exceeded 20 Bodansky units before operation.

The removal of a hyperfunctioning parathyroid may invite immediate chemical changes with resultant acidosis. Couch[15] reported a case of acidosis with a carbon dioxide combining power of 19 volumes per cent which was treated with dramatic results by intravenous sodium bicarbonate.

The explanation for the production of acidosis is that the acid radicals, phosphates, sulphates and chlorides tend to be retained in the blood stream while base sodium is freely excreted by the kidneys and the base calcium is retained in the bones.

Summary

We have presented a case of hyperparathyroidism due to an adenoma. This patient presented all of the principal diagnostic features of this syndrome, including (1) multiple bone cysts, (2) spontaneous fracture of bone, (3) generalized decalcification of bone, (4) renal calculi, (5) hypercalcemia, and (6) increased alkaline phosphatase.

In spite of the study of the case by several physicians, including at least one pathologist, an orthopedist, two roentgenologists, a surgeon, and two general practitioners, the diagnosis was not established over a six-year period. Physicians should always consider primary hyperparathyroidism in cases presenting (1) bone cysts, (2) pathologic fractures, (3) renal calculi, (4) "giant cell" tumor of bone, and (5) generalized decalcification of bone.

An incomplete review of the literature has been presented.

It has been estimated that nearly four per cent of all persons who visit physicians' offices are coughing or expectorating. The alert physician will insist upon a sputum examination of all such patients. Such practice will be rewarded by the discovery of tubercle bacilli in three or four of every 100 specimens examined. The country doctor will often be astonished to discover that a patient with slowly resolving pneumonia has an acid-fast reason for prolonged convalescence.—*Pub. Health Rep.,* Dec. 6, 1946.

CASE FOR DIAGNOSIS

A. J. HERTZOG, M.D., and JULIAN SETHER, M.D.
Minneapolis, Minnesota

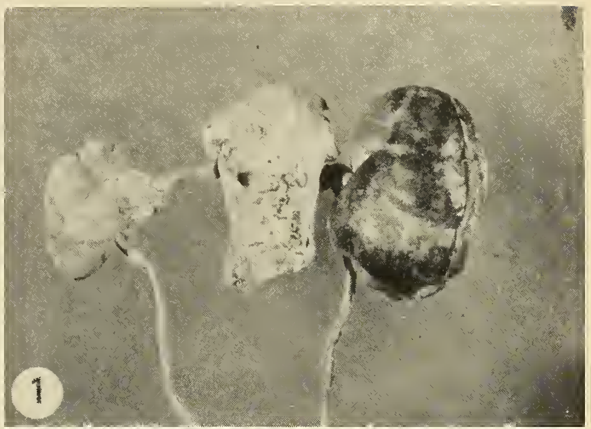
Dr. Julian Sether: This case (A-46-2461) was that of a sixty-six-year-old woman who was admitted to the Minneapolis General Hospital at 11:00 P.M. on November 30, 1946, with a two-hour history of severe sudden nonradiating pain in both lower abdominal quadrants. The pain was associated with nausea, vomiting, and several loose bowel movements. Melena or hematemesis was not noted. The pain was colicky, sharp, and stabbing.

The patient was first seen in this hospital in July, 1938, complaining of polydipsia, polyuria, and dysuria of one year's duration. Blood pressure at this time was 145/82. The diagnosis of diabetes mellitus was established. She was discharged on insulin therapy. She was again admitted in March, 1940, because of some swelling of her ankles. Blood pressure was 150/90. An electrocardiogram showed left axis deviation. The left optic lens was removed in 1941 because of a cataract. In 1942, a cystocele and rectocele were repaired. In March of 1943, auricular fibrillation was present and she was digitalized. In 1945, a midthigh amputation was performed for gangerene of the left foot. The blood pressure was 230/88. The heart showed numerous extrasystoles and a late diastolic murmur at the apex. She continued to take insulin and her diabetes appeared well controlled.

Physical examination on this last and final admission showed her temperature to be 98 degrees; pulse, 58 per minute; respiration, 24 per minute; and blood pressure, 210/90. She was slightly obese and was complaining of severe lower abdominal cramps. The lungs were clear. The heart was enlarged to the left. An early and late mid-diastolic low-pitched blowing murmur was present at the apex of the heart. The second pulmonic sound was slightly accentuated. The abdomen showed a minimal tenderness in the right upper and left lower quadrants. Minimal tenderness was present over the left costovertebral angle. The left mid-thigh amputation was healed.

Hemoglobin was 86 per cent (Sahli). Leukocyte count was 26,900 with 96 per cent neutrophiles and 4 per cent lymphocytes. Urinalysis revealed two plus sugar and numerous pus cells. The blood sugar was 515 mg. per cent and the carbon dioxide combining power of the blood was 62 volumes per cent. An electrocardiogram showed auricular fibrillation and low voltage in all three leads.

The pain persisted. On the second hospital day, she developed a complete anuria. The blood sugar dropped to 65 mg. per cent. The blood urea nitrogen rose from 79 mg. per cent on the third hospital day to 104 mg. per cent on the day of death. The anuria persisted. She became stuporous and had a convulsive seizure on the seventh hospital day. She expired a few minutes after the convulsion.



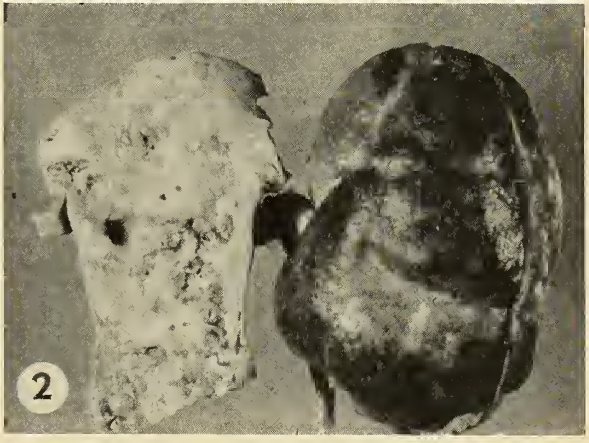


Fig. 1. *(above)* Marked atrophy of right kidney.

Fig. 2. *(below)* Infarction of left kidney with thrombosis of left renal artery.

Dr. Hertzog: This case represents a diagnostic problem. The patient was a sixty-six-year-old diabetic who expired seven days after the onset of severe lower abdominal pain. Within forty-eight hours after the onset of pain, she developed anuria. Death was apparently the result of uremia. Does anyone wish to make a diagnosis?

Dr. F. Gouze: We know the patient had severe arteriosclerosis and hypertension as well as her diabetes. The left leg was amputated in 1945 for arteriosclerotic gangrene of the left foot. One naturally thinks of some complication of arteriosclerosis such as mesenteric thrombosis. Her heart was fibrillating so there is also the basis for an embolic phenomenon. The cardiac murmur suggests a mitral stenosis. The left ventricular enlargement could be explained on the hypertension.

From the Department of Pathology, Minneapolis General Hospital, A. J. Hertzog, M.D., Pathologist.

Dr. Hertzog: The clinical picture was not that of a mesenteric thrombosis, as she was never distended nor showed signs of an ileus. A diabetic can develop chronic uremia on the basis of arteriosclerosis of the kidneys. In this case, the anuria and uremia were of sudden onset associated with severe lower abdominal pain. Does any one else wish to make a diagnosis?

Students: Dissecting aneurysm of the aorta. Thrombosis of a renal artery.

Dr. Hertzog: I think both of these are excellent suggestions in view of what we found at autopsy. How are we going to explain the anuria? Thrombosis of one renal artery would not give you an anuria. A dissecting aneurysm would likewise have to interrupt the blood supply to both kidneys. She never developed the picture of a shock. Dr. Sether will give the findings at autopsy.

Autopsy

Dr. Sether: We were naturally interested in the kidneys in this case. The right kidney was small and atrophic (Fig. 1). It weighed only 20 grams. The right renal artery showed approximately 80 per cent reduction of its lumen by atherosclerosis. The atrophy of the right kidney appeared to be due to arteriosclerosis of this renal artery. However, we cannot completely exclude a secondary atrophy associated with an old pyelonephritis. The left kidney weighed 140 grams. It had a swollen purplish red appearance. The left renal artery was completely occluded by a thrombus which began at the opening into the aorta. The appearance was that of a thrombus rather than an embolus (Fig. 2). On section of the kidney, it was completely infarcted. The heart weighed 350 grams. There was an old rheumatic mitral valve defect as found in mitral stenosis of a moderate degree. A mural thrombus was found in the left auricle. There was severe coronary sclerosis. The abdominal aorta, as seen in the illustrations, showed severe atherosclerosis. The pancreas showed hyalinization of the islands of Langerhans are found in diabetes mellitus.

The anatomical diagnosis was (1) thrombosis of left renal artery with acute infarction of left kidney; (2) renal arteriosclerosis with contraction and atrophy of right kidney; (3) uremia; (4) diabetes mellitus; (5) old rheumatic mitral valve defect; (6) mural thrombosis of left auricle; (7) generalized arteriosclerosis; and (8) ancient amputation of left leg.

Dr. Hertzog: The clinical picture is now explained when we know that from a functional standpoint the patient possessed only one kidney. When this remaining kidney became infarcted as a result of thrombosis of the left renal artery, she developed the pain and anuria.

DECAY OF THE FAMILY?

It is alleged that the institution of the family in Western civilization is going on the rocks. *Life* magazine† discusses the question editorially, pointing out that according to Dr. Carl Zimmerman, Harvard sociologist, "the Western family has collapsed twice before, in Greece about 300 B.C. and in Rome about 300 A.D., in each case marking the decline of those states." Decay of the family in Greece and Rome was marked by corruption, vanishing birth rate, demigration of parents, juvenile and adult delinquency, says *Life*.

Certainly, accumulating statistical evidence seems to lend weight to the warnings from many sources that something is happening to the modern family. Such a state of affairs should be of the gravest concern to doctors of medicine. It is probably inevitable that as civilizations evolve from their simpler, more rudimentary forms to their complex maturity the diseases of industrial middle age and early atomic-age senescence invade their cells destructively. Oswald Spengler elaborated the thesis in his *Decline of the West* some time ago.

If the family decays, what then becomes of the family doctor? The ready answer would be that he becomes the decayed-family doctor. How near to that status is he now? If the decay of the family is marked by the symptoms recited in our first paragraph, should not medical educators, medical societies, and others interested in the future of medicine, give thought to the fact that a falling birthrate will necessitate fewer obstetricians and pediatricians, but probably more gynecologists, genito-urinary practitioners, and psychiatrists? The decayed-family practitioner could conceivably be a combination in one person of formerly separate specialties best calculated to make of him a decayed-family friend and counselor. His premedical curriculum could include law, sociology, the rudiments of police work, philosophy with special emphasis on Spencer and Spengler, abnormal psychology, the rudiments of statism, with possibly some attention to English composition.

The medical curriculum could well omit any attention to all but a certain few infectious diseases, substitute nuclear physics and diseases of irradiation, which may be reasonably expected to increase as more and more radio-active gases and other substances are released. There you have the ideal, shortened course to produce the decayed-family practitioner. Medicine should be ever on the alert to be functional in its service to humanity, wherever that may lead, even to the establishment of the qualifications and training of decayed-family doctors, if need be.—*New York State J. Med.*, July 15, 1947.

Case Report

THE SURGICAL HISTORY OF A CENTENARIAN

DANIEL J. MOOS, M.D., and JOHN V. FARKAS, M.D.
Minneapolis, Minnesota

THE patient, J.F.D., aged ninety-eight years, was first admitted to the Minneapolis General Hospital on August 24, 1941, with the diagnosis of strangulated right inguinal hernia. He complained of severe pain in the right lower abdomen of approximately twelve hours' duration. There had been no nausea or vomiting. The patient's past history indicated that he had worn a truss for bilateral inguinal hernias for many years. Two years before admission he had suffered a mild heart attack but otherwise had been in good health.

Physical examination disclosed a well-developed, well-nourished, elderly white man suffering from severe pain in the right groin. His teeth were in an excellent state of preservation. The heart was enlarged to the left. The abdomen was not distended, but there was a very tender small mass in the right lower abdominal quadrant over the internal inguinal ring. Considerable excoriation of the skin was present in this region, due to mechanical irritation from a truss. The blood pressure was 168 mm. of mercury, systolic, and 72 mm., diastolic. The only other abnormal physical findings were a small inguinal hernia on the left side and a hydrocele on the right. On the day of admission the hernia was reduced by gentle taxis without anesthesia (DJM). The patient was observed in the hospital for a period of three days. During this time the dermatitis of the groin was treated locally and gradually improved. On August 27, 1941, the patient was sent home feeling well.

Second Admission—Age 99

The admission diagnosis one year later, on August 16, 1942, was strangulated right inguinal hernia.

The history obtained from relatives of the patient revealed that the man had complained of pain in the right side of his abdomen for four days, had had anorexia for several days, with no bowel movements during that time, and had had intermittent vomiting for thirty-six hours. Generalized abdominal tenderness, most marked in the right lower quadrant, severe abdominal distention, and a tender firm mass, 5 cm. in diameter, in the right inguinal region, were noted on physical examination. His temperature was 99° F. Laboratory studies, including blood and urine examinations, were within normal limits, save for signs of dehydration. A diagnosis of small bowel obstruction due to strangulated right inguinal hernia was made, and surgical treatment was advised. With an ilio-inguinal nerve block for anesthesia (1 per cent procaine solution), a right inguinal herniotomy was performed (DJM), revealing a strangulation at the internal inguinal ring. The sac contents included necrotic omentum, a large amount of dark serosanguinous fluid, and a loop of strangulated small intestine, 14 cm. long, which on further examination proved to be ileum. This was very dark in color, lacking in lustre and without visible peristalsis. There was a subserosal hematoma encircling the constricted portion of the intestine.

The internal inguinal ring was incised to allow return of circulation to the compromised portion of the bowel. The necrotic omentum was resected. The loop of ileum was wrapped in warm saline packs for ten minutes, after which it began to resume a more normal appearance, except for one portion, 3 cm. long and 2 cm. wide, which improved in color but through which peristalsis passed very poorly. The viability of this area was questionable; however, because of the extreme age and poor condition of the patient, it was decided not to resect the damaged bowel. As an alternate procedure a portion of peritoneum from the hernial sac was used as a free graft to cover the area, the peritoneum being attached to the intestine with interrupted cotton sutures. A modified Bassini-type repair was effected, using interrupted sutures of 35 gauge stainless steel wire.

Postoperatively the patient was quite ill. His course was complicated by marked ileus which was treated by duodenal suction and by restoration and maintenance of a normal fluid and electrolytic balance. On the second postoperative day, and daily thereafter, he was allowed to be out of bed in a chair. Signs of mild bronchopuneumonia developed on the third day. The temperature varied between 99° F. and 103° F. for the first ten days following surgery, then gradually returned to normal. A slight amount of purulent material drained from the operative wound, but the incision was completely healed at the time the patient was discharged from the hospital on October 6, 1942.

Third Admission—Age 100

The admission diagnosis, seven months later, on March 15, 1943, was a possible head injury with lacerations of the scalp.

According to the history obtained from relatives of the patient, he had been found lying in the street in a somewhat dazed condition, apparently having fallen on the icy pavement. Physical examination on admission revealed an elderly white man who had sustained a scalp laceration 3.5 inches long in the left parietal region. He was somewhat irrational but not unconscious. Further examination showed a well-healed right inguinal operative scar. The blood pressure was 148 mm. of mercury, systolic, and 100 mm., diastolic. The pulse rate was 100 beats per minute. Neurological examination was negative except for signs of mild confusion. The laceration of the scalp was cleansed and repaired under local anesthesia (1 per cent procaine solution) with several silk sutures. On March 18, 1943, a lumbar puncture was performed. The spinal fluid was clear, colorless, and under no increased pressure. The cell count was normal. Roentgenograms of the skull showed no evidence of fracture. The patient was allowed to be ambulatory, and his clinical course appeared to be satisfactory until March 20 when he complained of pain in the left groin. Examination at that time disclosed a tender mass, 7 cm. in diameter, in the left inguinal region which clinically appeared to be a direct inguinal hernia. This was irreducible using gentle taxis; therefore, an emergency herniotomy was performed (JVF).

One per cent procaine solution was used for local anesthesia. A strangulated sliding type of hernia, forming a mass 6 by 8 cm., was found. The hernial sac contained several cubic centimeters of clear yellow

---

From the surgical service of the Minneapolis General Hospital.

fluid. The sliding portion of the hernia was formed by a part of the sigmoid colon. After incision of the constricting band at the neck of the sac, no impairment of circulation of either the large bowel or the mesocolon persisted. The neck of the sac was reconstructed, ligated, and the redundant portion amputated. Orchidectomy was performed in order to obtain a more firm repair. Interrupted cotton sutures were used throughout.

The patient was permitted to be out of bed on the first postoperative day. On the fourth day following surgery his temperature suddenly rose to 104° F. and signs of left pulmonary atelectasis appeared. This was treated by inhalation of 20 per cent concentration of carbon dioxide gas, combined with manual chest compression over the left side of the thorax. The patient expectorated a large amount of grayish mucus, following which his condition steadily improved and his temperature receded to normal. He was allowed to be up each day. The skin clips were removed on the sixth postoperative day and the wound was found to be healing by primary intention. At the time of discharge on May 3, 1943, the patient was in good health. He had no complaints, and his operative wounds were well healed.

Fourth Admission—Age 102

The patient was admitted on October 7, 1943, to the neurological service with a diagnosis of cerebral apoplexy. Physical examination revealed an elderly white man in an unconscious state. His entire left side exhibited flaccid paralysis. The blood pressure was 190/80. Laboratory studies indicated normal blood and urine findings. Examination of the abdomen showed bilateral, well-healed herniorrhaphy scars, with no recurrence of hernia. The right hydrocele was again noted.

The patient was in poor general condition during his entire hospital stay, and his prognosis was grave. Despite the administration of 620,000 units of penicillin between October 15 and October 20, for treatment of pneumonia which had developed, his course was downhill, and he expired on November 27, 1945. Permission for autopsy was not obtained. The causes of death were: (1) encephalomalacia, right internal capsule due to thrombosis; (2) generalized arteriosclerosis, and (3) senility.

Summary

1. There is presented the case of a man requiring emergency operation for strangulated inguinal hernia on two occasions, one at the age of ninety-nine years, the other at the age of 100.

2. Local anesthesia was the anesthetic of choice for both procedures.

3. Early ambulation was allowed following each herniorrhaphy.

4. Pulmonary complications followed both operations despite early ambulation.

5. Wound healing was satisfactory.

6. The patient was observed over a period of two years, during which time no recurrence of either hernia was noted.

ARMY ENGINEERS TO BUILD MEDICAL CENTER

What is planned to be the greatest medical research center in the world will be built at Forest Glen, Maryland, by the Corps of Engineers for the Office of The Surgeon General, according to a recent announcement made by Major General Raymond W. Bliss, The Surgeon General. In keeping with technological advances in all fields, based on experiences in the late war, the center will be equipped to anticipate and meet the medical problems of the future as well as to cope with those of the present. The initial cost is estimated at approximately $40,000,000. Construction will be supervised by the District Engineer, Washington, D. C. Engineer District.

Officially designated as the "Army Medical Research and Graduate Teaching Center," the project will consist of a 1,000-bed general hospital, capable of expansion to 1,500 beds; the Army Institute of Pathology building; the Army Medical Museum and Center Administration building; Central Laboratory Group buildings; and the Army Institute of Medicine and Surgery. A working library, animal farm, quarters for the staff and other buildings, are included in the plans.

Located just outside of Washington, the new Army Medical Center will have the advantage of close relationship to the Walter Reed General Hospital, the Naval Medical Center, the medical schools of the District and the proposed new Washington Medical Center, with all of whom ideas can be interchanged. In addition, members of the District of Columbia Medical Society, among them some of the finest specialists in the world, and medical experts from other Government departments, will be available for consultation. The Center will also co-operate with the National Bureau of Standards, the National Institute of Health and the National Research Council.

BIRTHS EXCEED ONE AND ONE-HALF MILLION

Births in May, 1947, are estimated to have numbered 302,000 in the United States, according to figures released by the National Office of Vital Statistics, U. S. Public Health Service. This is 29 per cent more than the estimate for May of last year and it brings the total for the first five months of this year to 1,572,000.

Although the birth rate of 26.4 per 1,000 population including the armed forces overseas for the five-month period, January to May, 1947, was nearly 40 per cent higher than the provisional rate of 19.1 for the corresponding period of 1946, the birth rate has been lower this year than it was in the last four months of 1946 when it reached record-breaking heights. The decrease has taken place in spite of the fact that publications of this Office show that the number of marriages reported ten to twelve months ago and throughout 1946 were unusually large. It is possible that the peak in the birth rate in the latter months of 1946 was due not only to first births to newly married couples, but also to births to families who already had children and first births to couples married before or during the war. The fact that the birth rate has decreased while marriages remained high suggests that now second and third births to established families and first births to persons married more than one year are adding less to the birth rate than they did at the end of last year.

The estimated numbers of births in each of the forty-six states reporting monthly and the District of Columbia appear in the *Monthly Vital Statistics Bulletin* released by the National Office on July 9, 1947.

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from June issue)

D. N. Morse, born in New York in 1826, arrived in Chatfield in 1856 accompanied by his wife, Phoebe Morse, who was a native of Ohio, born in 1834. Their son, Travers, who in 1860 was three years old, according to a census report, was one of the first children born in Chatfield.

Physician and dentist, Dr. Morse was one of the earliest practitioners in Chatfield and certainly was one of the first of any profession to place a card in the recently established newspapers of the village, the *Republican* and the *Democrat,* both of which printed their initial editions early in the autumn of 1856.

In the *Chatfield Republican* of November 22, 1856, Dr. D. N. Morse, dentist, announced that he was one mile east of Chatfield on the La Crosse Road. In a later issue he elaborated as follows:

> D. N. Morse, Physician and Dentist, will be found at all hours except when absent on professional business, at his office one mile from town on the La Crosse Road. Particular attention paid to all branches of the profession of medicine and dentistry.

After 1857 Dr. Morse's cards did not appear in either of the newspapers. His name has not been noted in any of the available early business and professional directories, beginning in 1865.

"**Dr. Murray,** President," was the name appended to an announcement of a meeting of the Fillmore County Eclectic Medical Society to be held on July 31, 1869, which appeared in the *Preston Republican* of July 23, 1869. Inasmuch as this is the only mention of a Dr. Murray in Fillmore County that has been seen by the writer and inasmuch as Dr. J. J . Morey (and the name in the transactions of the society was spelled "Morrey") was a charter member and an early officer of the group, it is assumed that Dr. Mor(r)ey may have been the signer of the notice; furthermore, the two names never appeared in the same notice. The assumption seems justified when it is remembered that in those days material submitted to the local editor probably was written in longhand, which is easily subject to misinterpretation.

Hildus Augustinus O. Nass was born on January 8, 1872, in Winnesheik County, Iowa, the son of H. O. Nass and Anna Nass, both of whom were natives of Norway; his father was a farmer and storekeeper.

Hildus Nass was a pupil in the public schools of Waukon, Iowa, received his premedical instruction at the Preparatorial Department of Luther College, at Decorah, and his medical training at the State University of Iowa, at Iowa City, from which he was graduated on March 30, 1898. On the advice of friends who knew the needs of the locality and the opportunities it offered, in the summer following his graduation he settled in the village of Mabel, Fillmore County, taking up his residence there on July 19, 1898; a month earlier, on June 16, he had obtained his license to practice medicine in Minnesota. In the early days of his practice discouragement sometimes was near; he was young and looked especially young in comparison with the senior physicians of the vicinity, who were elderly men; and besides, as he had said, he was just starting and was not well known.

As it happened, when Hildus Nass was a senior medical student, he had the privilege of assisting in the office of Dr. Walter Bierring, who was then Professor of Pathology and Bacteriology in the medical department of the university. Diphtheria antitoxin had been discovered and was beginning to come into use, and Dr. Bierring recognized its merits and informed his classes. In the second autumn after Dr. Nass had settled in Mabel, an epidemic of virulent diphtheria broke out in the community, taking several lives. The disease struck, among others, a family of eight children who lived southeast of Hesper, Iowa, which is just across the state line and not far from Mabel; two of the children had died and the remaining six were desperately ill when Dr. Nass finally was called in. To quote him:

> I immediately sent to my old friend, Dr. Walter Bierring, for diphtheria antitoxin, for it was new and could not be picked up at any corner drug store, as now. I used the antitoxin in all six cases and the patients all made a happy recovery. As far as I know, I was the first to use diphtheria antitoxin in this community, and from then on I used it in other cases with satisfactory results, not having a death from the dreaded disease.

This experience established the young physician's name in the community and turned the tide of practice. For forty-five years, increasingly esteemed and trusted, Dr. Nass followed his profession in the locality of his original choice. In the later years of his practice his own suffering from a cardiac condition influenced him to make a specialty of the diagnosis and treatment of diseases of the heart. He long was a member of the Fillmore County Medical Society and affiliated county groups, the Southern Minnesota Medical Association, the Minnesota State Medical Association and the American Medical Association.

Early in his career Hildus Nass was married to Maymie Nassie, a native of Fillmore County, who aided him in his useful life. Dr. and Mrs. Nass were members of the Lutheran Church of Mabel.

Dr. Nass died in Mabel on March 27, 1944, at the age of seventy-two years; there were no surviving relatives.

D. F. O'Brien was a physician and surgeon, office one door north of the post office, in Canton, Fillmore County, for a few months in 1883.

On April 26 the *National Republican* of Preston, often quoted in this series of sketches, carried the following barbed announcement—the barb for a physician unnamed:

> Dr. D. F. O'Brien has opened an office in the village of Canton. He deserves a large practice. He will never neglect a patient or disgrace his profession by mal practice such as deprived Commissioner M— of the use of an arm. Dr. O'Brien's card appears in our columns. Call and make his acquaintance.

By August 30, 1883, Dr. O'Brien had departed to practice medicine in Rossville, Allamakee County, Iowa.

Christen K. Onsgard, who was born at the farm home of his parents in Spring Grove Township, Houston County, on April 10, 1863, was one of the eight children of Knute Onsgard and Bergit Larson Onsgard. His sisters and brothers were Karli, Guro, Bella, Marie, Ingeborg, Lewis and Martin. The father and mother were natives of Hallingdahl, Norway, who had come into Houston County in the early fifties.

In the biographical dictionary appended to notes on medical history in Houston County (Guthrey) a sketch of Dr. Lewis K. Onsgard contains information relative to the Onsgard family and other data common to the two physician brothers that need not be repeated in detail here.

Christen Onsgard, like his younger brother Lewis, was a pupil at the public and parochial schools of Spring Grove and helped on the home farm. The brothers, encouraged by Dr. Thore E. Jensen, of Spring Grove, who was married to their sister Ingeborg, decided to become physicians and in 1884 they enrolled at the Eclectic Medical Institute of Cincinnati, Ohio, the school where Dr. Jensen had received his training. In 1887 they were graduated in the same class and when, on June 22, 1887, they were licensed to practice in Minnesota, they received consecutively numbered certificates, Christen, No. 1460 and Lewis, No. 1461.

On receiving his degree, Dr. Christen K. Onsgard returned at once to Spring Grove to begin his medical practice. After five successful years during which he met cheerfully the hazards of country practice of the period, he moved to Halstad, Norman County, Minnesota. On his return to southern Minnesota six years later, in 1899, he settled in Rushford, Fillmore County, there to practice medicine actively for twenty-one years as an able and progressive physician and to play his part as a responsible citizen. In 1920 he moved once more to Halstad and there followed his profession until failing health forced his retirement in 1929.

Early in his career Christen K. Onsgard was married to Emma Louise Dokken, an American girl of Norwegian descent, who was born in Spring Grove. Mrs. Onsgard died in 1925 and when, in 1929, Dr. Onsgard was obliged to give up his work, he returned to Rushford to make his home with his daughter Benora (Mrs. Elvin Humble). Of Dr. and Mrs. Onsgard's five children only one, Lloyd, was living in 1942, in Halstad. Clifford died in 1906, Verna in 1912, Vernon in 1924 and Benora in 1936.

Dr. Onsgard died in Rushford on October 21, 1929, from nephritis. He was a faithful member of the Lutheran Church, was active in the local Masonic lodge (A. F. and A. M.), and was identified with medical organizations: the Houston-Fillmore County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Lewis K. Onsgard (1866-1938), for forty-six years a practicing physician of the village of Houston, in Houston County, spent the first five years, from 1887 to 1892, of his professional life in Harmony, Fillmore County. As stated earlier, a detailed biographical sketch of Dr. Onsgard is included in notes on the history of medicine in Houston County.

Of **Wellington Daniel Parker, Esq.,** who came into southern Minnesota from the East, probably toward the end of the eighties, there has been little information available. There is record, however, that he belonged to the regular school of medicine, that he was licensed in the state on June 30, 1887, receiving certificate No. 1503 (R), which he filed in Fillmore County on December 13, 1887. For a time he was in Spring Valley and by 1890 he was in Lanesboro. It has been recalled by an elderly resident of Lanesboro that in the middle nineties Dr. Parker died in that village while still a young man and that during his terminal illness his mother came from the East to see him.

James Henry Phillips, the son of parents who were natives of Tyrone County, in the North of Ireland, was born at St. John's, New Brunswick, on February 28, 1852. Five years later the family moved to Chicago, Illinois, where James Henry grew up and received his education; at one period he was employed as an engraver. Of the other members of the family little information has been available; his brother William, became a big-league baseball player with the Cleveland and Brooklyn teams between 1880 and 1890.

In 1878, immediately after his graduation from Rush Medical College, young Dr. Phillips practiced medicine in Chicago for a short time, but in June of that year he was establishing himself in Fillmore County, Minnesota, in the village of Wykoff, Fillmore Township, and in the following August he went briefly to Chicago to be married to Alice Van Osdel, of that city. Dr. and Mrs. Phillips had two children, John and Lucia, who were born in Wykoff.

Wykoff, in the seventies and early eighties, was a thriving, incorporated village, on the Southern Minnesota Railroad and connected by tri-weekly and weekly stages with the settlement of Fillmore and Watson Creek, respectively. There were mills of various sorts, hotels, wagon shops and machine shops, a German newspaper, two churches and several stores. Dr. Phillips, in addition to practicing medicine, operated a drug store, at first in association with Mr. Jorris and later with Dr. Calvin H. Robbins, with whom he had entered partnership in medical practice. Dr. Robbins, twelve years older than Dr. Phillips, had been in the county, boy and man, since 1859, in medical practice since 1866, and in Wykoff since 1875.

By late 1884 Dr. Phillips had moved from Wykoff to Preston, because of better opportunity, and in that village he spent the next eighteen years. There his chief medical contemporaries before the turn of the century were George A. Love, Henry Jones and Lyman Viall; in 1900 and 1901 came William D. M. Beadie and Wendell B. Grinnell.

Throughout his residence in the county Dr. Phillips shared in medical affairs. Beginning in January, 1880, he was county coroner for seven successive years, and from 1892 to 1895 he again held the office. After the "Diploma Law" of 1883 was passed, he received license No. 551 (R), given on December 31, 1883. In 1886 he was a member, with Dr. Love and Dr. Robbins, of the newly created medical examining board of the Bureau of Pensions of Fillmore County. At the annual meeting of the Minnesota State Medical Association, at St. Paul on June 19, 1890, he was elected to membership and there is record of his attendance at meetings thereafter and of his serving on the Committee on Necrology in 1893. In 1904 his name appeared on the roster of the new Houston-Fillmore County Medical Society.

As a public servant in civic capacity he played a useful role as well, serving several terms as mayor of Preston and many years as a member of the board of education. In 1887 he was a member of the village council. In 1889 he was a representative from his district to the state legislature. He was a member of the Presbyterian Church and of various fraternal organizations, among them the Masons (A. F. and A. M.) and the Benevolent and Protective Order of Elks.

In the early eighties Alice Van Osdel Phillips died, and in 1888 Dr. Phillips was married to Carrie Conkey, of Preston. Of this marriage there were three children: Delia, who died in infancy, William Conkey and Elizabeth.

A capable and honest physician—his son William has described him as being too honest and too articulate to be very popular—James H. Phillips was also a man of cultural background and formed literary taste, as reflected by his excellent and extensive library. The son, before he had finished high school, had read most of his college English courses from the books on his father's shelves.

From Preston Dr. Phillips moved in 1912 to Westlock, Alberta, Canada, where he carried on an arduous practice; members of his family have said that his death, on August 21, 1921, was the result of overwork. In 1943 there were living of the family: Mrs. Phillips, making her home with the daughter, Elizabeth Phillips (Mrs. L. M.) Pernell, in Dubuque, Iowa, and the son, William Conkey Phillips, of International Falls, Minnesota. John and Lucia, children of the first marriage, had died many years previously, as had the members of the original family group in Chicago.

Horace W. Pickett, a son of David Pickett, was born on July 5, 1822, in Washington County, New York, as were his older brothers, William, Edwin and Joseph. When the sons were young men they moved from New York with their father to become pioneer settlers near South Bend, Indiana.

Horace Pickett obtained his medical education at Utica, Oneida County, New York, where his uncle, Daniel Pickett, was a professor. In 1855 or perhaps a year later, then a practicing physician, he came from New York into Minnesota with his wife, Christiana L. Pickett, to the village of Carimona, Carimona Township, Fillmore County, following by several years his father and his brothers, William, Edwin, Joseph and, probably, Philo and Alonzo and his sisters, Nancy and Lorissa. The Picketts were the first settlers of Carimona; indeed, it was Dr. William C. Pickett who platted the settlement and founded it on his own land. Of the little colony Edwin Pickett returned to Indiana before 1862 but later came back to Minnesota to live, a fact which the following paragraph in the *Preston Republican* of June 28, 1862, gave presage: "An early settler, Edwin Pickett, Esq., one of the first settlers of this county, called on us the other day. He was looking well. At the present time he resides at South Bend, Indiana. He informs us that he prefers Minnesota to that state as a place of residence. He was a good citizen when here and his loss was felt when he left."

In Carimona and the surrounding community, Dr. Horace W. Pickett for many years practiced medicine and took part in civic and educational affairs of the community. An able and progressive physician, he was one of the charter members of the Fillmore County Medical Society, in 1866, and he otherwise contributed to the improvement of medical practice in spite of the fact that he was, as one of his nephews has said, so decided in his opinions that he antagonized people and lost their patronage. On an occasion when he had been called on a confinement case and arrived to find a midwife trying to make an instrumental delivery by means of a long pair of scissors, it would seem that a decided opinion was justified.

In the late winter of 1883 and 1884 Dr. and Mrs. Pickett disposed of their home in Carimona and removed to Welsh, Louisiana, in order to be near their only child, Lillie, who recently had been married to W. B. St. John of that place. Seventeen years later Mrs. Pickett died in Louisiana. Wishing to be once more with those of his father's name, Dr. Pickett, in the spring of 1901, old and frail though he was, traveled alone to Minnesota. He became ill en route, and on the day after his arrival in his pioneer home his death occurred. He was buried in Carimona Cemetery where are the graves of his old friends and of his own people: his father and mother, a sister and four brothers.

William Cowan Pickett, born on November 28, 1818, in Washington County, New York, was the son of Mr. and Mrs. David Pickett and the brother of Edwin, Joseph, Horace, Philo and Alonzo, and Nancy and Lorissa Pickett. Where he obtained his medical training has not been learned, but inasmuch as his brother Horace W. Pickett, studied at Utica, New York, where Daniel Pickett, an uncle of the brothers, was on a teaching staff, perhaps William C. Pickett also was a medical student there.

When he was a young man and already a qualified physician, William Pickett emigrated with the family from New York to Indiana and settled with them near South Bend. On the outbreak of the War with Mexico (1846-1848) he enlisted for military service and was appointed a surgeon in the United States Army.

After the war, bound on a new venture in pioneering, in the autumn of 1852 he traveled from South Bend by ox wagon with two of his brothers, Edwin and Joseph, and another young man into southeastern Minnesota Territory. They came with the view of making permanent homes, and in what was soon to be Fillmore County (March 5, 1853) they found conditions to their liking. When in a few weeks they returned to Indiana, it was to spend the winter disposing of their local property and completing preparations for their trek to Minnesota in the following spring. "On June 1, 1853, conditions being right for the maintenance of their stock on the long trip across the prairies," one of Dr. Pickett's nieces has written, " a company of four of the Pickett families (the households of David, Edwin, Joseph and William) who wished to remain together came back to the place where the three brothers had set their stakes the fall before." They were three weeks on the way.

William Pickett was accompanied by his young wife, Phoebe Means Pickett. On July 4, 1853, in the new settlement in Fillmore County, Dorso Leon Pickett was born, their first son and the first white child born in the community. In the next few years Dr. and Mrs. Pickett became the parents of two more children, Ida, born in 1854, and Ives, in 1859.

As soon as the land was opened for pre-emption, Dr. Pickett took a claim with his brother Edwin and laid out the village of Wahpeton. He evidenced his confidence in the site and the prospects by building as soon as he could a roomy, comfortable stone house as a home for his family. Owing to a clerical error the name of the post office was recorded as "Warpeton;" the settlers rejected this misnomer and chose still another Indian name, that of Chief Carimona (translated, The Walking Turtle), which duly was recorded. Before the change was made, however, W. C. Pickett served as sheriff of "Warpeton Precinct," in 1854. For a time at Carimona Dr. Pickett did a flourishing real estate business, in the conduct of which, being an ethical man and, like his brother Horace, of decided opinions, he refused to sell a lot to any one who proposed to dispense alcoholic liquor. In addition to founding a village, he was at the same time efficiently running a sawmill, operating a blacksmith shop with Joseph Pickett and a flourmill with H. Johnson, and was practicing medicine reliably.

Dr. Pickett's medical practice extended over a wide territory. Settlers were few and scattered; there were only thirteen families in the county on January 1, 1854, and on that date, it has been noted incidentally, William C. Pickett and Daniel (David?) Pickett were possessors of land in township 102, range 11; also that in the spring of 1854 "preaching" was held in the home of David Pickett. Perhaps the first practicing physician to settle within the borders of the present Fillmore County, Dr. Pickett certainly was one of the first six physicians, with Dr. Nelson W. Allen and Dr. Augustus H. Trow, of Chatfield, Dr. J. Early, of

Spring Valley, and Dr. Erastus Belden and his son Dr. Wallace P. Belden, of Hamilton and Spring Valley, all of whom are said to have come in 1853.

A good citizen, versatile and public-spirited, Dr. Pickett was active in civic affairs and local politics. Although in 1857 he was defeated for the office of county coroner, he was, in 1858, overseer of the poor and, from January 4, 1858, to January 4, 1860, he served as judge of probate court of Fillmore County and for the same two years as county sheriff. With regard to one of his less happy experiences as candidate for sheriff, the friendly *Chatfield Democrat* on October 9, 1858, stated with some bitterness:

> The Black Republican Party claim to be "the friends of free discussion," but have a poor way of showing it. Dr. W. C. Pickett, our indefatigable and worthy candidate for sheriff, in a discussion at Spring Valley a few days ago, was hissed and insulted in a manner worthy only of a crowd of "Negro worshippers," by Black Republicans present. This is free discussion with a vengeance.

In the late sixties Dr. Pickett left Carimona and the state. Carimona, his pride, was not to become the city of his dreams. Once the most promising village in the county, the county seat from March 20, 1855, to April 26, 1856, a key point on the thronging stage route from Galena and Dubuque to St. Paul and famed for its hostelry, the Carimona House, in the late sixties the village was left a few miles to the south by the Southern Minnesota Railroad. It was then that Dr. Pickett moved to Illinois, where he spent the remainder of his life.

M. G. Pingree first announced himself in Spring Valley, Fillmore County, as far as the writer has been able to learn, in the issue of August 11, 1870, of the local newspaper, *Western Progress,* and he was then in partnership with Dr. J. J. Morey, office in the Rogers Drug Store, the notice being dated as of June 22, 1870. By August 24 of that summer these physicians and surgeons were publishing separate announcements. Dr. Pingree, still in the Rogers Drug Store, stated that specialty was made of treatment of diseases of the eye and ear.

On August 25, 1870, there was announced the marriage of Dr. Pingree to Miss Frances E. Terrill, of Bath, New York, the ceremony having been performed by the Reverend N. C. Chapin; the editor, in the manner of country editors of the day, expressed affable if robust congratulations.

In January, 1871, Dr. Pingree expanded his professional announcement by informing the public that he was prepared to treat all chronic diseases of the eye and ear according to the most approved system, three years' practice in the Philadelphia hospitals (he stated) being sufficient guarantee of experience.

Whether or not the position of the space allotted was of significance, these cards or notices of Dr. Pingree appeared for many months in a different part of *Western Progress* from the cards of the other physicians of the village. Finally his name appeared in the same column as the names of his colleagues, but at the bottom, and by gradual degrees ascended to the top. By September, 1872, Dr. Pingree was calling himself an eclectic physician; by March, 1873, his name ceased to appear.

(To be continued in the August issue)

President's Letter

TUBERCULOSIS IN MINNESOTA

Throughout territorial days and for approximately the first quarter of a century of statehood, the climate of Minnesota was widely advertised as possessing curative value for those who suffered from consumption. Therefore, large numbers of families with one or more members suffering from tuberculosis migrated to this area. Thus in some years 15 per cent or more of deaths from all causes were reported to have been due to tuberculosis. It was this disease more than any other which caused the Minnesota State Medical Association to arrange for a State Board of Health in 1872. This was the third such board in the nation. Early in the present century, moreover, efforts of members of the State Medical Association brought about construction of sanatoriums in various parts of Minnesota. Minnesota physicians also supported the veterinarians in control of bovine tuberculosis. In 1895 those who sold milk in Minneapolis were required to have a license, which was not issued unless all their cows had been tested with tuberculin. This was the first city in the nation to make such a requirement. In 1923 the eradication of bovine tuberculosis was placed on a state-wide basis and Minnesota achieved a modified accredited rating in 1935.

These measures resulted in a decrease of mortality, of morbidity, and of infection attack rate from year to year. Through the educational campaign of the Minnesota Public Health Association and its component societies, people became so well informed concerning this disease that a state-wide attack by the Minnesota State Medical Association became feasible. Therefore, in 1940, a program was organized by the committee on tuberculosis of the Minnesota State Medical Association. Every county and district medical society appointed a committee on tuberculosis. The physicians of Meeker County were the first as a society, in the nation, to develop an effective tuberculosis control demonstration. The results of the work of this society and its allies are reported in the June issue of Minnesota Medicine. Physicians of McLeod County were second to undertake such a program. Other counties, such as Dakota and Steele, have conducted extensive chest surveys.

The idea evolved of accrediting whole counties, somewhat after the method of veterinarians, but on the basis of tuberculosis control among human beings. In 1941, Lincoln County was the first to be accredited, and now twelve counties are accredited. Next came the idea of certifying schools with reference to tuberculosis control programs in progress. Approximately 500 schools have already been certified.

The members of the State Committee on Tuberculosis have manifested concern over the counties within which are the three largest cities of the state; namely, St. Louis, Ramsey and Hennepin counties, where there is the greatest concentration of tuberculosis in the state. The physicians of St. Louis County, a few years ago, offered photofluorographic inspection of the chest to its entire citizenry of slightly more than 200,000. Already more than half of the citizens have responded. In Hennepin County the Medical Society has received enough support and aid from the Division of Tuberculosis Control of the United States Public Health Service to conduct a city-wide chest survey in Minneapolis. This began early in May, 1947, and 400,000 citizens more than fifteen years of age are being offered photofluorographic inspection of their chests. This is the largest survey of its kind that has ever been undertaken in the United States. In the June issue of Minnesota Medicine appears a comprehensive article on such survey work by H. E. Hilleboe, formerly Director of the Tuberculosis Control Division of the United States Public Health Service, and now Assistant Surgeon General. A city-wide chest survey is being contemplated in Saint Paul by the Ramsey County Medical Society.

In the August, 1946, issue of Minnesota Medicine, the State Committee on Tuberculosis published what it considers an ideal program for any county or district medical society. For many years the ideal program has been in effect in most of the ten counties served by the Southwestern Minnesota Sanatorium and the four counties in the Riverside Sanatorium district. Recently, in the Riverside Sanatorium district, tuberculosis was found to have been completely eradicated in 219 schools.

The State Board of Health is co-operating splendidly in the program of the State Medical Association. Any county or district medical society is free to request assistance from the State Department of Health.

In 1918 there were more than 2,500 deaths from tuberculosis in Minnesota, but only 628 in 1945. Already the Committee on Tuberculosis is about to abandon the word *control* and substitute *eradication.*

STATE MEETING A SUCCESS

THE ANNUAL MEETING held in Duluth, June 30 and July 1 and 2 was a great success from the standpoint of scientific interest and attendance.

The Southern Minnesota Medical Association prize for the best scientific exhibit by individuals went to Dr. Arthur H. Wells and Dr. Harold H. Joffe for their pathological anatomy exhibit, with honorable mention going to Dr. William V. Knoll for his kodachrome trasparencies of pathological specimens. The exhibits by the Mayo Foundation and Mayo Clinic were outstanding.

The total registration was 2,494, of which 1,099 were physicians and 333 were Woman's Auxiliary members.

The following officers for 1948 were elected:

President: Archibald E. Cardle, Minneapolis
First Vice President: J. R. Manley, Duluth
Second Vice President: G. I. Badeaux, Brainerd
Secretary: B. B. Souster, Saint Paul (re-elected)
Treasurer: W. H. Condit, Minneapolis (re-elected)
Speaker of the House of Delegates: C. G. Sheppard, Hutchinson
Vice Speaker: Haddon Carryer, Rochester
Chairman of Council: Frank J. Elias, Duluth
Councilor of Third District: L. G. Smith, Montevideo
Councilor of Sixth District (to fill the unexpired term of A. E. Cardle): O. J. Campbell, Minneapolis

The 1948 State Medical Association meeting will be held in Minneapolis.

LABORATORY ABUSE

THE TEACHING of medicine as conducted today in the average medical school has brought forth a crop of young physicians who seem to depend too much on laboratory procedures. Much of the bedside teaching in these schools has drifted into the dialectics of mechanised and biochemical data. The rapid strides in biochemical studies, the extension of mechanical procedures in contrast to the good history and physical examination, has crowded out clinical perception and dulled clinical judgment.

We must reverse this tendency and insist on a good analysis of a history and a physical examination before any laboratory investigations are done.

Thirty years ago, a wise clinician, noting the advent of the x-ray, electrocardiography and biochemical studies as applied to clinical medicine, made the pronouncement that all the aid of mechanical means and biochemical procedures has not shortened by one minute the making of a good clinician. No one decries the value of these laboratory methods or their growth. One does decry their unstinted use, particularly in the private hospital and office. The tendency of today, by the excessive expense of these laboratory techniques, is to "kill the goose that laid the golden egg." In fact, therein alone lies the only reasonable justification for those who advocate some form of the much tossed about shibboleth, "socialized medicine." To that thought we might add, laboratory technology is going to increase and its clinical application is going to multiply, which means that the necessity and justification of endowed laboratories to cushion the expense is obvious. A practical example of this type of cushion is the State Board of Health Laboratories.

THE NATIONAL FOUNDATION FOR INFANTILE PARALYSIS

AGAIN during these summer months outbreaks of poliomyelitis are making their appearance in many sections of the country. Last year 25,191 cases occurred in the nation, 2,882 of them in Minnesota. No one can forecast how many cases will occur this year or how badly the communities in this area will be affected. Medical science, unfortunately, cannot as yet prevent an epidemic or even one case.

Physicians in this area, as well as elsewhere, are aware of the multitude of problems poliomyelitis presents. Treatment of the disease is likely to be prolonged and extremely costly, requiring the services of many specialists. Too often the patient's family looks to the physician for advice and guidance far beyond the immediate problem of medical care.

In times such as these, it is helpful to physicians to know that there are others prepared to share these troublesome burdens. In addition to making possible epidemic aid, education, and scientific research, the National Foundation for Infantile Paralysis is pledged to assist financially those patients who require such help. Through their generous contributions to the March of Dimes, the American people have made this possible. Hospital bills, salaries for physical therapists and nurses, purchase of special equipment, and the many other charges which may comprise the essentials of good medical care may be paid for by the chapters of the National Foundation when necessary. Local chapters of the National Foundation are scattered throughout the United States. There is one in or near your own community. Your local health officer can furnish you with the address of the chapter nearest you.

Physicians serve on the local chapter's Medical Advisory Committee, guiding the chapter in developing medical care programs and solving allied problems. Physicians are urged to co-operate with the nearest National Foundation Chapter. Notify the chapter when a poliomyelitis patient comes under your supervision. Make certain that the family of your patient knows of the chapter's existence and willingness to assist. By so doing you will be performing an essential service to your patient and relieving yourself of many unnecessary burdens.

E. J. Simons, M.D.

FOLIC ACID IN PERNICIOUS ANEMIA

With the discovery and synthesis of folic acid and its availability for the therapeutic use, the question arises whether the use of liver in the treatment of pernicious anemia should be abandoned and folic acid substituted. The answer is no; and the reason is that a certain number of patients suffering from pernicious anemia will develop neurologic symptoms when treated with folic acid alone.

Folic acid or pteroyl glutamic acid has been obtained from yeast and liver and can now be synthesized. It has been shown to be identical with liver L casei or norite eluate factor, vitamin M, and Vitamin B_c. These various preparations were shown to be of value in the prevention and treatment of anemia in chicks and monkeys.

There is no doubt that folic acid is effective in producing remissions in pernicious anemia similar to those obtained by liver. That the folic acid content of liver preparations is not the sole antianemic factor in liver extract is shown by the fact that folic acid in the dosage contained in effective liver extract is not sufficient to cause remissions in pernicious anemia. If folic acid is used in the treatment of pernicious anemia, the use of liver extract is also advised, or the patient should be watched closely for the development of neurologic symptoms. That being the case, no economy is obtained for the patient through elimination of professional visits. The main reason, however, for not substituting folic acid for liver extract is, as was stated, that a certain number of patients with pernicious anemia will develop subacute combined sclerosis if treated with folic acid alone. In the presence of neurologic involvement, folic acid is not effective, whereas liver extract in large dosage has definite value.

LEMON JUICE AND TEETH

The announcement by Stafne and Lovestedt* that the excessive use of lemon juice may be harmful to the teeth was undoubtedly a new idea to most dentists as well as physicians. According to their observations, lemon juice can cause a distinct loss of enamel structure of the teeth as shown by a hypersensitivity of the teeth to thermal changes—absence of stain lines, defects in the enamel which have usually rounded margins in contrast to the sharp margins produced by wear, and the projection of fillings above the tooth surface. Ordinarily, the tooth and filling wear down equally so that a projection of a filling suggests tooth destruction beyond nerve wear.

Lemon juice is rich in Vitamin C as everyone knows, and its value in preventing scurvy among mariners was early discovered and utilized. It has been used to some extent in reducing diets, for rheumatism, constipation, and colds where its value is open to considerable question. Children frequently suck lemons, and the authors have observed individuals who have suffered defects in the labial surfaces of the upper teeth as a result of this habit.

The observation that excessive use of lemon juice can be detrimental to the teeth—perhaps more often in individuals who have less buffer action in the saliva—is one that should be borne in mind and doubtless can be confirmed. Because lemon juice in excess may be injurious to the teeth is, of course, no reason for eliminating it from the diet and thus sacrificing its valuable content of Vitamin C.

---

*Stafne, Edward C., and Lovestedt, Stanley A.: Dissolution of substance of teeth by lemon juice. Proc. Staff Meetings Mayo Clinic, 22:81, (March 5) 1947.

THE MAYO MEMORIAL

THE increased cost of construction has made necessary a substantial increase in the goal set for the construction of the proposed Mayo Memorial on the University of Minnesota medical campus, bringing the total to $3,000,000. The State Legislature appropriated $750,000 in 1945 for the Memorial, an an additional $1,160,000 had been subscribed by corporations and individuals. In view of increased cost of construction, the last Legislature made a second appropriation of $750,000 contingent upon the raising of a like amount by private subscription. This meant that the Mayo Memorial Committee had to raise an additional $340,000, if the original undertaking was to be carried through. Some $90,000 of this $340,000 had been raised by the middle of July.

For clarity's sake, it might be mentioned that the original Memorial has been enlarged to include the School of Public Health, the Medical Library, and the Cancer Research Institute, funds for all of which are being provided from other sources. This unification in one building will effect eventual economy in operation.

It would be unfortunate if the original scope of the Memorial would have to be curtailed because of lack of funds. The committee in charge is making every effort to raise the last $250,000 needed and is asking non-contributors for assistance in addition to requesting increases from those who have already contributed, wherever possible.

Checks should be made payable to the Mayo Memorial Fund and should be sent to 63 South Robert Street, Saint Paul 1, Minnesota.

BOND-A-MONTH PLAN

THE Treasury Department has devised an easy savings plan which in its simplicity should appeal to the physician. All he does is to sign a card at his bank authorizing the bank to purchase each month a Savings Bond for $37.50, $75, $150 or $300 and deduct the corresponding amount from his bank balance. He receives the bond each month and all he has to do after signing the card is to place the bond in his safety deposit box. It is rather surprising how much can be saved in ten years by this method. A $37.50 bond purchased each month will amount to $4,998 in ten years; a $300 bond a month, $39,984 in the same period.

The U. S. Department of Commerce has conducted studies of physicians' incomes and has shown that, on the average, the age period from thirty-five to fifty-four is the money-making period in the physician's career. The peak is reached in the early fifties and begins to decline at the age of fifty-four. Few physicians have the time to study investments, and even professional advice on the subject is notoriously unreliable. This bond-a-month plan furnishes a 30 per cent increase in the savings over the ten-year period in as guilt-edge securities as are obtainable. Physicians are not covered by social security nor other retirement plans and so are forced to provide for their own needs in their declining years. The bond-a-month plan recommends itself.

POLIOMYELITIS VIRUS IN SECRETIONS OF NOSE AND THROAT

Poliomyelitis virus has been demonstrated in material expelled from the mouth (or nose) of two patients out of nineteen studied. This was achieved by having patients blow or spit into cloth masks from which virus was extracted. Virus was also detected in nasal swabs of the first patient and pharyngeal swabs of the second patient shown to have eliminated virus from the nose or mouth. Certain implications of these findings have been discussed. It is to be emphasized that their epidemiological significance or insignificance is yet to be determined.

DOCTOR CHESLEY HONORED

The following citation was awarded Dr. A. J. Chesley, secretary and executive officer of the Minnesota State Board of Health since 1921, on the occasion of the presentation to him of an Honorary Life Membership by the American Social Hygiene Association. The citation gives a résumé of his busy career.

Dr. Chesley has been largely instrumental in making the Minnesota State Board of Health one of the most efficient organizations of its type in the country. His co-operation at all times with the medical profession of the state has been outstanding.

Albert J. Chesley, M.D.

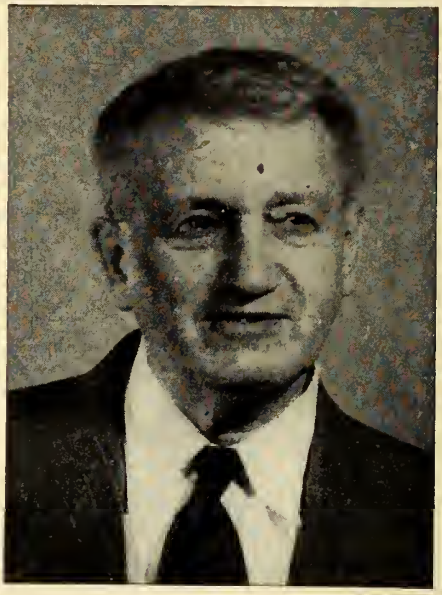
One way of measuring a man's worth is to consider what the history of his times and the setting of his life might have become without his influence. This method, like any other ordinary yardstick which one might try to apply to the subject of these remarks, will not do in his case. It is clearly impossible for those who have known and worked with Dr. Chesley through the years to visualize the scene without him. It would be even more preposterous to attempt any speculation as to what might have happened differently had he not been there. There is no room for hypothesis. He was always there. Usually ahead of the rest of us.

For example, take his connections with the State of Minnesota. He was born in Minnesota (September 12, 1877, say the excellent vital statistic records of that state) ; he was educated in Minnesota (Doctor of Medicine, University of Minnesota, 1907) ; he got his first job in Minnesota with the State Board of Health (assistant bacteriologist was the first full-time assignment, but he had worked in the state laboratory all the way through medical school, from 1902) ; he has worked for the same boss ever since, having been secretary and executive officer of the State Board since 1921. For twenty years, from 1925 to 1945, he was professor of public health in the State University's Department of Preventive Medicine. He married a Minnesota girl (another M.D., Placida Gardner, in 1920), and their daughter Louise is Minnesota-born and trained.

Nobody could very well think of health in Minnesota's last forty years without Chesley there.

Or consider his part in the affairs of the Conference of State and Provincial Health Authorities of North America. For more than a third of the history of this sixty-three-year-old organization, founded in 1884 to serve as a clearing-house and policy-planning agent for official public health activities in the United States and Canada, Dr. Chesley has been the king-pin. He became Conference president in 1924, served until 1927, and for the next twenty years was secretary-treasurer, 1946 being the first year he has succeeded in getting his annual resignation accepted. It would be hard to picture Conference matters during this quarter-century, which compassed the problems of World War I's postwar period, a major economic depression, and a second World War—without Chesley's hand among those on the helm.

Chesley knew war from first-hand experience. He was twenty-one when he enlisted in the Thirteenth Minnesota Volunteer Infantry, which saw service during 1898-99 in the Spanish-American War and the Philippine Insurrection. In 1918-19 he went to France as public health expert for the American Red Cross, and in 1919-20 he served in Poland as chief of staff for the ARC Commission. In 1940, when Minnesota's vast park areas were selected as the scene of the first National Guard maneuvers in the defense program, Chesley was there again, planning months ahead of the mobilization date for the welfare and health protection of the Guardsmen during their stay in the State of Lakes. Calling on the American Social Hygiene Association for advice, he set up a plan which involved patrols by the State Police, careful inspection by state authorities of applications for cottage and trailer-camp permits in the camp regions, and other safeguards against the invasion of camp-followers and the venereal disease infections they are prone to spread. The results of this preparation were summarized in a letter from the Corps Surgeon in Charge of Medical Services during the maneuvers, which said, in part: "There was no undue prevalence of any type of communicable disease; and further, since the completion of the maneuvers, with the return of regular Army troops to home stations and the demobilization of the National Guard troops back to civilian status, there has been no report to this office of venereal infection . . ."



Albert J. Chesley, M.D.

The Chesley program of planning ahead, seeing the job through, and measuring results is well-shown by Minnesota's social hygiene work developed under his direction. Trained in bacteriology, and epidemiology, and having served in both those departments of the State Board of Health, he early saw the dangers and the opportunities in venereal disease control and prevention.

In 1914 he was appointed director of the Board's newly created Bureau of Preventable Diseases, and in 1917, when the State of California appropriated funds to set up a war emergency social hygiene program and borrowed Dr. Harry G. Irvine of Minnesota to direct it, Dr. Chesley gave every assistance to the development of the project. In 1917 he secured a Commission in his own state and arranged for the return of Dr. Irvine as Minnesota's State Director of Venereal Disease Control. Dr. Irvine is still there, and in a characteristic disclaimer of personal credit, Dr. Chesley says of the Minnesota program: "Irvine has been responsible for it through World Wars I and II, and in the years between, with emphasis right along on the positive aspects of social hygiene, education, through courses in high schools and colleges in anatomy, ethics and sociology. A series of teaching units for use in high schools will be published in 1947."

Minnesota was one of the states showing the smallest proportion of venereal disease infections—less than seven per thousand men—among Selective Service candidates in World War II, and as in other states having long-range social hygiene educational programs, it is believed that this preventive campaign had much to do with this fine health record.

After assigning due credit to his efficient staff in other fields as well as in social hygiene, there seems to be plenty left over for the chief, according to competent judges. The pioneer American Child Health Association held him a member of its Board of Directors. The American Public Health Association, of which he is a fellow, elected him president in 1930. He has served on the Board of Scientific Directors of the Rockefeller Foundation's International Health Division. He is an Honorary Fellow of Britain's Royal Sanitary Institute. The American Medical Association (he is a Fellow) values him as a member of its Joint Committee with the National Education Association on Health Problems in Education. He is a member of various professional organizations, including the Hennepin County Medical Society, the Minnesota State Medical Association, the Association of Military Surgeons of the United States and the American Epidemiological Society, and of groups such as the National Society for Prevention of Blindness, the Veterans of Foreign Wars, the Order of Masons, Nu Sigma Nu Fraternity, and the American Social Hygiene Association. For the latter organization he has served as a member of the Board of Directors, a vice president, and on various special and standing committees, being at present a member of the committee on nominations.

These contributions as they stand could well serve as a basis for Dr. Chesley's election by the Association's 1947 Committee on Awards as an Honorary Life Member, and the Committee takes pleasure in setting down the facts. But quite aside from noting social hygiene co-operation and achievement, we desire to record here, on behalf of the many who share his friendship, a warm affection for and a deep appreciation of a stout-hearted fellow-worker in whom idealism, humor, common-sense and wisdom are equally measured and well mixed for the benefit of all with whom he has to do.

METOPON HYDROCHLORIDE

(Methyldihydromorphinone Hydrochloride)

In 1929 with the funds provided by the Rockefeller Foundation, the National Research Council, through its Committee on Drug Addiction, undertook a co-ordinated program to study drug addiction and search for a non-addicting analgesic comparable to morphine. The principal participating organizations were the Universities of Virginia and Michigan, the United States Public Health Service, the Treasury Department's Bureau of Narcotics, and the Health Department of the State of Massachusetts, which brought together chemical, pharmacological and clinical facilities for the purposes of the study. Metopon is one of the many compounds made and studied in this co-ordinated effort.

Chemically Metopon is a morphine derivative; pharmacologically it is qualitatively like morphine even to the properties of tolerance and addiction liability. Chemically Metopon differs from morphine in three particulars: one double bond of the phenathrene nucleus has been reduced by hydrogenation; the alcoholic hydroxyl has been replaced by oxygen; and a new substituent, a methyl group has been attached to the phenanthrene nucleus. Studies made thus far indicate that pharmacologically Metopon differs from morphine quantitatively in all of its important actions: its analgesic effectiveness is at least double and its duration of action is about equal to that of morphine; it is nearly devoid of emetic action; tolerance to it appears to develop more slowly and to disappear more quickly, and physical dependence builds up more slowly than with morphine; therapeutic analgesic doses produce little or no respiratory depression and much less mental dullness than does morphine; and it is relatively highly effective by oral administration.

In addition to animal experiments, these differences have been established by extensive employment of the drug in two types of patients: individuals addicted to morphine, and others (terminal malignancies) needing prolonged pain relief but without previous narcotic experience. In morphine addicts, Metopon appears only partially to prevent the impending signs of physical and psychical dependence. In terminal malignancy, administered orally, it gives adequate pain relief, with very little mental dulling, without nausea or vomiting and with slow developments of tolerance and dependence.

The high analgesic effectiveness of oral doses (with the elimination of the disadvantage to the patient of hypodermic injection), the absence of nausea and vomiting even in patients who vomit with morphine or other derivatives, the absence of mental dullness and the slow development of tolerance and dependence place Metopon in a class by itself for the treatment of the chronic suffering of malignancies, and it is for that purpose exclusively that it is being manufactured and marketed.

Metopon will be available *only* in capsule form *for oral administration.* The capsules will be put up in bottles of 100 and each capsule will contain 3.0 mg. of Metopon hydrochloride. They may be obtained by physicians only from Sharp & Dohme or Parke, Davis & Co., on a regular official Narcotics Order Form, which must be accompanied by a signed statement supplying information as to the number of patients to be treated and the diagnosis on each. The drug will be distributed for *no other purpose* than oral administration for chronic pain relief in cancer cases.

The dose of Metopon hydrochloride is 6.0 to 9.0 mg. (2 or 3 capsules), to be *repeated only on recurrence of pain,* avoiding regular by-the-clock administration. As with morphine, it is most desirable to keep the dose at the lowest level compatible with adequate pain relief. Therefore, administration should be started with two capsules per dose, increasing to three only if the analgesic effect is insufficient.

Tolerance to any narcotic drug develops more rapidly with excessive dosage and under regular by-the-clock administration. Also, as a rule, the pain of cancer varies widely in intensity from time to time. Pain, therefore, should be the only guide to time of administration and dosage level. Tolerance to Metopon hydrochloride develops slowly. It can be delayed or interrupted entirely by withholding the drug occasionally for twelve hours or for as much of that period as the incidence of pain will permit.

To each physician will be sent a record card for each patient to whom Metopon hydrochloride is to be administered. He will be requested to fill out these cards and return them in the addressed return envelope. He must furnish this record of his patient and his use of Metopon hydrochloride if he wishes to repeat his order for the drug. The principal object of this detailed report is to check the satisfactoriness of Metopon hydrochloride administration in general practice. The physician's cooperation in making it as complete as possible is earnestly solicited.

The limited use of Metopon hydrochloride as described above has been recommended by the Drug Addiction Committee of the National Research Council, and the Committee, with the co-operation of the American Cancer Society, will supervise the distribution of the drug. The committee is composed of Wm. Charles White, Chairman, Washington, D. C.; H. J. Anslinger, Commissioner of Narcotics, United States Treasury Department, Washington, D. C.; Lyndon F. Small, National Institute of Health, Washington, D. C.; and Nathan B. Eddy, National Institute of Health, Washington, D. C. Queries and comments on Metopon may be directed to Dr. Eddy, who will answer them for the committee.

MULTIPLE FOCI OF POLIOMYELITIS IN FATAL CASE

A fatal case of poliomyelitis is described which occurred in a laboratory worker. It is probable, although not definite, that this man acquired his infection as a result of exposure to poliomyelitis virus in the laboratory.

Prior to his infection he was working with human infectious material and with strains of poliomyelitis virus in their early monkey passage.

Poliomyelitis virus was isolated in this case: from the throat (during life), and at autopsy from the central nervous system, the washed wall of the duodenum, mesenteric lymph nodes and from some of the right axillary lymph nodes. Attention is called to this last fact because just prior to his illness, this patient sustained an injury to his skin on the right wrist.

Previous experiences, both published and unpublished, on the isolation of poliomyelitis virus from lymph nodes is reviewed and discussed in the light of the findings of the above case.

Histologic lesions of poliomyelitis were present in one anterior olfactory nucleus. Extensive lesions were present in the midbrain, pons, medulla and spinal cord.

"The portal of entry of the virus was not determined."

Wenner, H. A., and Paul, John: Fatal infection with poliomyelitis virus in a laboratory technician: isolation of virus from lymph nodes. Am. J. M. Sc., 213:9-18, (Jan.) 1947.

MEDICAL ECONOMICS

George Earl, M.D., Chairman

ADVISORY COMMITTEE FORMED TO TACKLE NURSE SHORTAGE

The great scarcity of registered nurses which presents a problem dangerous and tragic to hospitals, physicians and the public, both in urban and rural areas, is the reason behind the recent organization of a committee of eighteen members, known as the Minnesota Advisory Committee on Nursing.

Nine different organizations are represented on this committee: the Minnesota State Medical, hospital and Nurses Associations, the State Board of Examiners of Nurses, the State Board of Health, the Division of Public Institutions, the Minnesota Catholic Hospitals, the State Department of Education and the Minnesota Farm Bureau Federation.

This Committee met with the Governor in his office on May 28 and informed him about existing conditions resulting from the nurse shortage. The Governor was very much impressed with the findings of the Committee and requested that it continue its activities, suggesting that an executive committee be selected from the group. This is now being done.

Rural Hospital Representatives Meet

Hospitals, doctors, nurses and the general public have been aware of the serious shortage of nurses for a long time, but no one has made any workable suggestions as to what should be done about it. The first concrete step was taken by Dr. W. L. Burnap of Fergus Falls when he called a meeting of rural hospital representatives at that town on September 14, 1946. The response to this meeting was excellent. Twenty-five hospitals sent representatives; others wrote assuring their support.

It was decided to begin attacking the problem as it affected rural hospitals first because hospitals in rural areas depend entirely upon city schools for nurses and because 50 per cent of all patients hospitalized are in the country, that is, outside of the Twin Cities, Duluth and Rochester.

At this first meeting it was learned that state institutions, nearly all of which are outside of the large cities, suffer also from a lack of nurses. These institutions cannot turn patients away because of this lack, and yet they must provide patients with the best possible care.

At the meeting Dr. W. L. Patterson, superintendent of the Fergus Falls State Hospital said: "In one way or another the state will see that its patients are taken care of. It must be done, and if the nursing profession cannot furnish the nurses, then State Hospitals will have to start schools."

Practical Nurse Bill Passed

Although it was a compromise measure, the Bill for the Licensure of Practical Nurses, which was passed by the 1947 Legislature, is counted as an important step toward solving part of the nurse shortage problem. This law creates a board of examiners for practical nurses and as soon as the board is organized and standards and regulations have been set, it is expected that several practical nursing schools will be established.

It is felt that the present plan of licensing practical nurses will help to a certain extent, but it does not meet the great need for more graduate nurses. There is a solution to the pressing problem, in the committee's opinion—namely, the establishment of nurses' training courses in properly equipped rural hospitals with one-year affiliation in a large city hospital. This is the goal of the present advisory committee, to get as many hospitals in rural areas as are in a position to offer nurse training courses to establish them, or as the case may be, to re-open nurse schools which are now closed.

In order to extend the study of the nursing situation, a meeting was held on March 21, 1947, in Saint Paul at which representatives of all hospitals, large and small, who were interested in the problem were invited. Also present at this meeting were officials from the Nursing Association, the Hospital Association, the State Board of Examiners of Nurses, the League of Nursing Education and the Farm Bureau. The meeting was called by Dr. Burnap.

Problem Serious in Both City and Country

At this meeting it was learned that the nursing problem is just as serious in the city as in the country. The nursing board reported great difficulties in establishing nursing schools, particularly in rural hospitals, which have the facilities and teachers and which meet the minimum standards.

It was agreed by the group that in spite of difficulties it is vitally necessary to establish more schools in the country, as many well-qualified girls are found there and the training given in the small hospital makes an excellent nurse. It is the opinion of those who have been studying this problem that rural hospital courses are successful, first, because they are closer to the homes of the prospective students and, second, the courses are so arranged that the girls can earn their own way, aside from a few incidentals. Here a poor girl has an equal chance with those who have the means, the committee argues.

A special committee of physicians, hospital officials and nurses, with a representative from the Farm Bureau and one from the Department of Education, under the chairmanship of Dr. Burnap, was appointed to investigate the problems incident to setting up nursing schools in rural hospitals and also the qualifications for nurses, the question of practical nurses, student nurse recruitment and other phases of the general problem. This special committee reported to a meeting of the Committee as a whole on April 11, at which representatives from the State Legislature were present.

Up to this time the committee was unofficial. and it was agreed that there should be organized an official representative body, possessing all authority possible. With this in mind an interview with the Governor was arranged and his consent to endorse such a committee was received. The result was the present Nursing Advisory Committee.

Questionnaire Sent to Hospitals

In order that the Committee might have facts to work with, a questionnaire was drafted and sent to all hospitals in the state soliciting information as to present facilities, plans for expansion and present needs. Returns were excellent, with 75 per cent of the hospitals sending in reports within ten days, all of which was indicative of the interest in and importance of the problem.

It was evident from the returns on the survey that nursing schools in the cities are far from filled, that if they were filled there is a possibility that they might supply the nursing needs. This indicates the need for recruitment of more students of nursing.

The Committee has emphasized the fact that many well qualified girls will enter a training school near home who would not go to the city for training. Therefore, they urge the opening of rural nursing schools. However, they take note of the problems involved in setting up and staffing these schools. It is hoped that these problems can be worked out and that this state may be several steps nearer an adequate solution to the problem of the shortage of nurses as a result of the work done by the Nursing Advisory Committee.

It has been shown that this committee can be of service in continuing to clarify the nursing situation and as a liaison between the nursing board and the hospitals wishing to establish schools for practical nurses or those who offer courses leading to the degree of registered nurse. The State Medical Association has contributed financially to the study of this problem and it stands ready to support any constructive efforts which will help solve it.

HEARINGS BEING HELD ON NATIONAL HEALTH BILL

Hearings in Congress on S.545, the National Health Bill of 1947, began Wednesday, May 21, before the Committee on Labor and Public Welfare of the Senate, re-opening the verbal contest between those who believe Americans should be "helped to help themselves" and those who contend that compulsion is the only means whereby the health of this country can be maintained.

Developed along lines suggested by the American Medical Association and other allied health organizations, S.545, briefly, provides a plan and a means to permit broadest variation of health programs at local levels and meets the needs of low income groups without an expensive system of regimentation and the inevitable destruction of quality and medical service.

Senator Taft, one of the sponsors of the bill, opened the discussions briefly outlining his measure. Said Senator Taft: "Compulsory National Health insurance is nothing more than taxation to provide free medical care for all the people. . . . When you proceed to provide free care for people who are perfectly able to pay for it themselves, you socialize the field." Senator Taft pointed out that it would be better if the government just help states to provide free medical care for persons who *cannot* afford it.

Senator Taft maintained further that socialized medicine would make every physician the employe of the federal government. Freedom to choose a doctor, he said, is a major part of our system of free enterprise.

Denies Bill Provides Charity

Answering charges of Senator Murray and others that the Taft Bill is merely a "magnificent promise" and that it "pretends to assure medical care to all people," whereas it "only makes limited medical services available and these only to those willing to accept public charity," Senator Taft commented that for the state to help people pay their debts is not charity.

It was brought out at the hearings that the Taft Bill acknowledges the problem of the uneven distribution of health and medical services in many parts of our land. In contrast to the Wagner-Murray-Dingell Bill, it encourages the gradual development of local and statewide medical insurance programs. Provisions are made for the organization of newer and better forms of medical practice to meet the new conditions created by the spread of prepayment plans.

General provisions of the 1947 Health Bill include a grant of $200,000,000 a year to states on a population basis for medical care, chiefly to low-income patients (Minnesota's allotment would be $4,119,800); establishment of an independent national health agency to handle all the federal government's health activities; and grants to states for dental care, cancer control and periodical medical examinations for *all* school children.

AMA Representatives Appear in Behalf of Bill

Dr. R. L. Sensenich, Chairman of the AMA Board of Trustees, appeared early in the hearings in behalf of Taft's National Health Bill. Having observed the standards and methods of distribution of medical care in other nations, and on the basis of experience and advice of investigators trained in health activities, he declared that he feels it evident that social legislation containing compulsions cannot be enacted without infringing upon the basic quality of American freedom.

Government administration, said Dr. Sensenich, is too far removed to be applicable to local community and individual needs. Therefore, to attain a broad and effective approach to the problem, a health program must rest on voluntary effort with legislation providing assistance.

S.545 more nearly approximates the health program set forth by the AMA, Dr. Sensenich pointed out, since the provisions of this bill are well planned and provide a sensible approach to meet the needs of the whole nation.

Dr. E. J. McCormick, Chairman of the Council on Medical Service, called attention to the fact that better health for the citizens of the nation is not a single problem, nor merely a financial problem, but that it embraces several problems. The provision for assistance to states in making surveys of medical care preparatory to the formation of a plan for extending such care is therefore a very sound one, he maintained.

Hospital Representatives Testify

Referring to the Taft Bill as "plunging boldly and courageously" into the problem of co-ordinating federal health activities, the president of the Catholic Hospital Association, Reverend Alphonse M. Schwitalla, S.J., said that the reorganization planned would be conducive to greater effectiveness and economy. He gave three main reasons for his endorsement of the bill as follows: (1) The measure undertakes to provide health care to those most in need. (2) Co-operation between private and public agencies providing such health care is assured. (3) While health care is a national problem, the bill gives full consideration to local differences and individual rights.

The American Hospital Association sent both its president and executive secretary to offer their support of the measure. They added their appreciation of the features of the bill which

(Continued on Page 797)

Minnesota Academy of Medicine

Meeting of February 12, 1947

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, February 12, 1947. Dinner was served at 7 o'clock, and the meeting was called to order at 8:10 by the president, Dr. E. M. Hammes.

There were fifty-three members and six guests present.

Minutes of the January meeting were read and approved.

The scientific program followed. Dr. Charles F. Rea, Saint Paul, and Dr. Wallace P. Ritchie, Saint Paul, each read an inaugural thesis.

PRESENT-DAY CONCEPTS IN THE TREATMENT OF HYPERTHYROIDISM

CHARLES E. REA, M.D.

Saint Paul, Minnesota

In this paper, four phases of the present-day treatment of hyperthyroidism will be discussed: (1) the use of thiouracil; (2) the use of radioactive iodine; (3) the use of spinal anesthesia for operation and for post-operative treatment; and (4) the handling of patients who have a persistently high basal metabolic rate in spite of apparent adequate medical and surgical treatment.

Thiouracil.—The introduction of the use of thiouracil is the greatest advance in the treatment of hyperthyroidism since that of iodine. It is well known that certain substances, like urea and the sulfonamides, cause a decrease in thyroid activity and enlargement of the gland. It was only natural that the effect of other substances such as thiouracil should have been tried. Its physiologic action is to inhibit the iodine uptake of the thyroid gland. As a result, the pituitary gland becomes sensitive to the lack of thyroxin in the circulating blood and hypertrophies to produce more thyrotropic hormone. Under the stimulation of this hormone, the thyroid gland hypertrophies, but since the iodine uptake is blocked, no excess thyroxin is formed. Accordingly, there is a decrease in body metabolism.

Thiouracil is said to be effective against all types of hyperthyroidism and acute thyroiditis. In my own experience with three cases of acute thyroiditis treated with thiouracil, the results were not too impressive. At least, it took the patients as long to recover from the disease as others not treated by this drug. The dose of the drug is 0.6 gm. daily, given in four doses. Giving thiouracil in divided doses seems to be more effective than in one single dose. The response to this medication is not seen for several weeks and if iodine has been given previously, the time response is longer.

In collected reviews, it is said that about 10 to 15 per cent of all patients treated with thiouracil have some reaction to the drug. The reactions are related more to drug sensitivity than to dosage. In the first large series, death due to the drug was said to have occurred in 0.5 per cent of cases. This figure is undoubtedly high, as experience with the drug has been gained. Leukopenia occurs in 3 to 4 per cent and agranulocytosis in 1.5 to 2.5 per cent. The death rate from agranulocytosis is 26 per cent. When agranulocytosis occurs, the drug should be stopped, and penicillin and transfusions given. Fever, lymphadenopathy and skin rashes have also been reported as complications. As prophylaxis against these reactions, the patient should have his leukocyte count checked weekly and should report to his doctor immediately if signs of sore throat, coryza, malaise, skin rash, et cetera, develop. Even after the drug has been discontinued, the patient may develop toxic reactions and accordingly should be watched for at least three to four weeks after stopping the medication.

The question arises as to whether thiouracil can be used as the sole treatment of hyperthyroidism. The consensus of opinion seems to be that the drug should be used chiefly in the preoperative preparation of moderately and severely thyrotoxic patients and that it is risky to use it as the sole therapy in such cases. Some doctors have used the drug in the treatment of mildly toxic hyperthyroid patients over a period of six to eight months with no untoward effects. Such therapy is not without its dangers, however, and should be reserved for very selected cases.

The patient receiving thiouracil before thyroidectomy should have the drug stopped two weeks before operation and be given Lugol's solution, 10 drops three times a day. Under such conditions, the thyroid gland will be firmer and less vascular at operation.

The use of iodine and thiouracil gives us some insight as to the action of iodine in the hyperplastic goiter. Giving thiouracil to the hyperplastic thyroid gland makes it even more hyperplastic. While thiouracil prevents the utilization of iodine by the thyroid, notwithstanding this block, the addition of iodine as in Lugol's solution causes resolution of the thyroid gland in Graves' disease. Therefore, it is concluded that iodine exerts two actions upon the thyroid gland in hyperplastic goiter, an iodinating action and an involuting action, and that these two actions can be separated one from the other by means of thiouracil.

Radioactive Iodine.—Induced radioactivity was discovered in 1934 and that year Fermi and his co-workers in Italy prepared radioactive isotopes of iodine. In 1938 Hertz and his associates in Boston prepared radioactive iodine by exposing ethyl-iodide to radium mixed with beryllium. The activated iodine was injected into rabbits. When the various organs of the recipient rabbit were removed, minced, and spread on a mesh on a plate

---

Inaugural thesis.

and exposed to standard detection techniques, it was found that the normal thyroid gland had picked up eighty times as much iodine, prepared by the cyclotion method, as is utilized by a hyperplastic goiter in man.

Radioactive iodine is obtained at present by the deutron bombardment of tellurium. The result consists of a mixture of radioactive isotropes of iodine. The principal isotropes are I^{130} which has a half-life of 12.6 hours and I^{131} with a half-life of eight days. One mc. of 12 hour iodine per gram of thyroid tissue delivers 12.3 r/min., so with a 40 to 50 gm. thyroid a sizable dose of irradiation may be given.

The effect of the radioactive iodine is checked by (1) the urinary secretion; (2) measurement by external gamma ray counter (Geiger counter); (3) the basal metabolic rate; (4) involution of the thyroid gland; and (5) clinical improvement of the patient.

Radioactive iodine is given by mouth, and tastes like stale, distilled water. The dosage given is 0.5 to 1.0 mc. of 12 hour iodine per gram of thyroid tissue. The total doses average 40 to 50 mc. although as high as 79 mc. in a single dose has been given.

The advantages of administration and selective absorption of internal irradiation therapy as compared to external irradiation are apparent. Internal irradiation is not without its toxic reactions, however. Acute roentgen ray sickness may occur; hypometabolism, even to the degree of myxedema have been reported. The question of anemia and malignancy in such cases had not been answered although in the cases observed to date (and some for a period of almost ten years), the last two possible complications have not been observed.

In 1923 Means and his co-workers reported that in the treatment of hyperthyroidism by roentgen therapy, about one-third of the patients were cured, another third improved, and another third not affected. Radioactive iodine in selected series to date has been effective as a cure for hyperplastic goiter in 80 per cent of cases.

It should be stated that sufficient experiments have not been done to establish the limits of safety of the use of radioactive iodine in the treatment of thyroid disorders. At least, however, an advance in the treatment of thyroid disease has been made by this agent.

Spinal Anesthesia.—The importance of proper preparation before operation of patients with hyperthyroidism is well recognized. The patient is treated by high caloric (high protein-high carbohydrate) diet, physical and mental rest, Lugol's solution, sedation, et cetera. When the basal metabolic rate and pulse have been lowered to normal levels, the patient is considered ready for operation. More important than the decrease in the basal metabolic rate is the weight gain by the patient. It is much more important to have a patient gain weight even though the basal metabolic rate remains stationary, than to have the basal metabolic rate lowered but the patient lose weight.

The whole rationale of thyroidectomy in hyperthyroidism is to change the patient from a hyper to a hypo state of metabolism, hoping to hit a normal level. A bilateral subtotal lobectomy in one stage is the ideal procedure. About four-fifths of each lobe should be removed. Sometimes the patient is so very toxic that a stage procedure must be carried out.

In very severely hyperthyroid patients, it has been found that a one-stage bilateral lobectomy of the thyroid can be performed if a spinal anesthesia is given with the idea of inhibiting the nerve impulses to the adrenals. An anesthetic level to the fourth dorsal vertebra must be obtained if the splanchnic nerves to the adrenal are to be inhibited.

The procedure is as follows: the patient is "sneaked" under sodium pentothal anesthesia to the operating room, and 100 to 150 mg. of novocaine crystals are given intraspinally between the third and fourth lumbar vertebrae. The anesthesia level is checked by noting at what level the patient winces when pricked by a pin. Local or inhalation anesthesia is used for the neck incision. Twenty-five patients with very toxic goiters have been treated in this manner to date, and the results have been very gratifying. Especially impressive has been the smooth operative and postoperative course. Bilateral subtotal lobectomies have been performed in one stage on these patients, whereas otherwise only stage procedures would have been attempted. Also, five patients in "thyroid storm" have been treated to date by spinal anesthesia. Fortunately all the patients have responded to this therapy and there have been no deaths.

The rationale of this procedure is based on the principle that the adrenals play an important part in thyroid metabolism. Adrenalin has been used to flare up latent hyperthyroidism (Goetch test). Also, increase in adrenalin or sympathetic-like symptoms has been stated to occur in hyperthyroidism. Unfortunately the test used (Whitehorn test) to determine the amount of adrenalin in the blood is not too specific. Further study is necessary to determine how rational the premise is that adrenalin is a factor in thyroid storm. Clinically, however, spinal anesthesia in the operative and postoperative treatment of severe hyperthyroidism has proven to be a helpful procedure.

Management of patients with persistently high basal metabolic rates in spite of apparently adequate medical and surgical treatment.—Some patients with thyrotoxic goiters, in spite of excellent medical and seemingly adequate surgical treatment still have a persistently high basal metabolic rate. If the patient with hyperthyroidism has had a bilateral, subtotal lobectomy and has a high basal metabolic rate after operation, it is usually thought that there has been a recurrence or persistence of goiter to cause the difficulty. However, if the patient has had two or three operations on the neck, has had repeated series of medical management and even a course of deep x-ray therapy, the problem of how to treat such a patient with a high basal metabolic rate is quite difficult.

Fortunately, the above symptom complex does not occur very often. During the past eight years, however, six such patients have been seen by the author. They have had the following items in common: Each had had at least two explorations of the neck for thyroid tissue after the first thyroidectomy; in none was the basal metabolic rate lower than plus 30 per cent. Four had received a series of radiation therapy. All had a tachycardia. Two patients have had repeated electrocardiograms over a period of four years and nothing besides the tachycardia has been found. One patient was treated with thiouracil, and while the basal metabolic rate was lowered from plus 35 to plus 7 per cent, the patient felt no better, and so the drug was discontinued after a four months' trial.

The author has felt in the management of these cases that as long as the patients feel well and the pulse does not go over 100 per minute, nothing should be done. It will be interesting to note any cardiac damage that may result from a persistent tachycardia. Also, it would be interesting to note what effect radioactive iodine would have on these patients. It is possible that they may have aberrant hyperactive thyroid tissue somewhere else in the neck or thorax, but none of them wishes further operation. One of the patients has worked regularly in a department store over a period of six years. Needless to say, these patients are being carefully followed, and it is hoped that informative data will be accumulated over the years.

Summary

Some present-day concepts in the management of hyperthyroidism have been reviewed.

1. The use of thiouracil in the treatment of the thyrotoxic patient has been the greatest advance in therapy since the advent of iodine.
2. The use of radioactive iodine may prove to be the therapy of choice in certain forms of hyperthyroidism.
3. In twenty-five severely toxic patients, the use of spinal anesthesia as part of the operative treatment made possible a single stage bilateral subtotal lobectomy when otherwise only a several-stage operation would have been ventured. Spinal anesthesia had been used on five occasions in the treatment of "thyroid storm" with beneficial results.
4. Of six patients, followed over several years, with persistently high basal metabolic rates after seemingly adequate medical and surgical treatment, the author has adopted a policy of watchful waiting. As long as the patient feels well and does not have too high a tachycardia, no treatment of such patients is indicated.

Discussion

Dr. Martin Nordland, Minneapolis: I enjoyed listening to Dr. Rea in the presentation of this subject. He has made it very clear that hyperthyroidism is a disturbance strictly calling for special treatment. The term "goiter," like the word "rheumatism" covers too much territory. It would be fortunate if a more clear-cut distinction would be made in the minds of the profession between the functional disturbance of the thyroid, such as true hyperthyroidism, and the other disturbances of the gland such as the nodular and inflammatory changes. It is only in true hyperthyroidism that the new drugs will help. Thyroidectomy has been very successful in the treatment of all types of "goiters" with the exception of true hyperthyroidism. In true hyperthyroidism, statistics reveal that in about 27 per cent of those treated by operation, the results have not been satisfactory. Several years ago, Dr. William O'Brien, of the University of Minnesota, discussed the "Future of Medicine" before the Hennepin County Medical Society. In this discussion, he pointed out that anatomy, pathology, and even surgical technique, was relatively standard. He prophesied that new developments and progress would come through chemistry, biochemistry and allied fields.

We all know what penicillin and sulfa drugs have done for surgery. In time, no doubt, a drug such as thiouracil may eliminate surgery entirely in this disturbance of the thyroid. At this time, however, thiouracil is not the drug. Early reports seem to have been too optimistic in their evaluation of the thio drugs, and to have overlooked the toxicity likely to occur from large initial doses. Thiouracil may be a potent weapon for the control of thyrotoxicosis in many cases when used wisely, with full understanding of its possibilities and dangers. Long continuous observation is necessary. Serious complications have been observed long after discontinuance of the drug. I only wish to emphasize the fact that it is a dangerous drug, and that its use at the present time should be limited to the extremely toxic case in a large clinic or teaching institution where the patient can be observed very closely so that the severe complications, such as leukopenia and agranulocytosis do not develop. Even the most enthusiastic do not claim that this drug brings about a cure.

I cannot refrain at this time from discussing one of the important points in the diagnosis of hyperthyroidism. Too much emphasis has been placed upon the basal metabolic rate. The basal metabolic rate should never be taken as a criterion for surgery, or for the use of thiouracil. It is a recognized fact that the persistently rapid pulse comes first in importance. The rapid pulse with weight loss, together with the other cardinal symptoms of hyperthyroidism are much more important than the basal metabolic rate. This observation (basal metabolic rate) is only confirmatory.

I have had no experience with radioactive iodine and therefore cannot discuss this phase of treatment. This may be something well worth while in the near future.

Those of us who have seen a severe postoperative crisis in hyperthyroidism will welcome any additional method for the management of this problem. Spinal anesthesia, as Dr. Rea described it, may develop into an excellent weapon for the treatment of these patients. Fortunately, the severely toxic patients are seen less often than previously; and, in most of our toxic cases, the postoperative crisis can be avoided by proper preoperative preparation.

I want to congratulate Dr. Rea for his excellent presentation. I am very happy to have had the privilege of listening to him and to have had the opportunity of discussing his paper.

Dr. J. A. Lepak, Saint Paul: Dr. Rea ought to be congratulated for bringing to our attention such a timely subject as the recent advances in the treatment of hyperthyroidism. Anyone who wants to use thiouracil ought to be not only a good clinician but also employ a good laboratory. Some time ago I listened to a discussion of the action of thiouracil by a member of the Mayo Clinic. The more the drug was used, the more cautious was everyone in prescribing it. Where Lugol's solution sufficed to prepare the patient for operation, thiouracil was never employed. Certainly the mortality rate from thiouracil is all out of proportion to its benefits when compared with the harmlessness of Lugol's solution.

The clinical manifestations of hyperthyroidism do not run parallel with basal metabolic readings. Sometimes the clinical manifestations of hyperthyroidism are all out of proportion to the basal metabolic readings. We have to wait, therefore, for a considerable time for the proper evaluation of the benefits of thiouracil in the treatment of hyperthyroidism.

Personally, on account of the relatively high mortality rate of thiouracil at the present time in the treatment of hyperthyroidism, I favor the administration of Lugol's solution and the operative procedure. Dr. Rea has brought out a very controversial subject and I hesitate to accept it without further studies, controls and observations.

Dr. C. N. Hensel, Saint Paul: I do not like to let such a splendid presentation pass with nothing but "cold water" thrown on it by a surgeon and by an internist.

I have had experience with the use of thiouracil in the treatment of thyrotoxicosis in but one case; but, in that case, the results were so satisfactory and lacking in hazard that I am planning to use it again.

The case is that of a nineteen-year-old unmarried woman who had been nervous since puberty and whose symptoms of hyperthyroidism dated back about two years but were not recognized as such until February, 1945, when her metabolic rate was plus 48 per cent.

In May of 1945 she was examined at the Mayo Clinic where her metabolic rate was reported as plus 51 per cent. She was kept in bed, in the hospital at the Mayo Clinic, on sedatives and Lugol's and the standard preoperative management for a period of six weeks. She was then sent home as unsuitable for surgery.

On September 10, 1945, she entered the Miller Hospital as a patient of Dr. Jones to be prepared for thyroidectomy. She was put to bed on sedatives and Lugol's, 15 drops t.i.d. (the use of iodine had been haphazard in the previous weeks), and on a full diet.

Her metabolic rate was plus 54 per cent, heart rate 120 beats per minute, and blood pressure 180/100. After a week on such a regime, there was absolutely no improvement in her condition.

At this juncture, I was called in and found a patient with a severe thyrotoxicosis, exophthalmos, cardiac palpitation, bodily restlessness, tremor, quadriceps weakness, emotional instability, and insomnia. The thyroid gland was diffusely enlarged, smooth in outline, and firm in consistency. The heart was enlarged and slamming in action and there was a systolic murmur over the apex.

The standard treatment was obviously not effective in this case, so we decided to try thiouracil which was then on the reserve list and could only be obtained from the manufacturer.

We read the available literature on this new drug, familiarized ourselves with its dangers and precautions, and on September 22, 1945, commenced treatment with thiouracil 0.2 gram t.i.d., with 10 grains of soda bicarbonate added to each dose, and ordered leukocyte counts and differential smears made every day.

Within the first week there was an initial drop in leukocytes from 10,000 to 5,000 and then the count rose to 8,000 and remained in that vicinity. The polymorphonuclear cells ranged from 58 to 68 per cent.

By October 30, 1945, thirty-eight days after starting thiouracil, the patient was showing lessening of the thyroid drive, the metabolic rate was plus 33 per cent and the pulse rate was 80 beats per minute.

On November 1, 1945, the patient had an acute psychotic episode, left the hospital (unobserved) for two hours and on her return was in a state of shock and near collapse. Psychiatric consultation was obtained and treatment instituted on the basis of a schizophrenia. The patient was placed in bed, in restraints, put on sedatives and tube feeding. But the thiouracil was continued three times a day in a dose of 0.2 gram.

On November 21, 1945, the metabolic rate was plus 12 per cent and the pulse rate was 52 beats per minute. Because of the complicating psychosis and suggestions in the literature that long administration of thiouracil might effect a permanent cure of hyperthyroidism, we continued to give thiouracil 0.2 gram three times a day.

On November 27, 1945, shock treatments were started with insulin therapy.

On December 14, 1945, the metabolic rate was plus 7 per cent, pulse rate 62 beats per minute, and leukocyte count 12,400. Thiouracil was continued at 0.2 gram twice daily.

On December 20, 1945, the dose of insulin, which had reached 160 units a day, was stopped because of the presence of severe anginal pains and general debility. Papaverine hydrochloride, grains 1½, were used four times a day for the anginal pains. Believing that thiouracil might also be having some deleterious effect on the heart, the dose was reduced to 0.2 gram once daily and continued at that level. With the cessation of the insulin therapy, the patient soon revived, and it was evident that she would always be a schizophrenic at a childish level with a fanciful outlook on life. The hyperthyroidism was controlled and we hope to keep it so, for surely this individual was a most unsatisfactory candidate for goiter surgery.

She was discharged from the hospital on January 1, 1946, with instructions to continue thiouracil 0.2 gram once daily. At that time her hemoglobin was 90 per cent, leukocytes 7,600, polymorphonuclear cells 61 per cent and red blood cells normal. Fasting blood sugar was 105 mg., cholesterol 362 mg., blood pressure 114/60, and pulse rate 80 beats per minute.

By the persistent use of thiouracil for 100 days, we had carried this patient through a violent psychotic episode and brought a "flaming" thyrotoxicosis under control without hazard, when nothing else could have accomplished these results.

On February 2, 1946, thiouracil was stopped for one week because of joint pains and chilly sensation and then resumed in a dosage of 0.1 gram daily.

On April 3, 1946, the patient was examined at the office. Her eyes were no longer prominent. There was no vasomotor blotching of the skin; body nutrition was improved, and heart action was irritable, but quieted on held breath. The metabolic rate was plus 3 per cent, pulse 88, temperature 97.8°, and blood pressure 130/80. Cholesterol was 347 mg. and sedimentation rate 8 mm. in one hour. Hemoglobin was 89 per cent, red blood cells 4,620,000, and white blood cells 6,400. She was continued on thiouracil, 0.1 gram a day.

In June, 1946, she was seen by Dr. Jones after a bruising auto accident. He found clinical evidence of reactivation of the hyperthyroidism.

The dose of thiouracil was increased to 0.1 gram three times a day, without any amelioration in symptoms. It was now obvious that our only recourse was surgical removal of the thyroid gland and that promptly. So, on June 27, 1946, thiouracil was stopped, and Lugol's solution 15 drops three times a day was started and sedatives prescribed.

On July 10, 1946, the patient re-entered the Miller Hospital and on July 11 Dr. Jones performed a bilateral partial thyroidectomy with no undue bleeding or complications.

The microscopic diagnosis of removed tissue was "hyperplastic goiter, lugolized." The patient was out of bed on the third postoperative day, walked on the fifth day and went home on the ninth day.

A month later her metabolic rate was minus 11 per cent, pulse 66 to 70, temperature 98.6°, leukocytes, 8,300, and cholesterol 278 mg.

Dr. M. B. Visscher, University of Minnesota: I want to congratulate Dr. Rea on his studies with the use of spinal anesthesia in the attempt to eliminate some of the hazards in thyrotoxicosis. There is a very good physiological rationale for the type of procedure he is using. I think he would be the first to admit that only the future will tell what practical significance this innovation may have in the treatment. I feel sure he will add something to our knowledge about the thyroid gland and I want to urge him to carry on these studies on the thyroid gland. I think he is doing a very good job.

Dr. Rea, in closing: I wish to thank those who discussed this paper. I believe that thiouracil should be used only in the more severely toxic cases of goiter. The slightly toxic cases can be prepared adequately by iodine therapy without thiouracil.

I am glad the question of evaluating the basal metabolic rate was brought out in the discussion. It should be remembered that the basal metabolic rate is a laboratory test and is subject to error. Personally, I put more emphasis on whether or not the patient is gaining weight, rather than the lowering of the basal metabolic rate in determining the progress of the thyrotoxic patient under therapy. A thyrotoxic patient with a basal metabolic rate of plus 50 per cent that goes down to a plus 20 per cent, but who is losing weight, is a poorer risk than a similar patient whose basal metabolic rate remains stationary but who is gaining weight.

EXPERIENCES IN THE TREATMENT OF HYDROCEPHALUS IN INFANTS

WALLACE P. RITCHIE, M.D.
Saint Paul, Minnesota

The birth of a hydrocephalic infant has usually been faced with despair by the obstetrician, pediatrician and the family from the earliest ages. Only in the last ten years has there been an honest hope that the child will be one of the few which will either recover spontaneously or be a candidate for surgical amelioration of his condition.

This discussion is limited to hydrocephalus occurring in early infancy. It is a discussion of internal hydrocephalus in which the fluid is within the ventricular system. External hydrocephalus, caused by an excess of fluid in the subarachnoid space, or by subdural hematoma or hygroma, is a rare occurrence and is only mentioned in passing. Hydrocephalus occurring after infancy is due, in 95 per cent of cases[4], to tumors or cysts and will not be included.

There are no thorough studies of any large group of hydrocephalics as regards etiology and prognosis. The incidence is suggested by several authors. Dott and Levin[11] found sixty cases of hydrocephalus not caused by tumor in 700 cases of verified tumor. Wilder and Moldavalsy[27] record eight cases in 6,000 deliveries, while Putnam[19] states that according to Murphy there were found eighty-eight cases of hydrocephalus alone or associated with spina bifida in approximately 130,000 births. Putnam considers, however, that there are probably twice as many, as reported, as a large number do not develop until weeks or months after birth. Haynes[16] states that in 183,044 admissions to the Children's Hospital, there were 334 cases of hydrocephalus. These figures are certainly not satisfying. It is very important to know the percentage chance that any infant with hydrocephalus has of spontaneous recovery or of recovery by conservative means before subjecting it to a procedure with a rather high mortality. This would necessitate a careful evaluation of a large number of cases and such a study apparently has not been made. In all probability there are numerous mild cases which go unrecognized, but when a child has sufficient hydrocephalus to cause recognition and any concern, the chances of its spontaneous correction are apparently not small, according to Bucy[3] and Penfield,[18] although Putnam[19] states he has never seen a spontaneous recovery. It is our impression that if an infant has such a degree of hydrocephalus that the family or pediatrician is concerned, the chances are very great against recovery without treatment.

The cerebrospinal fluid and the subarachnoid spaces were first described by Cottugno[12] in 1784. According to Fraser and Dott[14] the cerebrospinal fluid is probably not produced before the fifth month of intra-uterine life as it is only after this time that the foramina of Luschka and Magendie appear as perforations in the tela choroidea. Their reasoning is by implication for if the fluid was secreted before this time it could not be absorbed and hydrocephalus would always result due to the as yet unpatent foramina. It is possible, however, that cerebrospinal fluid may have other avenues of exit in intra-uterine life. Browning[2] states that in fetal life there are spinal afferent vessels, possibly similar to lymphatics, which lead out through the spinal nerves as shown by Key and Retzius. This is the exit for cerebrospinal fluid in most animals and possibly is an avenue of exit in fetal and early infant life. If Fraser and Dott are correct, however, a congenital hydrocephalus would begin at the earliest after the fifth month of intra-uterine life.

The origin of the cerebrospinal fluid in the choroid plexus, its circulation through the aqueduct of Sylvus to the fourth ventricle and to the basal cisternae by way of the foramina of Luschka and Magendie, and thence to the arachnoid villi where it is absorbed, is quite well established. Hassin[15] is one of the few who question the fact that the cerebrospinal fluid is a product of the choroid plexus. He cites numerous cases of marked hydrocephalus with an atrophic, sclerosed choroid plexus which is imbedded in the brain and which could not secrete fluid. There may be some secretion of cerebrospinal fluid, however, in the perivascular spaces. Penfield[18] states that there is probably some absorption of cerebrospinal fluid by the ventricles themselves. Foley[13-1,13-2] has demonstrated a reversibility of flow through the choroid plexus. The spontaneous arrest of hydrocephalus may possibly be explained by some such process.

The surgical treatment of infantile hydrocephalus, however, is based on the well-established evidence of the production of the cerebrospinal fluid by the choroid plexus and its absorption over the surface of the brain.

Inaugural thesis.

There are two types of infantile internal hydrocephalus, obstructive and non-obstructive or communicating. In the first instance there is an obstructive mechanism so that fluid is unable to reach the spinal subarachnoid space due to an obstruction somewhere from the choroid plexus down to and including the foramina of Luschka and Magendie. Sachs,[23] reporting the largest series of operated cases in the literature (ninety-eight in all), states that fifty-four (60 per cent) were communicating types and forty-two (46 per cent) were obstructive in nature. Fraser and Dott[14] found that six cases out of twenty-one were communicating. In seven of their cases there was a definite history of birth trauma. The common causes of obstructive hydrocephalus are congenital artresias, ependymitis or arachnoiditis caused by toxins, infection or hemorrhage. Obstructive hydrocephalus frequently accompanies spina bifida due to the Arnold-Chiari deformity. Russell and Donald[22] describe the Arnold-Chiari deformity, first reported by Arnold in 1894 and shortly thereafter by Chiari, as primarily a deformity of the cerebellum. The fourth ventricle is elongated. The foramina of Luschka and Magendie lie below the foramen magnum and, because of the lack of space, fluid is unable to enter the basal cisternae. I shall further discuss this important syndrome under the subject of treatment.

In the communicating type of hydrocephalus, fluid is able to leave the fourth ventricle but the mechanism of absorption in the subarachnoid spaces is faulty, due to either failure of development of the subarachnoid spaces, arachnoiditis, ependymitis caused by toxins, infections or hemorrhage. Internal hydrocephalus is rarely if ever caused by hypersecretion of cerebrospinal fluid.

Toxoplasmosis,[1] a protozoan infection, which Cowen and Page[1] in 1939 showed could be transmitted to man is also a frequent cause of hydrocephalus.

Hydrocephalus may be congenital or acquired after birth.

Penfield studied twenty-seven cases and of these, seventeen were present at birth and seven developed after birth. In at least five cases he states that an inflammatory process started *in utero*. In twenty-six cases treated by Putnam,[21] fifteen were congenital. Dandy and Blackfan found in fifty-four cases of obstructive hydrocephalus, 21 per cent were congenital, while Bucy[3] found about 50 per cent of forty-five cases of communicating hydrocephalus were congenital.

Probably over half of the cases of infantile hydrocephalus are present at birth. In some instances there is such an aplasia of brain substance that either the hydrocephalus must have been present for many months or there was a congenital absence of brain tissue. In either event the prognosis is extremely poor no matter what procedure is attempted.

The pathological findings depend upon whether the hydrocephalus is communicating or obstructive. The white matter is stretched and is destroyed long before there is destruction of the gray matter. It is surprising to note the extent of damage in some individuals in whom there still remains a high degree of intelligence and function. Of course, the basal nucleii are little affected until late; therefore, a fairly normal function is possible even with a tremendous hydrocephalus. Cases have been recorded in which there has been a definite return of cortical thickness after relief from hydrocephalus. However, it is conceded by all that if the cortex is less than 1 cm. in thickness, efforts to treat the child should be abandoned, as only an imbecile will result.

Diagnosis

The determination of the presence of hydrocephalus is not always easy, particularly in the early stages. When one considers that diagnostic procedures such as spinal puncture, communication tests and air studies carry a definite risk, one must be quite certain that a hydrocephalus is developing before subjecting the infant to these procedures. If there are doubts, it will do no great harm to observe the size of the head over a period of several weeks before undertaking more active diagnostic measures.

If there is evidence that the size of the head is increasing out of proportion to the normal, the first procedure is a diagnostic ventricular tap, to rule out subdural collection of fluid. The next consideration in diagnosis is the determination of whether the hydrocephalus is communicating or obstructive. At the same time the severity of the hydrocephalus can be determined. The most satisfactory test to determine the type is the communication test. One c.c. of phenosulphopthalein is injected into a lateral ventricle and a spinal puncture done twenty to thirty minutes later. If there is an obstructive hydrocephalus there will be no dye recovered in the spinal fluid. Pressure readings of both ventricular and spinal fluid should be taken.

The width of the cortex should be noted, as a cortex of less than 1 cm. in thickness prognosticates a poor result.

Encephalography is of some value but encephalography carries some risk, and as a rule one has ample evidence of the type of hydrocephalus and the adequacy of the cortex without this procedure.

Other diagnostic procedures are secondary. One attempts to determine the cause of the obstructive or communicating hydrocephalus, whether it be toxoplasmosis, syphilis, Arnold-Chiari deformity, congenital aplasia or nonspecific infection. Tumor as a cause of early hydrocephalus is extremely rare.

Treatment

There is no doubt that there are spontaneously averted cases. There are no records of what this percentage is. It must, however, be small.

The excellent historical review by Davidoff[8] in 1939 and by Haynes[16] demonstrates the wide variety of surgical methods used in the treatment of infantile hydrocephalus.

Almost every means imaginable for draining the cerebrospinal fluid has been used. The drainage of spinal fluid outside the ventricles is as old as the hills. It was tried by Hippocrates and Celsus, and was resurrected by Von Bergman, Kocher, Lane and many others. All met with failure.

Drainage into the subcutaneous tissues, peritoneum and dural sinuses have all been attempted with poor results. Perhaps the best of these procedures is that described by Torquildsen[25] whereby he drains the lateral ventricles into the cisterna magna by means of a tube buried subcutaneously.

Fig. 1. Drawing to demonstrate the lamina terminalis and the point of puncture. From Stookey and Scarff: Bull. Neurol. Inst. New York, 5:367, (Aug.) 1936.

The three methods which have brought the best results in the treatment of infantile hydrocephalus are (1) the so-called "puncture" operations by means of which fluid is let out of the closed ventricular space into the subarachnoid spaces where it may be absorbed; (2) the operations directed against the choroid plexus itself in which either coagulation or extirpation is performed; and (3) the operation of the decompression of the foramen magnum in cases of Arnold-Chiari deformity.

The earliest so-called puncture operations were described first by Anton and Bramman in 1908. They recommend puncture of the corpus callosum, the so-called Balkenstitch procedure. This procedure has gradually been discarded because of failure of the puncture opening to remain patent. However, as late as 1927 Jennings[17] reported nineteen cases, with five deaths and only three good results.

Dandy[5] first advocated a puncture operation which has been successful in many cases, i.e., puncture of the lamina terminalis into the anterior wall of the third ventricle (Fig. 1). The two cases presented in detail in this paper were treated in this manner. Dandy modified his procedure by a temporal approach and so that the drainage was from the third ventricle into the cisterna interpeduncularis. White[26] does not believe this is necessary and gives good evidence that the puncture in the lamina terminalis remains open.

In obstructive hydrocephalus in infants, the puncture of the lamina terminalis is a rational procedure which has given satisfactory results in our hands.

Shunting operations are satisfactory for obstructive types of hydrocephalus, but in communicating hydrocephalus where absorption is faulty and there are no obstructed passages, the most successful operations have been in attempts to decrease the output of cerebrospinal fluid. Dandy[6] made the first attack in 1918 when he extirpated the choroid plexus in four cases. This method has been replaced by cauterization of the choroid plexus, although there are some neuro-surgeons who are again attempting extirpation.

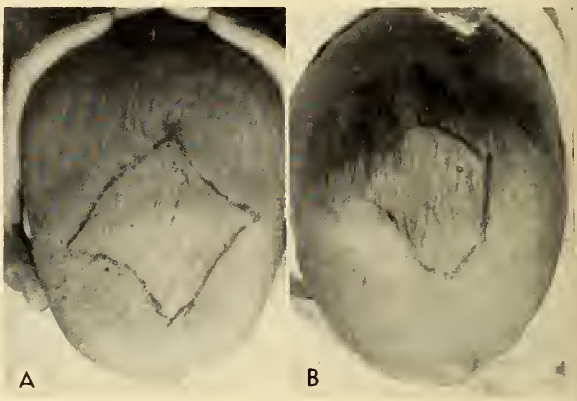

Fig. 2. (A) Size of anterior fontanelle before cauterization of the choroid plexus. (B) Size of anterior fontanelle one month following cauterization of the choroid plexus on one side.

Putnam[20] in 1935 first reported twenty-two patients in whom he had cauterized the choroid plexus by a bipolar endoscope. Only nine survived a period of four to fifteen months but five of these were well and normal, two were improved and two unimproved. In 1938 he reported a 21 per cent mortality with only two deaths in his last sixteen cases. Scarff[24] almost simultaneously reported similar results.

This method has given satisfactory results. It consists of bilateral occipital trephine with opening into the ventricles and cauterization of the choroid plexus of the lateral ventricle either by direct vision or by endoscopic methods. The two sides are cauterized at different operations. The technical aspects of the operation will not be discussed here. Suffice it to say there is ample evidence that cauterization of the choroid plexus is a very satisfactory method of decreasing the cerebrospinal fluid production (Fig. 2, a and b).

The third method of treating hydrocephalus is only applicable in those individuals who have an Arnold-Chiari deformity. D'Errico[9] first recommended unroofing the foramen magnum in such cases. He reported six cases with three satisfactory results. In 1942 he reported[10] a mortality of 12.5 per cent. In hydrocephalus associated with spina bifida, the Arnold-Chiari deformity is usually present and a cerebellar decompression is indicated. In some instances the choroid plexus may also have to be cauterized.

Results

If one recognizes that infantile hydrocephalus is present at birth in probably one-half of the cases, and the many of these are far advanced or there is a definite aplasia of the brain, the prognosis is discouraging at the outset. Nevertheless one successful result out of many cases cannot be forgotten or cast aside. The remark is heard so often: "What is the use, they will only grow up to be imbeciles?" That is true to some extent but it reflects our failure to recognize the infant who will be imbecilic if saved by operation, and should not be a reflection on the operation in the properly selected case.

Thirteen of the cases which have been studied are collected cases from the neurosurgical service at the University Hospital, and four are from the authors' series in Saint Paul.

Five of the seventeen cases were patients with hydrocephalus associated with spina bifida and with associated Arnold-Chiari deformity. One (BH) died postoperatively—a mortality of 20 per cent. One (NC) was a mental defective four years after operation, in whom operation was originally carried out at the insistence of the family, as the prognosis was admittedly poor. One (PB) living four years after is in fair condition, a cauterization of the choroid plexus having been performed following decompression. One (CY) was living and well one year after operation and was apparently normal. One (BB) was living and apparently normal five months after operation.

Thus in two of five cases the operation appeared to have produced a satisfactory result. When one realizes that this condition is secondary to another serious defect, a meningocele, a satisfactory recovery in 40 per cent is encouraging.

There were eight cases in which the etiology was undetermined. Two of these cases (TS) and (JS) were obstructive and were treated by puncture of the lamina terminalis. Both are living and normal thirteen and seven months after operation. Six were treated by cauterization of the choroid plexus. Two died postoperatively, and the remaining four are discouraging. Although the hydrocephalus was averted, not one has developed properly. This is the most discouraging group. The hydrocephalus has been averted but the child's development has been subnormal. The majority of these patients probably had their hydrocephalus *in utero* and as evidenced at operation had extremely thin cortices. The only positive statement that one can make about these cases is that hydrocephalus can be controlled by cauterization of the choroid plexus. Failure is due to lack of recognition of the chance of normal development rather than to the operation.

Two infants with congenital mal-development of the cerebellum were operated upon—one by puncture of the lamina terminalis and one by cerebellar decompression. Both died.

Only two cases of hydrocephalus caused by proven toxoplasmosis are included in this series. One (TH) has developed normally after cauterization of only one side. One (RLH) is progressing normally after six months.

In recapitulation, seventeen cases have been operated upon. Five operative deaths are recorded—a mortality of 29 per cent over all.

There are six patients who are developing properly.

Satisfactory results in 35 per cent of these cases is not a remarkable record. But if one could be able to determine the prognosis for each case and refuse operation for those with a poor prognosis, operation will cure 35 per cent of these children with hydrocephalus who would otherwise live only a few years.

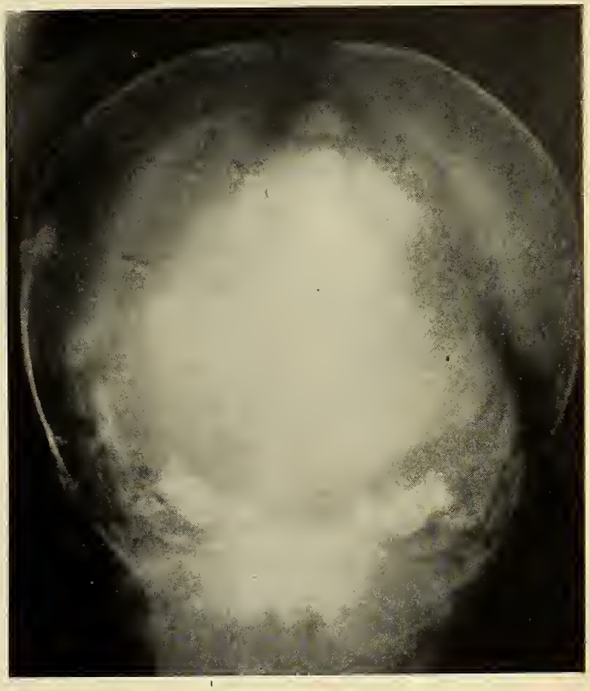

Fig. 3. (Case 1) Occipital view of the skull shows a marked separation of the sutures.

Case Reports

Case 1.—T.S. was first admitted to the Children's Hospital as a patient of Dr. Fred Ouellette on October 15, 1945. He was thirteen months old. His birth had been normal. His past history was negative except that at the age of ten months he developed chicken pox. Since that time he had been irritable and disliked any disturbance such as noise or movement. Although he had vomited before his chicken pox the vomiting had become almost continuous the week before admission. He could no longer walk.

Physical examination revealed a well-nourished child, not acutely ill but very irritable. The general examination was negative but the neurological examination (Dr. Gordon Kamman) revealed optic atrophy, right; left knee jerk increased on the right. Spinal fluid: colloidal gold negative, protein 112 mg., cell count 2, chloride 710 mg., sugar 70 mg. X-rays revealed slight enlargement of the skull with separation of the sutures (Fig. 3). He remained in the hospital six days, during which time he was very restless and irritable. He was readmitted fourteen days later. At this time he was much more irritable, did not like bright light and there was some bulging of the fontanelle. There was a right sixth cranial nerve paresis, optic atrophy on the right and a 3 diopter choked disc on the left. On November 6, 1945, communication tests revealed no dye appearing in the spinal canal after insertion into the ventricle. Because the symptoms seemed to have been definitely a sequela of chicken pox, an obstructive hydrocephalus due to encephalitis rather than to a tumor was considered to be the most likely etiology. Consequently, on the same day a puncture of the lamina terminales was performed and a free flow of fluid obtained, colored by the dye.

Postoperatively fluid collected beneath the skin flap, and frequent aspirations were necessary. Because the fluid did not seem to be absorbing, an attempt to cauterize the choroid plexus was made but the ventricles were collapsed. The brain appeared of fairly normal thickness. After about three weeks the fluid collecting beneath the scalp suddenly ceased and the patient was discharged after thirty-six days. The patient appeared to have only light perception. He remained irritable for three or four weeks, then suddenly improved and appeared to notice his surroundings.

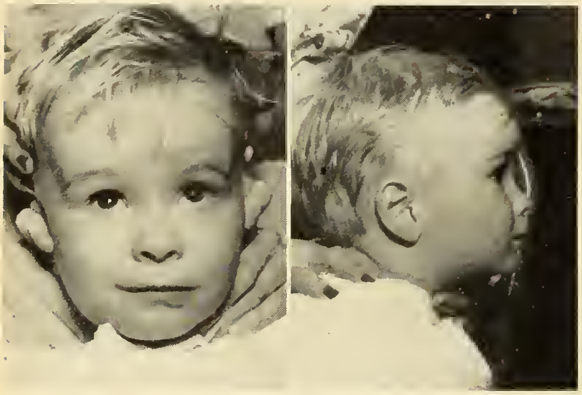

Fig. 4. (Case 1) One year after the lamina terminalis had been punctured.

Shortly thereafter he began to sit up, to walk and to develop normally. He developed poliomyelitis in July, 1946, but is recovering and according to all examinations is a normally developing child (Fig. 4).

Case 2.—J. S. was admitted to the Children's Hospital by Dr. Ray Shannon on May 25, 1946. She was five months old. She was a full-term baby and was delivered spontaneously. She appeared absolutely normal to the mother, and as a result medical care was not sought until a neighbor called the mother's attention to the fact that the baby's head was larger than normal.

On admission, the findings were essentially negative except that the anterior fontanelle measured 14 by 10 cm. and the circumference of the head was 48 cm., which was approximately 6 cm. larger than normal.

Puncture through the anterior fontanelle revealed the cortex to be approximately 1 cm. thick on the left and 2 cm. thick on the right. A communication test revealed a block, as no dye was recovered in the spinal fluid. The cell count, protein, colloidal gold curve and Kahn test were normal.

On May 31, 1946, a puncture of the lamina terminales was performed. Her postoperative course was uneventful except for a fever up to 103° for a few days.

The child now has a head 52 cm. in diameter. The fontanelles are sunken. She looks like a normal child and is beginning to stand up. Her mother thinks she is further developed than her other children were at the same age.

Discussion

Dr. E. F. Robb, Minneapolis: All pediatricians see a number of these cases, which have been most discouraging as far as I am concerned. A few have seemed to cure themselves but most of them have gone on to a fatal termination. The results from surgery have in my experience been 100 per cent bad. Dr. Ritchie's most excellent paper tonight should give us renewed courage. He is to be congratulated on his fine work.

Dr. Ritchie, in closing: I appreciate the discussion. Regarding the thickness of the cortex, I may have been somewhat misleading. In estimating the thickness of the cortex, one must subtract about 1 cm. from the depth at which ventricular fluid is obtained on puncture through the fontanelle.

Inasmuch as the gray matter is not destroyed until late, there is a good opportunity for recovery of function after the hydrocephalus has been relieved.

Although the results are not by any means perfect, there are a sufficient number of recoveries to warrant a careful evaluation of all cases of hydrocephalus before determining that they are hopeless.

The meeting adjourned.

INTERNATIONAL COLLEGE OF SURGEONS

The International College of Surgeons, United States Chapter, will hold its twelfth annual Assembly and Convocation in Chicago, September 28 to October 4, 1947.

The program will include operative and non-operative clinics, demonstrations, symposia, forums, medical motion pictures, exhibits and the formal dedication of the new library and permanent home of the United States Chapter. All meetings, with the exception of the operative clinics, will be held in the Palmer House and the Stevens Hotel.

Copy of the program and detailed information may be obtained by writing Max Thorek, M.D., Co-chairman, 1516 Lake Shore Drive, Chicago, Illinois.

AMERICAN COLLEGE OF PHYSICIANS AND SURGEONS

Dr. Julian DuBois, Sauk Centre, has been elected president of the American College of Physicians and Surgeons. Other recently elected officers of the organization are Dr. C. H. Pierce, Wadena, first vice president; Dr. A. E. Ritt, Saint Paul, second vice president; Dr. Henry D. Deissner, Minneapolis, third vice president, and Dr. O. A. Lenz, Minneapolis, secretary-treasurer.

The organization will hold its first annual dinner on June 29 at the Spalding Hotel in Duluth. Speakers at the dinner include Dr. Charles A. Dawson, president of the Wisconsin Medical Society, and Dr. F. G. Benn, Minneapolis, president of the Minnesota chapter.

MISSISSIPPI VALLEY MEDICAL SOCIETY

The twelfth annual meeting of the Mississippi Valley Medical Society will be held in Burlington, Iowa, October 1, 2 and 3, 1947. Over twenty-five clinical teachers from the leading medical schools of the country will conduct this postgraduate assembly, the entire program having been planned to appeal to general practitioners. Dr. Edward L. Bortz, president of the AMA, will be the principal speaker at the annual banquet, at which talks will also be given by the presidents of the Illinois, Iowa and Minnesota Medical Associations.

All ethical physicians are invited to attend, and for the first time in history no registration fee will be charged. A program may be obtained from Dr. Harold Swanberg, Secretary, 209 W. C. U. Building, Quincy, Illinois.

NORTHERN MINNESOTA MEDICAL ASSOCIATION

Announcement has been made that the annual meeting of the Northern Minnesota Medical Association will be held on Saturday, September 6, at Breezy Point Lodge, Pequot Lakes (near Brainerd).

The following program is scheduled for the one-day meeting.

"Abdominal Hodgkin's Disease"—Dr. W. O. B. Nelson and Dr. Leonard Dwinnell, Fergus Falls.

"Some Practical Aspects of the Rh Factor"—Dr. A. H. Wells, Duluth.

"The Diagnosis of Congenital Cardiac Defects Which Are Amenable to Surgery"—Dr. Thomas J. Dry, Rochester.

"The Management of Lesions of the Rectal Outlet"—Dr. Louis A. Buie, Rochester.

"Clinical Evaluation of New Developments in Allergy"—Dr. Albert V. Stoesser, Minneapolis.

"The Psychosomatic Component of Disease"—Dr. O. L. Norman Nelson, Minneapolis.

"Clinico-Roentgen-Pathological Conference"—Dr. E. L. Tuohy and associates, Duluth.

The meeting will close with an evening banquet, at which Governor Luther W. Youngdahl will be the principal speaker.

HENNEPIN-RAMSEY COUNTY SOCIETIES

At the first joint scientific meeting of the Hennepin and Ramsey County Medical Societies, held May 19 in the auditorium of the University of Minnesota Museum of Natural History, the principal speakers were Dr. James D. Bisgard, professor of surgery at the University of Nebraska, and Dr. Edgar S. Gordon, professor of medicine at the University of Wisconsin. Dr. Bisgard spoke on "Intra-thoracic Tumors," and Dr. Gordon discussed "Deficiency Diseases."

SOUTHWESTERN MINNESOTA SOCIETY

At a dinner meeting of the Southwestern Minnesota Medical Society, held June 3 at the Hotel Thompson in Worthington, Dr. R. W. Koucky, Minneapolis, spoke on "The Rh Factor," and Dr. John Stam, Worthington, gave a report on the cyanotic condition produced in infants by water heavily impregnated with nitrates.

At a business meeting of the society on May 20, Dr. Hermanus DeBoer of Edgerton reviewed the history of the Southwestern Minnesota Medical Society, which was founded in 1888. Dr. B. O. Mork, Jr., discussed a recent meeting of the state association of county medical officers.

UPPER MISSISSIPPI SOCIETY

Fifty-four members of the Upper Mississippi Medical Society, and their wives, were guests of the Bemidji Medical Society at a meeting held May 24 at the Cyrana Lodge on Lake Beltrami. Dr. Charles W. Vandersluis and Dr. Sidney F. Becker, both of Bemidji, were in charge of arrangements for the meeting, which was presided over by Dr. Otto F. Ringle, president of the Upper Mississippi Society.

The major part of the scientific program consisted of a discussion of low back pains by Dr. M. S. Henderson, professor of orthopedics at the Mayo Clinic, and by Dr. William Peyton, professor of surgery at the University of Minnesota.

WASHINGTON COUNTY SOCIETY

The Washington County Medical Society met for dinner on the evening of June 24, 1947, to honor one of its members, Dr. James H. Haines of Stillwater, who has completed fifty years of medical practice.

Dr. Haines was graduated from Rush Medical College, Chicago, in 1895 and was licensed to practice medicine in 1897. He went to Stillwater shortly after graduation and started his medical life as a house physician at the Stillwater Hospital, now known as Lakeview Memorial Hospital. Shortly after that he opened an office for the general practice of medicine, and he remained in active practice until January 1, 1947. Since that time he has been enjoying a much-needed rest.

Following the dinner meeting, the evening was spent in listening to tales by Dr. Haines and others of the early years of practice. A gift was presented to Dr. Haines in memory of the occasion.

MEDICAL ECONOMICS
NATIONAL HEALTH BILL

(Continued from Page 785)

provide federal assistance to states for the establishment of medical and hospital services for those whose low income makes it difficult or impossible for them to get adequate care. They further pointed out that health functions of the federal government are of sufficient importance to justify their separation into a unit headed by persons trained and experienced in health work. They especially favored the provisions of S.545 for local participation and administration, which would in every case make the community feel that it is carrying out the program according to its best judgment.

American Dental Association officials have also voiced their approval of the philosophy embodied in the Taft Bill, as opposed to that motivating such legislation as the Wagner-Murray-Dingell Bill. They point to the greater freedom to states in direction of their own programs and favor expending dental care to children whose parents cannot meet the cost of such care, but emphasize that such a program should be at the community level.

As the hearings progress, it is clear that the evidence is piling up in favor of this bill and that it shows considerable possibility of ultimate passage through Congress.

In Memoriam

GEORGE RALPH CHRISTIE

Dr. G. R. Christie, a practioner of Long Prairie since 1884, died January 20, 1947, at the age of eighty-nine.

Dr. Christie was born January 19, 1858, in Berlin, Wisconsin. After teaching for several years, he entered Rush Medical College from which he graduated in 1882. He began practice in Montello, Wisconsin, but moved to Long Prairie in 1884.

On September 1, 1887, he was married in Milwaukee to Susan West. Four children were born to them, three sons, and a daughter who passed away at the age of eight. Dr. Christie was left a widower in 1910. In 1911 he married Ida Lewis Mason who died in 1944.

Dr. Christie took an active interest in his community and county. He was one of the incorporators of the Bank of Long Prairie, and was interested in banking circles in neighboring towns. He was a past president of the Upper Mississippi Medical Society, president of the local board of education for upwards of twenty years, served as president of the village council and was president of the county pension board for a number of years.

In 1938, Dr. Christie, along with Dr. B. F. Van Valkenburg, was honored at a dinner by the Long Prairie Commercial Club, and tribute was paid to his long medical service and his contributions to community development.

A member of the Masonic Lodge, the Upper Mississippi Medical Society, the Minnesota State and American Medical Associations, the Great Northern Surgeons' Association, Dr. Christie gave valuable medical and civic service to his community for a long period of time until his retirement a few years ago. He will long be remembered by his many friends.

Dr. Catherine Burns, daughter of the late H. D. Burns, Albert Lea, recently became associated in medical practice with Dr. S. A. Whitson and Dr. J. P. Person in offices at Albert Lea.

* * *

One of the speakers at the annual convention of the AMA in June was Dr. W. G. Workman, Tracy, who with Mrs. Workman traveled by plane to Atlantic City for the meeting.

* * *

New offices for the practice of medicine in the specialty of eye, ear, nose and throat diseases have been opened in International Falls by Dr. R. Hugh Monahan, Jr., of that city.

* * *

Dr. William C. Dodds, a member of the Bratrud Clinic in Thief River Falls for more than a year, has entered into partnership with Dr. Donald M. Houston of Park Rapids and has begun his practice in that city.

* * *

On May 29 Dr. W. W. Brown terminated his practice in Isle and began a vacation trip to California. Upon his return he planned to establish his medical practice in Wilmont.

* * *

Dr. Henry E. Michelson, Minneapolis, was elected chairman of the Section of Dermatology and Syphilology at the recent meeting of the American Medical Association in Atlantic City.

* * *

At the annual meeting of the North Dakota State Medical Association, held in Fargo on May 27, Dr. H. O. McPheeters, Minneapolis, presented a paper entitled, "Peripheral Circulatory Disease and the General Practioner."

* * *

In the alphabetic roster of members of the Minnesota State Medical Association, printed in the May issue of MINNESOTA MEDICINE, Dr. Roberta G. Rice's address was incorrectly listed as Aitkin. It should have been Rochester.

* * *

Tracy acquired a new physician in May when Dr. O. J. Esser, formerly of Gibbon, became an associate of Dr. A. D. Hoidale and Dr. W. G. Workman in their clinic in Tracy. Dr. Esser recently completed postgraduate study in New York City.

* * *

Brazilian surgeon Dr. Paulo P. L. Baptista, who has been studying chest surgery and tuberculosis at Glen Lake Sanatorium for two years, recently left the sanatorium to undertake further study in surgical pathology elsewhere.

* * *

Recently elected as first vice chairman of the Minnesota Committee on Local Health Services was Dr. D. A. Dukelow of Minneapolis. The committee is beginning to form plans for resubmitting a new health bill to the next state legislature.

Since January, Dr. Frederick Kottke, Minneapolis, who has a traveling medical fellowship, has studied in Rochester, in New York City, and in Warm Springs, Georgia. His major field of study has been physical medicine, especially as it concerns poliomyelitis.

* * *

Back at work after a seven-month rest to improve his health, Dr. I. F. Seeley, Northfield, has resumed his medical practice. Dr. Seeley spent most of the past winter in Arizona and returned to Northfield in early spring.

* * *

Dr. Robert M. Ahrens, son of Dr. and Mrs. Albert E. Ahrens of Saint Paul, received his degree of doctor of medicine from New York Medical College on June 11. Dr. Ahrens served his internship at Ancker Hospital, Saint Paul.

* * *

Dr. Alvin L. Schultz, Minneapolis, was one of forty-one members of the Ohio State University hospital staff who received certificates of service at the annual dinner for medical and dietary interns at Columbus, Ohio, during June.

* * *

Three Rochester physicians, Dr. M. C. Petersen, superintendent of the Rochester State Hospital, and Dr. H. P. Heersema and Dr. Fred Moersch, Mayo Clinic staff members, attended the annual meeting of the American Psychiatric Association held in New York City during May. Dr. Moersch is a counsellor of the association.

Dr. H. F. Colfer, fellow in medicine in the Mayo Foundation, Rochester, has been granted the National Research Council award for study with Professor E. Adrian, chairman of the Department of Physiology at Cambridge University in England, and will begin a one-year fellowship at Cambridge in the fall.

* * *

Formerly of Watertown, South Dakota, Dr. Stephen Hanten has become associated in medical practice in Caledonia with Dr. J. J. Ahlfs. A graduate of Creighton University in Omaha, Nebraska, Dr. Hanten served his internship at St. Mary's Hospital in St. Louis, Missouri. He was in the army for five years during World War II.

* * *

Dr. Mario Fischer, Duluth health director and acting St. Louis County health officer, was a member of the Minnesota delegation which attended the forty-third annual meeting of the National Tuberculosis Association in San Francisco during June. Dr. Fischer is a director of the association.

* * *

Formerly of Kenyon, Dr. Clifford N. Rudie has opened offices in Staples for the practice of medicine and surgery. A graduate of the University of Louisville, Kentucky, Dr. Rudie served his internship at Miller Hospital in Saint Paul. He practiced in southern Minnesota for a number of years.

* * *

The association of Dr. Henry J. Borge in the practice of medicine and surgery has been announced by Dr.

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

448 East 75th Street, Chicago 19, Ill.

Dr. F. L. Stutzman, formerly of Newport, now attached to an army preventive medicine section in Manila, Philippine Islands, has been promoted to the rank of captain. A graduate of the University of Minnesota Medical School, Dr. Stutzman entered the army in April, 1946. He has been stationed in the Philippines since September, 1946.

* * *

Dr. George B. Eusterman of the Mayo Clinic has been awarded the Julius Friedenwald medal for outstanding contributions in his specialty of gastroenterology. The award was presented at the annual dinner of the American Gastroenterological Association, held at Atlantic City in conjunction with the AMA meeting in June. Dr. Eusterman was president of the association twenty-five years ago.

* * *

At a meeting of the American College of Chest Physicians in Atlantic City in early June, Dr. Lewis S. Jordan, superintendent of Riverside Sanatorium at Granite Falls, stated that on the basis of studies carried out in Minnesota the eradication of tuberculosis could probably be accomplished within the life span of the coming generation.

* * *

Seventy-five year old Dr. A. Cyr of Barnesville had the honor of pitching the first ball of the season on May 25 when the Barnesville baseball team opened its Red River League schedule with a game with Downer. In a brief ceremony which preceded the throwing of the first ball, Dr. Cyr was presented with an engraved pen and pencil set.

* * *

Dr. George McGeary, Jr., son of Dr. George McGeary, Sr., of Minneapolis, has joined Dr. M. I. Hauge in Clarkfield to form the Clarkfield Clinic.

A graduate of the University of Minnesota Medical School, Dr. McGeary, Jr., served his internship at Ancker Hospital in Saint Paul. He was recently discharged from the army.

* * *

At the recent meeting of the International Congress on Obstetrics, held in Dublin, Ireland, from July 5 to 12, Dr. Ann Arnold of Minneapolis was a member of the American delegation. Dr. Arnold, together with her daughter, Nancy, flew to London in June and planned to travel extensively in Ireland and Scotland in addition to attending the seven-day obstetrical meeting.

* * *

Dr. Arlie R. Barnes, Rochester, was elected president of the American Heart Association at a meeting in Atlantic City in June at which 100 laymen were admitted

Zemmer PHARMACEUTICALS

A complete line of laboratory controlled ethical pharmaceuticals.
Chemists to the Medical Profession for 44 years.

to membership in the association. Dr. Barnes succeeds Dr. Howard F. West of Los Angeles. Election of the laymen, who included Harold Stassen, Samuel Goldwyn and Mrs. Clare Booth Luce, was made in accordance with a newly approved reorganization of the association.

* * *

A modern medical office building was recently opened in Belle Plaine by Dr. H. M. Juergens of that city. Architectural features of the offices include the newest type of fluorescent lighting and a radiant heating system, in which the entire floor serves as a radiator. The building has been under construction since last winter when Dr. Juergens' old offices were destroyed in a fire.

* * *

A certificate of merit was awarded to Dr. Karl Pfuetze, superintendent of Mineral Springs Sanatorium, and Dr. William H. Feldman and Dr. H. C. Hinssaw, of the Mayo Foundation, for their exhibit at the AMA convention in Atlantic City in June. Their exhibit, which demonstrated the use of streptomycin in the treatment of tuberculosis, was entitled, "Streptomycin: Experimental and Clinical Observations."

* * *

Three thousand miles were covered by Dr. and Mrs. George Friedell, Ivanhoe, during a two-week June vacation trip which included attendance at the annual convention of the AMA in Atlantic City. A small family reunion was staged at the AMA meeting when Dr. Friedell met with his brother, Dr. Aaron Friedell of Minneapolis, and his nephews, Dr. H. L. Friedell of Cleveland and Dr. Morris Friedell of Chicago.

* * *

Thirteen physicians are co-operating this summer in a revised health program for 4-H members of Nobles County. Conducting examinations and determining health conditions of the 4-H members are Doctors E. A. Kilbride, B. O. Mork, Sr., B. O. Mork, Jr., P. W. Harrison, C. R. Stanley, F. L. Schade, R. P. Hallin, O. M. Heiberg, all of Worthington; E. W. Arnold, D. E. Nealy, L. A. Laikila, all of Adrian; D. J. Halpern, Brewster, and B. M. Stevenson, Fulda.

* * *

Two brothers are now practicing medicine together in Holdingford. Dr. E. J. Schmitz has announced that his brother, Dr. Glenn Schmitz, has joined him in practice at Holdingford, fulfilling a long-held ambition of both brothers.

A graduate of St. Louis University Medical School, Dr. Glenn Schmitz interned at Wheeling Hospital in West Virginia and then served in the army from 1945 until February of this year.

* * *

In Europe to attend a medical conference, Dr. Hulda Thelander, Little Falls, writes that living conditions in Denmark are extremely restricted, that rationing is severe, and that the Danish people have no heat, very little butter or meat, and no fresh fruit, coffee, tea or chocolate. Sweden, on the other hand, has a liberal rationing system and, judging by meals served and store-window displays, is a rich country compared with the

rest of Europe. That, Dr. Thelander writes, does not help the Danish people, however, for the Danes can take only $5 with them if they leave Denmark and they cannot get permission to leave without a good reason.

* * *

Dr. G. B. New, Rochester, discussed "Nasal Deformities, Congenital and Acquired: Methods of Treatment" at the meeting of the Canadian Otolaryngological Society at Minaki Lodge, Ontario, Canada, during the week of June 23.

* * *

At a meeting of the Wyoming State Medical Society during the week of June 23, Dr. J. Grafton Love, Rochester, spoke on "Injuries to the Central Nervous System" and "Spinal Cord Tumors and Protruded Disks as Causes of Backache and Sciatic Pain."

* * *

On July 1, Dr. A. L. Koskela, formerly of Grand Rapids, began an association with Dr. G. A. Miners in the Deer River Clinic. Since his return from military service, Dr. Koskela has been associated with Dr. M. J. McKenna, Dr. F. M. Jolin and Dr. A. V. Grinley of Grand Rapids.

Dr. H. R. Anderson, a member of the Deer River Clinic for the past twelve years, has withdrawn from the clinic and moved to to Arizona.

* * *

Mayo Clinic staff members Dr. P. A. O'Leary and Dr. C. F. Code of Rochester were on the program of the Canadian Medical Association meeting in Winnipeg, Canada, during the week of June 23. Dr. O'Leary spoke on the subjects, "The Present Status of Penicillin in the Treatment of Syphilis" and "Xanthomatoses." Dr. Code discussed a series of papers on the role of histamine in allergy and also presented a paper entitled, "A Study of the Action of Antihistamine Drugs in the Skin of Human Beings."

* * *

On his fiftieth anniversary as a practicing physician, Dr. Fred H. Rollins of St. Charles celebrated by attending a Chicago reunion of former classmates from the class of 1897 of Rush Medical College.

With the exception of a year at White Rock, South Dakota, and at West Salem, Wisconsin, Dr. Rollins has spent his entire medical career at St. Charles. A public-spirited citizen, he has served the community as mayor and for the past forty years as a member of the school board.

* * *

A new physician in Princeton is Dr. W. F. McManus, formerly of Chicago, who is now associated in the practice of medicine with Dr. W. R. Blomberg of Princeton. Dr. McManus graduated from the College of Medicine of Loyola University in 1938 and then served his internship at St. Anne's Hospital, Chicago. After practicing in Chicago for three years, he entered the army and served for thirty-nine months, part of the time as chief of the surgical and laboratory staffs of two hospitals in Florida.

A pre-medical student at the University of Minnesota, Jason Aronson of Little Falls is studying socialized medicine in England this summer. One of forty University students selected by a faculty committee to study conditions and people in Europe for two months, Aronson planned to concentrate on government-sponsored medical programs, considering advantages and disadvantages, gathering information on the attitudes of the laity and the professional men. Students participating in the European study program were selected on the basis of scholarship, leadership and background in their chosen field.

* * *

Two University of Minnesota medical scientists, Dr. Maurice B. Visscher and Dr. John J. Bittner, are touring Austria and Hungary this summer as members of a ten-man team of American and Swiss physicians to promote international exchange of medical and scientific knowledge.

Dr. Visscher, head of the Department of Physiology of the University of Minnesota, is chairman of the group, which is sponsored by the United Nations.

Dr. Bittner, professor of cancer biology at the University of Minnesota, who will tell European physicians of recent development in cancer research, was chosen as president of the American Association for Cancer Research at a meeting on June 2.

Main topics to be discussed by members of the ten-man team at medical meetings in Austria and Hungary include the latest developments in surgery, poliomyelitis, cancer, medicine and psychiatric research.

Red Wing physician Dr. L. E. Claydon, who has circled the globe three times, made seventeen Atlantic crossing and visited every continent in the world, completed his fifty-second year in the practice of medicine on June 12.

A graduate of the University of Minnesota Medical School, Dr. Claydon began his medical practice with Dr. M. H. Cremer at Mezeppa in 1895. After seven years in Mezeppa the two moved to Red Wing and established their practice there. Since 1900, when he went to Germany and Norway for additional medical study. Dr. Claydon has gone on some type of world jaunt every few years, but has always returned to his practice in Red Wing. At the present he has no thoughts of retiring.

* * *

Among the speakers at the forty-third annual meeting of the National Tuberculosis Association in San Francisco in June were Dr. J. A. Myers, professor of medicine at the University of Minnesota, and Dr. H. C. Hinshaw of the Mayo Foundation, Rochester. Dr. Myers participated in a panel discussion on the use of BCG vaccine in tuberculosis. Dr. Hinshaw, vice president of the association, spoke on recent research in tuberculosis and gave an evaluation of the use of streptomycin in the treatment of tuberculosis. President of the National Tuberculosis Association is a former Minnesota man, Dr. William P. Shepard, now of San Francisco, who was formerly on the staffs of the Minnesota State Department of Health and the University of Minnesota School of Public Health.

does HE like his PABENA!
© 1943, MEAD JOHNSON & CO.

WHEN interviewed between platefuls, this 11-months-old young man emphatically stated: "I have been brought up on Pablum and still like it, but some days when I'm in the mood for oatmeal, nothing satisfies me like Pabena!"

Nutritious, quick and easy to prepare,
both products are for sale at drug stores.

MEAD JOHNSON & COMPANY, EVANSVILLE, IND., U.S.A.

The traditional efforts to escape from areas of "high pollen count" by plane, car, train or ship may frequently be unnecessary. This summer many people will be able to stay at home, or go vacationing from preference rather than from the necessity of escape. The reason is BENADRYL. The patient will appreciate the facility with which this antihistaminic induces relief from the symptoms of allergy. In most cases, from 25 to 50 mg. are sufficient to produce complete symptomatic relief.

BENADRYL (diphenhydramine hydrochloride) is available in Kapseals® of 50 mg. each, in capsules of 25 mg. each, and as a palatable elixir containing 10 mg. in each teaspoonful.

Improvement in 83%
of Petit Mal Cases
with Tridione

Here's new evidence that Tridione is effective in petit mal. A recent study showed that it brought decided improvement in 83% of the patients to whom it was administered.[13] In this study, Tridione was given to 166 patients suffering from petit mal (pykno-epilepsy), myoclonic jerks or akinetic seizures. This group, as a whole, had received *little or no benefit from other medicaments.* With Tridione, 31% became free of seizures; 32% had fewer than one-fourth of the previous number of seizures; 20% improved to a lesser extent; 13% remained unchanged, and only 4% became worse. *Thus 83% showed improvement.* ● Furthermore, in some cases the seizures *did not return* when Tridione was discontinued. Studies also showed that Tridione was beneficial in certain psychomotor cases when given in conjunction with other antiepileptic drugs.[12] Prescription pharmacies everywhere stock Tridione in 0.3-Gm. capsules or in pleasant-tasting aqueous solution containing 0.15 Gm. per fluidrachm. May we send latest Tridione literature?

WHENEVER NUTRIENT INTAKE MUST BE AUGMENTED

The occasion frequently arises when the intake of all essential nutrients must be increased, as in general undernutrition, following recovery from infectious diseases and surgical trauma, and during periods of anorexia when food consumption is curtailed.

In the general management of these conditions, the dietary supplement made by mixing Ovaltine with milk can find wide applicability. Delicious in taste, it is enjoyed by all patients, young and old. Its low curd tension and easy digestibility impose no added gastrointestinal burden on the patient. This nutritious food drink supplies all the nutrients considered essential for a dietary supplement: biologically adequate protein, readily utilized carbohydrate, easily emulsified fat, B-complex and other vitamins including ascorbic acid, and essential minerals. The recommended three glassfuls daily virtually assures normal nutrient intake when taken in conjunction with even a fair or average diet.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

Three servings daily of Ovaltine, each made of ½ oz. of Ovaltine and 8 oz. of whole milk,* provide:

CALORIES	669	VITAMIN A	3000 I.U.
PROTEIN	32.1 Gm.	VITAMIN B_1	1.16 mg.
FAT	31.5 Gm.	RIBOFLAVIN	2.00 mg.
CARBOHYDRATE	64.8 Gm.	NIACIN	6.8 mg.
CALCIUM	1.12 Gm.	VITAMIN C	30.0 mg.
PHOSPHORUS	0.94 Gm.	VITAMIN D	417 I.U.
IRON	12.0 mg.	COPPER	0.50 mg.

*Based on average reported values for milk.

Putting palatability into high-protein diets

Swift's Strained Meats

Prepared originally for infant feeding now used extensively for special diet cases

Good food plays a psychologically as well as a physiologically important part in aiding recovery. This is one reason so many doctors are now using Swift's Strained Meats for patients on high-protein, low-residue diets containing chemically and physically non-irritating foods. Swift's Strained Meats provide a palatable, *natural* source of complete, high-quality proteins, B vitamins and minerals for patients whose condition prohibits the use of meats prepared in the ordinary manner. Each of the six kinds: beef, lamb, pork, veal, liver and heart, offers a tempting, distinctive meat flavor more readily accepted by patients, even when normal appetite is impaired.

Lean meat—strained fine enough for tube-feeding

Swift's Strained Meats, developed originally for feeding to young babies, are prepared from selected, lean U. S. Government Inspected Meats. They are carefully trimmed to reduce fat content to a minimum. The meats are slightly salted and strained so fine they will pass through the nipple of a nursing bottle . . . may easily be used in tube-feeding. Convenient to use—especially for patients at home—Swift's Strained Meats are ready to heat and serve! Each vacuum-sealed tin contains 3½ ounces of meat.

Swift's Diced Meats—tender, juicy cubes

For soft, smooth, high-protein and low-residue diets, these small cubes of lean meat offer new convenience and appetizing variety. Swift's Diced Meats are tender juicy pieces of meat, easily mashed into smaller particles if desired. 5 ounces per tin.

for an active middle age
....a "PLUS"

The "sense of well-being" so frequently reported by patients following "Premarin" therapy often means the difference between an active, enjoyable middle age and a sedentary one. Not only prompt relief from distressing menopausal symptoms but also a brighter mental outlook which may be translated into a desire "to be doing things"...such are the results which may usually be expected following "Premarin" administration . . . therapy with a "plus."

"Premarin" provides effective estrogenic therapy through the oral route with comparative freedom from untoward side effects.

"Premarin" is available as follows:

Tablets of 2.5 mg.	bottles of 20 and 100.
Tablets of 1.25 mg.	bottles of 20, 100 and 1000.
Tablets of 0.625 mg	bottles of 100 and 1000.
Liquid, containing 0.625 mg. in each 4 cc. (1 teaspoonful)	bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present as water-soluble sulfates. The water solubility of conjugated estrogens (equine) assures rapid absorption from the gastrointestinal tract.

The First Prescription...

The First Prescription was written in Egypt about 3700 B.C. Later, when the color of an herb was believed to indicate which planet it was under and for what disease it should be used, herbs were compounded with long prayers for their success to Jupiter, largest of the planets. Next, the prayers were condensed, written over the command "Recipe!" (Take!), and finally shortened to ℞ (R plus a vestige of the old sign of Jupiter).

The First Dental Prescription was Galen's, about 165 A.D.—a smooth paste for the cavity of an aching tooth (carrot, anise and parsley seeds, saffron, black pepper and opium).

Between those prescriptions—about 2030 B.C., in the Code of Hammurabi—broke the dawn of malpractice law. ("*If the doctor has caused a gentleman to die, one shall cut off his hands . . . if he has caused a slave's death, he shall render slave for slave.*")

The First Prescription Today, for most doctors, is the *complete protection* and the *confidential service* provided by a Medical Protective policy.

"Better Call the Doctor"

A familiar phrase in these United States. Self sacrificing, and willing to help at all times, the doctor has indeed earned his high place in our social esteem.

Right now we're "calling the doctor." Physicians and hospitals across the country are seriously concerned over the shortage of trained nurses available. We feel that in this case, too—**the doctor is best able to solve the problem.** A well trained corps of nurses is vitally necessary to insure the high standard of medicine as we now know it.

Glenwood Hills Hospital—through its school of nursing—is anxious to cooperate with you in your effort to increase the number of nurses in your community. A student from your locality will result in increased nursing assistance to you in the near future. Your help is greatly needed in recruiting candidates for this profession. For full information write Miss Margaret Chase, R.N., B.S., Director, School of Nursing.

"Hospital administrators and doctors throughout the country are seriously concerned over the dangerously inadequate nursing care available. Results of a recent survey indicate that 55 to 60 per cent of the required amount is obtainable . . .

" '. . . approved hospitals should provide training for such vocational nurses by means of short courses.'

"The doctor is responsible for the care of the patient. In order to meet this obligation, the medical staff together with the hospital and nursing administrators, are urged to undertake the development and execution of this program."[1]

"It is time that some of the present-day advantages of a nursing career be made known to young women."[2]

ONE YEAR NURSING COURSE

Glenwood Hills Hospitals are currently offering to qualified applicants a one year course in psychiatric nursing. All phases of the subject are skillfully presented by a capable and experienced faculty. TUITION IS FREE. Regular classes begin in January, June, and September.

SCHOOL OF PSYCHIATRIC NURSING

•

FALL CLASS will start in September

•

Candidates for the September class should make reservations at once . . . School and health record must be reviewed and correspondence completed prior to acceptance.

dyspepsia

the most common gastric disturbance

"Dyspepsia" due to hyperchlorhydria is the most common of all gastric disturbances. . . By prescribing Creamalin for the control of hyperacidity, the physician is assured of prolonged antacid action without the danger of alkalosis or acid rebound. Through the formation of a protective coating and a mild astringent effect, nonabsorbable Creamalin soothes the irritated gastric mucosa. Thus it rapidly relieves gastric pain and heartburn.

UPJOHN introduces

a new advance in the control of bleeding

The development of Gelfoam* by the Upjohn research laboratories marks a new advance in hemostasis. Gelfoam is a readily absorbable, easily cut and molded gelatin sponge which may be used with or without thrombin and may be left in situ without fear of tissue reactions. Gelfoam makes readily available biochemical hemostasis to simplify the clearing of oozing surfaces, the control of capillary bleeding, the arrest of trickling from small veins, and the staunching of annoying hemorrhage from resected tissues. It has a wide variety of indications in surgery and general practice. Gelfoam is a unique addition to the surgical armamentarium for the control of bleeding.

FORMULAC FOR GENERAL INFANT FEEDING

FORMULAC Infant Food provides a balanced and flexible formula basis for general infant feeding — both in normal and difficult diet cases.

A product of National Dairy research, FORMULAC is a concentrated milk in liquid form, fortified with all vitamins known to be necessary for proper infant nutrition. No supplementary vitamin administration is necessary with FORMULAC. The Vitamin C content is stabilized, assuring greater safety.

The only carbohydrate in FORMULAC is the natural lactose found in cow's milk—no other carbohydrate has been added. This permits you to prescribe both the amount and the type of carbohydrate supplementation required.

FORMULAC is promoted ethically, to the medical profession only. Clinical testing has proved it satisfactory in promoting normal infant growth and development. On sale in grocery and drug stores throughout the country, FORMULAC is priced within range of even modest incomes.

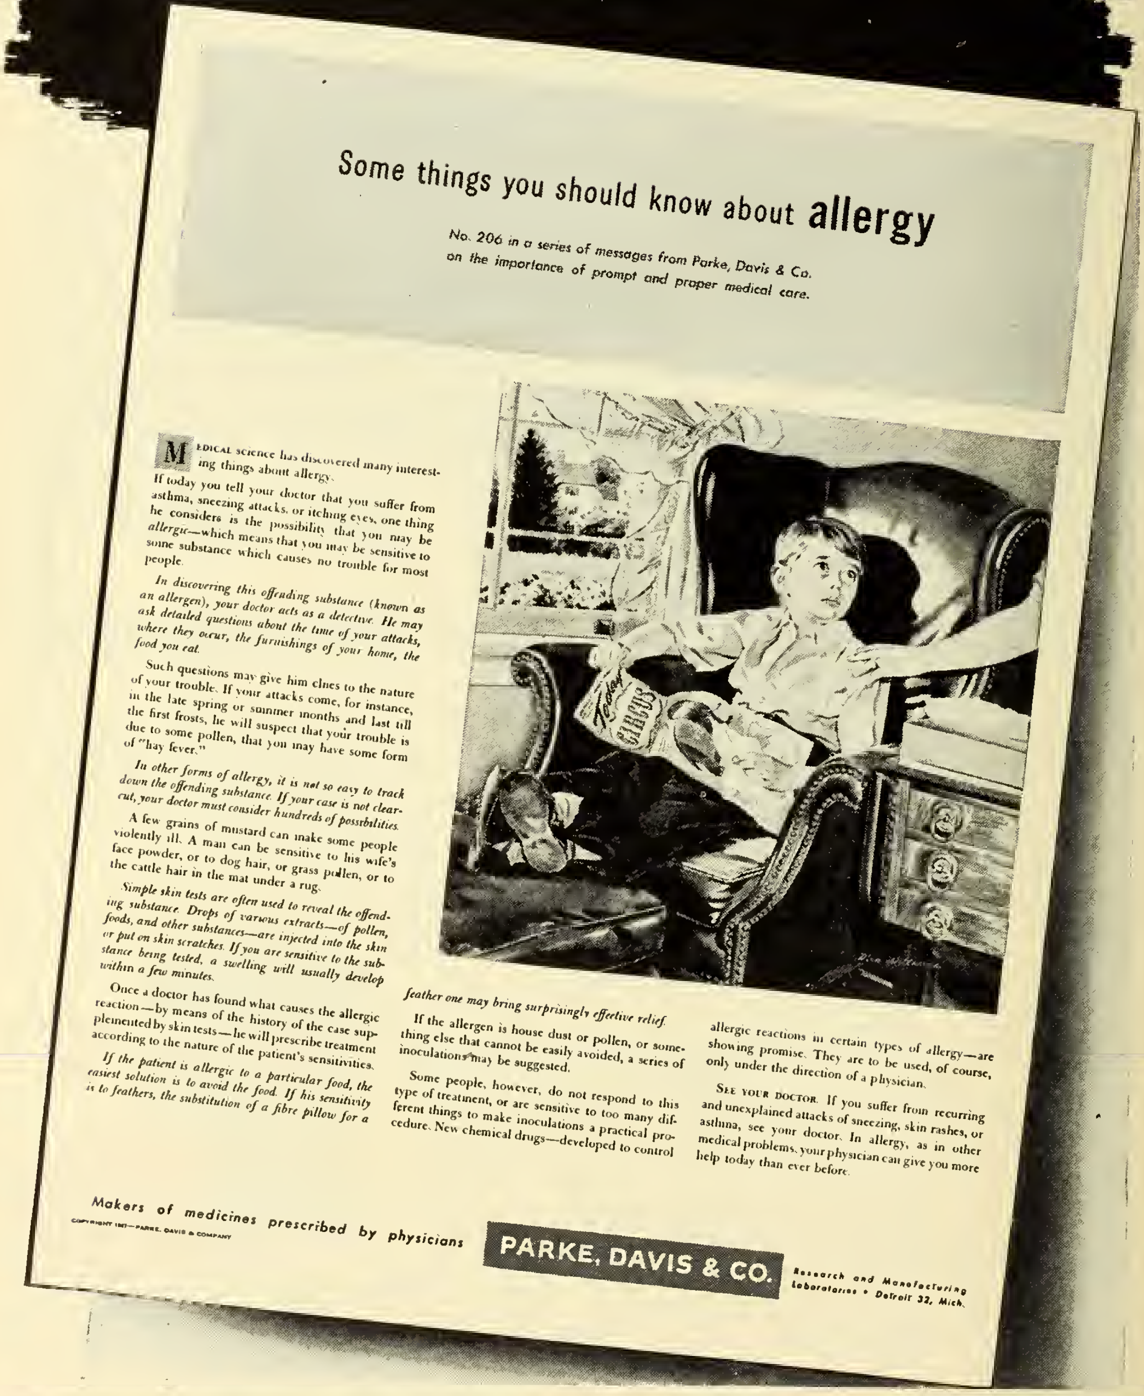
The subject is: Allergy

The advice, as usual, is: "SEE YOUR DOCTOR"

In LIFE and other national magazines, Parke-Davis presents a timely message about allergy (shown below). It appears in full color . . . reaches an audience of nearly 23 million people. It is No. 206 in the "See Your Doctor" series published in behalf of the medical profession.



Today
CIRCUS

Some things you should know about allergy

No. 206 in a series of messages from Parke, Davis & Co. on the importance of prompt and proper medical care.

Medical science has discovered many interesting things about allergy.

If today you tell your doctor that you suffer from asthma, sneezing attacks, or itching eyes, one thing he considers is the possibility that you may be *allergic*—which means that you may be sensitive to some substance which causes no trouble for most people.

In discovering this offending substance (known as an allergen), your doctor acts as a detective. He may ask detailed questions about the time of your attacks, where they occur, the furnishings of your home, the food you eat.

Such questions may give him clues to the nature of your trouble. If your attacks come, for instance, in the late spring or summer months and last till the first frosts, he will suspect that your trouble is due to some pollen, that you may have some form of "hay fever."

In other forms of allergy, it is not so easy to track down the offending substance. If your case is not clear-cut, your doctor must consider hundreds of possibilities.

A few grains of mustard can make some people violently ill. A man can be sensitive to his wife's face powder, or to dog hair, or grass pollen, or to the cattle hair in the mat under a rug.

Simple skin tests are often used to reveal the offending substance. Drops of various extracts—of pollen, foods, and other substances—are injected into the skin or put on skin scratches. If you are sensitive to the substance being tested, a swelling will usually develop within a few minutes.

Once a doctor has found what causes the allergic reaction—by means of the history of the case supplemented by skin tests—he will prescribe treatment according to the nature of the patient's sensitivities.

If the patient is allergic to a particular food, the easiest solution is to avoid the food. If his sensitivity is to feathers, the substitution of a fibre pillow for a feather one may bring surprisingly effective relief.

If the allergen is house dust or pollen, or something else that cannot be easily avoided, a series of inoculations may be suggested.

Some people, however, do not respond to this type of treatment, or are sensitive to too many different things to make inoculations a practical procedure. New chemical drugs—developed to control allergic reactions in certain types of allergy—are showing promise. They are to be used, of course, only under the direction of a physician.

See your doctor. If you suffer from recurring and unexplained attacks of sneezing, skin rashes, or asthma, see your doctor. In allergy, as in other medical problems, your physician can give you more help today than ever before.

DEPENDABLE PHARMACEUTICALS

- Like a gem, every case in your daily practice presents many facets besides the strictly medical ones—constitution, temperament, environment, AND the reliability of the medication you prescribe.

- Most of these contributing factors are outside your control. Certainly, in these busy days, you cannot take time to trace the manufacturing history of every drug you use.

- What you can do is to prescribe pharmaceuticals of unquestioned reliability—drugs you can depend upon.

- You can depend upon Dorsey products for unvarying purity and potency, for they are made under rigidly standardized conditions. Laboratory and manufacturing equipment, personnel and procedure are constantly protecting your treatment with Dorsey drugs.

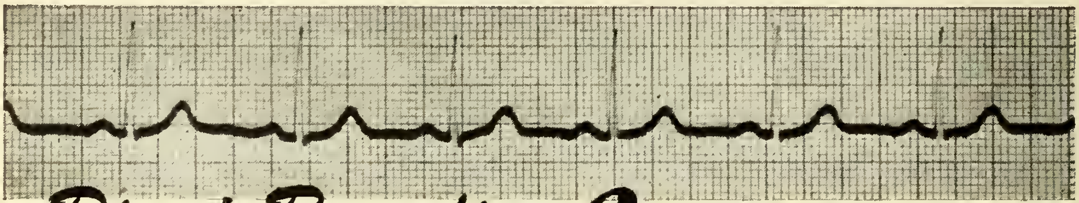
Modern ELECTRO-CARDIOGRAPHY



Direct-Recording **Cardiotron**

Portable, rugged, electrically operated without batteries. Cardiotron is available with or without stand.

The first successful

Direct-Recording

Electrocardiograph...

With more than 1200 now in use throughout the world, the Cardiotron has established the principle of instantaneous recording in general clinical electro-cardiography.

The Cardiotron is fast, accurate and sensitive. It makes an *immediate* black and white cardiogram—on *permanent* chart paper. It is free from skin resistance errors. It reveals more information than any other electrocardiograph instrument.

IMPORTANT: Factory-supervised installation and service are available in most parts of the world. Good deliveries are scheduled. Cardiotron is sensibly priced.

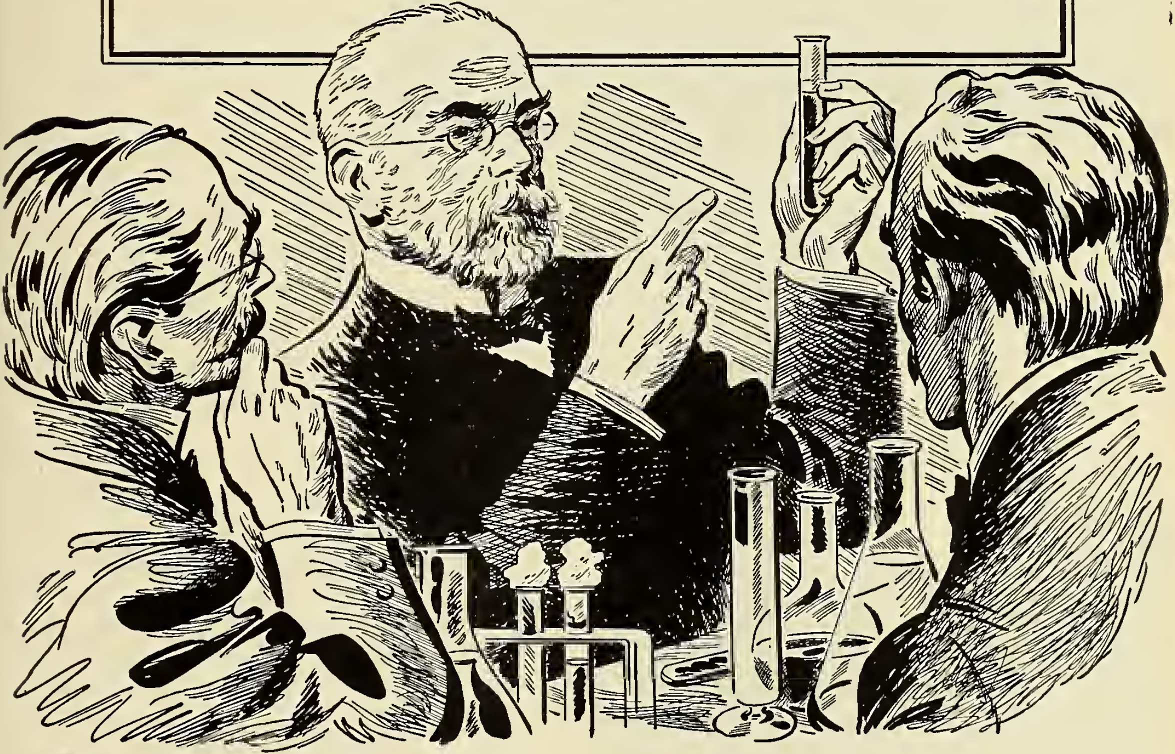
Experience is the Best Teacher

Robert Koch (*1843-1910*) **proved it in bacteriology...**

Koch showed in his postulates that he knew the value of experience: Specificity is demonstrated only when the microorganism (1) is present in all cases of the disease, (2) can be cultivated in pure culture, (3) produces the disease in susceptibles on inoculation, and (4) can be recultivated in pure culture.

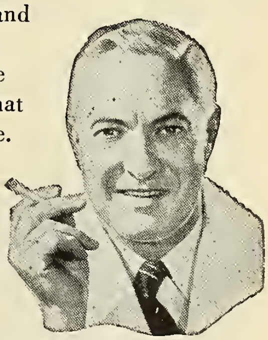


CAMEL
CHOICE QUALITY
TURKISH & DOMESTIC BLEND CIGARETTES

Yes, and experience is the best teacher in smoking too!

The wartime cigarette shortage was a real experience for smokers. Millions of people smoked whatever brand was available—more different brands than they might ordinarily have tried in years. And from that experience so many more smokers chose Camel as their cigarette that today more people are smoking Camels than ever before.

But, no matter how great the demand, we don't tamper with Camel quality. Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.



According to a recent Nationwide survey:

MORE DOCTORS SMOKE CAMELS

Pyribenzamine

HYDROCHLORIDE

In seasonal hay fever Pyribenzamine has provided effective symptomatic relief in 82 per cent of patients.* It has also been successfully employed in urticarial dermatoses, acute and chronic atopic dermatitis and certain allergic drug reactions. The comparatively low incidence of side effects permits adequate doses in cases where other antihistaminics have not been tolerated.

"FOR MANNERS ARE NOT IDLE"

LOUIS A. BUIE, M.D.
Rochester, Minnesota

NOW in this time when all that is human tends to be regarded as something reprehensible, I, myself an erring mortal, have the temerity to come before you, an association of physicians, and to offer you, of all things, a panacea. Nevertheless, bear with me if you can, for what I hold forth is not a nostrum. It is nothing, in truth, so satisfyingly concrete as that. It is rather an abstraction, a matter of behavior, which, when sterling, has its source in the character of a man and only when counterfeit is buttered upon him.

Yet, out of my sadly incomplete knowledge of how the centuries have molded the convictions of men, I venture to say that down through the ages, this trait, this quality which I have in mind, has been accorded its place of importance. Otherwise, springing from the so-called Wisdom Movement of the Near East, there might not have been preserved in the Biblical Book of Proverbs, that which reads, "A soft answer turneth away wrath." Later, comparatively recently in fact, since it was in Elizabethan times, Shakespeare put into the mouth of no less than the Lord Chamberlain Polonius, his precepts to his son. Moreover, whatever people in general may think of Lord Chesterfield, and whatever Samuel Johnson did not think of him, men of this age occupy no height from which to look down upon him. And who can say that his preoccupation with how a man should gracefully bear himself with relation to his fellows had nothing to do with the distinguished political service he gave to his country, including what most administrators have found impossible, conciliation of the factions in Ireland? Again, Cardinal Newman, the author of "Lead, Kindly Light," whose life was almost coextensive with the nineteenth century, saw fit in his discourses "The Idea of a University" to introduce two well-known paragraphs with the sentence, "Hence it is that it is almost a definition of a gentleman to say he never inflicts pain."* And to come down to the present time, that century which was borne in on so high a tide of hope but wherein, man is now struggling for existence in a whirlpool of degradation: can it not be asked whether in this time hope could have been renewed if present political opponents of the United States had read or, having read had retained, a memory of the works of this great man?

Therefore I, in my imperfect attempt to follow after the great men whose thoughts I have just cited, ask your leave to consider, for a few moments, how we physicians, in the various roles we must assume in this modern day, perhaps can perform our tasks with greater ease and effectiveness than otherwise we could if, in a world which seems no longer to value consideration for others, we insist on conducting our affairs with good manners, with courtesy, with decorum.

Never in the history of our organization have those within it, and those outside it, needed the organization more. The association maintains its effectiveness. Yet these are times of stress. Stress

---

Presidential address delivered at the Annual Banquet of the Minnesota State Medical Association, July 1, 1947, Hotel Duluth, Duluth, Minnesota.
From the Mayo Clinic, Rochester, Minnesota.

*Newman, John Henry: The Idea of a University, Discourse VIII.

engenders fatigue and fatigue, impatience. Out of impatience come altercation, enmity and the search, in unlikely places, for solutions of problems. Perhaps these are reasons why we physicians find great obstacles in our path as we set ourselves to the task of maintaining the standards of our work, or of elevating them. The nature of these obstacles is familiar to everyone here. Suffice it to say, there are modern institutions and organizations, and even large segments of our population whose interests we seek to defend, who face with skepticism and even with antagonism the proposals which we offer as solutions of perplexing problems.

Yet I believe that the people of the world not only are tired of struggle against hunger, illness and an uncertain future but that they also are tired of strife. If this is so, it is particularly desirable now for our association to function with harmony among its members as well as in its environment. To this end the physician must consciously deal gently with his colleagues and he must exercise extreme caution as he proceeds with plans for the benefit of those among whom he dwells. Very easily he can offend without intention. Among those who work for a living he is accorded, whether he wishes it or not, a slightly superior position. This he may accept but the assumption of a superior manner on his part will not be condoned, particularly by those of his neighbors whose knowledge of sociology and economics may be better than his. He will need constantly to employ his insight into human nature to get the other's point of view. From this exercise of his faculties, he will derive the habit of tolerance.

Certainly the physician will converse with many enlightened and competent individuals. Often they will entertain notions concerning medicine and the distribution of medical care which they will advocate with confidence and support with arguments which are satisfactory to themselves. Many times, to the physician, with his special knowledge of his own field, these arguments may seem worthy of contempt but he must not reject them with a contemptuous air. He must try to assume the objective position of an impartial inquirer and to seek some means whereby he may determine why, or even whether, his opponent is wrong.

Concerning some questions, the further he searches, the more he may become convinced that no answer is at hand and that some questions, if they do not transcend the limits of human understanding, may at least transcend its present resources. He cannot afford to permit himself to be discouraged by such experiences. He must be willing to take the time and to make the effort to clarify matters for others or to explain, fully and courteously, that knowledge which would allow him to answer the question under consideration is not as yet available.

Such an approach discourages strife and encourages amicable discussion. It is through discussion that experience is analyzed and eventually, we hope, correctly interpreted. I said "eventually" because often the correct interpretation is considerably delayed while men in a free society experiment and discuss. This freedom to try and to think and to express ourselves, probably most of us consider among our greatest strengths and greatest blessings. This freedom, which allows us to take our time, may render us a little tardy. Nevertheless it allows us to live up to the precept, "First of all, do no harm."

Now, if the foregoing advantages lead most physicians to the conviction that private enterprise brings the greatest good to the greatest number, well and good. Nevertheless, if there is a dissenter among us who believes that our concern for the public interest should lead us to accept a greater measure of public control, is he less our brother?

Surely there is one community enterprise which we can afford to strengthen, to revive or to inaugurate, depending on our belief as to the state which existed formerly. I refer to a more or less generally recognized moral standard which, it seems to me, used to have more force than it has now in guiding individual and corporate conduct.

It may seem that to treat of morals as a subtopic under good manners is to interchange the small for the great. But it is the fact that the two are related, not the order in which they are considered, which is important. Tennyson, who had considerable influence in forming our Anglo-American culture, expressed the relationship in words of which I took a part as the title of this address. He wrote,

> "For manners are not idle but the fruit
> Of loyal nature and of noble mind."

This is an age of science; an age of dangerous science; an age when science is about to outstrip all other activities. It is important to realize that science, unrestrained by moral precepts, can destroy man and all that he possesses and inhabits. Man must learn to live with man and he must know how to conduct himself in the presence of his own capacity for destruction.

It should be possible to evolve a system or a manner of living which, when guided by conscience and principles of ordinary decency, might be capable of developing proper human relationships. I insist that this can be done, given the proper human behavior. In each and every human being, if the soul has been lost, the soul must be re-created. A community soul must be reborn; a national conscience; a native American morality. These must be displayed to the world. At the same time, all must be prepared, with good grace, to accept change in all values, even these.

Knowledge is the product of great labor and great sacrifice but it is the advance of ideas by which progress ultimately is determined. Progress itself depends on change. Consequently, it is probable that in the march of ages many different creeds, apparently good creeds, which now exist, are destined to die out and to be succeeded by some which are better. The world has witnessed the beginning of some of them and there is no assurance that it will not see their end. All values which are essential to human progress must sustain the shock and the vicissitudes of time.

Moreover, if man adopted only the opinions of his forebears and contemporaries, he would create nothing new. The result would be an evident decay of that vigor of character and that audacity of conception and execution which paves the way to achievement. Our duty as physicians is clear. We shall freshen the fabric of our knowledge. We shall color anew its various parts and harmonize its apparent discrepancies. We shall employ every resource which we possess in an effort to determine what is best for all and, having arrived at a sound conclusion, we shall uphold it zealously, being assured that if it is true, ultimately it will prevail. In addition, we shall urge it with courtesy that it may more likely be adopted with willingness. Perhaps tolerance, maintained in an atmosphere of righteousness, persisting through change, may develop into esteem and that, in turn, may broaden into something resembling affection for our fellow men.

The safest and most impregnable ground on which social advancement can be founded is the universality of the affections. It is the bond of our common humanity; it is the golden link which joins together and preserves the human species. It is in the acts prompted by these affections that the existence of the highest instincts of our nature is revealed. Affection can warm the coldest temperament and soften the hardest heart. Regardless of how greatly the character of an individual may be deteriorated and debased, this spirit is capable of redeeming it. It is a godlike attribute.

The affections even transcend death and we feel, in the presence of death, that something remains—something which possibly the eye of reason cannot discern but which the eye of affection perceives. If this be a delusion, it is one which the affections themselves have created and we are forced to believe that the noblest and purest elements of our nature conspire to deceive us. Of all the moral sentiments which adorn and elevate the human character, the instinct of affection is one of the most vibrant and profound. It is the choicest of our possessions and bears upon itself the impression of truth. It is at once the condition and the consequence of our being. It flourishes best in an atmosphere of consideration and courtesy.

In fact, there are few fields of human endeavor wherein attention given to the feelings of others can be neglected safely. This applies even in the realm of practical politics, wherein we physicians have much to learn. We have been censured and justly so, for our failure to enter into community, state and national life. We have felt that for us to enter politics was scarcely consonant with the principles of medical ethics. We have looked with lack of esteem on many whose activities have been confined to political life and we would have to use stronger language to give our estimate of the lobbyist. Now it is necessary, however, that we alter our opinion concerning these matters.

I do not believe that human progress is chiefly owing to the wisdom of governments. Those who control government often are the creatures of the age in which they live and are not its creators. Often their accomplishments are the result of social progress and not the cause of it. Many times such men are the accidental and insufficient representatives of the spirit of their time. They may discern fallacies and may point out means to protect by presuming to raise themselves into positions as supreme judges of national interests. Great political reform or improvement often is not originated by such individuals but by bold and capable thinkers who are outside the governmental establishment. Persons of the latter type may discern fallacies and may point out means by which they can be remedied.

Thus, it is no longer advisable for the physician to confine his activities to the care of the infirm. Much of the progress which he may effect will depend on governmental action, energized not by others, but by himself. It is imperative now that the physician, with befitting dignity, assume his proper place beside those who determine the destiny of nations. We have a venerable precedent in the life of Dr. Benjamin Rush, signer of the Declaration of Independence. Since his time, a number of physicians have served effectively in political capacities.

If, in what I have said, my central thought has ever seemed too tenuous, perhaps I can bind all together by stating my basic conviction. I agree with that philosophy which holds that mankind is more virtuous than vicious and that good acts are of more frequent occurrence than bad acts. We know that cruelty is counteracted by benevolence. We know that sympathy is excited by suffering. We know that the injustice of some provokes the charity of others and we know that new evils are met by new remedies.

Accordingly, outstanding qualities of estimable men are these: gentleness and courage, boldness and prudence, tolerance, reverence, confidence, stability, humility, wisdom, patience and honesty. I believe not only that possession of these qualities engenders good manners but that the exercise of good manners furnishes proper soil for the cultivation of these qualities. The two elements working together, not alone, I believe, would do much to allay those twin dreads of the world today: fear and want.

Finally, we, in our profession, have been reared well. The code of ethics of our organization provides that "a physician shall be an upright man, instructed in the art of healing." Furthermore, he "must keep himself pure in character and conform to a high standard of morals and must be diligent and conscientious in his studies . . . conducting himself with propriety in his profession and in all actions of life." Perhaps no other group is in a more favorable position to exemplify the union of good manners and good faith.

CANCER APPROPRIATIONS

With the passage by Congress of legislation more than tripling appropriations for research and control of cancer, and bringing next year's budget of the National Cancer Institute in Bethesda, Md., to the all-time high of $14,000,000, the U. S. Public Health Service announces plans for an expanded attack on the cancer problem that will place cancer in the forefront of the Government's medical research and control programs.

Under the broad authority provided in Public Health Service Law and the Appropriation Act, support may now be extended to universities to assist them in developing greatly expanded cancer research and training programs. The law also supports the acquisition of land and construction of buildings when urgently needed. Evidence of the over-all desire on the part of the Congress and the President to provide continuity in cancer research is shown in a provision of the Act, under which funds for cancer research and training grants remain available until spent.

Already the National Advisory Cancer Council of the Institute has recommended greatly increased grants-in-aid to outside institutions engaged in experiments to find the cause and cure of cancer. With the passage of the Appropriations Act a total of forty-six project grants, involving the expenditure of $594,348, was made to widely scattered groups. In all, thirty-five institutions in twenty-three states are recipients. At the same time the Institute is greatly expanding its own research program at Bethesda, where there will be increased emphasis on clinical research.

Four million dollars of the increase in NCI's budget will go—not to research—but to cancer control, the program administered through the States to increase the effective use of present methods of diagnosing and treating cancer. It is estimated that while a fourth of cancer patients are cured today, another fourth could be cured if they received early treatment.

The cancer control program will place emphasis on the improvement of cancer detection, diagnostic and treatment facilities; the development of refresher courses for doctors; the establishment of adequate statistical services on cancer; and the setting up of cancer control units in State Health Departments.

POSTGRADUATE MEDICAL EDUCATION IN A PRIVATE HOSPITAL

ARTHUR H. WELLS, M.D.
Duluth, Minnesota

THE logical center for the continuation of medical education in a community is the hospital. There one can find an abundance of material and qualified teachers. National, state, and regional medical meetings, as well as short postgraduate training courses, should be considered indispensable adjuncts to the daily local teaching program. Furthermore, unless the hospital is the physician's most productive source of medical knowledge, then the doctor, his patients, and his community are missing something of inestimable importance. Determined steps can change a lethargic, procrastinating institution into a dynamic teaching center equivalent to that found in many medical schools. This goal has been reached in two private hospitals in this city of 100,000 population.

Any 200-bed or larger general hospital with a full-time clinical pathologist and roentgenologist has the basic essentials for the establishment and the continuous support of such a co-operative educational program. All that is necessary is the proper organization of: (1) the truly overwhelming amount of interesting subject matter in such an institution; and (2) the qualified, but frequently hidden, teaching talents of its medical staff.

The tried and proved teaching methods of medical schools are the key to success. Some of the basic rules include the following:

1. All departments and all staff members are expected to contribute their part to a well-rounded program.
2. Interns and residents present as much as 50 per cent of the teaching material.
3. Lectures, conferences, literature seminars, medical meetings, patients' chart reviews, demonstrations, et cetera, must be scheduled at least one month in advance.
4. Fixed weekly schedules are mandatory.
5. Someone who is intimately associated with the institution, its medical staff, and its patients, and who is willing to give whatever is necessary for success, must assume a leading role in arranging much of the program.
6. Participants must be notified three times: one month, one week, and one day in advance of their scheduled activity.
7. Insistence upon a thorough preparation and a good delivery is essential.
8. The material and methods of presentation must be varied and have a practical value.
9. As a rule, diagnostic and therapeutic problems should have been solved before presentation.
10. The limitation of teaching assignments to a few men is detrimental and is not to be tolerated.
11. The long range educational benefit to the participating physicians is the criterion for selection of subjects and speakers.
12. The frequent publication in medical journals of the material covered in the teaching program is highly desirable (Table I).

Adherence to these twelve rules results in a stimulation to greater effort, a spirited interest, a broader comprehension of medicine, and a warmer appreciation of one's colleagues.

The specific assignments of this hospital's educational program are arranged during the previous month to fit into an established weekly schedule (Table II). All staff members are sent the mimeographed monthly program (Table III) and are invited to all presentations, although certain items are primarily designed for interns and residents. On each of four days of the week, Tuesday through Friday, two one-hour medical subjects are scheduled. A third one-hour session in the form of a necropsy, with a co-ordinated study of the clinical aspects of the case, occurs on the average of almost every day of the week. These examinations are announced in advance by phone and on bulletin boards. On Tuesday (Table II) there is an 8:00 A.M. postgraduate medical conference (P.M.C.). In the afternoon the roentgenologist reviews selected films from the previous week's x-ray diagnostic problems (X-ray). On the first Tuesday of the month the Duluth Pediatric Society has its pediatric-pathologic conference (P.P.C.). A lecture (Lect.) is scheduled primarily for the interns and residents on Wednesday, and in the same evening they conduct an informal medical literature seminar (M.L.S.).

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

TABLE II. BASIC WEEKLY SCHEDULE

	Tuesday		Wednesday		Thursday		Friday	
	A.M.	P.M.	A.M.	P.M.	A.M.	P.M.	A.M.	P.M.
First week	P.M.C.	P.P.C.	Lect.	M.L.S.	Lect.	St.M.S.	St.M.C.	M.Chart
Second week	P.M.C.	X-ray	Lect.	M.L.S.	Lect.	St.L.Co.	St.M.C.	S.Chart
Third week	P.M.C.	X-ray	Lect.	M.L.S.	Lect.	St.L.S.	St.M.C.	P.Chart
Fourth week	P.M.C.	X-ray	Lect.	M.L.S.	Lect.	D.S.S.	St.M.C.	O.Chart

Key: P.M.C.=Postgraduate Medical Conference. P.P.C.=Pediatric Pathologic Conference. Lect.=Lecture. M.L.S.=Medical Literature Review. St.M.S.=St. Mary's Hospital Monthly Staff Meeting. St.L.Co.=St. Louis County Monthly Meeting. St.L.S.=St. Luke's Hospital Monthly Staff Meeting. D.S.S.=Duluth Surgical Society Monthly Meeting. St.M.C.=St. Mary's Hospital Pathologic Conference. M.Chart=Medical Chart Review. S.Chart=Surgical Chart Review. P.Chart=Pediatric Chart Review. O.Chart=Obstetric Chart Review.

On Thursday there is a second weekly lecture. The regular monthly medical meetings occur on Thursday evenings, including those of the staffs of the two larger hospitals (St.M.S. and St.L.S.), the county medical society (St.L.C.) and the Duluth Surgical Society (D.S.S.). A second weekly postgraduate medical conference is conducted on Friday in the collaborating neighboring institution, St. Mary's Hospital (St.M.C.). On the same day the chiefs or assistants in the various departments of medicine (M.Chart), surgery (S.Chart), pediatrics (P.Chart), and obstetrics (O.Chart) conduct a review before the interns and residents of selected charts of patients discharged from the respective departments during the preceding thirty days.

The two weekly postgraduate medical conferences play a more important role in medical education of our physicians and interns than do the regular monthly medical meetings. They are conducted in a manner similar to that of the clinical pathologic conferences of other medical institutions, except that a much wider variety of subjects is covered. An attempt is made to include all practical aspects of the field of medicine, with frequent variations of the subject matter and method of presentation. The principal sources of material include the following: postmortem examinations, living patient case studies and demonstrations, out-of-town medical meetings, outstanding articles from the medical literature, recent advances in special fields, reviews of selected topics in the basic sciences or clinical medicine, clinical experimental studies, and collective case reviews. All serious diagnostic and therapeutic mistakes are routinely discussed with complete frankness. Even the pathologist admits his mistakes.

Approximately 100 lectures (Table IV) delivered by forty-five physicians are scheduled for delivery to the house staff during the year. These informal talks are designed to prepare the students for the practical application of medicine in general practice. The subjects have at times been selected with the talent of the teacher in mind. They may not cover the entire field of the general practitioner; however, upon the request of the

*Interns and residents

interns or residents, any additional subjects are scheduled.

Other factors of importance in the postgraduate training of the hospital medical staff members are: (1) an informed and progressive hospital board of directors whose members constantly anticipate the rapid advances in medical science and appreciate fully the importance of continuous collaboration with the medical staff; (2) a community which has been educated over a long period by its physicians as to the value of postmortem examinations; (3) a flat rate fee for laboratory tests based upon the time spent in the hospital and not upon the amount of work performed, thus permitting the equivalent of medical school laboratory studies without financially burdening the patient; (4) the aid of a full-time medical anesthesiologist; (5) a medical library of adequate size; (6) a well-balanced, rotating internship; (7) properly supervised residencies; (8) a guarded minimum of laboratory, blood bank, and parenteral fluid routine duties for interns, with specially trained technicians and nurses performing the bulk of these tasks; (9) a maximum of 700 hospital admissions per intern per year; and ten of the greatest importance, a congenial medical staff alerted to the mutual benefit derived from a continuous effort at personally teaching and entertaining interns and collaborating with medical colleagues in all of the details of maintaining a high standard of medical practice in the community.

The great majority of private hospitals of this country are deficient in their medical educational program. Inasmuch as this may be due to the lack of realization of its advantages and feasibility of attainment or a need of methods and rules of procedure, an ideal postgraduate teaching center for both private practitioners and resident physicians has been briefly described.

WATER-BORNE TULAREMIA

ABRAHAM FALK, M.D.
Minneapolis, Minnesota

THE clinical recognition of tularemia and the expanding reservoirs of infection for man among the warm-blooded animals have been reported more frequently. The clarification and recognition of clinical states of the disease, including the important pleuropulmonary manifestations, have resulted in an entity considerably enlarged from its original description[13] in 1911. With the evident specificity of streptomycin in its treatment the clinical cycle appears to have been completed.

The reported sources of infection for man, however, appear to be increasing. Francis[6] in 1937 noted over twenty animal and insect sources, although the cottontail rabbit, jack rabbit and snowshoe hare alone were implicated in over 90 per cent of human cases in the United States. Additional reports since that time have described transmission of the disease to man by the pheasant, grouse, horned owl, chicken hawk, beaver, raccoon, dog, fox, squirrel, and snapping turtle. Burroughs[4] in 1945, listed all known naturally infected vertebrates, including five bird species and twenty-three mammalia in the United States and six in Canada. The latter area included species of ground squirrels, mice, rabbits, and the gull. The evidence of the large animal reservoir of infection is impressive. Infection in man, in most instances, occurred through infected tick, flea or other insect bites, or direct contact with the tissues of infected animals. Transmission from animal to animal and from animal to man is known, but no instance of transmission from man to man has been reported.

Human infection through the handling of cold-blooded animals has been described as incurred in the skinning of a bull snake,[6] and Miller[11] described infection from the fin prick of a catfish caught in a small Kansas river, resulting in a small wound on the palm of the left hand, with onset of symptoms five days later. Rabbits with so-called "rabit fever" had been seen to fall into the river and drown and numerous rabbit carcasses were noted in the water. No other similar instances are noted in the literature, although infection from fish caught with infected rabbit meat as bait is reported. It is not assumed that reptiles or fish present reservoirs of infection, but rather are the inadvertent sources of trauma to the skin allowing entry of the organism from the contaminated body surfaces.

Water-borne infection, presumably from contamination with animals, dead or alive, has been recognized. About 1,000 cases of tularemia reported from Russia in 1928 resulted from the skinning of water rats for their pelts. Karpoff and Antonoff[9] in 1936 reported forty-three cases from Russia in natives who drank unboiled water from a brook thought to have been contaminated by water rats. The presence of the organisms in the water course was proved experimentally and bacteriologically, as 100 per cent of guinea pigs infected with the water died, and cultures of P. tularense were obtained from their organs. The stream was not stagnant, but it was noted to have been good flowing water of shallow depth.

Parker[12] reported tularemic infection in Montana streams and Jellison[8] subsequently reported infection in beaver in that state with coincidental contamination of stream water. The association of stream infection with epizootics occasionally observed in beavers was suggested. The dangers of infection from run-off water from rain and melting snow contaminated with animal carcasses and later stored in reservoirs for animal and human use are emphasized by Bow and Brown[3] as possible sources of water-borne tularemia in Western Canada.

A case of tularemia due to infection while cleaning fish, with successful treatment with streptomycin, is reported.

P. V., aged thirty-nine, white, male, caretaker of a tourist camp, and resident of a southern Minnesota town, was admitted on September 3, 1946. On August 27 the patient experienced the onset of malaise, slight nausea, fever and profuse perspiration, followed by shaking chills during the next two days. He was admitted to a local hospital on August 29 with continued symptoms and fever of 101-103° F. Atabrine, penicillin and several blood transfusions were given without benefit, and he was subsequently transferred to this hospital.

Examination revealed a well-developed and well-nourished white man, perspiring profusely and appear-

ing acutely ill, with temperature of 100° F. Positive findings were confined to the left upper extremity. An irregular deep ulcer with fairly sharp edges and purulent, necrotic base was noted on the dorsal aspect of the left thumb overlying the interphalangeal joint, with moderate redness and slight edema of the immediately surrounding skin. On the dorsal aspect of distal phalanx, left little finger, was a small, rounded, crusted, healing ulceration. Moderate enlargement and tenderness of the left axillary nodes and a few slightly enlarged right axillary nodes were palpable.

Laboratory studies: Hemoglobin 17.7 Gms., red blood count 4,350,000, white blood count 6,400 with 50 per cent neutrophils, 45 per cent lymphocytes, 5 per cent monocytes. Urinalysis, blood Wassermann and repeated malaria smears were negative. Sedimentation rate (Westergren) 46 mm./hr. Admission chest radiograph was negative.

Careful questioning on many occasions failed to reveal any history of the handling of live or dead game or other animals. There was no history of tick bite. He never hunted, but did fish almost daily for carp and catfish in the Minnesota River. He recalled scratching the dorsum of the left thumb while cleaning fish sometime during a two-week period prior to onset of his illness, with the appearance of infection and ulceration with concomitant pain and enlargement of left axilliary nodes several days prior to August 27. A small infected, ulcerated area appeared on the left little finger at about the same time.

Agglutinations for B. abortus and typhoid-paratyphoid were negative on admission and remained negative. P. tularense agglutination on September 7 was 1:80, with cross agglutination of Proteus OX 19 to 1:160. Cultures from the ulcers on the left hand revealed hemolytic Staphylococcus aureus. Cultures of material from the ulcers and blood cultures on cystine media produced no growth.

Symptoms remained unchanged, with profuse perspiration as the most prominent complaint. Temperature became normal on September 5, then rose sharply to 103.8° F. on September 6, with a subsequent daily spiking fever of 101.4° to 104° F. Intramuscular penicillin, 40,000 units every three hours, was given from September 7 to 12 without response. The lesion on the left thumb healed rapidly after application of hot, moist compresses followed by 5 per cent sulfathiazole ointment, with gradual subsidence of axillary lymphadenopathy.

On September 8 a small patch of crepitant râles was heard at the left lung base and chest radiograph revealed a diffuse pneumonitis at the left base and to a lesser degree in the right upper lobe. Cold agglutinin titres were negative. Tularemia was considered the most likely diagnosis at this time and streptomycin was requested for therapy. P. tularense agglutination titre repeated on September 13 had risen to 1:2560.

Streptomycin therapy, 0.2 grams intramuscularly every three hours, was begun on September 13 and continued until September 20, the patient receiving a total of 9.9 grams. Subjective improvement with subsidence of the profuse diaphoresis was noted by the patient on the second day of treatment. Temperature became normal on September 17 and remained normal subsequently.

On September 22 there was an episode of severe pain in the left chest, exacerbated by respiration, relieved by strapping and sedation. Chest film revealed no extension of the pneumonitis, there were no abnormal physical findings and the temperature remained normal. The symptoms were attributed to pleuritis, and subsided slowly over a period of ten days. Electrocardiogram on September 23 was normal. No evidence of pleural effusion was noted at any time, and final chest radiograph on October 7 showed only minimal residuals of the pneumonic consolidations and complete resolution of all infiltrative lesions.

The highest titre of P. tularense agglutination on September 17 was 1:1280, on September 27, 1:640, and on October 5, 1:1280. Sedimentation rate on October 11 was 27 mm./hr. The white blood count ranged between 6000 and 9000, with moderate lymphocytosis.

At the time of discharge on October 15, 1946, the patient was ambulant, asymptomatic and without positive physical findings.

This case of tularemia, with cutaneous and pulmonary infection, responded rapidly and effectively to treatment with streptomycin. The mortality in pleuropulmonary tularemia has previously been reported[2] as from 30-60 per cent. Stuart and Pullen[14] reported 268 cases from the literature with a mortality of 39.9 per cent. Hunt[7] recently reported twelve cases treated with an average of 0.5 grams streptomycin daily with one death occurring in a case with cerebral manifestations. He recommends a therapeutic trial of the antibiotic for several days in cases of severe pneumonia of undetermined origin in areas of endemic tularemia, since waiting for confirmatory laboratory studies, in some cases, may endanger lives. Recommended dosage at the time our case was treated was higher than that now recommended by the National Research Council,[10] the present suggested dosage being 0.5 to 1.0 grams daily for five to seven days.

The resurgence of hunting and fishing following the recent war years, especially in the upper Midwest, suggests the possibility of increasing exposure and infection. The relatively wide variety of infected game birds and animals and the possibility of contamination of fishing waters should be adequately recognized. The ingestion of improperly sterilized water from such sources may also be of significance, as the oral portal of infection from water has been previously noted. Amoss and others[1,14] have also reported cases due to the ingestion of partially cooked rabbit meat.

Summary

A second case of tularemia incurred during the handling of fish, in which the source of infection was undoubtedly water borne, is presented, together with some comment on the possibilities of other human infection from this source.

INFECTION OF THE NECK AFTER TONSILLECTOMY

CLIFFORD F. LAKE, M.D.
Rochester, Minnesota

FORTUNATELY, infection of the neck after tonsillectomy is not a common occurrence among the large number of tonsillectomies performed. However, when such infection does occur it is dangerous and demands prompt, rational treatment.

Infections of the neck may be represented by cervical adenitis, cellulitis of the neck, infection of a fascial space, thrombophlebitis and septicemia or any combination of these conditions.

Etiology and Prophylaxis

Obviously infection of the neck after tonsillectomy results from invasion of one of the cervical structures by pathogenic bacteria. The avenue of entrance of such bacteria into the neck cannot be determined definitely. Certain conditions already present in the patient's throat and trauma incident to surgery may predispose to postoperative infection. The presence of an active infection of the throat or a common cold may predispose to infection of the neck after tonsillectomy. Injury to the superior constrictor muscle, which lies between the tonsil and the pharyngomaxillary space, conceivably may predispose to infection of this space. Undue trauma incident to performance of tonsillectomy, especially that caused by dissection of the lower pole of the tonsil from its rather firm attachment to the superior constrictor muscle, may produce an avenue of infection to the pharyngomaxillary space.

In introducing a local anesthetic agent great care should be employed to direct the needle properly, especially in the region of the lower pole of the tonsil, wherein deep insertion of the needle might readily cause penetration of the superior constrictor muscle. At the lower pole, the needle should be directed into the plica in a direction horizontal to the palatoglossal muscle in order to avoid penetration of the superior constrictor muscle. All injections about the tonsil should be made into the plane which lies between the tonsillar capsule and the aponeurosis of the superior constrictor muscle; the needle should be felt to move freely in this plane. The use of unsterile equipment in administration of injections obviously may lead to infection of the neck.

Occasionally the styloid process produces a convexity or "tenting effect" in the otherwise concave tonsillar fossa; if this condition is not recognized, undue trauma to the tonsillar fossa may result from operation. Obviously, if careful dissection is done, injury to the tonsillar fossa should not occur.

From a bacteriologic standpoint, the virulence of the invading organism is undoubtedly of great importance. In 1939 New and Erich[2] reviewed the articles which had appeared in English during the previous five years on the subject of infections of the neck. In summarizing the results of the bacteriologic studies that had been recorded these authors made the following statement: "It would appear that many types and strains of organisms will produce cervical abscess or cellulitis under favorable conditions. Most frequently encountered in such suppurative conditions is the hemolytic streptococcus. In many cases the Borrelia vincentii plays a prominent role. Only infrequently are such organisms as staphylococci, non-hemolytic streptococci, and pneumococci the primary cause of the inflammatory process, although they occur commonly in the mixed type of infections."

Such diseases as diabetes, chronic nephritis or other severe constitutional diseases, although they may not actually predispose to infection of the neck, certainly make the patient less resistant once infection has developed.

Anatomic Considerations

From a pathologic standpoint knowledge of the anatomy of the neck, especially that of the fascial planes, is important. It is especially important that every practitioner of otolaryngology be familiar with the pharyngomaxillary space, which lies very near the tonsil. To understand better the importance of this space one must be familiar with the anatomy of the deep cervical fascia. This fascia lies beneath the platysma muscle and invests the neck. It also forms sheaths for the carotid vessels and for structures in front of the vertebral

---

Read at the meeting of the Minnesota Academy of Ophthalmology and Otolaryngology, St. Paul, Minnesota, December 13, 1946.

column. The investing layer of deep cervical fascia is attached posteriorly to the ligamentum nuchae and to the spinous process of the seventh cervical vertebra. As it passes around the neck, the fascia invests the trapezius and sternocleidomastoid muscles. In the posterior triangle of the neck the fascia is a rather loose areolar tissue, while in the anterior triangle it forms a single fascial lamella which continues anteriorly to the midline to join with its fellow of the opposite side. In the midline of the neck anteriorly the fascia is attached to the hyoid bone and the symphysis mandibulae.

Above, the fascia is attached to the superior nuchal line, to the mastoid process and to the inferior border of the mandible throughout its length. It ensheathes the parotid gland and extends upward to attach to the zygomatic arch. The part that passes medial to the parotid forms a strong band known as the stylomandibular ligament.

Below, the fascia is attached to the acromion, the clavicle and the manubrium. Above the manubrium it splits into two layers to form the suprasternal space (Burns' space).

The fascia which covers the deep surface of the sternocleidomastoid muscle gives off several processes which form the sheath of the omohyoid muscle, the carotid sheath and the prevertebral, buccopharyngeal and pretracheal layers of fascia.

The prevertebral fascia is fixed to the skull above and continues into the thorax below. The buccopharyngeal fascia ensheathes the constrictor muscles of the pharynx and is carried superiorly onto the buccinator muscle; it is separated from the prevertebral fascia by loose areolar tissue to form a space known as the retropharyngeal space.

The pretracheal fascia ensheathes the thyroid gland. It is fixed above to the hyoid bone and is extended below beyond the root of the neck to fuse with the pericardium. It also fuses on either side with the prevertebral fascia to form a compartment for the thyroid gland, trachea, larynx, pharynx and esophagus.

It should be understood that the pharyngomaxillary space in the normal neck is merely a potential space and that only as a result of the formation of an abscess within it or of the introduction of the dissector's finger or instrument into it does this potential space become an actual space or compartment.

The pharyngomaxillary space is pyramidal in shape; its base is the skull and its apex is at the greater cornu of the hyoid bone. The lateral boundary consists of the parotid space and fascia. The internal pterygoid muscle and the ascending ramus of the mandible form the anterior boundary. The superior constrictor muscle separates the pharyngomaxillary space from the tonsil and provides the medial boundary of this space. Posteriorly the space is bounded by the stylopharyngeal aponeurosis which covers the great vessels of the neck.

Signs and Symptoms

Deep infections of the neck frequently have an insidious onset, although those which follow tonsillectomy may have a rapid onset. The temperature rises daily to peaks, then may level off and gradually fall. Chills and sweats commonly occur. Various degrees of toxemia may exist. Dysphagia and dyspnea may be present. The patient complains of pain in the throat and neck. At examination, some evidence of tenderness can be elicited. In infections of the pharyngomaxillary space trismus, swelling in the region of the parotid gland and displacement of the tonsillar fossa and the palate occur. The patient who has infection of the pharyngomaxillary space should be observed closely for symptoms and signs of phlebitis.

Treatment

There are two schools of thought in respect to treatment of deep infections of the neck: those of one school favor early opening of the lesion, while those of the other favor the relatively conservative practice of waiting for appearance of signs of fluctuation or of localization of the infection before institution of drainage. Use of hot packs and irradiation may prove beneficial. The sulfonamide drugs and penicillin are valuable in combating infections caused by organisms which are sensitive to the action of these therapeutic agents. General supportive measures should be instituted. If dysphagia is severe a feeding tube should be inserted. Should involvement of certain structures cause dyspnea, tracheotomy should be performed. The value of blood transfusions should not be forgotten.

Incision for opening an infected pharyngomaxillary space is made from below and behind the angle of the mandible forward on a line toward the hyoid bone. The T incision of Mosher[1] may also be used. After the superficial structures have been separated, the finger is inserted in the space between the parotid and submaxillary salivary glands medial to the mandible and pushed along the inner aspect of the internal pterygoid muscle into the pharyngomaxillary space. A large rubber-dam type of drain should be inserted deeply into the space and a suitable dressing applied.

If thrombophlebitis of the internal jugular vein has taken place the incision should be extended down over the course of the vein so that adequate exposure of the vessel may be secured to permit treatment of this complication.

Reports of two cases follow. One case is that of an uncomplicated infection of the pharyngomaxillary space which followed tonsillectomy; the other is that of an infection of the pharyngomaxillary space complicated by the occurrence of thrombophlebitis and the presence of frank pus in the internal jugular vein.

Report of Cases

Case 1.—A white woman, aged twenty-three years, entered the hospital on August 14, 1946. She stated that tonsillectomy had been done two weeks previously and that the right side of her throat had remained sore ever since. The patient complained of headache and attacks of nausea, vomiting and dizziness; she said that in the last three days before admission to the hospital she had noticed, in the right upper cervical region, swelling which extended up to the cheek. She stated that she had received penicillin for one week previous to admission. A culture taken elsewhere was said to have revealed streptococci.

The patient was given both penicillin and sulfadiazine for five days; then administration of sulfadiazine was stopped and use of penicillin alone was continued for another five days. The amount of penicillin given during the course of treatment was 1,420,000 units. After the third day the patient showed marked improvement and only very slight induration remained in the superior cervical region. The induration seemed to clear up shortly thereafter. At no time was there fever of the spiking type. It was only during the first three days of treatment that she had fever at all. The highest temperature recorded was 100.6° F.; this occurred on the second day after admission.

After hospitalization for ten days the patient was dismissed. She got along well for three days, after which she again noted pain in the right side of the throat and had difficulty opening her mouth. She returned one week after dismissal. It was difficult to examine the throat because the patient was unable to open her mouth satisfactorily. Induration was present in the right submandibular region. Again the patient was given penicillin; over a period of eight days 1,040,000 units were administered. Again symptoms disappeared. A small abscess at the upper pole of the right tonsillar fossa was opened and the patient was dismissed from the hospital eight days after admission. At no time during this second period of hospitalization was there fever.

Six days after the second dismissal the patient entered the hospital for the third time. Marked swelling of the right upper cervical region and cheek was present. The patient was again given penicillin. The temperature varied between normal and 99.8° F. Two days after admission an incision was made below the angle of the jaw and an abscess in the pharyngomaxillary space was drained. The abscess also extended to the submaxillary space. Two ounces of thick yellow pus were evacuated and a Penrose drain was inserted into the wound. The patient was dismissed on the fifth day after drainage of the abscess. The amount of penicillin given during this period of hospitalization was 640,000 units. The patient has remained well since.

Case 2.—A white man, aged twenty-six years, was admitted to the hospital on October 16, 1941. The patient had undergone tonsillectomy one week before admission. Two days after tonsillectomy the patient felt ill and began to have severe chills which lasted for an hour. He noted swelling on the right side of the neck. At examination the right tonsillar fossa appeared swollen. There was tenderness in the right superior cervical region. The patient appeared acutely ill.

On the day of admission, a spiking type of temperature with a peak of 101.6° F. was observed. Intravenous administration of sodium sulfapyridine was started. On the second day blood transfusion was performed and a pharyngomaxillary abscess was drained. The infection had caused phlebitis, the site of which was the internal jugular vein. The vein, when opened, contained frank pus. There was no bleeding from the vein when a sucker tip was inserted superiorly or inferiorly. Transfusion was performed on the first postoperative day. On the second postoperative day the temperature rose to 106° F. and continued elevated. On the third postoperative day the temperature reached 107° F.; the patient died a few hours later. Cultures taken from the throat revealed Diplococcus pneumoniae. Cultures obtained from the abscess revealed green-producing streptococci.

Summary and Conclusions

Infection in the neck following tonsillectomy is dangerous. Tonsillectomy should not be carried out in the presence of acute infection in the pharynx or mouth. Great care should be employed in introducing the local anesthetic agent for tonsillectomy. Familiarity with the anatomy of the neck is important in carrying out both the infiltration for anesthesia and the tonsillectomy. After tonsillectomy all patients should be observed

(Continued on Page 896)

SPOROTRICHOSIS IN MINNESOTA

JOHN F. MADDEN, M.D.
Saint Paul, Minnesota

SPOROTRICHOSIS is a rare disease in Minnesota. Montgomery[3] reported the last case in this state in a patient seen at the Mayo Clinic in January, 1937. Gastineau, Spolyar, and Haynes[2] reviewed the literature up to 1941 and could find only three cases from Minnesota.

The disease is comparatively common in plants and much more common in animals than in man. It is believed that man acquires sporotrichosis from contact with plants, infected animals, or animals acting as carriers. There is no record of direct transmission of the infection from man to man although Foerster[1] reported two cases in which the disease was thought to be contracted by handling contaminated dressings from lesions of sporotrichosis.

Sporotrichosis may appear in several definite or mixed clinical types. Localized lymphatic sporotrichosis is the most common type seen in the United States. Our cases were of this type and the initial lesion occurred on the usual place, the hand. The initial lesion is sometimes spoken of as a "sporotrichotic chancre" and may be present for days or weeks before other lesions appear. It was taken for a "boil" in our cases, and that is the usual diagnosis. The initial nodule is round, firm, indolent, and relatively painless. It later undergoes necrosis, liquefaction and ulceration. Days or weeks later other similar nodules appear along the lymphatics draining the initial lesion. They in turn undergo the same changes. The localized lymphatic type rarely disseminates, although the secondary gummatous lesions may remain for months or years.

The disseminated form is seen most frequently in France. Usually no primary lesion is seen, the onset is insidious, and the first symptom is multiple nodules scattered over the skin surface suggesting a blood stream infection. The lesions may or may not ulcerate. The patients are acutely ill and deaths occur.

The epidermal form usually is accompanied by nodular lesions and appears as infiltrated plaques, areas of folliculitis, or eczematous or verrucous lesions. It may mimic many other dermatoses. In some instances it may be an "id" type of lesions accompanying the subcutaneous nodular type of the disease. In both types the constitutional symptoms are mild or absent.

Sporotrichosis of the mucous membranes may be primary or a manifestation of the disseminated form. The eruption is usually in the nose or mouth and appears as erythematous, ulcerated or vegetative lesions simulating more common types of stomatitis or rhinitis.

Skeletal and visceral sporotrichosis is very rare but cases have been reported where the bones, joints, muscles, kidneys, testes, or breasts have been involved.

A positive diagnosis is made by culture and identification of the organism. In our cases the organism, *sporotrichum Schencki,* grew well on Sabouraud's glucose agar slants maintained at room temperature. In some instances it took three weeks to obtain a good growth. Examination of direct smears from pus from the lesions is unreliable and not considered of diagnostic value. It is also generally conceded that the causative organism cannot be identified in microscopic sections of the diseased tissue.

Case Reports

Case 1—D. R., a school boy, aged twelve, cut his right index finger while skinning a rabbit the first of November, 1944. About a week later an abscess appeared on the dorsum of the right index finger over the first phalangeal joint at the site of the cut. This was incised by his local doctor. At intervals of a few days several marble-sized nodules and abscesses began to appear and extend up the arm. Some of these ulcerated and others remained hard, painless and red. On examination there were two irregular olive-sized fungating lesions on the dorsum of the hand, and several marble- to olive-sized nodules on the forearm and arm, extending from the fingers to the shoulder. The lesions were asymptomatic. There was also an olive-sized ulcer on the lateral surface of the middle third of the left leg. The patient felt well and his temperature was normal. The patient had three negative agglutination tests for tularemia, the last one the first week of January, 1945. The blood Wassermann reaction was negative. The Mantoux test, 1:1000, was negative. Fungi were not found in fresh preparations made with sodium hydroxide. *Sporotrichum Schencki* were demonstrated from cultures made on Sabouraud's media. The family doctor prescribed wet packs to the lesions, the abscesses were

---

From the Ancker Hospital, Saint Paul, and the Division of Dermatology and Syphilology, University of Minnesota, Dr. H. E. Michelson, director.

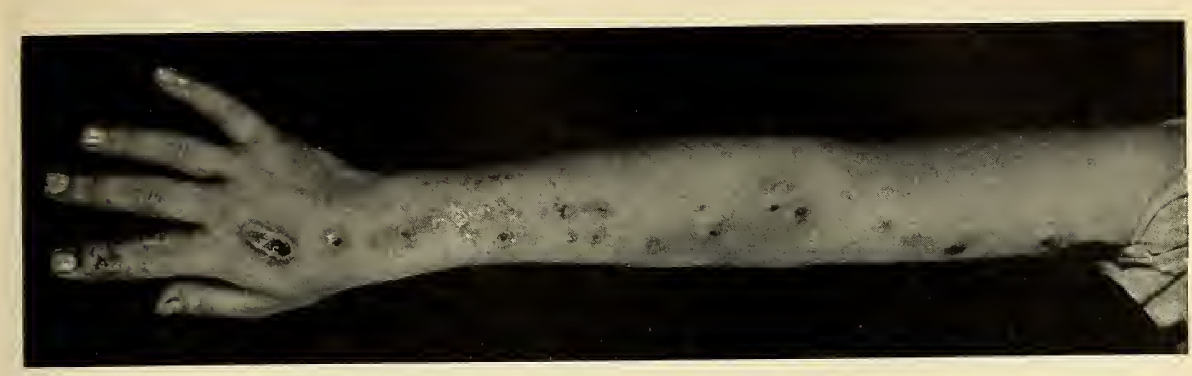

Fig. 1. Case 1. The initial lesion is on the index finger, with ulcers and nodules extending along the lymphatics.

incised and drained, sulfathiazole ointment was applied, and he was given sulfathiazole by mouth for two months without improvement. The lesions healed permanently after the patient took 15 drops of a saturated solution of potassium iodide by mouth for three weeks.

Case 2. (Dr. H. E. Michelson's Case)—M. D., a Mexican, aged forty-one, stated that on September 1, 1945, he injured the third finger of the right hand while loading corn. The fingers and the back of the hand became swollen. The lesion on the finger was incised by his local doctor but did not heal. About September 21 the patient noticed a dark, painless streak extending up his forearm. There were hard nodules at intervals along the streak. The eruption was painless and purplish-red color. The patient was admitted to the University Hospital on November 1, 1945. There was a dime-sized verrucous granulating lesion on the dorsum of the third finger of the right hand; a fluctuant, reddish-brown olive-sized mass on the dorsum of the right hand and a hard cord-like brownish-red streak extending a little above the elbow. There was bean- to marble-sized epitrochlear and right axillary lymphadenitis. The sporothrix was recovered from cultures made on Sabouraud's media. All other examinations, including a roentgenogram of the chest, were negative. The patient was given 45 grains of potassium iodide daily, and the eruption healed in seventeen days.

Case 3. (Case of Drs. F. W. Lynch and G. E. Harmon)—Mrs. O. L., a farmer's wife, aged forty-one, stated that an indolent nodule appeared on the palm at the base of the right thumb in November, 1945. The patient did not remember injuring her hand. The lesion was incised and pus expressed, but it did not heal. In a few days new lesions appeared. When seen in December, 1945, about thirty marble- to olive-sized, red, comparatively painless, subcutaneous nodules or ulcers extended from the hand to the elbow along the lymphatics draining the initial lesion. There was slight epitrochlear and axillary lymphadenitis. The sporothrix was recovered from cultures made on Sabouraud's media. The patient was given 45 grains of potassium iodide a day by mouth, and the lesions healed within three weeks. (Note: The patient stated that cattle on her farm had actinomycosis.)

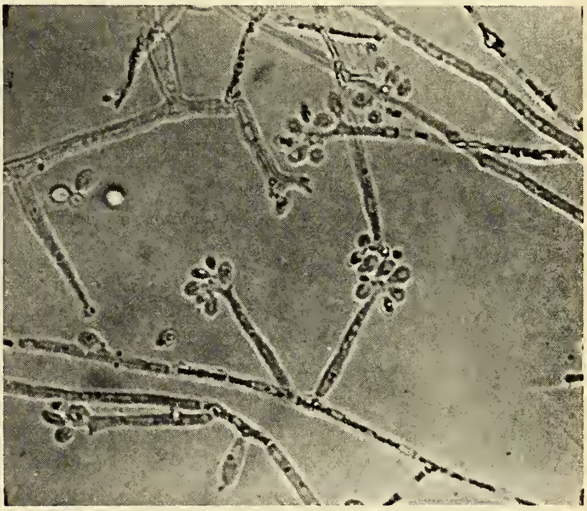

Fig. 2. Case 1. *Sporotrichum Schencki* from cultures on Sabouraud's glucose agar, showing hyphae supporting conidiophores terminated with a cluster of pyriform conidia.

Potassium iodide is considered specific in the treatment of sporotrichosis. In our cases it was specific with rapid cure. The localized lymphatic type, of which our cases were examples, responds more favorably and rapidly to treatment than other types. Roentgen ray therapy may be of value in some cases. In the first case of ours, sulfathiazole was of no value even though given over a comparatively long period.

Summary

Three additional cases of sporotrichosis were reported from Minnesota, making a total of six reported up to the present time. They were of the localized lymphatic type and all responded rapidly to treatment with potassium iodide.

TUBERCULOSIS AMONG RESIDENTS OF OLMSTED COUNTY OVER THE AGE OF SIXTY-FIVE

Data on Blood Pressure, Hemoglobin and Urine Tests

F. M. FELDMAN, M.D., Dr. P.H.
Rochester, Minnesota

TUBERCULOSIS mortality rates in this area are reaching very low levels. Over the last five years, only twenty-four deaths in Olmsted County residents have been recorded as due to tuberculosis. This is less than five per year. If we estimate the population at 48,000, the mortality rate would be 10. The rate for the same period in the whole of Minnesota will approximate 25.1. More striking is the fact that for the calendar year 1946, only three residents of this county died of tuberculosis. It also might be pointed out that during this same year seventy-seven residents died of heart disease, forty-six of intracranial vascular lesions, forty-three of cancer and eight of accidents. Tuberculosis accounted for only 1 per cent of the 293 deaths.

With these low tuberculosis mortality rates, we are surprised and pleased to find an average of twenty-six tuberculosis patients from our county under treatment in various institutions. This is over five per annual death.

Surveys of adult groups of all ages in this area indicate that less than 0.2 per cent have active reinfection-type tuberculosis. This means that the finding of active cases by any survey methods covering the whole population is becoming increasingly more difficult and expensive.

Another well-marked trend has been the increase in the average age of patients admitted to sanatoria. Laird[1] states that no patients over the age of fifty were admitted to Nopeming Sanatorium in 1913. In the years 1923, 1933, and 1943, the respective percentages were 4, 9, and 20. Other sanatorium superintendents have also noted this shift in age.

In 1940, the highest tuberculosis death rate in the Registration Area of the United States for any ten-year age group was 110. This was for the age group fifty-five to sixty-four inclusive.

Considering the obvious decrease in tuberculosis infections and deaths in the general population, and the equally obvious shift toward the older age groups, the officers of the Olmsted County Public Health Association decided to attempt an x-ray sampling survey of older persons in the community.

Through the Rochester City Health Department and the Mayo Clinic, arrangements were made for weekly half-day clinics to be held during the summer of 1946. As an added inducement for patients to come to the clinic, blood pressure tests, hemoglobin tests and urine tests were also offered along with the chest x-ray examinations. The lower age limit was arbitrarily set at sixty-five, partly because this happens to be the earliest age at which persons can participate in the old-age assistance program of the County Welfare Board. Expenses of this clinic, except for certain facilities of the Health Department and the Mayo Clinic, were borne by funds from the Public Health Association, obtained through the sale of Christmas Seals. No charge was made to patients for these rather limited procedures.

Publicity was obtained through the local newspapers, the radio, the Welfare Board, and by various other means. The response varied directly with the amount of such promotional effort.

In Rochester and Olmsted County there are approximately 2,500 persons over the age of sixty-five. Although the total attendance at these clinics was only 162, or 6.5 per cent, this sample revealed several things of interest. Figure 1 shows the age and sex of those who came in.

Since the primary purpose of this project was the discovery of tuberculosis, the x-ray findings will be discussed first. Of the 151 who received chest x-rays, thirteen (8.6 per cent) had definite evidence of reinfection tuberculosis. Only one was a previously reported case. So far, we have been unable to show that any are active cases, but great difficulty has been encountered in obtaining adequate follow-up examinations, so it is quite possible that some may be discharging tubercle bacilli.

Of the lesions seen, eleven could be classified as minimal, and two moderately advanced. None was far advanced. An additional fifteen patients had some apical fibrosis. Sputum examinations were made on four of the minimal cases and on the two moderately advanced cases, but no tubercle bacilli were found. This is consistent with the x-ray appearances which did not suggest activity except in the two moderately advanced cases.

We will continue our efforts to obtain sputum examinations and periodic x-rays on some of these patients, just as we follow other known tuberculosis cases. We are hoping to persuade a few to come in for gastric washings.

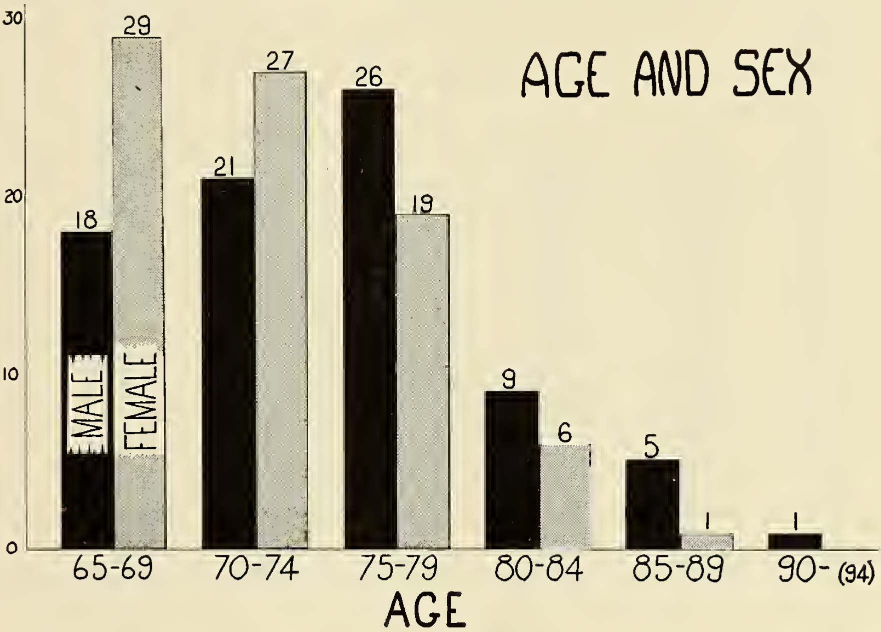

Fig. 1

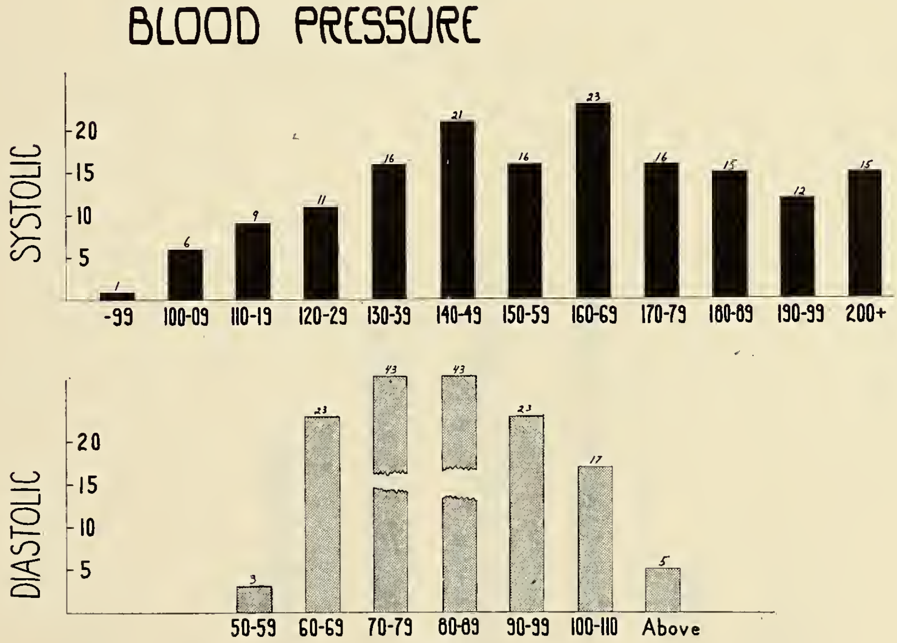

Fig. 2

As is usual in x-ray surveys, other pathologic conditions were also uncovered. Heart enlargement was noted in eleven, and one man had a lung carcinoma from which he has since died.

The other tests, which were offered primarily to encourage attendance at the clinics, also afforded an unusual opportunity for the collection of some limited but valuable data.

The blood pressure determinations were all made by one experienced nurse using the stethoscope and mercury manometer technique. As shown by Figure 2, and as expected, wide variations were encountered, with a large proportion having systolic pressures over 150 mm. Diastolic pressures also covered an extensive range.

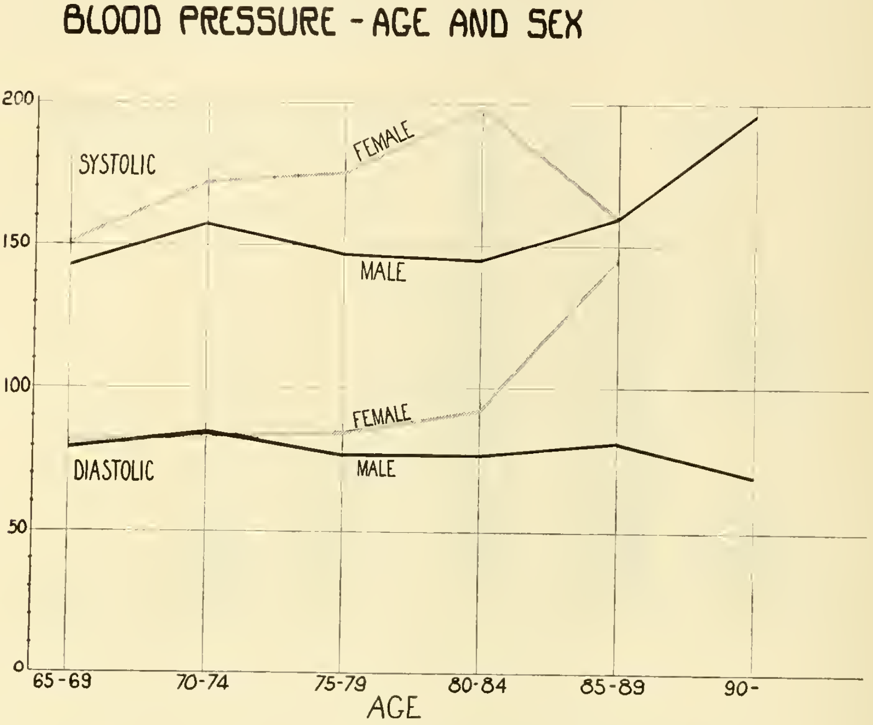

Fig. 3.

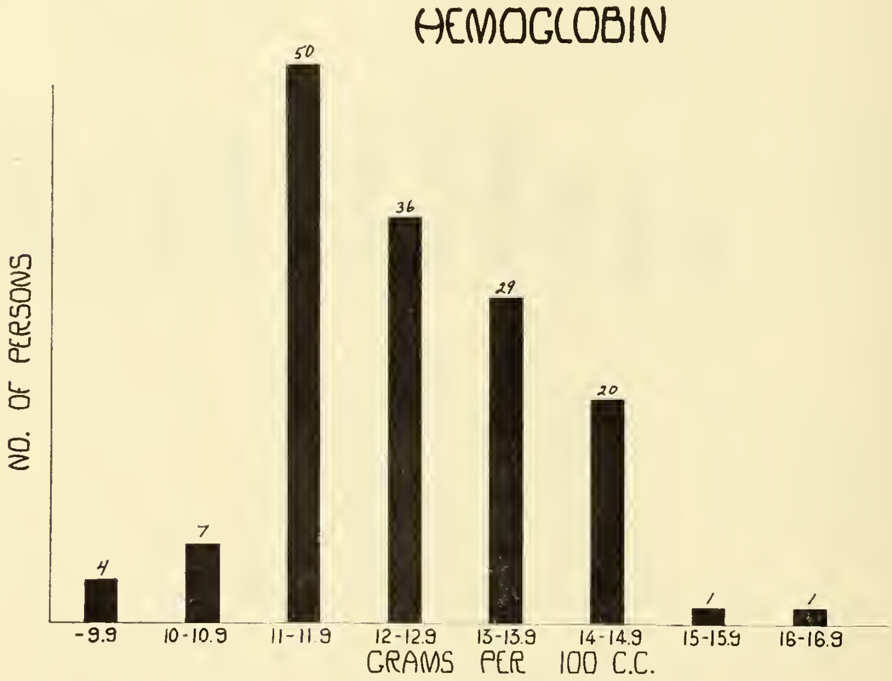

Fig. 4.

In Figure 3, average blood pressures have been tabulated and charted by age and sex. Systolic pressures for women were higher than for men in every age group except in the last two where the number of observations is too small to be of any significance. Diastolic averages, however, did not rise with age, particularly in men. This is consistent with observations on 5,331 men reported by Russek.[2] No such extensive studies on women could be found in recent literature.

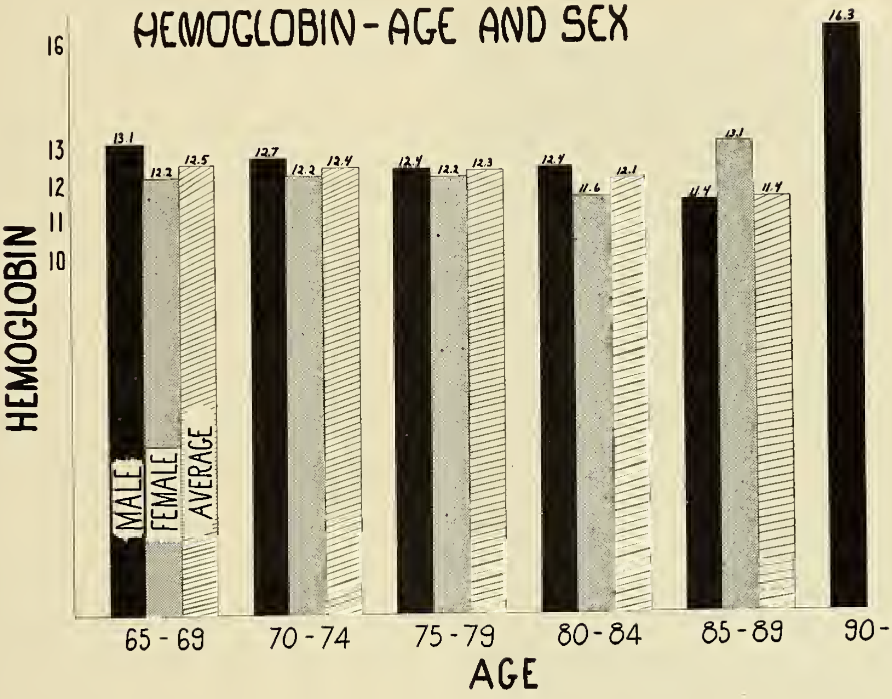

Fig. 5

Although not shown by this chart, the variations within each age group were considerable. For example, the systolic pressure in the group age eighty to eighty-four ranged from 116 to 222, with six of the fifteen below 150, and, interestingly enough, all six in men. The significance of these observations I must leave to the clinicians.

The hemoglobin determinations were done photoelectrically. Although it is often stated that a normal person should have 14 grams of hemoglobin per 100 c.c. of blood, most physicians would agree that this is a rather high standard. As can be seen in Figure 4, all except twenty-one fell below the 14 gram level, and a very considerable proportion below 12 grams.

In Figure 5, average hemoglobins are charted for age and sex. The differences are not great, but the women are consistently lower than the men in every age group. Also there is a definite inverse correlation with age.

This chart was constructed from averages, and does not reveal the variations within each age group. In the seventy-five to seventy-nine age group the lowest was 10.2 grams and the highest 14.2 grams.

The average for persons receiving old-age assistance was 12.1 grams, and for the others 12.6 grams. Considering the fact that of the 150 persons upon whom hemoglobin determinations were made, sixty were receiving assistance and ninety were not, this difference is probably statistically significant.

Qualitative tests on urine for albumin and sugar were made using Exton's solution for albumin and a commercial compressed tablet for sugar. Only one was found with excessive amounts of albumin. He had a systolic blood pressure of 260 mm. and has since died. One of the others with a 1+ albumin was later found to have a large stone in the kidney pelvis.

Three persons had sugar in the urine rated as 3+, one rated as 2+, and two rated as 1+. Only two of these six would consent to go to their physicians for further examinations, and no final diagnoses are available at this time.

Perhaps no great fundamental discoveries were made through studying this limited sample, par-

METASTATIC CARCINOMA OF THE HEART

Report of a Sole Metastasis from Carcinoma of the Cecum Diagnosed Before Death

J. S. BLUMENTHAL, M.D., F.A.C.P. and HERBERT W. PETERSON, M.D.
Minneapolis, Minnesota

THE incidence of primary tumor of the heart is very small: eight cases in 480,331 (.0017 per cent), according to the national autopsy experience in internship hospitals from 1938 to 1942, as reported in the *Journal of the American Medical Association*.[10] The frequency of cardiac invasion in various neoplastic diseases, however, is reported to be from 2 per cent[11] to 10.9 per cent.[15] Ritchie[12] at the Wisconsin General Hospital reports 3,000 autopsies with sixteen metastatic tumors of the myocardium. Metastases to the heart have been reported from neoplasms of all the main organs. These metastases are usually generalized but the heart may be the only one present, though this is infrequent. Burke[4] in his series of fourteen cases noted none. Yater[20] in his extensive review makes no specific observation on this point. Ritchie[12] reports one case, a cancer of the esophagus, in which the myocardium was the sole site of remote metastases.

Three routes of invasion are recognized:[4,20] (1) blood stream through the coronaries; (2) lymphatics from the mediastinal nodes against the lymph stream; and (3) direct extension.

Age in the cases reported reveals nothing of note as it corresponds to the age group in which the original tumor is apt to be found. Sex is of no importance. Ritchie[12] reports twelve males in sixteen cases but the autopsy material is weighted in about the same proportion.

Clinically no signs of involvement of the heart may be found even when extensive invasion has taken place. Any impairment and findings can usually be more easily explained by non-neoplastic conditions. Ritchie[12] reports that none of his sixteen cases was diagnosed before death. Fishbert,[5] however, records three cardiac tumors diagnosed by the presence of auricular fibrillation in two and auricular flutter in one. In 1934, Barnes[2] reported a case of a sixty-two-year-old woman in whom a diagnosis of a possible primary sarcoma of the heart was made during life. The findings were bloody pericardial effusion, an electrocardiogram showing interference in conduction, and a biopsy of a node diagnosed as metastatic sarcoma. At autopsy a tumor was found involving the right auricle and ventricle. In 1935, Shelburne[16] reported a primary cardiac tumor diagnosed during life in a twenty-four-year-old negro male by reason of (1) sudden onset of cardiac decompensation without known cause; (2) rapid accumulation of bloody pericardial fluid which did not clot; (3) no evidence of tuberculosis or syphilis; (4) predominance of lymphocytes in the pericardial fluid eliminating acute pericarditis, and (5) heart block. Rosenbaum[13] and others [7,8,12,20] have noted almost complete replacement of the heart by metastatic carcinoma in which few symptoms have been noted.[6,9] Precordial pain, angina, cyanosis, and all other cardiac symptoms or none at all may be present. The location of the lesion will of course determine many of the signs and symptoms noted.

The electrocardiographic findings that occur in the presence of tumors of the heart are not distinctive. Here again the location of the tumor is all important.[2,13,15] Right bundle-branch block,[5,16,19] partial heart block, complete atrio-ventricular block,[7] changes in the P waves,[18] flutter and paroxysmal auricular fibrillation,[1,5,14,17] small QRS complex have all been reported. They have been, in themselves, of little value in diagnosis as the very same findings may take place in many other conditions. Rosenbaum[13] reports a case of cancer of the esophagus with metastases to the heart in which persistent upward displacement of the RS-T segment occurred. The probable explanation was that the neoplastic infiltration caused almost continuous injury to the myocardium.

We are here reporting a case of cancer of the heart. It was metastatic from the colon. It was the only site found. The diagnosis was made before death.

Case Report

The patient was admitted to the St. Andrews Hospital on September 26, 1946, and died on October 10, 1946.

The patient had a questionable history of dyspnea on exertion for eleven and one-half months and was told that she had heart trouble only four weeks previously when a murmur was first heard by her local doctor. There was no history of rheumatic fever. One week previously she was sent to Dr. H. W. Peterson with complaints of pain in the right lower quadrant which had begun fourteen months before and had become more severe in the past month. A barium enema was done before entrance to the hospital and showed a neoplasm of the cecum. The patient was sent to the hospital for operation.

On first examination the patient appeared toxic and somewhat orthopneic and cyanotic on exertion. Blood pressure was 121/86, pulse rate 100, respirations 20. The heart was not enlarged to percussion. There was a loud systolic murmur at the left of the sternum and no diastolic murmurs were heard. P_2 was equal to the A_2. No other findings of significance were noted. A mass was noted in the right lower quadrant. There was moderate tenderness in this area.

The electrocardiogram (Fig. 1) showed sinus tachycardia, a flat T wave, diphasic ST_2 and ST_3, notched QRS—a definitely abnormal tracing. A flat plate of the chest showed a normal heart and chest. A diagnosis of probable neoplastic involvement of the heart was made.

Laboratory examinations showed a negative Kline test and Rh positive blood; hemoglobin 73 per cent, red blood cell count 4,000,000, white blood cell count 13,300, with neutrophiles 65 per cent, lymphocytes 34, and monocytes 1. The urine on September 26 was straw colored, with 1+ albumin and no sugar.

On September 31 at about 3:00 p.m., the patient passed about 300 c.c. of blood per rectum, which was followed by collapse. A gallop rhythm of the heart was noted. On October 1, neurological examination showed a definite weakness of the left arm and leg, and it was thought that the patient had had a cerebral accident or possibly a metastasis to the brain. The pulse improved and was regular but the patient remained listless and unresponsive. Throughout her hospital stay she had a streaking of the stools with blood and a cyanosis of the lips and fingers. She also had slurred speech and a dysphagia. From October 1 until her death the patient remained unresponsive and flailed her arms about a great deal. She was involuntary from that time on. On October 9 a urine odor was noted on her breath. She expired on October 10. Her temperature varied between 97° and 103° during her hospital stay.

The autopsy showed a 161 cm. woman weighing approximately 105 pounds. She was well developed and poorly nourished. Rigor was present as well as hypostasis. There was no edema. The fingernails and toenails were cyanotic. The pupils were 7 mm. and equal. The right leg and arm appeared smaller than the left. The right leg measured 24 cm. at the calf and the left 29 cm. There were small bruises on the right hip and a hemorrhage on the left hip. The left upper arm was swollen and reddened and the veins were very prominent. The peritoneal cavity was smooth and glistening. No fluid was present. The appendix was present and normal. The liver was 11 cm. below the xiphoid process and 3 cm. below the midclavicular line on the right. The pleural cavities showed no fluid. There was an adhesion on the base of the right upper lobe. The pericardial sac contained 50 c.c. of straw colored fluid.

The heart weighed 350 grams and had an enlarged right auricle. A mural thrombus was present in the right auricle. The right ventricle had a tumor filling the entire chamber, with the point of attachment on the posterior side. One knob of the tumor extended through the pulmonary valve. The root of the aorta was normal. The coronaries were patent and showed no sclerosis.

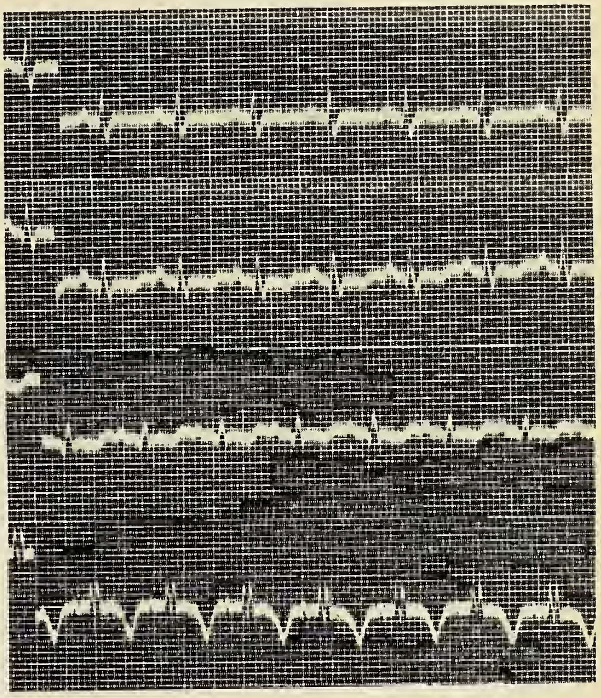

Fig. 1. Electrocardiogram shows sinus tachycardia, a flat T_1, diphasic ST_2 and ST_3, and notched QRS.

The right lung weighed 200 grams and the left 150. The right lung had many small areas of hemorrhage, the largest one measuring 3 cm. in diameter. In the left lung the same small hemorrhagic areas were present.

The spleen weighed 200 grams. It had four hard whitish areas on its surface, the largest measuring 2 cm. in diameter.

The liver weighed 1,600 grams. On cut section it had a pale mottled appearance. The gall bladder was normal and the bile ducts were patent.

Gastrointestinal tract: There were adhesions of the omentum over the cecum. A mass was palpable in the cecum. When the tumor in the cecum was cut, it had a fungating appearance and measured 6 cm. in diameter. There were portions of the tumor which contained cartilage.

The pancreas and adrenals appeared normal. Each kidney weighed 110 grams. Both kidneys had large white nodular masses on their surfaces which extended into the cortex of the kidney and measured 2 by 5 cm. in diameter. Aside from this the kidney surface was smooth. The right ureter was slightly dilated, but the bladder and genital organs appeared normal.

The organs of the neck appeared normal. No enlarged mesenteric lymph nodes were found.

Thrombi were present in the common iliac veins. An embolus was found in the portal vein.

Microscopic: The lungs showed areas of infarct and patchy areas of atelectasis. A section taken through the tumor in the cecum showed an adenocarcinoma, with some sections having a gelatinous appearance.

The kidneys microscopically showed small infarcts; otherwise the glomeruli and tubules were normal.

Sections through the tumor in the heart showed an adenocarcinoma.

The liver had areas of central lobular necrosis typical of chronic passive congestion.

The spleen had thrombi in its arteries and infarction of the parenchyma.

The brain showed a large necrotic area in the right occipital lobe 2 cm. in diameter. No tumor cells were present.

Diagnoses: 1. Adenocarcinoma of the cecum.

2. Large metastasis of adenocarcinoma to the wall of the right ventricle completely filling the chamber.
3. Thrombosis of the common iliac artery.
4. Infarct of the kidney, spleen, and lungs.
5. Thrombosis of left axillary vein.
6. Infarction of the right occipital lobe of the brain.
7. Chronic passive congestion of the liver.

Comment

Given a case of known cancer with no previous history of cardiac pathology, with sudden development of rapid pulse and cyanosis on exertion, a loud systolic murmur only recently heard, a negative history of rheumatic fever, negative findings or history of syphilis or tuberculosis; and beyond that a definitely abnormal electrocardiogram in a young individual—it is quite reasonable to give strong consideration to neoplastic involvement of the heart. The findings in this case justified the diagnosis which autopsy confirmed.

The following quotation is taken from the U. S. Senate's report on a bill providing for the appointment of a by-partisan commission to streamline the executive branch of our government as reported by the Council on Medical Service of the AMA.

"During the past sixteen years, national and international events have necessitated a constantly expanding emergency government. In the wake of the prolonged economic distress of the 1930's and the four years of direct participation in World War II, the number of principal components of the Federal Government have multiplied from 521, in 1932, to 2,369, in 1947. The annual pay roll of the executive branch of the Government today approximates 6¼ billion dollars which is 1½ billion dollars more than the Government spent for all purposes in 1933. The executive branch now employs more people than all the State, city, and county governments combined. In this sprawling organization called the United States Government, functions and services criss-cross and overlap to a degree which has astounded every student of governmental operation. For example, there are no less than twenty-nine agencies lending Government funds, thirty-four engaged in the acquisition of land, sixteen engaged in wildlife preservation, ten in Government construction, nine in credit and finance, twelve in home and community planning, ten in materials and construction, twenty-eight in welfare matters, four in bank examinations, fourteen in forestry matters, and sixty-five in gathering statistics. Excluding the Army and the Navy, there are more Federal employes on the pay roll today than on V-J day.

"In its annual evaluation of Government budget estimates, the Congress and its committees are constantly faced with a well-nigh insoluble dilemma. In striving to strike an equitable balance between justifiable expenditures and imperative economy, the conscientious search for the necessary facts more often than not leads up dead-end paths or becomes enmeshed in a maze of confusion and doubt. There is nobody who can tell us in detail, and with informed authority, just where we can consolidate, or where we can eliminate, or where, if necessary, we must expand. This situation forces Congress to swing the meat ax rather than manipulate the surgeon's scalpel. Efficient economy cannot be predicated on guesswork, no matter how sincere the effort. Efficient and economical government can be the product only of painstaking study and authoritative analysis."

CLINICAL-PATHOLOGICAL CONFERENCE

CHORDOMA

A Sacrococcygeal Type Case Report

ARTHUR H. WELLS, M.D., ARNOLD O. SWENSON, M.D., and HAROLD H. JOFFE, M.D.
Duluth, Minnesota

Dr. A. H. Wells: Although a rare disease process, chordoma is indeed a most interesting subject for a review.

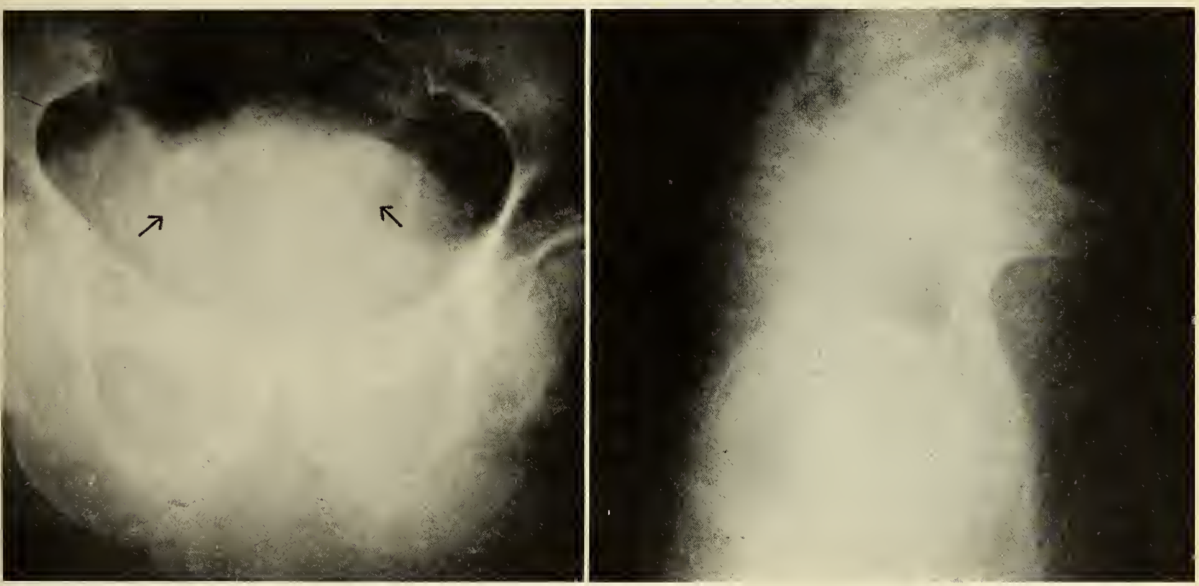

Fig. 1. Anterior-posterior view of soft tissue mass and destruction of sacrum marked by arrows.

Fig. 2. Lateral view of destruction of sacrum.

Case Report

Dr. A. O. Swenson: This eighty-seven-year-old retired white male (Case 82963) was admitted on April 31, 1947, complaining primarily of difficulty of having bowel movements, and secondarily, of a large mass situated over the sacrum. He sustained a bad bump on his back in an auto accident twelve years earlier, but not sufficiently severe to consult a physician. A few months later, he noticed a small lump over the injured area (sacrum). This mass slowly grew in size and caused no trouble until he began having difficulty with his usual daily bowel movements. There had been no pain, sphincteric or other sensory disturbances. His weight and appetite had not changed.

The physical examination revealed the expected usual senile changes in an eighty-seven-year-old, well-nourished, and fairly well-developed male. There was a huge, irregularly rounded, firm mass extending from about the second sacral nerve to the anus and measuring about a foot in diameter. It was firmly fixed to the pelvis over a large base. There was no bruit or fluctuation. The mass could be felt crowding the rectum from the dorsal aspect but did not infiltrate its walls. The patient stood with a decided foreward tilt above the hips.

His blood pressure was 230/130 mm. of mercury. Urinalysis, blood counts, and blood urea nitrogen, sugar, nonprotein nitrogen and creatinine were in a normal range.

Dr. A. L. Abraham: Roentgenograms (Figs. 1 and 2) reveal the soft tissue mass inferior and posterior to the ischial bone. There is destruction of the inferior portion of the sacrum and coccyx of an osteolytic nature. A chest film reveals a double scoliosis of the thoracic spine. There is, in addition, a marked curvature of the lumbar spine with its convexity to the left and hypertrophic changes in the bodies of the vertebrae.

The sacrococcygeal lesion best fits the diagnosis of a chordoma; however, some other bone-destroying lesion cannot be ruled out.

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota, Arthur H. Wells, Pathologist.

Dr. A. O. Swenson: On April 7, 1947, under procaine spinal, nitrous oxide and ether anesthesia, the large tumor mass was resected except for fragments invading the remaining eroded sacrum. The postoperative course was uneventful. A large defect over the rectum had been packed with gauze. This slowly granulated in over a period of two months.

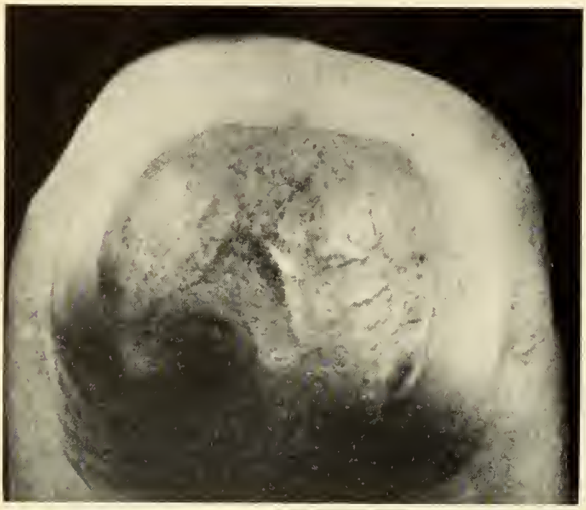

Fig. 3. Dorsal view of the buttocks and the protruding tumor mass.

Dr. A. H. Wells: The irregularily rounded, relatively smooth surfaced mass measures 10.5 by 21 by 23.5 centimeters. There is a strong opague, fibrous capsule covering all but about 20 per cent of the outer surface at the site of attachment to the sacrum. The cut surface (Fig. 4) is made up of numerous irregularly rounded, highly refractile spaces filled with tenacious to solid clear mucoid material. These vary from about 1 millimeter to 2.5 centimeters in diameter and are separated from each other by strong, clear-cut fibrous septa. Occasionally clusters of nodules form larger nodules.

Histologically (Figs. 5 and 6) the prominent fibrous septa separate rounded areas containing what appears to be badly degenerated and vacuolated neoplastic cells. There is a predominance of mucoid material inclosed in delicate fibril-like strands generally arranged in irregular circles. These, at times, appear to be the remnants of cell walls for there are transitions between them and the huge vacuolated or physaliphorus cells which are present in clusters near the margins of nodules. Isolated cells with elongated cytoplasm, with indistinct margins and oval or elongated nuclei, are scattered through the more mucoid areas. A few closely related syncytial cells with three to six nuclei are also found in these areas.

The diagnosis in sacrococcygeal chordoma.

Notochord

The notochord, or corda dorsalis has its origin from the entoderm about the same time that the ectoderm gives rise to a similar parallel dorsally placed longitudinal tube of epithelial cells, the neural tube. It forms the functioning spiral axis in the amphioxus, a species representing the connecting link between vertebrates and invertebrates. In man the structure is generally considered destined to physiologic and anatomic oblivion by the formation of the vertebral axis. However, it may conceivably have a function in the nucleus pulposus into which it has been forced from the bodies of vertebrae by "tissue growth pressure." Remnants of its cells have been described in the semiliquid centers of the intervertebrae fibrocartilages even in adults. Schmorl has observed three cases of persistence of the notochordal channel through the centers of the bodies of vertebrae in adults. Offshoots of the chorda which are located principally in the saggital plane have been repeatedly described.[14] Remnants of notochordal cells have been found on the anterior or dorsal aspects of the vertebral bodies. At the cephalic end the notochord passes through the dens and the dentate ligament to the dorsal surface of the basilar portion of the occipital bone, thence through this bone to its ventral surface to lie immediately adjacent to the pharynx. It then passes back into the basilar bone finally to end up in the dorsal sellar region of the sphenoid bone. At the caudal extreme, the regression of the tail vertebrae results in much coiling and offshoots from the main stem which finally lie in the bodies of the sacrum and coccyx.[14]

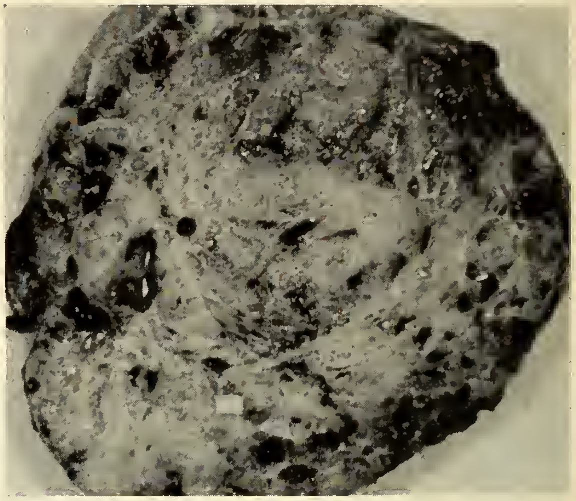

Fig. 4. Cut surface of chordoma.

Pathology

Chordomas are found at any point along the notochord and are generally designated as to location. A modification[8] of Coenen's topographic classification is as follows:

I. Cranial
    (A) Ecchordosis physalifera
    (B) Chordomas
        1. Sphenoid
        2. Spheno-occipital
        3. Nasopharyngeal
        4. Dental

II. Vertebral
  (A) Cervical
  (B) Thoracic
  (C) Lumbar

III. Sacrococcygeal
  (A) Antesacral
  (B) Central
  (C) Retrosacral

Ecchordosis physalifera has been substituted for Virchow's original and erroneous term of ecchondrosis physalifera and is defined as a non-neoplastic and subclinical chordal ectopia occurring on the clivus Blumenbachii (the sloping surface between the sella and the foramen magnum).[22] This apparently noninfiltrating jelly-like mass of notochordal cells ranging up to 3 centimeters in diameter has been an incidental finding in from 1.5 to 2 per cent of autopsies.[23]

Although the true chordomas are most often histologically benign, they are seldom cured because of their characteristic infiltrative nature and their intimate relationship to the central nervous system and its bony support. The tumor cells are occasionally highly embryonic with many tumor giant cells. Metastasis to local lymphnodes, liver, lungs, pleura, skin, et cetera have been found at autopsies in eleven cases, all of which were primarily located in the sacrococcygeal area.[12]

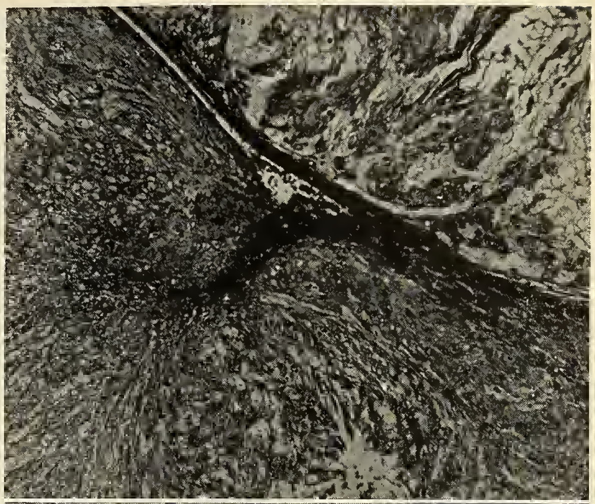
Of the approximately 250 cases of chordoma in the literature, a little over one-third are intracranial and all but a few of the remainder are sacrococcygeal in origin.[6,7,10] One study[14] of the reported cases up to 1941, revealed eighty-one cranial (33.1 per cent), 135 sacrococcygeal (55.1 per cent) and twenty-nine vertebral cases. The latter were divided ino cervical, eleven; thoracic, six, and lumbar, twelve.

No matter in what part of the axis the tumor is located, the main bulk of the neoplasm tends to be in the saggital plain and ventral, dorsal, or central in reference to bodies of vertebra or the basilar bone of the skull.

Of the cranial tumors, approximately 80 per cent are intracranial and 20 per cent extend into the nasopharynx.[2] There are five directions of extension of the cranial chordomata. The most common is from the clivus with dorsal extension. There is also an anterior-cephalic progression from the clivus, an extension into the sella, a directly anterior growth through the sphenoid sinus and a protrusion into the pharynx or the nasal cavities. They are nearly always associated with much destruction of basilar bone. Frequently intracranial nerves are engulfed and seldom the tumor invades the pons, pituitary, or temporal lobes of the cerebrum.

The sacrococcygeal chordomata can be generally classified as anterior, posterior, or central in location. There is nearly always much invasion of the sacrum and extension along its nerves.[3,7,15,20,25] The anterior lesions frequently crowd the pelvic organs and occasionally invade the rectum.

The histology of chordomata reproduces the ontogeny of the notochord from the rarely found regular cavities lined by cuboidal epithelium as found in the primitive tube to the most mature manifestation of stringy atrophic syncitial cells engulfed in mucus, at times found in the nucleus pulposus. The two intervening stages progress from large solid polyhedral epithelial-like cells frequently in cords to vaculated or physaliferous (physalis bubble) cells. The latter are characteristically found in practically all chordomata. The older cells appear to die in their own secretions similar to the common phenomena in mucoid carcinoma. The intracytoplasmic vacuoles stain with glycogen identifying dyes even after the glycogen should have been dissolved out by the fixitative.[7] Intranuclear vacuolization is more rarely noted. Most chordomata have a coarse capsule and well-defined globular, fibrous septa enclosing nodules with a more cellular peripheral zone made up of solid polyhedral and physaliphorous cells and a poorly cellular central area with stringy atrophic and syncitial cells with much extra cellular mucus.[7,21]



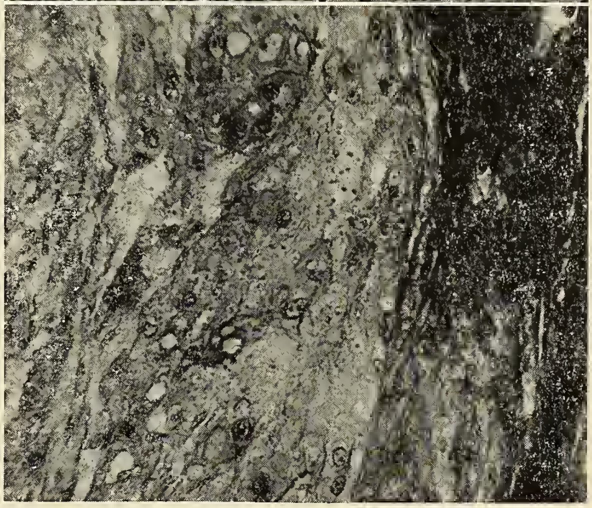


Fig. 5. *(above)* Low power view of fibrous septa and adjacent tumor cells.

Fig. 6. *(below)* Physaliphorus and polyhedral cells typical of chordoma adjacent to fibrous septa.

Clinical Manifestations

The signs and symptoms of chordomata are those of a slowly growing malignant tumor interfering with nerve function or mechanically pressing on adjacent organs at some site along the original path of the notochord. The intercranial lesions generally cause a progression of unilateral or bilateral palsies especially of the sixth, third, and fifth nerves. Intracranial pressure symptoms are next most important, with evidence of interference with the optic nerves, the pyramidal tract and the cerebellum of less frequent occurrence. [5,10,24] A characteristic V-shaped defect is occasionally demonstrated by x-ray examination of the basilar bone.[24] Pneumographic visualization of a cephalic displacement of the fourth ventricle and aqueduct appears to be more reliable than the demonstration of bone destruction.[2,8] Nasopharyngeal extensions may mechanically block these passageways and even invade the paranasal sinuses. None of the findings is pathognomonic except biopsy or aspiration. One must differentiate cranial chordoma from craniopharyngioma (Rathke's pouch), parasellar meingioma, pontile glioma, neurinoma, dermoid cyst, chondroma, myxosarcoma, hypophsis tumor, metastatic carcinoma and pharyngeal carcinoma.

The sacrococcygeal chordomas are nearly always associated with pelvic pain and sometimes sciatic pain. Tenderness is common. Objective and subjective numbness are frequent. Sphincteric disorders and obstruction of the rectum are found.[7,11,25] Sacrococcygeal chordomas are almost twice as frequent in males as females as compared to an almost equal sex occurrence in the cranial neoplasms.[17] The caudal lesions have their highest incidence in the fifth and sixth decades about twenty years after the peak occurrence of sphenoöccipital chordomata.[17] The neoplasms at either site may be found at any age.

The digital demonstration of a mass in the hollow of the sacrum and x-ray evidence of a tumor-like destruction of the coccyx and sacrum should always suggest chordoma. This neoplasm must be differentiated from teratoma, dermoid cyst, ependymoma, giant cell tumor, neurofibroma, Ewings tumor, myxochondrosarcoma, metastatic carcinoma, and carcinoma of the rectum.

Treatment

A cure for chordoma in any site nearly always necessitates radical surgery. Temporary amelioration is all that can be hoped for in the cranial lesions.[13,4] For intercranial lesions a two-stage operation has been devised.[24] First, a cerebellar decompression, with resection of a large part of the cerebellum on the side of greater nerve palsies, and tentorial section are performed. The second operation consists of a piecemeal extirpation of the mass with sacrifice of the fifth, seventh, and eighth cranial nerves.

The sacrococcygeal chordomas have a slim but hopeful chance of complete removal. With this in mind a block resection is advised[3,18,19] with extirpation of the coccyx and sacrum up to, but not including, the second sacral nerve. A two-stage procedure with primary colostomy may be advisable.[18] Those who advise piecemeal eradication simply hope to prolong life.[7] Deep x-ray therapy is generally considered of little value except for occasional cases where alleviation of symptoms and prolongation of life are hoped for.[7,16]

The duration of life from the onset of symptoms has been estimated to from two and a half to three and a half years in cranial chordomata, six and a half to seven and a half years in sacrococcygeal lesions and one and a half to two years in the tumors of the lumbar group.[19]

Summary

The case of an eighty-year-old male with a sacrococcygeal chordoma has been presented. The tumor had grown slowly beginning shortly after trauma to the sacral region twelve years ago. Recent interference with bowel movements was the only complaint. A recurrence is expected following incomplete excision.

A summary of the literature concerning the notochord, pathology, clinical manifestations and treatment is included.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from July issue)

Albert Plummer, ninth of the eleven children of Dr. and Mrs. Nathan Plummer, was born at Auburn, Rockingham County, New Hampshire, on September 7, 1840. Nathan Plummer, a physician of English descent, was a native of Londonderry, New Hampshire, and, in 1816, a medical student at Dartmouth College; his father, also Nathan Plummer, served three years in the Continental Army during the American Revolution. Albert Plummer's mother, Mahitabel Dinsmore Plummer, of Scotch-Irish descent, was, like her husband, a native of Londonderry, New Hampshire.

Albert Plummer received his early schooling in Auburn and his academic education at Kimball Union Academy, in Meriden, New Hampshire, from which he was graduated on April 28, 1862. For a few months immediately afterward he studied medicine under his father's preceptorship, so that when he enlisted in August in the Tenth New Hampshire Regiment of Volunteer Infantry he possessed special knowledge that was to be of value throughout his military service, to the close of the Civil War, and especially in the last period, since in August, 1864, he officially was appointed hospital steward and in February, 1865, he was promoted to assistant surgeon to his regiment; from February to May, 1865, he was stationed at an army hospital at Old Point Comfort, Virginia. In the following autumn, on his discharge from military service, he entered the medical department of Dartmouth College; later he transferred to the medical school of Bowdoin College, Brunswick, Maine, from which he was graduated in 1867, having completed three full years of medical study. For a year or two thereafter Dr. Plummer taught a rural school, before deciding on the practice of medicine in the Middle West.

Among the adventures and mishaps incidental to the young physician's journey west in 1869, the uncomfortable experience of running out of money just as he entered Fillmore County, Minnesota, proved to be a disguised blessing, of lasting influence. Dr. Plummer, as he had planned to do, stopped in Rushford, in the northeastern corner of the county, to see his half-brother, Henry Plummer, who was a bookkeeper at Sprague's Mills in that town, and to view the prospects for a medical practice. Rushford, he found, already was well supplied with physicians and surgeons, and Henry Plummer, having heard that Hamilton, on the western edge of the county, might be a good location for a doctor, and having a friend who lived there, advised his brother to look over that settlement. On foot and penniless, not having mentioned his financial predicament, Dr. Plummer set out; a few miles east of Hamilton he traded his jackknife, his last piece of portable property, for a glass of milk. Fortunately, Hamilton was greatly in need of a physician and surgeon and he started practice almost at once; Henry Plummer's friend lent him a horse to ride on calls in the community. The newcomer had found his place, and from Hamilton as a center Dr. Plummer followed his profession for the next twenty-four years.

Hamilton, in the valley of Bear Creek, was platted in 1855 in two parts, the upper and lower villages, and by 1858 it had a store, a hotel and a Methodist church and was the home of the Bronson Institute, a Methodist "Academical school of the first class," which already had eighty pupils; the financial endowment of the school failed to materialize, however, and the institute was short-lived. The little settlement, seven miles from Spring Valley and twenty-five from Preston, was near the Mower County line; in fact, Hamilton was in both Mower and Fillmore Counties, but ultimately the entire business portion was on the Fillmore side. Because it was in a wheat-growing section and had excellent water power for grist and flour mills, the village prospered; in the sixties and into the seventies it had two mills, five stores, three churches, machine and blacksmith shops, stage connections with Spring Valley and Rochester, and "mail three times a week, on Monday, Wednesday and Friday." One of the most beautiful and most valued natural features of the place was the "Hamilton Boiling Spring," at the western edge of the village, a never failing source of bubbling clear cold water. With the gradual absorption of flour milling by the huge mills, such as those of Minneapolis, and the failure of the Southern Minnesota Railroad to pass through the little town, Hamilton gradually declined and became by the nineties one of the phantom villages of Minnesota history; its business interests gravitated to near-by Racine, in Mower County, which was founded in 1893 on the line of the Chicago, Great Western Railway.

In Hamilton, in 1869, Dr. Plummer entered into a full life, carrying a heavy practice, succeeding as he did to the local field of Dr. Wallace P. Belden and extending it, acting as dentist whenever required, for in those days none of the small communities had a resident dentist, and serving his community in ways other than professional. Ethical and progressive, he early became a member of the Fillmore County Medical Society (organized in 1866) and of the Minnesota State Medical Society, which was revived and reorganized in 1869. Further evidence that he was an able and conscientious physician is the record in the reports of the State Board of Health that he was one of the eleven physicians of Fillmore County who co-operated with the board to compile the official report on diphtheria in the county for the period from November 1, 1879, to November 1, 1880. In 1882 and 1883, temporarily adding major civic duties to professional, he served in the state legislature as representative from his district. After the passage of the "Diploma Law" of 1883 Dr. Plummer was licensed to practice in the state, receiving certificate No. 738 (R), given on January 15, 1884. In 1895 he was appointed to the Board of Examining Surgeons for the Bureau of Pensions at Spring Valley. He attended services at the Congregational and Methodist Churches, was a Mason (A. F. and A. M.) and an Odd Fellow. Other than in his profession, his greatest interest and pleasure lay in farming, gardening and raising flowers and in fishing and hunting, and happily the conditions of his life were such as to make these occupations and recreations readily possible.

Albert Plummer's marriage to Isabel Steer took place in the village of Sumner, Fillmore County, on Thursday evening, October 10, 1872 (as announced in an item in *Western Progress,* of Spring Valley, on November 6, 1872), at the residence of M. J. Hoag, The Reverend Mr. G. Millet performing the ceremony. Isabelle Steer Plummer, of Scotch-English descent, a schoolteacher in Sumner Township before her marriage, was the daughter of Greenberry Steer, of Adrian, Michigan. Of the four children of Dr. and Mrs. Plummer, Sadie and Ray died in infancy. Henry Stanley, born in 1874, at Hamilton, and his brother, William Albert, born in 1883, at Racine, lived to devote themselves to the practice of medicine.

In 1893, Hamilton having become a hamlet rather than a village, Dr. Plummer moved to Racine, Mower County, a better center from which to serve his patients, and there he remained for eighteen active years. In this place at different times he had as associates three physicians: his son, Dr. Henry S. Plummer, between 1898 and 1901; Dr. Jacob Prinzing, a graduate of the medical department of the University of Minnesota, from 1901 into 1903; and between 1903 and 1910 Dr. E. E. Benedict, also from the University of Minnesota.

The experiences of Dr. Albert Plummer as physician and surgeon, and equally as guide, philosopher and friend to his patients, were countless and of all degrees, from funny to solemn. Of the years in Hamilton and Racine Mrs. Plummer, decades later, used occasionally to reminisce, on request, to her family and close friends. These recollections, always kindly, told by a true raconteur in her own inimitable style, were a delight to the few who were privileged to hear them. One story concerned a family of many children whose parents, not blessed with mental lucidity, never could agree as to the number of the progeny that had been born to them; Dr. Plummer was called frequently to settle the quarrel, for it was a quarrel, and time after time at great inconvenience to himself he responded and with characteristic patience recounted the number of the children, their names, the dates of their birth (and of death, of some of them) and the conditions of each event.

In 1911 Dr. and Mrs. Plummer moved from Racine to make their home in Rochester. Dr. Plummer was then in failing health; his death occurred on March 20, 1912, in his seventy-second year. Mrs. Plummer lived twenty-four years longer and died in Rochester on January 15, 1936, little less than a year before the death, on December 31, 1936, of her older son, Dr. Henry S. Plummer, of Rochester, of whose household she had long been a member. Dr. William A. Plummer, the second son, survives (1947).

Graduated in medicine from Northwestern University in 1910, Dr. W. A. Plummer in June of that year entered the Mayo group as a member of the staff. He is head of a section in medicine in the Clinic and associate professor of medicine, Mayo Foundation for Medical Education and Research, Graduate School, University of Minnesota.

A brief note on the life and work of Dr. Henry S. Plummer is included here for the reason that, although he began to practice medicine when a resident of Mower County, he was, with his father, active professionally in Fillmore County.

Henry Stanley Plummer, one of the four children of Dr. and Mrs. Albert Plummer, was born on March 3, 1874, at Hamilton, Fillmore County, Minnesota. He grew up in the village, went to the local schools, and early felt the interest in a medical career that was to last all his life. He often accompanied his father on professional calls and helped him in many ways, so that to some extent, even as a youth, he was associated with medicine in Fillmore County. When Henry Plummer was a boy of sixteen a case of thyroid tumor in his father's practice so interested him that from that time he gave thought to goiter; in his years at the Medical School of Northwestern University he followed with special care the cases of thyroid disease, medical and surgical, and in the dissecting room and the experimental laboratories, to learn all that he could about them.

In 1898 Henry S. Plummer received the degree of doctor of medicine from Northwestern University and returned to Racine, where Dr. Albert Plummer had settled in 1893, to join his father in the practice of medicine in a community which extended into Fillmore County and into Olmsted County as well. He remained in the village three years, at the end of which he joined the staff of the Drs. Mayo, Stinchfield and Graham, in Rochester. Let Dr. William J. Mayo, whose lasting pride and satisfaction it was that it had been his privilege to recognize the unusual intelligence and ability of Henry S. Plummer, tell the story:*

> It was in the latter part of the year 1900 that I was called in consultation to see a patient by Dr. Albert Plummer, a well-known practitioner of Racine, Minnesota. Dr. Plummer had two sons, Henry the elder and William the junior.
>
> I drove out the twenty miles from Rochester to Racine, to find that Dr. Plummer was ill in bed with a cold, but he said that his son Henry, who recently had been graduated in Medicine at Northwestern University, was in practice with him and would be glad to go with me to see the patient. It was arranged that I should leave my team of horses and ride the seven miles with Henry, who came out carrying a microscope in a case in his hand. We got into a little buckboard behind a gray horse and started on an hour's drive to see the patient. During this ride Henry talked to me about the blood, of which I did not know any too much. He had an extraordinary amount of information about the composition of the blood, its characteristics and function, much of which I realized was not to be found at that time in print.
>
> The case we were to see was one of leukemia, of the type with a diminution rather than an excess of the white cells; at that time it was called aleukemic leukemia; it is now designated leukopenic leukemia. Henry took a drop of blood from the ear of the patient, put it under the microscope and demonstrated the findings to me. He called in the hired man and a member of the family and took blood from each of them and under the microscope contrasted it with the blood of the patient for my information. On the way back he continued to talk about the blood; I continued to listen, and I learned much. He also spoke of interest in the thyroid gland, to which subject my brother, Dr. Charles H. Mayo, was devoting a great deal of study.
>
> When I got home that night, I told my brother, "Dr. Plummer has a son in Racine who certainly knows more about the blood, at least, than any one I have ever met. I think he is really an extraordinary young man, and I believe we had better try to bring him here and add him to the staff to bring our laboratories up to date." At that time our laboratory equipment and routine were fairly good, about that commonly found in general practice, but largely confined to surgical needs. I wrote young Dr. Plummer and asked him to come up to talk with us. He came, we went over the situation, and he came on the permanent staff early in the year 1901, thirty-seven years ago.

Dr. Plummer remained with the Mayo Clinic the rest of his life, making contributions of almost incalculable value to the institution and in many fields of medical science. Wherever modern medicine is known, there is knowledge of his work on the blood, on esophageal stenosis, on bronchoscopy and, especially, on the diagnosis and treatment of diseases of the thyroid gland. He was a master in mechanical detail also; the Mayo Clinic buildings, the first in 1912, the second, adjoining, in 1929, are monuments to his genius, marvels of efficiency for the performance and correlation of scientific work.

---

*Excerpt from Dr. Mayo's article "The Work of Dr. Henry S. Plummer," published in the Proceedings of the Staff Meetings of the Mayo Clinic, 13:417-422 (July 6), 1938; reprinted in the Collected Papers of the Mayo Clinic, 30:928-934, 1938.

Henry S. Plummer was married on October 4, 1904, to Daisy Berkman, of Rochester. He died at his home in Rochester on December 31, 1936, at the age of sixty-two.

Inasmuch as the greater part of Dr. Plummer's distinguished scientific career was identified with the Mayo Clinic, a detailed biographical account will be given in the story of the growth of medical practice in Olmsted County.

David Frank Powell, a graduate of the Medical College of Louisville, Kentucky, was a successful and popular physician who practiced medicine in Lanesboro, Fillmore County, in the seventies and into the eighties.

When Dr. Powell came to Lanesboro, he was accompanied by his brothers, George and William, also practitioners, both of whom subsequently studied at medical schools in Burlington and Keokuk, Iowa, from which they are said to have emerged as full-fledged doctors of medicine. The three brothers, David Frank Powell especially, were picturesque figures, tall and large, wearing their long hair flowing to their shoulders in the manner of "Buffalo Bill" Cody; in fact, Buffalo Bill (William Frederick Cody, a native of Scott County, Iowa, who lived from 1846 to 1917), was their admired and good friend. In 1880, on the occasion of a celebration in Lanesboro, Colonel Cody came to the village in order to be present at a powwow and to visit the Powells, and at that time he enlisted Dr. Powell's help in Cody's Wild West Show, which came into full flower in 1883. Dr. Powell stayed with the show for a while during its modest beginning but later returned to medical practice.

Sometime in the seventies Dr. Powell, who apparently had unusually sympathetic understanding of the Indians, received from a Siouan tribe farther west in the state the name "White Beaver," and this endorsement of him by their kinsmen brought him the friendship and acceptance of the local Winnebago Indians, with whom he evidently was on the best of terms, for in December, 1879, a band of Winnebagos in Lanesboro "got up an exhibition under the patronage of Dr. Powell and realized almost $50." On occasion, furthermore, they would rally to his defense: At times Dr. Powell, uplifted by liquor, so ran a reminiscent account, would don a beautiful suit of buckskins, no doubt the gift of his Indian friends, get on his horse and tear up and down the streets of the village yelling and shooting off revolvers, one in each hand, to such effect that the Indians near town, fearing that he was in trouble, would hurry to the rescue, only to be assured by White Beaver that he was all right and that they might return to camp.

Mr. C. A. Ward, long a resident of Lanesboro, has described these scenes of Dr. Powell's revelry and has given other vignettes of this physician who must have been a source of interest to his more staid fellow citizens. A crack shot, Dr. Powell delighted in displaying his marksmanship, a pastime in which he was encouraged by his boon companions, Frank Bergey, who was Mr. Ward's brother-in-law, and John Rogers. Mr. Bergey, in particular, had such confidence in White Beaver that he often and cheerfully would support a potato or an apple on his head as a target for his friend who for the moment fancied the role of William Tell. When Mr. Ward was a youth he had trouble with his eyes: Dr. Powell treated him for the disorder, kept him in a dark room a week or ten days, and the eyes were cured "slick as a whistle," and evidently remained in that condition for they were functioning without the aid of glasses, except for reading, when Mr. Ward, in 1941, was eighty-seven. Also, while Dr. Powell was still in Lanesboro, he performed "the first appendectomy on record," on a farmer living three miles southeast of Whalan, and it is said that Minneapolis newspaper in recent years published an article about it; this reference has not been susceptible of confirmation by the writer. On one occasion Dr. Powell himself was the patient, when in August, 1877, he was bitten by a rattlesnake; as has been told, Dr. Luke Miller, then of Lanesboro, formerly of Chatfield, "prescribed R. spiritus frumenti, ad lib."

Reminiscent comments on Dr. Powell's professional courage and skill are substantiated by various editorial notes of praise in county newspapers, among them the *Lanesboro Journal* and the *Rochester City Post.* In 1879 Dr. Powell's "Lanesboro Sanitarium," about which unfortunately, details are not known, was in full operation. Late in that year it was stated that Dr. D. F. Powell, "Lanesboro's skillful physician and surgeon, has been driven to the curtailment of his general practice in order to meet the demands of his special practice in surgery and the treatment of female diseases. From five to a dozen different ladies from neighboring towns and cities are constantly under his care at the Sanitarium and his success is bringing him customers for miles around." And early in 1880 it was stated that in the past fifteen months Dr. Powell had performed sixty-one operations for cross eyes and that every operation had been successful.

In 1880 Dr. Powell removed to La Crosse, Wisconsin, where in a broader sphere he continued his colorful career, practicing medicine and taking an active part in local and civic affairs; for many years he was mayor of La Crosse. After the passage of the "Diploma Law" in Minnesota, in 1883, Dr. Powell was licensed to practice in this state and received certificate No. 42 (R), given on October 11, 1883.

In the early eighties the White Beaver Medical and Surgical Institute of Saint Paul and La Crosse was in operation, by Dr. Powell. In 1883 there appeared among advertisements of medicines and appliances in the *Northwestern Lancet* of September 15 an endorsement by Dr. D. F. Powell of Celerina, The Nerve Tonic: *"I believe that Celerina is the best nerve tonic in use.* In one case (in which no other remedy was of benefit) a cure was effected. My patient was grateful and so was I."

And in the *Chatfield Democrat* of February 16, 1884, Dr. Powell had a full column advertisement for "Cough Cream made only by Dr. Frank Powell, Medicine Chief of the Winnebago Indians." To this the editor added: "Dr. Frank is having a lively tussle with the state medical board and is coming out on top. He has the reputation of being a first-class physician. We know he is a good advertiser, and what is more, does not pay for it grudgingly."

When, in May, 1906, Dr. David Frank Powell died, *the Journal of the Minnesota State Medical Association and Northwestern Lancet* stated, "Dr. D. R. F. Powell, known as 'White Beaver,' died last month. Dr. Powell was a man of no mean attainment, in medicine and other lines, and lived a life of usefulness."

George Powell, brother of Drs. David Frank Powell and William A. Powell, was a practitioner of medicine in Lanesboro. He and his brother

William in the winter of 1881-1882 spent a few months, according to the *National Republican* of Preston, in attendance upon medical lectures and in other preparation for a more thorough practice of medicine, and on their return to Lanesboro late in March, 1882, opened an office in the village for resumption of their professional work.

William A. Powell, as stated, was the brother of Drs. David Frank Powell and George Powell. Little has been learned about him except that he was well liked, as were his brothers, and that when he and Dr. George Powell returned in March, 1882, from additional study at medical schools, presumably in Burlington and Keokuk, Iowa, they renewed their medical practice "among old friends" in Lanesboro.*

Albert Wentworth Powers was born on March 31, 1850, at New Castle, Ontario, Canada West, the son and one of the five children of Calvin Siscoe Powers and Mary Ann Bailey Powers; the other children were Hartwell and Helen, older than Albert, and Martha and Frederick, who were younger. His parents both were primarily of English descent and natives of Canada; Mary Ann Bailey was born in Canada East.

The recorded genealogy of the Powers family in America dates from 1639 with the birth of Walter, who with his wife early immigrated to this country. Of Calvin Siscoe Powers' great uncles, eight fought throughout the American Revolution. Representatives of the Bailey family came from England around 1630; among their descendants one was an officer in the Revolution; many others have been clergymen. Members of the present generations of the Powers family have stated that a distant cousin of Albert Wentworth Powers was the Hart for whom Hartford, Connecticut, was named; another cousin married a McDougal, governor of Massachusetts; a third was descended directly from the wife of Millard Fillmore, onetime President of the United States.

Calvin Siscoe Powers, father of Albert Wentworth, Harley, Frederick, Helen and Martha, was a man of originality and force of character. Himself a native of Canada, his father was born in Vermont and his mother in Ireland. Leaving Canada in 1860, he brought his family to Waukokee, near Carimona, in Fillmore County in the period when Indian uprisings were imminent in Minnesota; his grandchildren have recalled stories, told them by their parents, of the frequent warnings and scares. A member of a family that had produced artists in various lines, Calvin Powers' tastes and talents ran to the study of general science, to sculpture, but chiefly to literature, public speaking and politics. He had been the editor of a literary paper in Canada; in 1878, in Minnesota, he was editing the *Dollar Weekly* at Wykoff in the interest of the Greenback Party; the following year he became editor of the *Fillmore County Radical;* in the same general period, of the *Fountain Radical,* and in April, 1881, he began the publication, at Rochester, in Olmsted County, of the *Rochester National,* also a Greenback paper and a large one, of eight columns, well executed and "edited with much spirit;" after six months, however, he returned to Fountain. In 1879 and in 1881 he represented the district in the state senate. In most of these enterprises his son, Albert Wentworth Powers, by 1872 a physician, was his associate.

---

*Information has been received in the archives of the Wisconsin State Historical Society there are numerous letters written by Dr. Powell and his physician brothers, all of whom practiced in Wisconsin after leaving Lanesboro, Fillmore County, Minnesota.

Albert W. Powers went to district school at Waukokee and in due time studied high school subjects under tutors. In 1869 he entered the office of Dr. Lafayette Redmon, at Preston, as a student to learn what he could of medicine and surgery before going to Chicago to enroll at Rush Medical College. The course of 1871-1872 at Rush was interrupted by the great fire of October 8 and 9, in which the college buildings were reduced to piles of brick and twisted iron and half melted apparatus. Among the students in the city who became part of the huge army of homeless citizens was Albert Powers, who lost most of his personal property in the fire and narrowly escaped with his life. The faculty members of Rush in a few days reassembled classes; the Cook County Hospital had offered the use of a clinical amphitheater for a lecture room and the Chicago Medical College the use of a dissecting room; both aids were accepted and the students of Rush Medical College were enabled to continue their work.

From Chicago Dr. Powers returned in February, 1872, to his home town of Fountain to begin his medical practice, and for a year or two immediately thereafter he was in partnership with Dr. John A. Ross; Dr. Powers was in Fountain, Dr. Ross retained his residence in Preston. By 1874 this association had been dissolved, and Dr. Powers and his father, Professor Powers were putting up the stone building that was to be occupied by them as drug store and residence. In later years the doctor's consulting rooms and his medical library were in his separate residence; after his death the books were placed in the drug store, where they have remained (1943).

The year after the completion of his medical course, Albert Wentworth Powers was married, on February 21, 1873, to Amanda Justina Bickford, of English descent, born near Rochester, New Hampshire, a daughter of Ira Bickford. Dr. and Mrs. Powers were the parents of five children, Elsie, Albert, Frederick, Alta and Glenn.

Dr. Powers was a good citizen, sharing the life of the community as civil servant, businessman and general medical and surgical practitioner. At one time or another in the nearly fifty years of his adult life there, he held almost every town and village office and county and state office in addition. He was justice of the peace, mayor, councilman, a member of the school board, and in 1912 he was rounding out thirty years as town clerk. When his father was state senator from the district, Dr. Powers went along on appointment as clerk for the senate.

In his capacity as physician he carried on a heavy practice, was local health officer, co-operating with the State Board of Health, county coroner from 1895 to 1896, and for a time he served, with Dr. W. W. Mayo, of Rochester, on the pension board for veterans of the Civil War. During most of his professional life prior to 1900 he was the only physician in the village; for a year or so in 1885 and 1886 Dr. Ole T. Hoftoe, newly graduated from Rush Medical College, was in Fountain before going on to Lanesboro and, in 1888, to Abercrombie, North Dakota. Under the medical practice acts of 1883 and 1887 Dr. Powers was authorized to practice in the state, in official registers of physicians of Minnesota he is listed as the holder of an exemption certificate. Part of the record, as embodied in the following letter, is of interest in connection with methods of licensure:

State of Minnesota, State Board of Medical Examiners
Seven Corners, St. Paul, Minnesota, June 3, 1899.

Dr. W. A. Powers
Fountain, Minnesota.
Dear Doctor:

I have received your affidavit of practice prior to the law of 1887. This will be placed on file in the office of the Secretary of the State Board of Medical Examiners. This gives you the legal right to practice medicine in the state of Minnesota. No other certificate is provided by law.

Sincerely yours,
(signed) John B. Brimhall,
Secretary

This letter duly was filed and recorded in the office of the Clerk of the Court of Fillmore County.

To his patients Dr. Powers was friend, confidant and adviser as well as physician. His fellow practitioners who came into the county soon after the turn of the century have spoken of Dr. Powers as an interesting character, a pleasing personality. He liked good stories, that is, funny stories, to hear and to tell, and some of his favorites still are quoted. He was a supporter of the Baptist Church of Fountain and, when this denomination was superseded in the village by the Methodist Church, he lent his support to the latter. In sympathy with fraternal organizations, he was a member of several, among them the Masonic Lodge (A. F. and A. M.) and the Royal Neighbors of America. A very dark brunet, with black eyes, when he still was a young man he began to wear a black flowing beard; as the years whitened his hair and beard and added to his weight he became in appearance so much the conventional figure of Saint Nicholas that children who did not know him addressed him as "Santa Claus."

Dr. Powers died of heart disease at Fountain on May 30, 1921. Of his five children three survived him; Frederick of Kansas City, Missouri; Alta (Mrs. Gilbert) Kolstad, of Spring Valley, Fillmore County, who before her marriage had been a teacher in Houston, Rushford and Lindstrom, and a teacher and assistant principal of the Fountain grammar school; and Glenn, formerly principal of the high schools of Ely and Gilbert, Minnesota, of later years a photographic artist. On November 8, 1943, Mr. Glenn Powers died suddenly from cardiac disease at his home in Virginia, Minnesota. Of the original family, his brother and his sister were living.

Donald Bannerman Pritchard (1865-1931), a native of Fort Garry (Winnipeg), Canada, became one of the distinguished physicians of Minnesota. On graduation in medicine and surgery from the University of Edinburgh, Scotland, in 1887, Dr. Pritchard returned to America, and in April, 1887, having received Minnesota state license No. 1370-1 (R), he began his career as a physician in the village of Rushford, Fillmore County. In 1889 Dr. Pritchard moved from Rushford to Winona, Winona County, where he spent the remaining forty-two years of his useful life.*

Charles Wilbur (sometimes spelled Wilbor) **Ray,** born in 1856, was a graduate of the Bennett College of Eclectic Medicine and Surgery, of Chicago, in 1885. Two years later he was licensed to practice medicine in Minnesota,

---

*When the *History of Medicine in Winona County* appeared in MINNESOTA MEDICINE, in 1941, because of an unfortunate inadvertence it lacked a biographical note on Dr. Pritchard. A detailed sketch of Dr. Pritchard, originally prepared by the present writer as part of the story of medicine in Fillmore County, will appear separately in due time and ultimately will be included with material on the physicians of Winona County.

receiving state certificate No. 1414 (E), given on May 26, 1887, and in the next twenty-two years he followed his profession in various localities in the state. In 1890 and presumably for a year or two previously he was in St. Clair, Blue Earth County; in 1893 he was practicing in Owatonna, Steel County; and in 1894 and 1895 he was resident in the village of Canton, Fillmore County.

In Canton Dr. Ray had his home and office together in a house "back of the Presbyterian Church, facing on the opposite street." From conversations of her elders in the village it has been recalled by an early citizen, who was then a child, that Dr. Ray in his preferred specialty of obstetrics advocated the use of a mysterious "twilight sleep," and that in addition to his general medical practice he on occasion undertook surgical operations. His professional contemporaries in Canton were Dr. Henry H. Haskins and Dr. Robert A. Sturgeon.

Dr. Ray has been described in Canton as tall and dark, of medium weight, a man of social aptitude and of artistic and dramatic ability that found expression in home talent plays, which he coached and for which he designed and painted the scenery. These extraprofessional activities were not regarded with favor by certain of the residents, who in consequence called him visionary. It was Dr. Ray who, one evening in March, 1895, when the Modern Woodmen of America in Canton were holding a meeting, initiated another organization; by prearranged plans with the ladies of the village who were eligible to become members of the Royal Neighbors of America, Dr. Ray brought this group into the meeting hall during recess and then and there organized the Surprise Camp of the Royal Neighbors.

On leaving Canton in 1896, Dr. Ray moved with his wife and children to the village of Nicollet, in Nicollet County, succeeding to the practice of the late Dr. Joseph Wicke, whose stock of drugs and medicines he bought from Mrs. Wicke. For part of 1896 Dr. Ray was the editor of the **Nicollet Leader.** At this period of his life he was a member of the Minnesota State Eclectic Medical Association and for some years its secretary. It has been said that the summer of 1899 he spent in Boston and other eastern cities visiting hospitals and that in 1900 he moved with his family to California; and record exists that in 1901 he was licensed to practice medicine in California.

Within the memory of a citizen of Nicollet who in 1941 was fifty years old, Dr. Ray at two different, unspecified periods practiced medicine in that village. It seems probable that after a relatively short time in California he returned to Nicollet, for in 1907, then a member of the American Medical Association, he was living in the village, and he remained that at least into 1909. By 1912 he again was in California, in Los Angeles, where his death occurred in the following year. Mrs. Ray and the children in 1941 were said to be living in Los Angeles; attempts to communicate with them for the purpose of this sketch have not been successful.

(To be continued in September issue)

President's Letter

THE GENERAL PRACTITIONER

IN an effort to uphold the prestige of the general practitioner and to encourage him to provide his patients with the kind of medical care which he is peculiarly qualified to furnish, the Council on Medical Education and Hospitals of the American Medical Association submitted a significant supplementary report to the House of Delegates of the American Medical Association at its recent meeting in Atlantic City.

Attention was called to the fact that a Section on the General Practice of Medicine was established in 1945 and that almost a thousand physicians had registered in this section at the 1946 Scientific Assembly. Also, it was recalled that the House of Delegates had expressed its approval of the organization of sections on general practice in state and county medical societies. "In spite of this," the Council report stated, "certain hospitals have inaugurated as a matter of policy limitation of their staff appointments to physicians certified by specialty boards or holding membership in certain special medical societies. Such a policy is contrary to the principles of the Council and seems unsound. In publications which have dealt with hospital standards, the Council has expressed repeatedly the need for a hospital staff of high quality; it has never mentioned certification by a specialty board or membership in a special medical society as an important credential."

The report called attention to a resolution which was adopted by the House of Delegates at the San Francisco meeting in 1946 and which in part read as follows:

"Whereas, Many hospitals have not established general practice sections in their visiting active staffs and their governing heads are doubtful whether such action has the approval of the bodies which set up the rules and regulations for the approval of their hospitals for interns and residents; therefore be it

"Resolved, That hospitals should be encouraged to establish general practitioner services. Appointments to a general practice section shall be made by the hospital authorities on the merits and training of the physician. . . . The criterion of whether a physician may be a member of a hospital staff should not be dependent on certification by the various specialty boards or membership in special societies."

The report stated further that the Council had published a statement in the *Journal of the American Medical Association* of May 3, 1947, which read in part as follows: "It was never intended that staff appointments in hospitals generally, or even in hospitals approved for residencies, should be limited to board-certified physicians, as is now the policy in some hospitals. . . . Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society memberships.

"In this opinion," the report continues, "the Council has the full concurrence of the Advisory Board for Medical Specialties."

Also, "The American Board of Surgery is not concerned with measures that might gain special privileges or recognition for its certificants in the practice of surgery. It is neither the intent nor has it been the purpose of the Board of Surgery to define requirements for membership on the staffs of hospitals."

The concluding note in the supplementary report was to the effect that the Section on the General Practice of Medicine is considering the establishment of an American Board of General Practice. The Council expressed the opinion that the wisdom of such a move at this time is debatable. Possibly a greater usage of the skill of the general practitioner in hospital practice may make superfluous the need for a specialty board.

Louis A. Buie

President, Minnesota State Medical Association

Editorial

CARL B. DRAKE, M.D., *Editor;* GEORGE EARL, M.D., HENRY L. ULRICH, M.D., *Associate Editors*

IF YOU WERE TOLD—

That President Truman in a message sent to Congress, November 19, 1945, urged the enactment of a national health program typified by the Wagner-Murray-Dingell Bill which had been submitted to Congress;

That Thomas Parran, Surgeon General of the U. S. Public Health Service, on December 10, 1945, sent a letter to all his field men and operatives throughout the country telling them that the executive agencies of the Government had been instructed by the President to assist in carrying out this proposed national health program;

That pursuant to this policy, the U. S. Public Health Service launched a series of so-called "health workshops" throughout the country which were meetings held in order to develop pressure groups favoring the Wagner-Murray-Dingell Bill;

That the "health workshops" were planned, conducted and largely financed with Federal funds by a key group on the Government payroll, who used the workshop method of discussion subtly to generate public sentiment in favor of socalized medicine;

That the Government paid the expense of attendance at these "health workshops" of Federal employes in the USPHS, the Children's Bureau, the Office of Education, the U. S. Employment Service, the Department of Agriculture, and the Bureau of Research and Statistics, Social Security Board;

That Federal employes arranged these "health workshop" meetings, invited delegates, trained delegates, presided at meetings, and framed resolutions;

That the Bureau of Research Statistics in the Social Security Board prepared pamphlets and propaganda literature for the CIO, AFofL and Physicians' Forum (a propaganda agency for the Wagner-Murray-Dingell Bill) biased in favor of socialized medicine;

That $75,000,000 were spent in 1946 in the executive branch of the Federal Government for publicity and propaganda purposes and that during that year 45,000 Federal employes were engaged full or part time in such activities;

That Mr. Isadore Falk, Director of the Bureau of Research and Statistics, urged that one Jacob Fisher, a member of his staff and an avowed communist, be sent to New Zealand at Government expense to study compulsory health insurance there—

Would you believe it?

Yet this information* and more, too, was unearthed by a subcommittee of the Committee on Expenditures of the Executive Department of the House of Representatives, was transmitted to the Speaker of the House, and was brought to the attention of the U. S. Department of Justice with the request that the Attorney General at once initiate proceedings to stop this illegal expenditure of public money.

While it is quite proper for the President of the United States to transmit his views on legislation to Congress, it is absolutely contrary to law to use Federal funds for the purpose of influencing legislation pending before Congress.

We taxpayers are apparently employing individuals in the executive division of our Federal Government who at our expense are trying to influence the public to enact the Wagner-Murray-Dingell Bill, which will add thousands of employes and strength to bureaucratic Washington and will lead to deterioration of medical care in our country.

ASSOCIATED MEDICAL CARE PLANS

It was not until the December, 1945, meeting of the American Medical Association House of Delegates that our national organization gave its approval of voluntary nonprofit prepayment plans for medical care. The organized profession was slow to give its official approval to the Blue

---

*Investigation of the Participation of Federal Officials in the Formation and Operation of Health Workshops. House Report No. 786, 80th Congress.

Cross, although many physicians felt that hospital expense was an insurable expense. The Blue Cross eventually proved its practicability and obtained the wholehearted support of the profession.

By December, 1945, some nine organizations had established nonprofit prepayment plans for medical care, the oldest statewide plan being the California Physicians' Service established in 1939. These organizations had formed an informal Council on Medical Care Plans, representatives of which met with the AMA Council of Medical Service in February, 1946, and formed Associated Medical Care Plans, an independent corporation. A few years ago there had been some talk of forming a prepayment medical organization on a national scale, but the idea was wisely abandoned.

The AMCP is governed by a commission of thirteen members, ten of whom are selected from persons directly associated with member Plans and three of whom are nominated by the AMA Council of Medical Service. Thus, while controlled by component members of the organization, AMCP is closely associated with the AMA.

On May 1, 1947, AMCP claimed thirty-nine members, and many additional units in the process of organization will doubtless be added in the near future, Minnesota Medical Service being one.

The AMCP has several important functions. It will assemble actuarial data which are essential for any insurance undertaking. This will be made available to the component units and to new organizations. Reciprocal arrangements will be made for exchange of membership privileges with a minimum of red tape. A mechanism is provided for selling the idea of this type of insurance to the medical profession, as well as to the public, on a national basis. Insurance, no matter how meritorious it may be, does not sell itself.

There is every reason to believe that medical insurance not only for the low-income group, for whom the organizations sponsored by the profession provides complete coverage, but also for those in the higher income brackets will grow by leaps and bounds, just as hospital insurance has. Members of the medical profession sold on the idea can act as publicity agents by urging their patients to buy medical insurance.

COMMUNITY CHEST

EACH year the 1,000 Community Chests throughout this country and Canada put on campaigns for raising funds for the 12,000 services they support. These campaigns take place each fall in the larger cities in Minnesota.

The idea of grouping the local services, which depend on the generosity of citizens, began sixty years ago in Denver, Colorado. This grouping of local activities affects an economy in the raising of funds, enables the contributor to give one sum yearly to a group of worthy activities instead of giving to them separately and does away with his not knowing how many he will be asked to contribute to nor how much he should give to each. He is also saved numerous calls from solicitors. Another advantage of the Community Chest idea is the apportioning of contributions by the Chest Budgeting Committee so that certain units do not suffer from lack of funds and others are not surfeited.

During the war, foreign relief organizations were combined with Community Chests thus providing the same advantages and economies. These affiliations were terminated last year.

The American Red Cross has never joined the Community Chest and, we think, quite wisely. The Red Cross has a special appeal, and its budget varies from year to year being enormously increased in war years and when other catastrophies strike. The organization's new undertaking of establishing blood banks on a nationwide and permanent basis is sure to prove a valuable but expensive undertaking.

The Community Chest idea is what we like to think of as a typical American institution. The majority of citizens dig into their pockets to support activities for the benefit of the communities. It is said that four out of ten individuals benefit directly from chest-supported activities. The other six undoubtedly benefit indirectly. The agencies which provide activities for children and the youth of the community and for the betterment of family life constitute a large part of Chest membership. With juvenile delinquency on the increase, nothing is needed more. Last year in our country 108,787 persons under twenty-one were arrested. Though this represents only 16.9 per cent of the total number arrested, it is a reflection on present-day trends.

Community Chest units are not all dispensers of charity. Many provide activities not charitable in nature. Community Chests deserve wholehearted support, because they make life better wherever they operate.

REPORT OF MINNESOTA AMA DELEGATES

This year, 1947, marked the 100th year of the organization of the American Medical Association at Atlantic City. The occasion was made especially notable by the visitation of noted medical representatives from practically every country on the globe, who brought to the convention offerings for the AMA, either from their national medical societies or their respective governments.

The meetings of the House of Delegates this year were somewhat more arduous than usual, and Mr. Delegate could find only two half days to visit the scientific session and none for the commercial exhibits.

There are several topics we would like to report on. First, the day of the general practitioner is here, and receiving more attention than usual. Last year a section was created for the general practice of medicine; suggestions were made that hospitals establish a division of service for the general practitioner. This emphasis was made necessary by the fact that many hospital staffs are dictated to by the numerous specialty boards. Second, the mid-year session of the House of Delegates will hereafter be held in various sections of the United States, two days being set aside, preceding the meeting of the delegates, for scientific sessions devoted to the general practice of medicine.

The nursing problem was another highlight, arousing much discussion, and the questions of practical nursing education and the shortening of nurses' training periods were brought up. It is apparent that too much stress has been put on technical and scientific preparation for the prospective student nurse rather than on her sympathetic understanding of problems in patient handling. We will hope for an attempt to bring about a solution by a joint committee of members appointed by the AMA, the American Board of Nursing, and the American Hospital Association.

A new section on chest disease was created, which, it is felt, will stimulate more knowledge on many obscure problems of the chest.

Problems of the Army and Navy regarding medical care in possible future wars resulted in the formation of a National Emergency Medical Service, which will undoubtedly not only change many medical problems resulting from World War II, but plans of civilian medical men. The next war, if and when there is one, will be an atomic war, and non-combat areas must be protected as well, if not better, than combat areas.

As a result of surveys made in 1946 by the AMA, it is generally agreed that affairs at the Home Office are gradually crystalizing into a far more efficient management. Dr. George Lull, general secretary and manager, is rounding out a very capable group of executives for the various divisions. The National Physicians Committee was again endorsed. During the past year they did a most excellent piece of work in Hawaii, when a bill to establish a socialized type of medical practice in the Hawaiian Islands was defeated.

The inability to secure paper, in addition to the inability to secure medical publications from abroad—a result of the war—is about licked, and you soon will see the Index Medicus on your shelves again. Also, the Directory of the AMA will soon be published. These are two very important publications.

The election of Dr. R. L. Sensenich of South Bend, Indiana, as President-Elect, was unanimous. Dr. Sensenich, an able executive, excellent speaker and a good internist with a keen grasp of AMA affairs, has the highest respect of the medical profession.

TUBERCULOSIS AMONG RESIDENTS OF OLMSTED COUNTY OVER THE AGE OF SIXTY-FIVE

(*Continued from Page 859*)

ticularly since there was a definite overemphasis on persons receiving old-age assistance, but the finding of 8.6 per cent of this group with reinfection-type tuberculosis is certainly of immediate importance. In no other group of our population can we find such a high percentage of significant lesions.

Minnesota State Medical Association
George Earl, M.D., Chairman

DELEGATES DISCUSS HEALTH QUESTIONS AT DULUTH MEET

Use of an anti-tuberculosis vaccine, a plan for co-ordinating local health services, a program for stimulating public interest in heart disease and a cash sickness benefit system for railroad employes were among the several important matters to come up for discussion at the House of Delegates at its annual session in Duluth last month.

Physicians were urged to "proceed with caution" as regards inoculating patients with the widely popularized anti-tuberculosis vaccine, BCG. The House of Delegates passed a resolution opposing the indiscriminate use of this drug.

The new agent, whose full name is Bacillus-Calmette-Guerin, is prepared by suspending virulent tubercle bacilli in an innocuous liquid. The bacilli used for BCG are not as strong as some but are strong enough to produce tuberculosis.

Not Sufficiently Studied

No organized, thorough studies have been made to determine BCG's actual value in treatment or prevention of tuberculosis, the resolution pointed out. It further said that inoculation with BCG renders body tissues particularly sensitive to tuberculin and thus nullifies the value of the tuberculin test which has been used so effectively.

Further study of special groups under carefully controlled conditions with sufficient time to make the experiment worth while before its use is publicly advocated was deemed necessary by the delegates. The resolution deplored the widespread publicity given to the use of BCG for tuberculosis control work, which is leading to a feeling of security among our citizens. In Minnesota highly satisfactory results are being obtained by proved methods, as shown by marked reduction in mortality, morbidity and infection attack rates, and therefore every effort should be exerted to protect these results.

Health Council Plan Approved

A plan for the co-ordination of all health services and the bringing together for greater mutual understanding of all of the members of medical and allied health professions who provide health care and the citizens who receive the services was approved by the House of Delegates, as outlined in the report of the recently organized committee on Rural Medical Service.

As its answer to the various problems with regard to the distribution of medical and nursing services, hospital facilities, school health and health education programs and conflicting health campaigns, which can beset an individual community, the Committee proposed that a health council be organized at the local level to provide a chance for interchange of ideas and opinions leading to better understanding among those groups involved.

The health council idea is not a new one. Other states, notably Michigan, have formed them and have found them to be a sound, practical answer to much of the overlapping of services which can occur. These councils are formed first at the local level, in areas where they are deemed most advisable. Later a council can be formed at the state level, and eventually at the national level.

AMA Advocates Health Council Plan

Our State Committee on Rural Medical Service, which with the approval of the House of Delegates now has for its official project the formation of local health councils, was created by action of the Council of the Minnesota State Medical Association following a request of the American Medical Association. On January 4, 1947, the present Committee, with one representative from each of the nine Councilor Districts, was appointed by the Council; and Dr. Paul C. Leck of Austin was named Chairman.

The activities of the present Committee are co-ordinated closely with those of the parent committee of the AMA. At the two national conferences on Rural Health, sponsored by the AMA committee, there has been developed rather uniform agreement that health councils should be organized to enable professional and lay groups interested in health problems to meet together. The AMA Committee on Rural Medical Service recommends that these health councils be organized on a local, county or trade-area basis before state and national councils are developed. The national committee further urges that the medical profession show active leadership in organization of these health councils as a part of a program for extension of medical service.

Three Groups Represented

According to the proposals made at the National Rural Health Conference, health councils should be organized so as to represent three major groups concerned. First of all, there should be members of those allied and auxiliary professional groups who render health service; second, there should be representatives of the public-at-large who receive health service; and, third, persons representing governmental agencies manifesting a continuing interest in health and medical care should be admitted to membership in the health council.

Health professions to be represented would, of course, include doctors, dentists, nurses, pharmacists, and hospital administrators. The spokesmen for the public-at-large could be chosen from among the farm, labor, veterans', women's civic and professional organizations, parent-teacher associations and members of the clergy and church boards. Governmental agencies concerned would include the county welfare board, the county health unit, the city health unit, the city or village council and the sanatorium commission. Voluntary organizations, such bodies as the Tuberculosis association, the Infantile Paralysis Foundation, the Cancer Society, the Crippled Children's association and the Red Cross, should send their delegates.

Promote Discussion and Sound Planning

There are two major objectives of a health council: (1) to bring together the interested groups for the purpose of promoting discussion, debate and interchange of opinions and the sound planning of health and medical care programs and (2) to encourage, stimulate, foster and support the establishment of health and medical care councils in areas as deemed advisable within each state.

To obtain these ends, the councils could survey the medical and health needs, determining the existing and needed facilities and personnel for meeting the findings of such a survey; recommend ways and means of providing adequate facilities and personnel to meet the constantly changing needs; disseminate as widely as possible information pertaining to health and medical care problems and programs; and conduct or promote such meetings as may be helpful in effectuating the program.

Echoing the AMA's original appeal for the cooperation of the medical profession in the establishment of these health councils, which is so vital to their success, the Committee urged in its report to the House of Delegates that the local medical societies lend their support to the project by appointing committees on rural health in each society, to work with the State Committee.

The report pointed out that the very live interest in the rural health problem on the part of the public indicates the need for active leadership by the medical profession. It further warned that lay groups are prepared to proceed with their own plans if the active interest of the profession is not soon forthcoming.

Delegates Approve Heart Program

Recognizing the fact that a program to control a disease which is responsible currently for one-third of all deaths in the nation should not lack public and professional support, the House of Delegates approved a report submitted by the Heart Committee, which outlined plans for the establishment of a Minnesota branch of the American Heart Association.

The Heart Committee, of which Dr. Frank J. Hirschboeck of Duluth is chairman, reported that it had been planning during the year to expand its efforts toward activating public interest in heart disease. At the request of the American Heart Association, the Committee has held several meetings to consider plans for the formation of a Minnesota Heart Association. Dr. Hirschboeck appeared before the Council of the Minnesota State Medical Association and requested its approval for the Heart Committee to petition the American Heart Association for a charter for the Minnesota branch. This approval was granted and the Committee has since been considering the question of membership.

Present plans are based on a recent change in policy of the American Heart Association, the delegates were told. At first the AHA was interested only in scientific matters, research and education of physicians. Under the new policy, the AHA plans to broaden its scope of activities, to concentrate more on public health education. And in order to foster this program for the spread of information and the development of public interest, it is proposed by the AHA to have sectional or state Heart associations formed.

Members Include Physicians and Laymen

It is planned to extend membership not only to physicians but to members of other professional groups and to laymen, lay membership to be limited to less than fifty per cent of the total. The Committee noted in its report that Minnesota supplies a very satisfactory field for the formation of a Heart association chapter, since in this state the interest evidenced in heart disease has been as intensive as in any other community in the United States, if not more so. The interest of various organizations, such as the Minnesota Public Health Association, the American Legion, the Variety Club, the Alpha Phi sorority, and several others, has long been known. All have indicated their interest and willingness to do their share in advancing a definite research and education program. The Minnesota Heart Association will seek to co-ordinate and encourage the activities of all of these organizations.

An early meeting with representatives of the medical profession, interested allied professional groups and laymen is planned, at which time definite action for the formation of the Heart Association will be discussed.

Hear Railroaders' Benefit Plan

A cash sickness benefit system for railroad employes which became operative July 1, and which will require the close co-operation of physicians, was explained to the House of Delegates by representatives of the Railroad Retirement Board. Benefits, the delegates learned, are payable under the Railroad Unemployment Insurance Act to qualified railroad employes when they are unable to work because of sickness or injury. Physicians are concerned in the program since in order to receive benefits an employe must submit a statement of sickness signed by his physician.

Only doctors of medicine are authorized to sign statements of sickness except when information furnished on the form is derived from current records of hospitals or institutions, in which case the hospital superintendent or institutional head may sign the statement.

Need Complete, Accurate Information

The need for complete and accurate information as called for by each item of the form was stressed in the report to the delegates. It is also expected that the doctor will enter an estimate of the date on which he believes the employe will have recovered sufficiently to resume work in his last occupation.

All disabilities which prevent railroad employes from working, regardless of how or where they occur, are covered under the program. It is estimated that the program will require about 650,000 medical examinations a year. Employes are free to choose their own doctors; and, since the Retirement Board is not liable for any charge in connection with completing the statement of sickness, the relationship between the doctor and the patient is not affected by this program.

There are two forms on which doctors are to provide medical information. The first, which is intended primarily for information at the beginning of an illness or disability, is the "Statement of Sickness." The second, intended to provide additional information when it is needed later on in connection with the same illness, is the "Supplemental Doctor's Statement."

Prompt Mailing Required

The form to be filled in by the employe in applying for sickness benefits and that to be filled in by the physician are combined on the application form, but if the physician considers the information he is entering to be confidential, that part of the form can be detached and mailed by him direct to the Board's Regional Office. Prompt mailing of the employe's form and the doctor's statement is very important. If mailing is delayed, the employe may lose benefits to which he is otherwise entitled.

Any employe who earned $150 or more in railroad employment during a calendar year is eligible to receive benefits if he applies for them

Minnesota Academy of Medicine

Meeting of March 12, 1947

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, March 12, 1947. Dinner was served at 7 o'clock and the meeting was called to order by the president, Dr. E. M. Hammes, at 8 p.m.

There were forty-one members present.

Minutes of the February meeting were read and approved.

The secretary read a letter from Dr. H. Z. Giffin presenting his resignation from the Academy. However, upon motion, it was voted unanimously to place Dr. Giffin's name on the Honorary List of the Academy, and the secretary was instructed to notify Dr. Giffin of this action.

The scientific program followed. Dr. Harvey O. Beek, Saint Paul, and Dr. Vernon L. Hart, Minneapolis, each read an Inaugural Thesis.

EDUCATIONAL MANAGEMENT IN PSYCHOSOMATIC MEDICINE, WITH SPECIAL REFERENCE TO THE GASTROINTESTINAL TRACT

HARVEY O. BEEK, M.D.
Saint Paul, Minnesota

The purpose of this paper is threefold: (1) to call attention to the psychosomatic problem, especially in its relation to certain diseases of and symptoms of the gastrointestinal tract; (2) to advocate and define the concept of educational management in the treatment of these cases; (3) to present cases illustrative of this common problem and their management.

Psychosomatic medicine changes the traditional concept that disease is a fixed pathologic state. The traditional view, based on the precise pathologic studies of Virchow, explained the symptoms of disease as being a result of pathologic tissue changes which could be traced back to certain mechanical, chemical, or infectious factors, or to the natural process of aging. Psychosomatic medicine recognizes that certain symptoms and pathologic anatomical changes are the consequences of disturbed organ function which is associated with chronic emotional conflicts.

According to Fultons' belief, visceral changes are secondary to the mental state or neurosis, that positive mental and emotional states, concomitant with activity of the cerebral cortex, are accompanied by visceral changes also arising from cortical excitation. Another view supported by psychological data suggests that the visceral activity indicates a concomitant psychological vector, and that the neurosis is both mental and visceral change, and that they are inseparable.

It has been noted for a long time that functional disorders of long duration may gradually lead to serious organic disorders based on anatomical change. Common examples of this are the hyperactivity of the heart with resultant hypertrophy of the heart muscle, or hysterical paralysis of a limb which may lead, due to inactivity, to certain degenerative changes in the muscle. With the development of the psychogenic concept it has become evident there can be no sharp dividing line between functional and organic.

Alkan in 1930 was one of the early leaders to point out that organic disease could properly be studied by psychologic methods. According to his belief organic changes may be the final result of emotional disturbances within the field of the autonomic nervous system. He postulated that intrapsychic conflicts may be expressed by spasms of smooth muscle which secondarily lead to anemia of an organ, vascular stasis, dyskinesia, atrophy or infection. The result of this may be organic changes in visceral tissue or somatic structures, which of themselves, as terminal events, are irreversible and constitute the so-called organic disease.

Alexander and his group, through their psychoanalytic studies, have become convinced of the psychogenic origin of gastrointestinal disorders. It is their belief that the organic changes are the last link in a complicated functional chain of events with psychologic conflicts as the basic etiologic factor.

Intensive psychic and somatic studies of cases of peptic ulcer have produced marked evidence for the assumption that emotional conflicts of long duration may be the first step to a stomach neurosis which may result in an ulcer. Present electroencephalogram studies on ulcer patients are adding to this evidence by correlating the electroencephalogram findings with the personality study.

Claude Bernard indicated the importance of the maintenance of a stabilized internal milieu of an organism for its normal existence. The autonomic nervous system has the major role in the maintenance of this condition. Forces pulling in the opposite direction are equilibrated to give an appearance of the rest homeostasis of Cannon. An automatic response involved in the interest of homeostatic balance or as an expression of emotional behavior may become excessive and give rise to symptoms.

Emotional conflicts and abnormal tensions that cannot be expressed outwardly through normal channels are converted to symptoms and organic disease. These emotions become the source of excessive energy which, centered in the hypothalmic region, overflows on the nuclei of the autonomic nervous system. The diencephalon with its regulating influence upon both major divisions of the vegetative nervous system apparently serves as the distributor of the emotional components of disease. The cerebral cortex appears to transmit, under conflict and abnormal tension, stimuli to the area in

---

Inaugural thesis.

the diencephalon which sets up impulses responsible for secondary changes in function and structural change.

Grinker and Ingram have reviewed the evidence that there are controlling nuclei for the sympathetic and parasympathetic nervous systems in the hypothalmus and that these centers are not only under the controlling influence of the hypothalmus, but also of the hypophysis and cortex. Stimulation of the hypothalmic region will cause various sympathetic or parasympathetic responses which will disappear when the vagus or sympathetic nerves are cut. It is postulated that the tonus of the two nervous systems is regulated in the area, and it is apparent that emotional tension can affect either one or the other separately or both simultaneously.

The manifestations of disturbed autonomic nervous system are numerous and this discussion will be limited to the gastrointestinal tract.

It was the experience of the medical corps in the recent war that gastrointestinal manifestation replaced the "soldiers heart" of World War I. In my practice, in a charity clinic, and in an educational therapy class, it is by far the most common condition.

1. In my private practice 25 per cent of the patients seen have complained of gastrointestinal symptoms which have been diagnosed as functional.
2. In a charity clinic figures based on samplings showed approximately 40 per cent with these complaints.
3. In an educational therapy class of 150 members, 36 per cent gave gastrointestinal complaints as their main problem.

There is probably no other system which shows such fine shadings between functional and organic changes as the gastrointestinal tract. Long-standing emotional disturbances result in tissue changes as seen in the stomach, duodenal ulcers and the ulcerative lesions of the colon.

There are certain factors which contribute to making this area a logical endpoint for emotional tension: (1) the sheer length of the tract; (2) the abundant afferent and efferent nerve supply of the gastrointestinal tract; (3) the association of relief from physical discomfort; (4) the fact that it is subjected to a wide range of abuses and insults; (5) the demands made upon it for adjustment and accommodation; (6) the association of the tract—through the act of feeding—with the emotions.

Wolf and Wolff have shown in their monograph, "Human Gastric Function," that the gastrointestinal tract is a battle ground for conflicts between the body and the emotional state. They demonstrated that alterations in gastric function may occur in response to a very large number of stimuli, and that even in the case of drugs and other physical and chemical agents, the usual effects may be profoundly modified or even reversed by changes associated with the situation in which the subject found himself and his reaction to it. It was further shown that these functional alterations in the stomach, when sustained, lead to the appearance of distressing symptoms and structural damage.

In a group of 158 patients attending an educational therapy class the most prominent emotions found to be the apparent causative factors of the tension state were first, fear and anxiety, and next, hostility and resentment.

Wolf and Wolff's subject again demonstrated well the changes in the stomach in response to these emotions. Fear, giving a picture of pallor of the face with blanching of the mucous membrane of the stomach accompanied by reduced acid secretion; anxiety, showing hyperemia, hypersecretion, and hypermotility, with flushing of the face; hostility and resentment showing turgidity, engorgement, hyperacidity, and violent contractions. Sustained emotional tension revealed the changes in the stomach mucous membrane and the patient complained of cramps and diarrhea. The sensitivity of the stomach to pain from vigorous contractions increased at the times of hyperemia and engorgement.

The cases to be presented and discussed are given because:

1. The emotional and life situation of the patients is a dominating factor in their illness.
2. They are all cases with sustained emotional tension.
3. All cases showed more than one manifestation of autonomic nervous system imbalance.
4. In each case the emotional component was easily accessible.
5. All cases had failed to respond to accepted medical management.
6. They did respond to either educational management alone or the addition of educational management.

Case Reports

Case 1.—(Ulcer-like Syndrome) J. W. T. aged fifty-five, a married white man, was first seen in May, 1946, complaining of gas, gnawing sensation in the epigastrium, intolerance of many foods, weakness, and stating definitely that he had an "ulcer." He also complained of spells of rapid heart, fatigue, sweating, and "collapse." His symptoms first appeared in mild form between 1932 and 1934, and since then have been the focus point of his life. During this period he had seven gastrointestinal x-rays series, and two gall-bladder x-rays. One x-ray examination supposedly showed a small ulcer in the duodenum. A retrocecal appendix was removed in 1942. He failed to respond to the large number of sedatives, antispasmodics, diets, and interval feedings which his physicians tried. An attempt was made by a surgical consultant to explain his condition on a functional basis, but this he absolutely refused to accept.

When seen in May, 1946, he was hospitalized and kept on modified ulcer diet while an attempt was made to start educational therapy. This failed and he was discharged in five days. His symptoms continued and he spent a great deal of the summer in bed. In September he was again hospitalized, but again he refused to accept educational therapy and was discharged at the end of seven days. On October 9, he had such a severe attack of distress and tachycardia that he was returned to the hospital, where x-ray studies failed to reveal an ulcer. According to his statement he had reached such a low ebb that he was willing to try anything. From the moment that he was willing to admit his condition was functional and was willing to accept educational therapy, his progress was one of steady and rapid improvement. He was discharged from the hospital on October 30, on a normal diet, no medication, no activity restriction except the avoidance of excessive fatigue. He has continued to the present, free from distress, and has not missed a meal or work day in six months, a record that had not been achieved in thirteen years. He is able to eat any foods, and does not avoid moderate amounts of alcohol. Under strain he does have mild spells of tachycardia and some "tight sensation" in the stomach, but he is able to break this immediately with the relaxing exercises that he has been taught.

The history revealed that the symptoms began during the depression years while the patient was guiding a financially unsound business. He is of Irish decent, of an explosive nature at times, and not given to controlling his emotions.

This case history shows a patient who for a period of fourteen years failed to respond to medical management for gastrointestinal complaints. With his improvement he realized that, after all, his condition was functional and that the advocated educational therapy did make sense. He also admitted that he had always hoped for some definite organic finding and that he had pounced on the one questionable x-ray with great hopes, but that the failure of diet to cure him had been a disappointment. This case well illustrates the change from medical management to educational management.

Case 2.—(Gastritis) E. G., aged twenty-three, an unmarried Mexican woman, was first seen in January, 1946, complaining of nausea, burning in the epigastrium, loss of weight, gas, distress after eating, and fatigue. These symptoms had a duration of six years with varying degrees of intensity. She also complained of spells of sweating, palpitation, and dizziness for three years.

During the period of six years she had been seen by seven different private physicians and had failed to respond to any of the types of therapy given.

The only significant findings on examination were spasm of the gastrointestinal tract and moderate tenderness in the ileocecal region. The x-ray examination showed a rather large stomach containing an excess of secretion and slight changes suggestive of gastritis.

She was treated intentionally as an out-patient on medical management until May, 1946, and continued to have the same complaints with no signs of improvement. In May, 1946, she was hospitalized for one month for strict medical management. There was no change in her symptoms or x-ray findings after this period. No attempt was made to get a history of her emotional situation.

In August, 1946, a detailed life and emotional history revealed that her father had become a drunkard and when she was nine, a brother took to drinking with resultant family drunken brawls. She had noted the appearance of a tight feeling in her stomach as the household tension developed, which was accentuated by each violent episode. Her brother was convicted of "white slavery" and at this time her symptoms increased and became permanent. She refused to marry a boy whom she was really fond of shortly before he went overseas. He was soon killed, and her symptoms became more marked. She had been unable to work for two years because of her distress.

She was of average intelligence and desired to raise herself above the level of her family.

After educational management was started in August, she responded slowly but well, and in two months was able to eat nearly all foods without distress, gained 5 pounds and obtained a position.

She gained sufficient understanding so that she volunteered that she could correlate her mother's asthmatic attacks with the home situations, and that she felt this asthma was of the same functional nature.

In this case it is seen that the patient failed to respond to treatment over a six-year period with seven different physicians. It is to be noted that no adequate history was taken during this time. This patient failed to respond to medical management as an in- and out-patient over an eight-month period, but did respond when educational therapy was started and the emotional aspect of her condition explained. This patient is still being followed.

Case 3.—(Duodenal Ulcer) E. M., aged fifteen, an unmarried negro girl (illegitimate), was first seen in September, 1946, complaining of gnawing pain in the epigastrium, nausea, vomiting, sweating, and weakness. These symptoms had been persistent for two years.

The patient was said to have had stomach distress ever since she was an infant. At the age of nine, her condition became more marked and she was taken to various clinics where the diagnosis of nervous stomach, gastroenteritis, and food intolerance were made. In September, 1945, because of a severe attack she was given a gastrointestinal x-ray at a city hospital, and a shallow ulcer crater about ½ inch in diameter was found on the posterior wall of the middle third of the cap of the duodenum. She was placed on diet and Sippy powders with only moderate relief. In September at another clinic she had an x-ray study and the findings were reported as showing an active ulcer with associated gastritis. She was continued on the same diet and also started on educational therapy. One month later she showed decrease in the size of the ulcer crater, and her improvement has continued. X-rays taken February 15, 1947, showed no signs of an ulcer crater.

In obtaining the history of her family and emotional life it was found that this had not been done before. The important points in the history revealed that she believed her father had died shortly after her birth. She lived with her mother, grandmother and aunt. There was constant friction in the home, which the patient realized caused her stomach to be upset. When she was nine her mother married a man whom she feared, and who refused to support and rejected the patient. At this time she had a severe attack of stomach pain and vomiting. She lived with her aunt. With the birth of each of two half-sisters she developed severe attacks and had to be taken to clinics. When she was fourteen she had her severest attack. This followed an attempt by the Welfare Board to urge her to return to her mother and stepfather and she lived for a period in fear that this might be brought about. It was at that time the ulcer was found.

This case reveals a fifteen-year-old Negro girl in whom a definite ulcer had been recognized for one year. It had not responded to medical management, in the year, but did respond when educational therapy was added to this regime. The periods of exacerbation of her symptoms are easily correlated with the increase in the emotions of fear, anxiety, and resentment.

Case 4.—(Duodenal Ulcer) R.R., aged sixty-two, a married white woman, was first seen in November, 1946, complaining of typical ulcer symptoms, insomnia, and restlessness. She stated that she had been on ulcer regime of restricted diet and medication for twenty years, and that she had not been free of chronic distress during the last fourteen years.

X-Ray studies on November 4, 1946, showed an active duodenal ulcer with marked deformity.

She was continued on medical regime and educational management started. She soon experienced relief and on November 18, 1946, the x-rays showed marked improvement with no evidence of the previously demonstrated ulcer crater.

The history revealed this person to be a chronic worrier, with marked periods of anxiety.

This patient has not been followed very long, but she is enjoying more comfort than in the past fourteen years and has recently gone through a period of distress caused by a tragic family death, which she states should have made her stomach symptoms almost unbearable. As in the other cases the only change in treatment was the addition of educational management.

Case 5.—(Ulcerative Colitis) G. L. D., aged forty-five, a married Jewish woman, was first seen in August, 1945, complaining of bloody diarrhea, tenesmus, abdominal cramps, weakness, loss of weight, insomnia, fatigue, and dizziness, and sweating. Her first symptoms appeared as mild cramps and diarrhea in 1934 and increased in severity until 1941 when her physician made the diagnosis of ulcerative colitis. She was placed on various medical regimes until August, 1945, when she was referred to a surgeon.

Proctoscopic and x-ray examinations confirmed the diagnoses. Examination showed marked abdominal tenderness and moderate rigidity.

Emotional history revealed financial insecurity, numerous family conflicts, anxiety over her husband and children, one of whom was a marked behavior problem.

She was hospitalized from August 28 to December 16, 1945, on medical management and educational therapy. She made slow and steady improvement. After her discharge she continued educational management until April, 1946, when she returned to her home in Detroit to face unchanged conditions. She was able to do this and handle difficult situations without an exacerbation, and recent letters state that she is doing well at the end of one year.

This case is of importance because it shows a typical case of ulcerative colitis which was referred to a surgeon for operation. The surgeon recognizing the emotional component placed the patient on educational management, instead of surgery.

Case 6.—(Diarrhea) G. M., aged forty-two, a married white woman, was first seen in October, 1945, complaining of occasional diarrhea, abdominal cramps, tachycardia, and dizziness. Her symptoms had been present three years.

Examination was negative except for marked spasm and tenderness of the lower gastrointestinal tract.

History showed she had married a man twenty years older than herself. When she discovered that he drank, her symptoms appeared. She found that the sight of a drunken man or the act of merely walking by a parlor seeing people drink would bring on a violent attack of diarrhea. She had failed to respond to diet and sedation but did respond to educational management and is free from diarrhea.

This case furnishes a good example of the reflex action established by emotion, the strong feeling regarding drink. It appears as a potential case of ulcerative colitis without educational management.

Comment

It is interesting to note that, in a number of ulcer patients from the same group now being studied, the figures show that patients on continued educational management after cessation of the ulcer regime are less likely to have recurrence of symptoms, than those in whom this therapy is not used, the medical management in these cases being modified ulcer diets and antiacids, or protein hydrolosate.

In none of these cases reported was a glucose tolerance study made, but in some of the group this is being done, and a low curve with a two-hour drop to 55-60 mg. is being found, the degree depending on the severity of the emotional problem. This is consistent with the studies made on psychoneurotic soldiers.

Accepting one of the theories advanced for the role which the autonomic nervous system plays in the production of these conditions, it is easy to understand why the usual medical management of these patients fails. Once the emotional state has caused the regulating mechanism to respond in this altered manner, and established an emotional reflex, the condition cannot be changed until the emotional component has been corrected. The re-establishment of the emotional-autonomic nervous system relationship is the purpose of educational management.

Recognizing this conflict or tension pattern, the internist has been criticized for not more frequently seeking psychiatric consultation in the handling of these cases. It is felt that this consultation is impossible because of the terrific case load, and that in the majority of cases it is not necessary but might be unwise treatment.

Educational management as advocated is a means for handling these functional problems which is within the reach of any physician or surgeon who is willing to take the time with his patient, and who is willing to devote himself to understanding the emotional state and response of his patients.

These patients are suffering from a condition which is due to their own emotional response to situations and their condition is usually accompanied by a general state of tension. A study of a group of patients in an educational management class showed that nearly all of them had more than one manifestation of autonomic imbalance such as sweating, tachycardia, dilated pupils. They must be made to understand their problem, the importance of the emotional involvement, and the association of relaxation.

Patients before being elegible for this form of therapy must be thoroughly studied and all complaints investigated. There must be no doubt in the mind of the examiner as to what the patient's condition is. Any doubt about the mental status of the patient has to be evaluated by a psychiatrist. It has been pointed out that the problems of these patients must be simple and on the surface.

Educational management is exactly what its name implies, education in understanding oneself and one's problems, and that most important tool, relaxation. The program must be carried out by developing the two phases at the same time.

The patient should be presented with the results and facts of the examination in a manner any intelligent person is entitled to. Any doubts about his condition or questions pertaining to it must be satisfied. A patient whose attitude is "Yes, Doctor, but" will not respond as long as he maintains that attitude. The best results are obtained in group management, although a modified program can be carried out individually. In attending a group the individual gets things that he cannot when handled alone. He quickly grasps certain very obvious facts. The presence of many others assures him that, contrary to his belief, he is not the only person in the world with a functional problem. The most important step is in making the patient realize that his ailment is just as real as a definite organic disease, in making him see that there is no more shame, stigma, or disgrace in admitting he has a functional condition, than there would be in admitting he had a broken leg or diseased heart. In the group he learns that functional conditions are not respectors of persons, that they may plague the rich as well as the poor; those of higher intelligence levels and those of lower; the laborer and the man behind the desk. In the group he has the opportunity to watch the progress of other individuals in the conquer-ing of their problems; he has the opportunity of talking with them and learning at first hand of their progress and does not have to rely on the statement of the physician. This is one of the extremely valuable facts in developing his confidence. He learns that the physician and the group furnish him tools, but that he alone can get himself out of his difficulty. It is made clear to him that his group attendance is not compulsory, that he must want this type of therapy, that the results depend on his desire to get well.

In the group his educational process consists of showing him, by means of discussion in simple language, something of the physiology and anatomy of the body. He has to learn that emotions can, through a chain of events, be converted into changes in function that may even result in a structural change which produces his symptoms.

As important as understanding the effects of emotions is understanding the art of relaxation. This is taught at the same time by having the group follow the physician through a simple series of exercises. The principle of these is the simple contrast between tensed and relaxed muscle groups, and a simple form of mental relaxation.

The patient is encouraged to discuss openly in the group his problem and his progress in handling it.

These patients are taught not to believe that all conditions are functional, that organic and functional can coexist, that while they may have a functional condition they may acquire some other, and that new symptoms must be explained by their physician.

A question has been raised as to whether or not this form of therapy is not an encroachment on the field of psychiatry. It is felt that it is not. There is no attempt made to interpret dreams, to use uncovering technique, psychoanalysis or any other procedure which rightfully belongs to the trained psychiatrist.

The statement has been made that because of its simplicity this type of therapy could be abused. That is correct. It could be degraded into a series of pep talks and a modified form of "laying on hands." If abused, it could be very dangerous. Intelligently used, it appears the ideal solution for handling a great many functional cases.

The cases cited are from an educational management group in Saint Paul, and opinions expressed about this therapy were formed in the management of this group.

In summary it is felt that educational management is a definite form of therapy in the field of psychosomatic medicine, and that the problem of handling these patients resolves itself into that of handling the whole man rather than his ulcer, gastritis, or colitis.

A British doctor, Crookshank, stated, "It always seems to me odd in the extreme that doctors, who, when students, suffered with frequency of micturition before an oral examination, or who when in France had actual experiences of the bowel looseness that occurred before action, should persistently refuse to seek a psychological correlative—not to say an etiological—factor when confronted with a case of functional enuresis or mucous colitis. I often wonder that some hard-boiled and orthodox clinician does not describe emotional weeping as a 'New Disease,' calling it paroxysmal lacrymation, and suggesting treatment by belladonna, astringent, local applications, avoidance of sexual excess, tea, tobacco, fluid intake; proceeding, in the event of failure, to early removal of the tear glands. Of course, this sounds ludicrous. But a good deal of contemporary medicine and surgery seems to me to be on much the same level."

Discussion

Dr. Moses Barron, Minneapolis: Dr. Beek's paper was a very instructive one. He touched upon a field in medicine that is not sufficiently emphasized in our medical schools. I have always felt that it is very important to obtain a careful history from the patients so as to get a proper background in devising treatment. I myself have used a similar method in the care of my gastrointestinal patients to which I do not give any name such as education. I simply consider it as a method of getting the co-operation of the patient in carrying out the treatment. I have tried to emphasize this approach to the students and have insisted on careful histories of the patients. In the treatment of ulcers, for example, I carefully go over the entire field of management with the patient, pointing out the importance of regulating the diet, the reason for certain foods being used, the reason for the various medicines used, and just what we try to obtain by the management.

The importance of the psychic factors is always emphasized, the importance of eliminating tension and excitement. I have found the procedure a very satisfactory one. We realize that about 40 to 50 per cent of our patients have complaints with no organic basis that can be demonstrated. As Dr. Beek has well said, the complaints and symptoms, whether organic or functional, affect the patients just the same. They suffer just as much and often more from functional ailments than they do from definitely organic lesions. A careful discussion with the patient will help toward an understanding of just what is involved and will bring about better results in treatment.

Dr. C. N. Hensel, Saint Paul: I am very glad to rise to my feet and give commendation to Dr. Beek for bringing this topic before the Academy.

I have been a member of this organization for some thirteen years, and this is the first time I can recall such a topic being presented here.

In view of so much stress being presently given to psychosomatic problems, I think it is a very timely subject and very well presented. In my training as a medical student I was indoctrinated by the force of the pathological thinking of that time, namely, that unless you could find a lesion in an organ during life or at the autopsy table after death, no disease existed. Therefore, after graduation and in my early years of practice, I sought for the pathological lesion, applied the proper treatment and expected the patient to get well.

When patients did not improve or get well, I was disappointed and I then began to investigate further and inquire what was wrong. Often I would discover that, in addition to their complaints of sick organs, these patients were carrying a flock of bothers and troubles, that they had not mentioned when I first obtained their history; and so, without any training in psychoanalytical technique, I attempted in a practical common-sense way to resolve some of these bothers. If I was successful in so doing, then these patients seemed to improve, and so I became interested in the relationship of emotions and feelings to disease.

Thereafter when a medical problem would not be resolved by medical management, I would inquire further and sometimes I obtained a frank discussion by the patient; more often, I would be met by evasion or denial that there was anything wrong emotionally in the patient's life.

After repeated conferences, I might uncover factors that were denied at the first visit. Personal pride and an instinctive sense of protecting one's weaknesses or inadequacies, seemed to be the greatest hindrance in preventing such patients from freely discussing their basic problems with the physician. And so, in order to relax that pride, I would assume that certain problems (which I had already come to suspect) existed in that patient's life and proceed to discuss them as though they were facts. With this lead, uncommunicative patients might begin to talk about their problems and thus find relief from inner tensions. I am convinced that it is either pain or fear which most often drives patients to their doctor. The pain motive is definite and tangible, usually localized and inevitably leads the doctor to the proper diagnosis and treatment. The fear motive is usually hidden and the patient is unable to express it; often such patients come with some unrelated complaint, hoping, perhaps, that in the course of the examination the doctor will discover whether there is a cancer of the uterus or the stomach or whether the palpitation of the heart is serious.

Many patients who consult a doctor are inadequate to their life's situation, are unable to cope with their problems, and they become dissatisfied with what they are doing and unconsciously resort to perpetual complaining as sort of an excuse for their inadequacy. To such people the doctor must be not only their physician but their guide and leader who helps them with their problems. You cannot obtain an informative history from such patients in ten or fifteen minutes; you must let these people talk and tell their story in their own way. Confessions are made slowly and painfully and take time if you are to obtain the crux of what is bothering the patient. If you choke them off as too time-consuming or discursive, you drive back deep within them the trouble which is seeking an outlet. Such patients need understanding, and a kindly guiding hand to help them with the revelation of their problem which oftentimes they are aware of themselves, but too shy or too ashamed to reveal to others.

Dr. Beek has chosen the educational class method because it saves time and he can deal with a larger number of people with the same expenditure of effort. For myself, I have liked the person-to-person relationship and felt I could secure better results in this way. Whichever method you have used and found best, you yourself can use best. I can recall an oration by Dr. Cannon, of Boston, at a meeting of the American College of Physicians in 1938 on "The Role of the Emotions on Bodily Functions and Disease," in which he deplored the fact that medical teachers were still bound by Virchow's ideas on cellular pathology and Freud's ideas of the unconscious. He felt that medical schools should put more stress on emotional factors in the study of disease.

Dr. Beek (in closing): I want to comment on one of the things which Dr. Hensel mentioned; and that is I do not wish to create the impression that the individual is forgotten. We must have some personal contact with them and that is done at other times than in the class. We must maintain personal contact with our patients.

CONGENITAL DISLOCATION AND CONGENITAL SUBLUXATION OF THE HIP

Etiology and Roentgenographic Features

VERNON L. HART, M.D.
Minneapolis, Minnesota

Congenital dislocation and congenital subluxation of the hip joint are two separate and distinct clinical entities and each may be the cause of serious disability. The two conditions should be considered together because they have the same etiology.

Classical congenital dislocation of the hip is secondary to a primary genetic dysplasia of the hip, or flat acetabulum, and develops during intra-uterine life, or in the course of the first or second year of postnatal life. Dislocation is a consequence of the primary dysplasia or "flat socket"; it is a secondary and incidental phenomenon. "Dysplastic acetabulum" is a term now generally accepted, and means a congenital and genetic anomaly of the acetabulum, with hip-joint instability and incongruity. The primary anomaly is not limited to the acetabulum, but involves all mesodermal structures of the hip joint. Aplasia or hypoplasia of the roof or buttress of the rim of the acetabulum causes a flat socket which is the important expression of the dysplasia of the pelvis and hip joint. Dislocation of the femoral head may result because the hypoplastic and insufficient roof of the acetabulum lies in the axis of transference of forces of body weight and muscle contraction. Acclivity of the roof of the socket is the principal anatomical feature and a constant defect in congenital dislocation of the hip (Fig. 1).

Actual dislocation can, but need not necessarily, occur. Primary dysplasia of the hip without dislocation, but with varying degrees of subluxation, is a distinct clinical entity. The two entities, with and without dislocation, are identical in their etiology but are different in their clinical, radiological and pathological manifestations. Either entity may exist as a unilateral or bilateral lesion of the hip joint; frequently the two entities are present in a single patient with bilateral hip-joint dysplasia (Fig. 2).

Hip dysplasia with potential dislocation in a child one or several months of age may, if not properly treated, become a complete dislocation before or soon after the child starts to walk. Dysplasia of the hip with dislocation was at some previous period a potential dislocation; but hip dysplasia without dislocation does not necessarily progress to a complete or classical dislocation. Whether or not a gradual transition occurs from potential to complete dislocation depends on the degree of hypoplasia of the acetabular rim, the sex, the position *in utero,* and the forces of muscle contraction and weight-bearing. It is now an established fact that dysplasia of the hip with subluxation, which was thought to be only a precursor of the classical dislocation, may remain as a permament deformity with characteristic clinical symptoms and roentgenographic findings.

Inaugural thesis.

In the textbooks, the chapter on congenital dislocation of the hip is incomplete, since only the entity "dislocation" is considered. The entity "subluxation," which is more common, and frequently more disabling than the classical dislocation, should be included. The terms "dysplastic acetabulum" or "hip dysplasia without dislocation," "preluxation," "potential dislocation," "inadequate acetabulum," "incompetent acetabulum," "flat socket," and "subluxation" are synonymous, since they are expressions for a single entity.

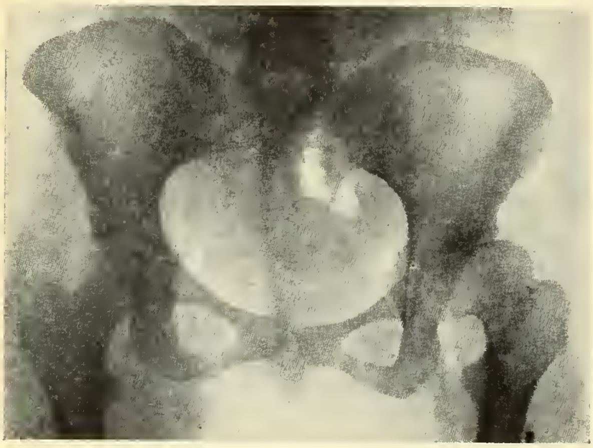

Fig. 1. Roentgenogram of patient twenty years after manipulative reduction of congenital dislocation of the left hip. Note that the principal anatomical feature and constant defect in congenital hip is acclivity of the roof of the acetabulum. The patient is now twenty-five years old. There is no evidence of traumatic arthritis which is inevitable at a later age. Secondary roentgenographic features of maldevelopment of the femoral head and neck are apparent; also the adaptive physiological sclerosis of the roof of the inadequate acetabulum.

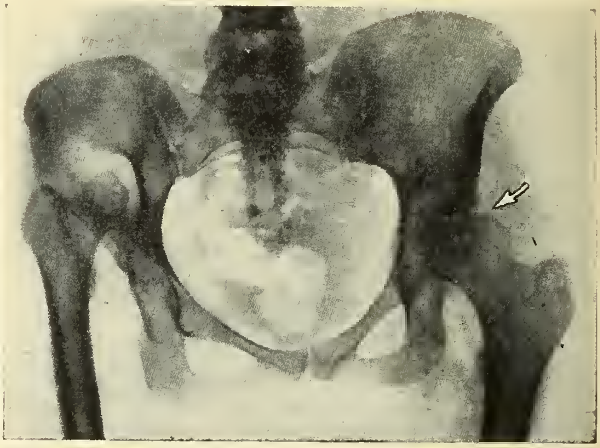

Fig. 2. Patient has always heen disabled with a unilateral hip dislocation. She is now forty-six years old, and has experienced pain and stiffness during the past year in the opposite "normal" hip. Note the characteristic signs of primary hip dysplasia of the "normal" hip with early traumatic osteoarthritis. Careful study of dysplastic acetabula shows that bilateral cases outweigh the unilateral, which is the opposite of statements made by earlier authors.

Heredity Conditions

Many authors have reported genetic occurrence in families in about 20 per cent of all cases of congenital hip dislocation. A notable and fundamental contribution to our knowledge of congenital dislocation of the hip was reported by Faber in 1937. Previous to Faber's work, all genetic investigations were based on the concept of a "dislocation gene" or diseased chromosome. The only "patients" in the genealogical studies were those with classical dislocation. Faber's research was based on the concept that the heredity, upon which dislocation of the hip depends, is not itself the hip dislocation, but, instead, is a primarily existent defect or acetabular anomaly which is in general designated as a flat socket. Because of a flat socket, an actual dislocation of the joint can, but need not necessarily, occur. There is no "dislocation-gene-conditioned chromosome," but there is a "hip-dysplasia gene." The hereditary factor is not the dislocation, but is a primary hip and acetabular dysplasia. Congenital hip dysplasia with dislocation and with subluxation are clinical expressions of the same gene-conditioned chromosome. They have the same heredity.

Roentgenographic consanguinity investigations were made by Faber on all living members of the families of ten children with congenital dislocation of the hip (Fig. 3). The ten children were considered ostensibly sound in their heredity by those who accepted the concept of a "dislocation gene." From these studies, Faber demonstrated that dysplasia of the hip joint without dislocation was three times as frequent as was classical hip dislocation. In a total of ninety-eight cases of primary hip dysplasia, twenty-five were with dislocation and seventy-three without dislocation. The occurence of primary acetabular dysplasia is, therefore, four times as frequent as had been supposed up to the present time, from the sole consideration of hip dislocation. In some of the families, only a few individuals manifested classical dislocation, while many showed hip dysplasia with subluxation. In one family, no dislocation was observed although many flat sockets were demonstrated. Not all apparently normal individuals were genetically sound. Some patients with hip dislocation had parents who were normal in (phenotype) appearance, but roentgenographic studies showed one of the parents to have a flat socket. The affected parent, although clinically normal, was a latent carrier of the gene.

Variations in the manifestation or expressivity of the gene indicate that other conditions are active in determining the penetrance of the gene, and thus the expression of the character. Under the influence of function, a growing child with hip dysplasia without dislocation may in adolescent or adult life present a spontaneously healed or normal hip joint; the apparently normal individual would be genetically abnormal and a conductor or latent carrier of the "hip-dysplasia" gene. In many instances, it is not possible to measure the exact environmental condition which can affect the gene action. Genes primarily active in the development of a trait may act differently under various genotypes (genic milieu). A trait develops as the result of the interaction of several gene pairs; and, if one of these pairs is different, the primary gene may not be able to produce a trait as completely or as incompletely as it could under the other genic complex. Some genes are secondary in their nature of action, in that they modify the action of the gene pair primarily associated with the trait. A true genetic history cannot be gained from a study limited to classical dislocation, since this expression of the gene occurs only if the environment, genic and otherwise, is proper for that complete expression. Only by roentgenographic consanguinity studies can a true genetic picture with all the variations of the penetrance and expressivity of the gene-conditioned chromosome be gained.

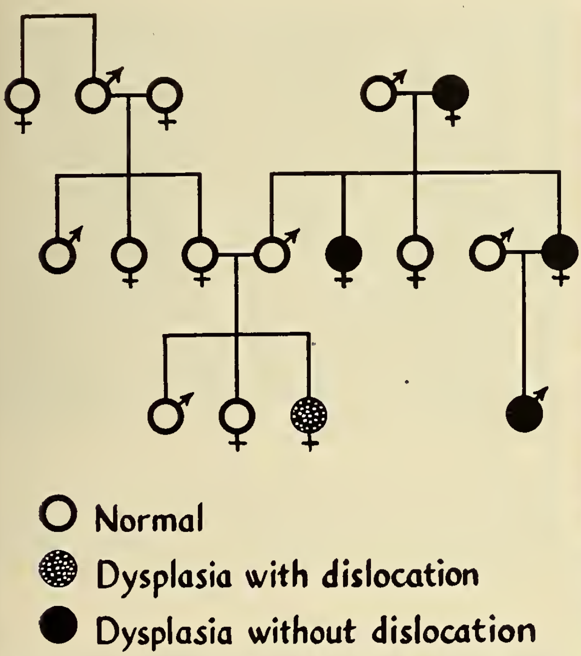

Fig. 3. One of Faber's roentgenographic consanguinity studies shows that in the family of the mother of the patient no carriers were found, while in the family of the father four carriers of the primary hip dysplasia without dislocation were found. (Reproduced from Stammtafel 8. Zeitschrift für Orthopädie, 66:160, 1937.[3])

The sex ratio of the total number of dysplasias approached the universal average, showing that there is, after all, not such a very great difference in the dysplasias of the hip joint between the sexes. The sex ratio of the total number of dysplasias with dislocation, however, revealed a preponderance of dislocations among the female sex. The ratio between the sexes did not vary from previously reported investigations on great numbers of cases, which revealed a ratio of female to male, of six to one. In the female, the dysplastic hip can lead much more easily to complete dislocation than in the male. This constant sex distribution is understood if it is true that a sex-conditioned structure of the pelvis exists—the female having a more perpendicular innominate bone and a shallower acetabulum. The phenomenon of female-sex predominance with actual dislocation requires further investigation.

Sex linkage in the hereditary pattern does not exist, because the genealogical trees show transmission of the genetic character of hip dysplasia from father to son. The dysplasia gene is transmitted usually only from one of the parents, and a recessivity of the genes predisposing to primary dysplasia of the hip is not probable. Hip dysplasia is due to a dominant gene.

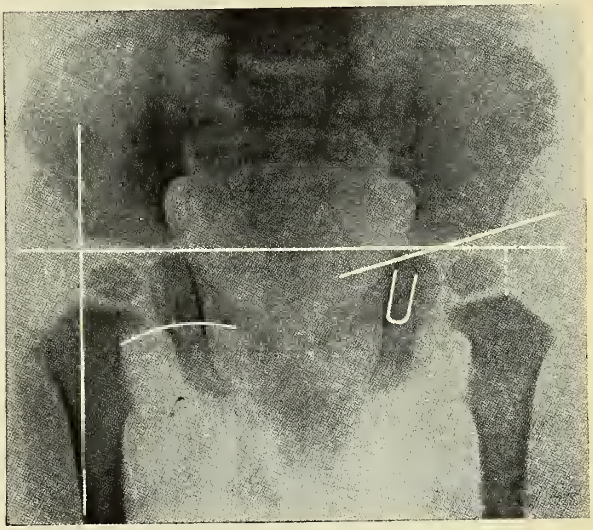

Fig. 4. Roentgenographic study of a normal hip (aged two years). A horizontal line is drawn on the roentgenogram through the clear areas in the depths of the acetabula, which represent the triradiate or Y cartilages. This line is called the Y line. A second vertical line is drawn through the lateral border of the acetabulum and the Y line. Normally the capital epiphysis lies below the horizontal line and within the lower medial quadrant formed by the Y and vertical lines. The angle of incidence of the roof of a normal acetabulum is about 20 degrees. This angle is formed by the junction of the Y line with a line passing from the depth of the socket at the Y line through the lateral border of the acetabular roof.

In case of unilateral hip-joint dysplasia, the vertical line is drawn on the normal side; and on the opposite side a parallel line is drawn at an equal distance from the mid-line.

In hip dysplasia without dislocation, but with varying degrees of subluxation, the capital epiphysis lies below or partially above the horizontal or Y line, but lateral to the vertical line. In hip dysplasia with actual dislocation, it lies above the Y line and lateral to the vertical line.

Note Shenton's line and the tear-drop. Also note the line which measures the distance from the most proximal shadow of the diaphysis to the Y line.

Mendelian ratios cannot be predicted in human families because the genotypes are not known at the time of mating, and the offspring do not occur in numbers great enough to fulfill the mathematical expectancy.

Roentgenographic Features of the Normal Hip

There is no one particular rotentgenographic form of hip joint to be exclusively designated as the normal. There is a range of normals, since there are numerous variations which certainly do not fall outside the classification of the normal. A range of normalcy so generous and wide will be recognized in order to eliminate error which would necessarily result from a narrow and rigid definition of the normal.

The following description of the anatomical and roentgenographic appearance of the normal hip is quoted from Wiberg:

"The acetabulum of the hip joint is a hollow which embraces 170 to 175 degrees of a sphere, and whose opening looks forwards, outwards and downwards. Lining the circumference of the hollow and enclosing the acetabular fossa is the lunate surface, a horseshoe-shaped surface with an anterior and posterior horn which articulates with the head of the femur. Articular cartilage is only found on the lunate surface. The acetabular fossa is filled by the ligamentum teres and fat tissue, and continues in front and below into the obturator foramen by means of the acetabular notch (incisura acetabuli). Attached to the bony margin of the acetabulum and increasing the depth of its cavity is the cotyloid ligament, otherwise known as the labrum glenoidale or limbus of the hip joint. Its inner surface, which is concave, constitutes a direct continuation of the articular cartilage in the acetabulum; its outer surface is convex. The capsule is attached superiorly to the bony margin of the acetabulum outside the attachment of the cotyloid ligament, and consequently there is a space between the two. At the acetabular notch, the cotyloid ligament continues into the transverse ligament.

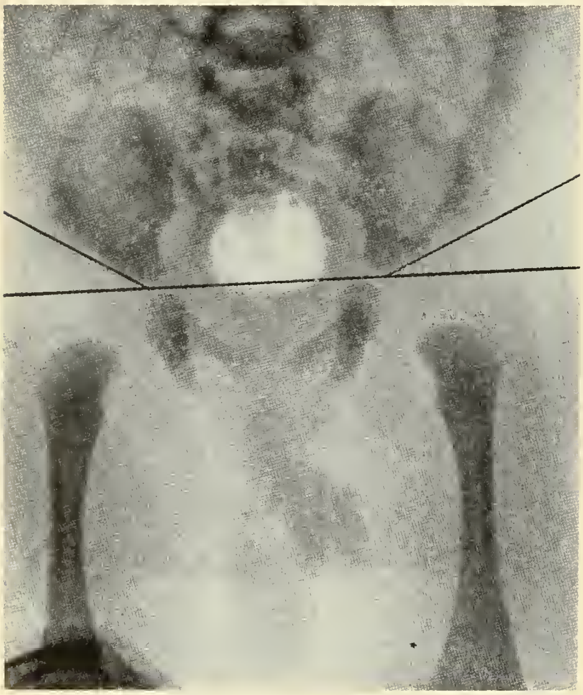

Fig. 5. Roentgenogram of a normal newborn (aged one day). Note the acetabular index.

"The femoral head forms about two-thirds of a sphere and is practically spherical in shape. Two-thirds to three-quarters of the head are received into the acetabulum and cotyloid ligament.

"The roentgen picture of an adult hip has a number of characteristic features (Fig. 6). As a rule, the acetabulum appears as a practically circular segment. The upper part, the roof, runs practically horizontally, with the vertex of the concavity lying almost directly above the center of the head. The inferior part of the acetabulum, the floor, lies practically vertically, and corresponds anatomically with the acetabular fossa. The transition between these two parts of the joint cavity is marked by a step. At the same time the bottom of the acetabular fossa, the acetabular floor, gives rise to the outer side of the formation which is called the U figure, or the tear figure, whose inner side is formed by the bony border of the small pelvis. That this is the way the U figure is formed has been proved by Werndorff, who made it disappear in the roentgen picture by sawing out the bottom plate of the acetabular floor.

"The bone in the acetabular roof nearest the articular cartilage is comprised of a thin layer of cortex which appears as a dense zone in the roentgen picture . . . (Fig. 6).

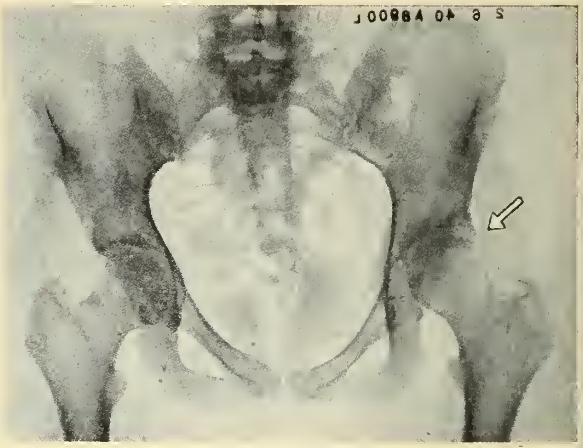

Fig. 6. Note the characteristic features of primary dysplastic acetabulum (Calot's half-citron socket). There is physiological adaptive sclerosis of the acetabular roof. The patient's complaints were hip fatigue and a mild limp when tired. Symptoms were completely relieved by rest and change of occupation. The opposite hip is normal. The patient is a female in the period of early adult life. Her sister is disabled with a classical hip dislocation.

"If the line of the inner curve of the neck is extended, it will continue along the upper border of the obturator foramen—Shenton's line (Fig. 4).

"Children show a number of characteristic details in the roentgen picture, due to the incomplete ossification of their joints (Fig. 4). The cartilage connecting the three pelvic bones in the acetabulum appears as a gap, and because this cartilage has the shape of a Y anatomically, it is called the Y (or triradiate) cartilage . . . therefore . . . the line which is drawn through both the gaps (is known as) the Y line. If the cartilaginous area is broad, it may be difficult to know where to draw the Y line. . . . The bony part belonging to the ischium (is selected) as a definite point, and the line (is drawn) so that it touches it. As long as the epiphyseal nucleus is still separated from the rest of the neck by an epiphyseal line, the most medial part of the diaphysis of the neck looks like a spine, and is called the spine of the neck."

Proper roentgenographic technique is essential to prevent distorted views and erroneous measurements. The patient must be relaxed and placed flat on his or her back. The lower extremities should be in contact, the hips extended, and the patellae facing directly forward. The roentgen tube must be centered in the mid-line of the body and directly over the superior border of the symphysis pubis.

Primary Roentgenographic Features of the Dysplastic Hip

Radiographic diagnosis of hip dysplasia without dislocation is very difficult during the first months of life, and the condition is rarely recognized except where the routine examinations of the newborn are made. Most often it is dislocation of the opposite hip which leads to its discovery. Putti recognized and treated by his abduction method a dysplastic hip without dislocation in a child only thirty-four days old. Unless dislocation is present on the opposite side, it is advisable to wait until the third or fourth month before reaching a definite conclusion; then the ossification center of the femoral head is visible in the roentgenogram and the possibility of error is reduced.

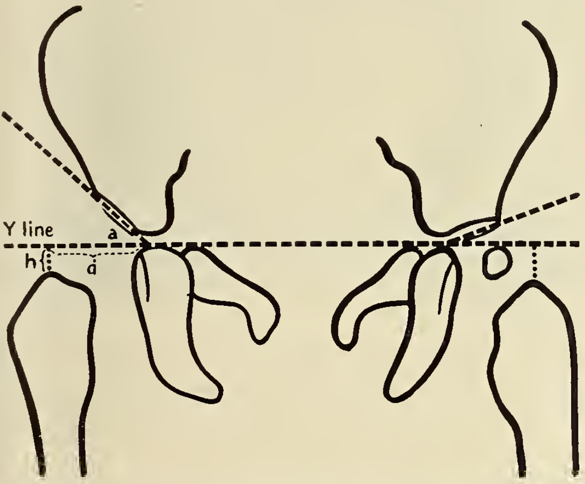

Fig. 7. Hilgenreiner's measurement. Note the Y line, acetabular index (a), high position of the diaphysis as measured from the most proximal shadow of the diaphysis to the Y or triradiate line (h), increased distance from the most proximal shadow of the diaphysis to the acetabular floor (d). (Reproduced with slight changes from Abbildung 1. Zeitschrift für Orthopädie, 66: 151, 1937.[3])

Hip dysplasia or "flat socket" refers not only to the steep acetabulum, but also to all joint-forming parts of the hip joint. However, the primary anatomical and roentgenographic feature of hip dysplasia is the abnormal acclivity of the roof of the acetabulum, which increases the angle of incidence of the roof of the socket. The acetabular index is the angle formed between the roof or iliac portion of the acetabulum and a horizontal line passing through the Y or triradiate cartilages (Fig. 4). Normally the acetabular index in a child is about 20 degrees. The angle is increased to 30 or more degrees in dysplasias (Fig. 7). Kleinberg and Lieberman studied the angle of incidence of the roof of the acetabulum and found the average angle of incidence in the normal newborn to be 27.5 degrees (Fig. 5), and at two years of age 20 degrees (Fig. 4). The angle was 37.5 degrees at the age of two years when the hip presented dysplasia with dislocation. The authors stated that if the angle of incidence is above 30 degrees in an infant, a dislocation probably will develop (Fig. 5). The flatness of the inadequate and incompetent acetabulum can further be proved through the increase in the radius of curvature where the centrum of the sector, which the acetabulum presents on the roentgenogram, goes off laterally, instead of, as in the normal, lying somewhere in the middle of the head of the femur (Calot's half-citron shape) (Fig. 6).

Besides all degrees of subluxation of the femoral head, from the imperceptible to the extreme or potential dislocation, the following features, which are an integral part of the primary dysplasia, should be noted:

1. Hypoplasia of the pelvis.
2. Hypoplasia of the head and central diaphyseal end of the femur (observed before puberty).
3. Delayed appearance and hypoplasia of the epiphyseal ossification center of the head of the femur.
4. Disturbance of Shenton's (obturator-coxofemoral) line.
5. Delayed bony bridging of the ischiopubic synchondrosis.
6. Increased distance of the most superior shadow of the metaphysis or neck of the femur from the acetabular floor or tear-drop shadow (if it is present).
7. High position of the diaphysis as measured from the most proximal shadow of the diaphysis to the Y or triradiate line.
8. The increase in the distance from the shadow of the most medial part of the metaphysis of the neck, which looks like a spine and is called the spine of the neck, to the acetabular floor, or tear-drop, and the decrease in the distance to the Y line.
9. Frequently a classical dislocation of the opposite hip.
10. The position of the limbus cartilage and the relation of the cartilaginous acetabulum and capsule to the femoral head as shown by arthrography.

Putti, one of the greatest authorities on hip dysplasia without dislocation, or preluxation as he called it, depended on the following triad for diagnosis (Fig. 7):

1. An increased distance between the upper femoral diaphysis and the acetabular floor.
2. Hypoplasia or delayed development of the epiphyseal nucleus of the femoral head.
3. An abnormally steep or short acetabular roof.

Secondary Roentgenographic Features of the Dysplastic Hip

Because of the repeated trauma resulting from abnormal sheering forces, mechanical instability, and incongruity of the dysplastic hip, secondary changes are added to the primary anatomical and roentgenographic features. Abnormal development of bone and soft tissues, vascular changes and arthritic sequelae are the result. These changes may be listed as follows:

1. Increased subluxation when compared with previous studies.
2. Delayed development of the epiphyses.
3. Delayed fusion of the epiphyses.
4. Maldevelopment of the femoral head and torsion or anteversion of the femoral neck (Wolff's law).
5. Increased sclerosis of the acetabular roof. The degree of sclerosis is in direct proportion to the degree of maldevelopment of the acetabular roof—physiological adaptive sclerosis (Fig. 6).
6. Coxa valga luxans (Klapp).

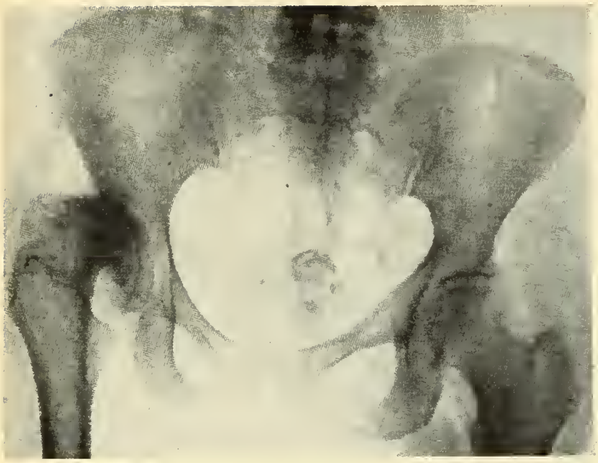

Fig. 8. Note the characteristic features of hip dysplasia with added secondary changes of traumatic arthritis, manifested by loss of joint space, sclerosis, cystic areas of rarefaction, double acetabular floor, osteophytic deposits, and capital drop. The patient is now sixty years of age and walks with the aid of a crutch. Her mother was disabled with classical hip dislocation.

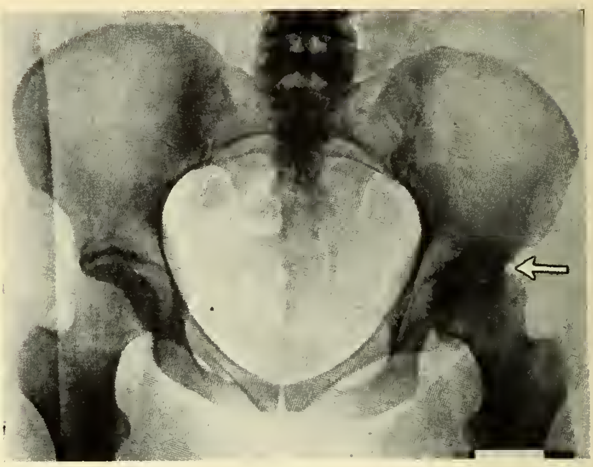

Fig. 9. Note the characteristic features of primary hip dysplasia with acclivity of the acetabular roof and subluxation. Secondary changes of traumatic arthrities with loss of joint space, sclerosis, cystic rarefaction, and double acetabular floor have been added to the primary features. The patient's onset of symptoms had occurred six years previously, with hip fatigue and limp. One year previously severe pain, loss of motion, and deformity developed. She was totally disabled for work, and was not relieved by conservative measures. The opposite hip presents a very mild expression of dysplastic acetabulum. She has a sister disabled with bilateral hip dysplasia, with dislocations reduced in 1903 by Dr. Adolf Lorenz (Fig. 10). Arthrodesis of the hip was advised and performed.

7. Osteochondrosis, coxa plana, Legg-Perthes disease, or osteochondritis deformans coxae juvenilis.

8. Traumatic hypertrophic arthritis of the hip joint or malum coxae senilis with: (a) narrowing of the joint space; (b) osteophytic deposits, capital drop, and double acetabular floor; (c) sclerosis of bone and areas of cystic rarefaction involving the weight-bearing areas of the acetabulum and femoral head (Figs. 8-11).

9. Capsular adhesions, constriction and hypertrophy.

The author is aware of the fact that coxa plana or Legg-Perthes disease does not necessarily have a dysplastic acetabular background. He has observed several cases of coxa plana develop in clinically and roentgenographically normal hips. The acetabular changes were adaptive and developed secondarily to the deformed head. However, the author believes that primary dysplasia of the acetabulum may be the precursor of a group of cases with clinical findings and roentgenographic features that are indistinguishable from cases of coxa plana of unknown etiology. This problem should stimulate investigation.

Preiser in 1907 presented his theory that development of osteoarthritis in the hip was due to poor adaptation between the head and the joint cavity. Wiberg in 1939 conclusively demonstrated the correctness of Preiser's theory. He presented roentgenographic studies of nineteen cases with primary hip dysplasia before and after the development of secondary changes of osteoarthritis.

The author believes that osteoarthritis of the hip, or malum coxae senilis, is frequently traumatic arthritis and develops because of anatomical incongruity and instability of a primary dysplastic acetabulum (Figs. 8-11). He has studied twenty patients who had disability from dysplastic acetabula. Each patient had one member of the family disabled with classical congenital dislocation of the hip. The author's first case (Fig. 9) was recognized in 1935. The patient's sister had congenital dislocation of both hips (Fig. 10), which were reduced by Dr. Adolf Lorenz in Chicago in 1903. This patient with hip dysplasia without dislocation, but with secondary traumatic arthritis, was being treated for tuberculosis of the affected hip.

Roentgenographic Differential Diagnosis

The following list of hip-joint lesions may at times require careful study for differentiation from primary hip dysplasias:

1. Coxa plana or Legg-Perthes disease,
2. Epiphyseal separation,
3. Tuberculosis,
4. Infectious arthritis,
5. Hypertrophic arthritis,
6. Aseptic necrosis,
7. Late septic hip,
8. Neoplasm,
9. Neurotrophic lesions,
10. Old fracture-dislocations,
11. Endocrine dysfunction.

Summary

1. One human trait which has been difficult to explain genetically is congenital dislocation of the hip.

2. An individual does not inherit congenital dislocation of the hip, but does inherit a primary defect, or hip dysplasia, which produces anatomical and physiological alterations of the joint called "flat socket." Only secondarily does actual dislocation occur, and dislocation need not necessarily occur.

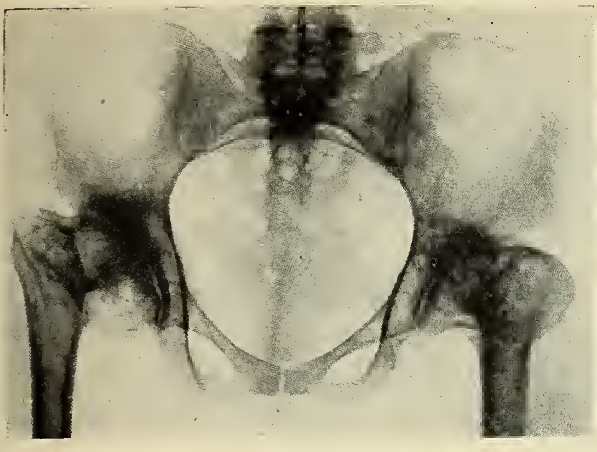

Fig. 10. The patient had bilateral hip dysplasia with dislocations which were reduced by Dr. Adolf Lorenz in 1903 when the patient was three years of age. Note the signs of bilateral hip dysplasia with added changes of traumatic arthritis. The patient is now seriously disabled at the age of forty-two years. Her sister has hip dysplasia without dislocation, but with secondary changes of traumatic arthritis (Fig. 9).

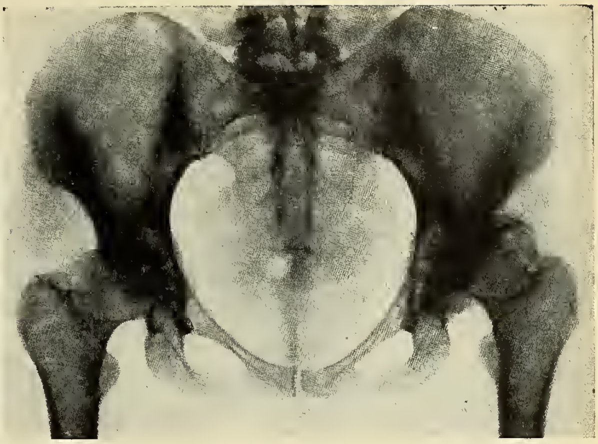

Fig. 11. Roentgenogram of patient thirty-five years old. Note the primary and secondary roentgenographic features of bilateral hip-joint dysplasia without dislocation. The patient's brother has classical dislocation of both hips.

3. Primary hip dysplasia is due to a genetic background.

4. Roentgenographic consanguinity studies are essential for a true genetic investigation of hip dislocation.

5. Dysplasia of the hip without dislocation but with varying degrees of subluxation is a distinct clinical and roentgenographic entity, and should be included in textbooks in the chapter on classical dislocation, because the two entities have the same genetic etiology.

6. Dysplasia of the hip with subluxation occurs more frequently and may be more disabling than classical dislocation.

7. Acclivity of the roof of the acetabulum is the primary anatomical feature of a dysplastic acetabulum or flat socket.

8. Hip dysplasia refers not only to the acetablum, but also to all joint-forming parts of the hip joint.

9. Primary hip dysplasia with dislocation on one side is frequently associated with dysplasia with subluxation on the opposite side.

10. Hip-joint instability and incongruity between the head and socket are the physiological and anatomical expressions of hip dysplasia.

11. Primary hip dysplasia with subluxation may remain asymptomatic for many years; in some individuals it may never be expressed clinically.

12. The extreme disability observed in some individuals is caused by traumatic arthritis of the hip joint resulting from mechanical factors of instability and incongruity.

13. The patient may gain relief of pain and disability by conservative treatment and surgical measures.

14. The geneticist and the surgeon have a tremendous opportunity for co-operative investigation.

15. Earlier recognition and earlier treatment of the dysplastic hip is our only hope for reducing the disability of this large group of patients.

Discussion

Dr. Leo G. Rigler, University of Minnesota: I was glad to hear Dr. Hart say that the diagnosis of congenital dislocations could be made before the evidence of development of the epiphysis. It is unfortunate that these cases are missed. In my experience, the grandmother sometimes knows more than the doctor about congenital dislocations of the hip. A while ago a doctor called me and told me that the grandmother of a little patient he was treating was making a lot of trouble for him; the grandmother insisted that the child had dislocation. He sent the child in for x-ray examination and I had the unhappy task of admitting to them that the grandmother was right and the doctor was wrong. This was bilateral. Some years ago Dr. Hart brought to our attention this matter of dysplasia of the acetabulum. There are one or two things that always intrigue me about that. If the flat acetabulum is the major factor in congenital dislocations, why don't we meet more dislocations in older children? The other thing that is of interest was the beautiful development of the socket when the dislocation is well reduced in early infancy.

The pressure of any object against bone will tend to produce a socket for it to fit into. The absence of the pressure of the head of the femur may well be a factor in the flatness of the acetabulum. On the whole, however, the evidence favors the theory that Dr. Hart advances.

Dr. Logan Leven, Saint Paul: I wish to ask Dr. Hart one question. He mentioned that dysplasia of the acetabulum was the primary factor in congenital dislocation of the hip and that the deformity of the head and neck of the femur resulted according to Wolff's law. In one case that he showed, there was some dysplasia of the head and neck of the femur at age three months. Since this would be before weight bearing, I do not think that Wolff's law would be a significant factor. Does not the dysplasia affect the head of the femur as well as the acetabulum?

Dr. Hart (in closing): The flat socket which I defined is referred to as a dysplastic hip—a term generally used today. The dysplasia is not limited to the socket but also involves all mesodermal tissues entering into the formation of the hip joint. Bilateral involvement is common. For many years we have focused our attention on the dislocated side and failed to recognize dysplasia of the opposite "healthy" hip. If we study both hips we will find some degree of dysplasia on both sides in the majority of patients. We are continuing to study this problem clinically and radiologically but it is very difficult to approach it genetically. It is practically impossible to obtain roentgenograms of an entire family tree. One must have roentgenological consanguinity studies for a thorough genetic study. If we could study the entire family tree roentgenologically, I am sure that we could repeat the evidence which Dr. Alexander Faber reported in 1935. The bane growth changes of the epiphysis are both primary and secondary, the primary cause being genetic and the secondary cause the result of Wolff's law.

Dr. Rigler: Many have flat acetabuli but do not have dislocations.

Dr. Hart: It is true that the subluxated hip never dislocates. I believe that it is the degree of dysplasia of the capsule as well as the degree of dysplasia of the socket which determines dislocation or subluxation.

The meeting adjourned.

A. E. Cardle, M.D., *Secretary.*

INFECTION OF THE NECK AFTER TONSILLECTOMY

(Continued from Page 853)

for signs and symptoms of the onset of infection in the neck. Should such infection occur, prompt and rational treatment should be instituted. Two cases in which infection in the neck occurred after tonsillectomy are reported.

DOCTOR OF WHAT?

The *J.A.M.A.*[1], in discussing editorially the term "doctor" in America, says:

Dr. Edward M. Repp, of Philadelphia, has a question for the medical Emily Post. His daily work requires occasional conferences with his druggist and also with the head of a laboratory who examines specimens. Should he address these associates as doctor or mister? In the neighborhood where he resides are also an osteopath, a chiropactor, and a chiropodist. These, too, he meets occasionally while en route on his medical tasks; he never knows whether to say "doctor" or something different. A similar question disturbed Hugh J. McDonald,[2] who discussed the subject not long ago in the *Journal of Higher Education.* A survey of the graduate degrees awarded by the colleges and schools of New York State during 1937 reveals thirteen types of doctors' degrees awarded during the year. . . .

The degree of doctor is now conferred in so many areas of learning that the result is confusion. McDonald feels that the conferring of the doctoral degree is in need of a thorough house cleaning.

The degree of doctor of philosophy (Ph.D.) is granted for three years of full-time study and examination and the preparation of a thesis following the bachelor's degree. The degree of doctor of science (D.Sc.) is granted for an identical program when the major part of the work is in science.

Many times in education, history, literature, economics, sociology, and natural sciences the Ph.D. seems to be granted for meeting a standard of mediocrity. . . .

As McDonald points out, in the field of ill health the assortment of doctorates now includes the degree of naprapathy, which can be had in ninety days without any entrance requirements; doctor of chiropractic in from one to four years depending on the school, with the minimum entrance requirement usually just an elementary school education; doctor of surgical chiropody in from eighteen months to three years, with an entrance requirement like that of chiropractic; doctor of optometry three to four years after high-school graduation; doctor of osteopathy a minimum of four years, with one year of college work as prerequisite; doctor of public health, with as yet little standardization and, incidentally, available to graduates in bacteriology or related fields after three years' study. McDonald believes that some of these people have about as much legitimate claim to a doctor's degree as would a hotel dishwasher to a D.D.W. Then there are also doctors of medicine, doctors of dental medicine, doctors of veterinary medicine, and doctors of dental surgery with better standardized requirements.

Educational authorities might well consider the desirability of some standardization in this area so that the degree of doctor, regardless of the field of learning in which it is applied, will have real significance.

Furthermore, the public should be able to determine from a title the actual qualifications of the man who adorns himself with it. Finally, the economists who devote themselves to propaganda for revolutionizing medical care persistently trade on their doctor of philosophy degrees and thus perpetrate a fraud on the public, who take it for granted that these "doctors" are physicians.—Editorial, *New York State Journal of Medicine,* Dec. 15, 1946.

AMERICAN ASSOCIATION FOR THE STUDY OF GOITER

The annual meeting of The American Association for the Study of Goiter will be held in the King Edward Hotel, Toronto, Canada, May 6, 7, and 8, 1948.

The program for the three-day meeting will consist of papers dealing with goiter and other diseases of the thyroid gland, dry clinics and demonstrations.

Communications regarding the program may be addressed to the Corresponding Secretary, T. C. Davison, M.D., Atlanta, Georgia.

AMERICAN COLLEGE OF ALLERGISTS—INSTRUCTIONAL COURSE

The American College of Allergists has announced that its annual Fall Graduate Instructional Course in Allergy will be given in Cincinnati, Ohio, November 3-8, inclusive, under the auspices of the Medical College of the University of Cincinnati.

The program this year is the best ever offered by the College. Forty-six formal lectures are listed and also a special allergy clinic of case presentations. An added feature this year will be three informal discussion groups led by various members of the faculty.

The faculty is composed of more than forty outstanding physicians and scientists from prominent medical centers and colleges in the United States and Canada. The Course presents a comprehensive study of the entire field of allergy—covering the fundamentals, special allergies, specific diseases, and all modern methods of treatment. Symposiums on dermatologic and pediatric allergy are also included, as well as a survey of the laboratory approach to the subject including preparation and standardization of extracts and skin testing.

ANNOUNCES CONTINUOUS COURSES

SURGERY—Two-week Intensive Course in Surgical Technique, starting September 22, October 30, November 17.
Four-week Course in General Surgery, starting September 8, October 6, November 3.
Two-week Course in Surgical Anatomy and Clinical Surgery, starting September 22, October 20, November 17.
One-week Course in Surgery of Colon and Rectum, starting September 15 and November 3.
Two-week Course in Surgical Pathology, every two weeks.

FRACTURES AND TRAUMATIC SURGERY—Two-week Intensive Course, starting October 6.

GYNECOLOGY—Two-week Intensive Course, starting September 22, October 20.
One-week Course in Vaginal Approach to Pelvic Surgery, starting September 15 and October 13.

OBSTETRICS—Two-week Intensive Course, starting September 8, October 6.

MEDICINE—Two-week Intensive Course, starting October 6.
Two-week Course in Gastro-enterology, starting October 20.
Two-week Course in Hematology, starting September 29.
One-month Course in Electrocardiography and Heart Disease, starting September 15.

DERMATOLOGY and SYPHILOLOGY — Two-week Course, starting October 20.

General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties

TEACHING FACULTY — ATTENDING
STAFF OF COOK COUNTY HOSPITAL
Address:
Registrar, 427 S. Honore St., Chicago 12, Ill.

The course is recommended to all those especially interested in allergy, and to the general practitioner and specialist who anticipates treating his own allergic patients. It is designed to provide a more comprehensive understanding of the many manifestations of allergy so commonly encountered by the doctor, and to emphasize methods of diagnosis and treatment so that the physician is prepared to offer the greatest aid to his patient.

Programs and complete information can be obtained by writing to the College Secretary, Dr. Fred W. Wittich, 423 La Salle Medical Building, Minneapolis 2, Minnesota.

AMERICAN COLLEGE OF CHEST PHYSICIANS—POSTGRADUATE COURSE

The American College of Chest Physicians is sponsoring a second annual postgraduate course in diseases of the chest to be held during the week of September 15-20, 1947, at the Municipal Tuberculosis Sanitarium, Chicago, Illinois.

The emphasis in this course will be placed on the newer developments in all aspects of diagnosis and treatment of diseases of the chest.

The course will be limited to 30 physicians. Tuition fee is $50.00.

Further information may be secured at the office of the American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

AMERICAN COLLEGE OF PHYSICIANS—RESEARCH FELLOWSHIPS

The American College of Physicians announces that a limited number of Fellowships in Medicine will be available from July 1, 1948-June 30, 1949. These Fellowships are designed to provide an opportunity for research training either in the basic medical sciences or in the application of these sciences to clinical investigation. They are for the benefit of physicians who are in the early stages of their preparation for a teaching and investigative career in Internal Medicine. Assurance must be provided that the applicant will be acceptable in the laboratory or clinic of his choice and that he will be provided with the facilities necessary for the proper pursuit of his work. The stipend will be from $2,200 to $3,000.

Application forms will be supplied on request to The American College of Physicians, 4200 Pine Street, Philadelphia 4, Pa., and must be submitted in duplicate not later than November 1, 1947. Announcement of the awards will be made as promptly as is possible.

The next annual session of the American College of Physicians will be held in San Francisco, April 19-23, 1948.

AMERICAN COLLEGE OF SURGEONS—CLINICAL CONGRESS

The thirty-third annual Clinical Congress of the American College of Surgeons, including the twenty-sixth annual Hospital Standardization Conference, will be

"EUREKA! I THINK THIS IS IT!"

400 FIRST NATIONAL BANK BUILDING • OMAHA 2, NEBRASKA

held at The Waldorf-Astoria, New York, from September 8 to 12.

The five-day program will feature operative and nonoperative clinics in thirty-eight hospitals in New York and Brooklyn, and scientific sessions in general surgery and the surgical specialties, official meetings, hospital conferences, medical motion pictures, and educational and technical exhibits, at the headquarters hotel. Dr. Howard A. Patterson of New York is Chairman of the Committee on Arrangements; Dr. Frank Glenn is Secretary. Dr. Malcolm T. MacEachern and Dr. Bowman C. Crowell, Chicago, the Associate Directors, are in general charge.

For particulars address L. G. Jackson, American College of Surgeons, 40 E. Erie Street, Chicago 11, Illinois.

CHICAGO OPHTHALMOLOGICAL SOCIETY—REFRESHER COURSE

The Chicago Ophthalmological Society will give a 40-hour refresher course December 8 to 13, inclusive. The faculty will include members of the Eye Department of The University of Chicago, The University of Illinois, Loyola University, Northwestern University and staff members of all of the principal hospitals of Chicago. Instruction will consist of didactic and practical course, emphasis being placed on the practical courses given to small groups.

Physicians practicing ophthalmology and eye, ear, nose and throat are eligible for the course. The fee will be $100.00. For details write to the registrar, Miss Maude Fairbairn, 8 West Oak Street, Chicago, Ill.

MEDICO-LEGAL CONFERENCE AND SEMINAR

A medico-legal conference and seminar for pathologists, medical examiners and coroners will be held October 13-18, 1947, at Harvard Medical School, Boston.

The Department of Legal Medicine of the medical schools of Harvard, Tufts, and Boston University in association with the Massachusetts Medico-Legal Society will present a six-day program of lectures, conferences, and demonstrations having to do with the investigation of deaths in the interests of public safety. Attendance will be limited to twenty-five persons who have registered in advance.

Further information may be obtained from the Department of Legal Medicine, 25 Shattuck Street, Boston, Massachusetts.

FIFTIETH ANNIVERSARY CELEBRATION

The September meeting of the Ramsey County Medical Society will be held at 8 P.M. September 23 in the society auditorium, and will be devoted to a celebration of the Fiftieth Anniversary of the founding of the library. Dr. John F. Fulton, Sterling Professor of Physiology at Yale University, will be the speaker of the evening. His being a former St. Paulite, well-known author and authority on medical libraries, makes his choice a particularly happy one. All physicians are cordially invited to attend this meeting.

In 1895, a loan medical library for mutual betterment was established by Dr. J. L. Rothrock, Dr. Arthur Dunning and Dr. Edward Boeckman with headquarters in a room in the old Lowry Arcade in St. Paul. Medical books and journals were contributed and collected by enthusiasts, among whom were Dr. Boeckman and Dr. H. L. Taylor. In the fall of 1897, the Ramsey County Medical Society took over the activities of the Library Association, and a library committee consisting of Drs. J. L. Rothrock, W. B. Morley, and H. L. Taylor was appointed. In 1898, this committee endorsed the publication of a medical journal to provide funds and exchanges for the support of the library. *The St. Paul Medical Journal* began publication in 1899 with Dr. Burnside Foster as editor. From such a modest beginning the Ramsey County Medical Society Library has become one of the largest and best in the state.

MISSISSIPPI VALLEY MEDICAL SOCIETY

The twelfth annual meeting of the Mississippi Valley Medical Society at Burlington, Iowa, October 1-2-3, 1947, will have over thirty clinician-teacher speakers. October 1 will feature an all-St. Louis program conducted by clinical teachers from St. Louis and Washington Universities. On October 2 there will be speakers from various medical centers including Dr. E. L. Bortz, President, American Medical Association, Dr. I. H. Neece, President, Illinois State Medical Society, Dr. M. B. Simpson, President, Missouri State Medical Association, and Dr. H. A. Spilman, President, Iowa State Medical Society. There will be a social hour and banquet on this date. The afternoon program will be devoted to presentations by a group from the University of Iowa. October 3 will feature an all-Chicago program with a number of well-known clinical teachers from Chicago medical schools. A Clinico-Pathologic Conference and a Round Table luncheon will be featured on this date.

The fourth annual meeting of the Mississippi Valley Medical Editors' Association will be held during the annual convention of the Mississippi Valley Medical Society on October 1.

A complete, detailed program will be available September 20 and may be obtained from Dr. Harold Swanberg, Secretary, W.C.U. Building, Quincy, Illinois.

CIVIL SERVICE EXAMINATIONS FOR PHYSICIANS

The State Civil Service Department is announcing unassembled examinations for physicians for appointment in state hospitals and institutions in general medicine as well as in such specialties as psychiatry and tuberculosis.

Salary levels are as follows:

Physician I	$270-$320	in five $10 steps
Physician II	$397-$457	in five $12 steps
Physician III	$474-$544	in five $14 steps

Announcements and application blanks may be obtained by writing the State Department of Civil Service, 122 State Office Building, St. Paul. Applications will be received until further notice, but for inclusion on the first list should be submitted by September 22, 1947.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The annual meeting of the Southern Minnesota Medical Association will be held in Turner Hall, New Ulm, Minnesota, Monday, September 8, 1947.

The morning session will include the following papers, ending with a Clinical Pathological Conference:

Management of Minimal Pulmonary Tuberculosis—David T. Carr, M.D., Rochester
Management of Bronchial Asthma in Childhood—George B. Logan, M.D., Rochester
Experiences with Urethane in the Treatment of Myelogenous Leukemia—Charles H. Watkins, M.D., Rochester
Results of Treatment of Subacute Bacterial Endocarditis—Charles H. Scheifley, M.D., Rochester
Diverticulitis—W. G. Sauer, M.D., Rochester

A complimentary luncheon and the annual business meeting will occupy the noon hour.

The afternoon session, beginning at two o'clock, will include a number of case reports and the following papers:

Proctology and the General Practitioner—W. C. Bernstein, M.D., Saint Paul
New Proctologic Dressings—James K. Anderson, M.D., Minneapolis
Complications Following Hip Fractures—Forrest L. Flashman, M.D., and R. K. Ghormley, M.D., Rochester
Incidence of Pulmonary Embolism in Venous Sclerosing Therapy—M. A. Johnson, M.D., and F. L. Smith, M.D., Rochester
Physical Rehabilitation of the Paraplegic: Treatment of Spastics (Movie)—Earl Elkins, M.D., Rochester

The banquet will be in Turner Hall at 6:30 o'clock, following which L. A. Buie, M.D., Rochester, President, State Medical Association, will speak. The Presidential Address will be delivered by C. M. Robilliard, M.D., Faribault.

In Memoriam

JOSEPH H. ABRAMOVICH

Dr. Joseph H. Abramovich of Saint Paul died June 12, 1947, at the age of sixty-eight.

Born in Russia in 1878, Dr. Abramovich came to America as a boy. He graduated from Hamline Medical School in 1905 and took postgraduate study in Vienna. He had practiced most of the past forty years in Saint Paul and recently was a medical consultant for the Veterans Administration in Minneapolis. He was a member of the Ramsey County Medical Society, the Minnesota State and American Medical Associations. He is survived by his wife, two brothers, and three sisters.

WILLIAM DAVIS

Dr. William Davis, for fifty-six years a general practitioner in St. Paul before his retirement on April 30. 1939, passed away on May 9, 1947, at the age of ninety-three.

Dr. Davis was born in Plymouth, Massachusetts, September 28, 1853, the ninth lineal descendant of his Pilgrim ancestors to be born in that historic New England town. Following his graduation from Phillips Exeter Academy in 1871, on the advice of his physician as a cure for astigmatism, he went as passenger on a sailing vessel carrying a cargo of ice from Boston to India. On the return trip he read all the books of Virgil during his spare hours.

After graduating from Harvard College in 1876 he attended Harvard Medical School receiving his M.D. in 1879 and served a three months' internship at the McLean Lying-In Hospital in Boston. One June 26, 1878, he married Sally White Holyoke and in 1880 spent a year in Vienna where his second child was born.

After practicing in Syracuse, New York, for three years, Dr. Davis moved to Saint Paul in 1883, the same year joining the Ramsey County Medical Society. On the occasion of the Diamond Jubilee dinner celebration of the Society in 1935 he told of the early days; how in 1885 many doctors had no telephone but used those in the nearby drug stores, the public being allowed to use the phones located in the fire department barns for calling a physician. The attendance at the County Medical Society meeting was poor until dinner meetings were instituted in 1890. "Das Essen; das ist die Hauptsache" as he was wont to quote from his Vienna days, proved true of medical meetings in the early days as well as the present.

Dr. Davis was president of the Ramsey County Medical Society in 1892, president of the Minnesota State Medical Association in 1901, a charter member of Minnesota Academy of Medicine which was founded October 12, 1887, and its president in 1903, and a member of the Minnesota State Board of Medical Examiners from 1900 until 1906.

Dr. Davis contributed much to early medical publications having been Associate Editor of the *Northwestern Lancet* from October, 1886, until December, 1899, and on the Editing and Publishing Committee of the *Saint Paul Medical Journal* from 1901 until 1912.

Beginning in 1905, Dr. Davis spent his summers at South Orleans, Massachusetts, building a summer home there in 1907. This practice he continued until 1942 when gasoline rationing interfered with motoring East, which he so much enjoyed.

Dr. and Mrs. Davis celebrated their golden wedding in 1928. They were blessed with four children, fourteen grandchildren and twenty-three great grandchildren. Their summers were spent surrounded by members of their large family and friends. Mrs. Davis died in 1929.

Dr. Davis was a member of Unity Church, Saint Paul, and for many years belonged to the Informal Club. He had little use for clubs in general. Fond of bridge, he played a keen game until he was invalided as a result of a fractured hip in November, 1945.

Dr. Davis was held in high esteem by the profession and his many patients, for his medical sagacity and his lovable personal qualities. His was a richer and longer life than most of us can expect to attain.

CHARLES MILTON KISTLER

Dr. Charles Milton Kistler was born August 12, 1869, at Pleasant Corner, Carbon County, Pennsylvania. He was descended from Peter Kistler, President of the Republic of Berne, Switzerland. His parents were David and Mary Kistler.

Dr. Charles Kistler came to Minneapolis in 1887, where he studied pharmacy. After three years, however, he entered the Medical Department of the University of

ZEMMER pharmaceuticals
A complete line of laboratory controlled ethical pharmaceuticals.
Chemists to the Medical Profession for 44 years.
THE ZEMMER COMPANY • Oakland Station • PITTSBURGH 13, PA.
MN 8-47

Minnesota, where he graduated in 1893. He then took a course at the New York Polyclinic Institute.

His early hospital practice was at the St. Barnabas and Asbury Hospitals. At the beginning of the century, when the New Swedish Hospital was opened, he joined the surgical staff.

On March 29, 1900, he married Grace T. Braem of Alma, Wisconsin.

He went abroad for special work in surgery several times—in 1900, in 1905 and in 1934.

Dr. Kistler practiced in Minneapolis for fifty years, restricting his work to surgery. When he became ill four years ago, he retired and spent much time in travel. During the past year, however, he was confined to his home, where he died on July 8, 1947.

Dr. Kistler was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association.

He is survived by his wife, Grace, his son, Stuart, a sister, Mrs. Arthur Kistler of Saint Paul and several nieces and nephews, among whom is Dr. Alvin Kistler of Minneapolis.

CHARLES WESLEY MORE

Dr. Charles Wesley More of Eveleth, prominent in medical circles in northern Minnesota for many years before his retirement several years ago, died June 1, 1947, at the age of eighty-six.

Dr. More was born in Elkader, Iowa, January 6, 1861. He graduated from Northwestern Medical School in 1888 and took postgraduate work at the Polyclinic in New York.

He began practice at Two Harbors in 1888 and in 1889 moved to Ely. For the next four years he practiced at Ely and from 1891 to 1893 served as a member of the first Board of Health of that city.

He came to Eveleth in 1893 at the time iron mining on the range was just beginning to be developed. He began practice and established a hospital in a one-story building before the town of Eveleth was platted. In 1900 he built the present hospital which bears his name.

Dr. More was a member and past chairman of the Public Library Board of Eveleth, a member and past chairman of the Eveleth Board of Education, one of the first directors of the Miners National Bank of Eveleth, a director of the First National Bank since 1921. During the first World War he was active in the Liberty Loan and American Red Cross drives.

Dr. More was a member of the St. Louis County Medical Society, the Minnesota State and American Medical Associations, a founder and third Master of the Eveleth Masonic lodge, a member of the Scottish Rite and Aad Temple, Ancient and Arabic Order of the Mystic Shrine in Duluth. He was also an active member of the First Methodist Church.

On October 26, 1892, Dr. More married Blanche E. Streiter and they celebrated their Golden Wedding Anniversary in 1942. Mrs. More passed away in 1944, and for several years Dr. More resided with his daughter, Margaret.

The following editorial which appeared in the *Eveleth News-Clarion* well expresses the esteem in which Dr. More was held in his community.

He Surely Left His Mark

All Eveleth bowed in silent respect and deep sadness when it learned last Sunday morning that the soul of Dr. Charles W. More had departed this earth for its place in Heaven.

So much of the history of this community from its very infancy was wrapped up in this lovable character, that every home was sorely affected.

He was one of the remaining stalwarts who had seen the town outgrow its muddy streets, mining shacks and frontier handicaps to a clean, modern and progressive city.

He was one whose profession was a religion, who brought many a present-day citizen into this world, who took a personal interest in his patients, no matter what the risk or difficulty to reach them and who maintained the pace until his reserve strength was all but exhausted.

Few people will ever know all that he did for the community and for the cause of suffering humanity. Never once did public confidence and respect ever flag in Dr. More's ability and honesty. He was Eveleth's No. 1 gentleman.

Keenly interested in seeing that youngsters of this community secured the best in education, Dr. More served many years on the library and school boards and our entire school system is a memorial to his efforts —for he was one of its foremost champions.

When his name became connected with a local business institution, it immediately carried public confidence.

His own hospital, about the earliest and most recognized on the Mesaba Range, stood for the best in medical and surgical attention. It is significant that this man passed to his eternal reward in the institution that he founded.

To this great example of manhood, the editor pays his humble tribute.

ROBERT HUGH MONAHAN

Dr. Robert H. Monahan of International Falls, formerly an orthopedist in Minneapolis, died June 3, 1947, at the age of seventy-six, while en route to his former home in New Brunswick, Canada.

Dr. Monahan obtained his medical degree from the University of Minnesota in 1906 and practiced at International Falls and at Blackduck. He held the rank of Captain in the British Army Medical Corps during World War I, and located in Minneapolis in 1920. In 1935 he returned to International Falls. While in Minneapolis he was a member of the Hennepin County Medical Society and transferred to the Upper Mississippi Medical Society on moving to International Falls.

Dr. Monahan is survived by his wife, Dr. Elizabeth Monahan of Minneapolis, a son Robert, Jr., a daughter, Mary, and five grandchildren.

LLEWELLINGTON D. PECK

Dr. L. D. Peck, prominent physician of Hastings for the past forty-five years, died July 4, 1947 at St. Mary's Hospital, Rochester, from cerebral thrombosis. He had been seriously ill for six weeks and was sixty-nine years old at the time of his death.

Born in Rochester, Minnesota, August 22, 1877, Dr. Peck received his early schooling there, graduating from the Rochester High School. He received his medical degree from Hamline Medical School in 1902. The same year he began practice in Hastings and for the entire period of his practice there served as physician for the river division of the Milwaukee railroad. About fifteen years ago he established St. Francis Hospital. For a number of years he served as alderman and twice was elected mayor. He was also an active and influential member of the Hastings school board.

Dr. Peck was a member of the Dakota County Medical Society, of which he was secretary at the time of his death, the Minnesota State and American Medical Associations. He was a member of the Guardian Angels church and the Knights of Columbus.

During World War I, Dr. Peck was chosen as medical examiner for Dakota County.

In 1904 Dr. Peck married Katherine Fasbender of Hastings. He is survived by his wife and two children, Dr. Llewellyn R. Peck, who was a partner with his father, and a daughter, Mrs. Cyrus C. Erickson of Durham, North Carolina.

For these many years active in the civic life of Hastings, Dr. Peck will be greatly missed by his many patients and friends.

EMIL C. ROBITSHEK

Dr. Emil C. Robitshek, a prominent surgeon of Mankato and Clinical Assistant Professor of Surgery at the University of Minnesota, died June 23, 1947. He was sixty-six years of age, having been born in Bohemia, August 18, 1880. As an infant he came to America and became a naturalized citizen in 1903.

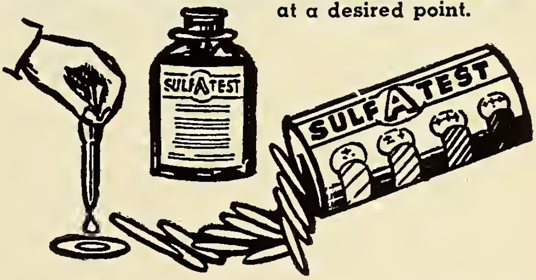
A graduate of South High School, Mankato, Dr. Robitshek obtained his medical degree from the University of Minnesota in 1903, and interned at the Minneapolis General Hospital. He took postgraduate work in Vienna, Berlin, and Prague before beginning practice in Minneapolis.

Dr. Robitshek was a Fellow of the American College of Surgeons, a diplomate of the American Board of Surgery, and a past president of the Minneapolis Surgical Society. He was also a member of the Minnesota Academy of Medicine and a staff member of Eitel and Abbott Hospitals. He was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations. He also belonged to Phi Delta Epsilon medical fraternity, Acacia Lodge and Zuhrah Shrine Temple.

Dr. Robitshek is surved by his wife, a son, H. J Robitshek of Green Bay, Wisconsin, and a daughter, Mrs. Lewis K. Wayne of Minneapolis.

A SIMPLE 10 SECOND TEST
for SULFA DRUGS

Makes frequent check of patient's Sulfa level easy, enabling physician to maintain the level at a desired point.



SULFATEST will show:

1. If previous treatment has geen given.
2. If the kidneys are excreting the sulfa compounds after the initial dose.
3. The approximate mgms. % in the blood per 100 cc.
4. If renal damage has been done, the sulfa compounds will be present after they normally should have been excreted from the body.

A homecoming celebration was held on July 13 in honor of Dr. M. L. Ransom, Hancock, who has practiced medicine in that city for forty-four years. Highlight of the celebration was a parade comprised entirely of persons whose births Dr. Ransom attended. The procession was divided into five divisions, according to the birth years of the participants, with the first section consisting of persons brought into the world by Dr. Ransom from 1903 to 1910. Succeeding divisions were for the years 1911 to 1920, 1921 to 1930, 1931 to 1940 and 1941 to 1947.

* * *

Fifty years in the practice of medicine were celebrated by Dr. K. E. Berquist, Battle Lake, on June 10.

A graduate of Hamline University in 1899, Dr. Berquist served his internship at Bethesda Hospital in Saint Paul. He then practiced in several cities in Minnesota before moving to Chicago to specialize in eye, ear, nose and throat diseases. From 1914 to 1935 he carried on his medical practice in Duluth and then joined his son-in-law, Dr. C. A. Boline, in Battle Lake. Since 1943 he has been affiliated with the Otter Tail County Sanatorium.

* * *

Robert G. Rossing, son of Rev. T. H. Rossing of Sacred Heart, Minnesota, a member of the graduating class of the University of Minnesota medical school this year, was presented on July 24 by Dean Diehl with an award consisting of a silver medallion and a check for $100.00, the prize offered by the Southern Minnesota Medical Association to the member of the Senior Class who has shown the greatest proficiency in the clinical fields of medicine and surgery during his Junior and Senior years. Rossing is twenty-two years of age, married, and plans to become a medical missionary to China after completing his internship.

Knighthood was recently conferred upon a former fellow of the Mayo Foundation, Dr. A. H. McIndoe, London, for conspicuous services to the state.

Coming from New Zealand, Dr. McIndoe became a fellow in surgery in the Mayo Foundation in January, 1925, and in 1930 he received an M.S. degree from the University of Minnesota. He then went to England and entered private practice. Specializing in plastic surgery, he won high recognition for his contributions both before and during the war. In 1936 he delivered a Mayo Foundation lecture in Rochester on the subject of plastic surgery as practiced in England.

* * *

Dr. Herbert A. Hartfiel, formerly of New York City, has announced the opening of his office for the practice of medicine and surgery in Montevideo.

A pre-medical student at the University of Minnesota, Dr. Hartfiel took his medical training at the University of Kentucky in Louisville. Following internship in Norton Memorial Infirmary and St. Joseph's Hospital in Louisville, he engaged in general practice in Northwood, Iowa, for several years. He then went to Europe and studied surgery for two years in Berlin and Vienna. Upon his return he practiced for ten years in New York City before coming back to Minnesota.

* * *

July 27 was "Dr. Higgs Day" in Park Rapids when residents of that city and surrounding communities gathered to celebrate the thirty-fifth anniversary of the arrival of Dr. Walter Higgs in Park Rapids as a practicing physician.

The celebration began with a parade, which had as a principal feature a large group of the persons brought into the world by Dr. Higgs in the past thirty-five years, many of whom were accompanied by their own children. At a program in the school park following the parade, tribute was paid to Dr. Higgs by the principal speaker, Dr. Charles H. Pierce of Wadena. After the program a community picnic was staged in the park.

* * *

Formerly of Duluth, Dr. W. O. McLane has joined the Wadena Clinic, taking over the Eye, Ear, Nose and Throat Department, left vacant last fall by the death of Dr. Harry T. Frost. In his new practice Dr. McLane is associated with Dr. C. H. Pierce and Dr. J. S. Grogan of the Wadena Clinic.

Dr. McLane was graduated from Rush Medical College, Chicago, in 1928. He then practiced in several Minnesota cities until 1942. From 1943 to 1946 he took postgraduate work in eye, ear, nose and throat diseases at the University of Illinois, after which he became associated with Dr. F. N. Knapp and Dr. A. O. Olson in Duluth. He moved to Wadena on July 15.

Liberation of the University of Minnesota's nonresident admission policy as it pertains to the school of nursing now permits consideration of the admission applications of young women high school graduates from outside the state who desire to study nursing.

Students admitted under this new liberalized policy must meet the required admission qualifications. They must also remain in the nursing program to be permitted to remain in the University.

The University of Minnesota nursing program includes basic professional training in nursing leading to the bachelor of science degree, advanced professional training for professional nurses, a certificate course in clinical nursing for professional nurses and a certificate course in practical nursing.

* * *

Surgical research at the University of Minnesota will be greatly benefited when the proposed Mayo Memorial building is completed, Dr. Owen H. Wangensteen, head of the Department of Surgery at the University, has announced.

"Construction of the building also will augment our opportunity to bring the work of our experimental surgical laboratory into closer liaison with the work being done in the University Hospitals," he stated.

At present the eight operating rooms of the University Hospitals are divided into three suites in three different sections of the hospitals, while the surgical laboratory is located in Millard Hall, a block away from the hospitals. The nineteen-story Mayo Memorial, on which construction is expected to start next spring, will provide the Department of Surgery with a compact unit on one floor, including sixteen operating rooms, surgical laboratories, offices and consulting rooms.

* * *

A father and five sons practicing together in a group is unique and worth recognition. Dr. William F. C. Heise of Winona, head of the Heise Clinic of that city, has four sons, Herbert, William, Carl, and Paul already associated with him, and his fifth son, Phillip, will join the group November 1. Dr. William F. C. Heise has been practicing in Winona since 1898, having graduated from Rush Medical College in 1896. Dr. Herbert graduated from Jefferson Medical College and has specialized in surgery; Dr. William graduated from Northwestern and is a pediatrician; Dr. Phillip, now a resident at St. Barnabas Hospital in Minneapolis, has specialized in obstetrics and gynecology; Dr. Paul, a graduate of Marquette University, has specialized in surgery and pathology, and Dr. Carl, a graduate of Jefferson Medical College has chosen eye, ear, nose and throat for his specialty. The new clinic building which is completely equipped for the best in medical service, was officially opened July 7, 1947.

DR. MELLBY HONORED

In recognition of forty years of service to the community of Thief River Falls, the citizens of that city celebrated Doctor Mellby Day on June 30, 1947. The celebration consisted of a banquet at the Trinity Lutheran Church followed by a community program at the Lincoln Hight School Auditorium, which was concluded by an address by President James L. Morrell of the University of Minnesota.

Dr. O. F. Mellby came to Thief River Falls in 1907 when the estimated population of the town was about 5,000. The son of the Reverend Ole Andreas Mellby of Norway who came to Le Sueur in 1872, Dr. Mellby attended St. Olaf Academy in Northfield, St. Olaf College, and the Minneapolis College of Physicians and Surgeons. After a year's internship at Ancker Hospital and five years of practice at Willmar and Warren, Minnesota, he began practice at his present location in August, 1907. Those were the days of long trips by horse and buggy, and Dr. Mellby had his share of that strenuous life.

Dr. Mellby has been active in civic, social and religious affairs, having served on the local school and park boards. For nine years he served on the Minnesota State Board of Health. He was a trustee of the Trinity Lutheran Church a number of years.

To those who know Dr. Mellby, this recognition of forty years of service is justly deserved.

RELIABILITY!

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

RH: ITS RELATION TO CONGENITAL HEMOLYTIC DISEASE AND TO INTRAGROUP TRANSFUSION REACTIONS.

Edith L. Potter, M.D., Ph.D., Assistant Professor of Pathology. Dept. of Obstetrics and Gynecology, The University of Chicago and the Chicago Lying-in Hospital. 344 pages. Prices $5.50. Chicago: Year Book Publishers, 1947.

Since the discovery of the Rh factor in 1941, the literature, both lay and scientific, has been flooded—at times to surfeit—with articles concerning it. Unfortunate it is, that a development of such importance should have appeared during the war years in which the activities of physicians left little time for comprehensive study of the many new developments in medicine. While at the same time the lay press, in attempts to dramatize the new techniques of medicine has, at least in the instance of the Rh factor, created considerable concern among the laity.

Dr. Potter's book, therefore, appears at an opportune moment. The author is admirably qualified to present an authoritative summary of the subject. She is a pathologist in the field of obstetrics and of diseases of the fetus and newborn infant and has had wide experience with infants who suffer from erythroblastosis or anemia of the newborn.

The book is unusually easy to read for a treatise—the logical flow of ideas, the carefully arranged plates and tables, the excellent topography and pleasing format, all contributing. The author is especially to be commended for her clear presentation of a subject with such a complex, contradictory, and labile terminology.

In contrast to usual procedures, the author has presented in the first twenty pages of the book a general summary of the entire subject. This, in itself, is a tremendous aid to the hurried practitioner. Succeeding chapters give a comprehensive study of the literature leading to the discovery of the Rh factor in 1941 and concerning subsequent studies. The history, theoretical background, genetic theories of the Rh factor as well as the theory, pathology clinical diagonsis, course, differential diagnosis, prevention, and treatment of hemolytic disease of the newborn are discussed. The author includes a chapter on techniques of determination of Rh status and of antibody determination.

The volume is highly recommended, both as an introduction to the subject and as a constant reference for all practitioners who will find in it the basis for valid judgments, preventative care, and therapy in practice.

John G. Mayne, M.D.

Classified Advertising

Replies to advertisements should be mailed in care of Minnesota Medicine, *2642 University Avenue, Saint Paul 4, Minn.*

WANTED—Physician as an assistant in excellent general practice, with object of buying practice. Address E-25, care Minnesota Medicine.

Test No.
MEAD JOHNSON & CO.
EVANSVILLE, IND., U.S.A.

COUNCIL-ACCEPTED

AMIGEN

for parenteral administration of amino acids

The function of Amigen and Protolysate is to supply the amino acids essential for nutrition. Both can be given in place of protein when protein cannot be eaten or digested, or in addition to protein when the protein intake is insufficient. Administered in adequate amounts, they prevent wastage of protein, restore previous losses, or build up new body protein.

COUNCIL-ACCEPTED

PROTOLYSATE

for oral and tube feeding of amino acids

Like Amigen, Protolysate is an enzymic digest of casein and consists of amino acids and polypeptides. Like Amigen, Protolysate supplies the nitrogen essential for maintenance, repair and growth.

Unlike Amigen, which may be employed both orally and parenterally, Protolysate is designed only for oral use.

1 LB. NET (454 GM.)
MEADS
PROTOLYSATE
For Oral Administration
A dry enzymic digest of casein containing amino acids and polypeptides, useful as a source of readily absorbed food nitrogen when given orally or by tube. Protolysate is designed for administration in cases requiring predigested protein. The mode of administration and the amount to be given should be prescribed by the physician.
MEAD JOHNSON & CO.
EVANSVILLE, IND., U.S.A.

MEAD JOHNSON & CO., EVANSVILLE 21, INDIANA

There is no shortage now of AMIGEN for parenteral use. There is no shortage now of PROTOLYSATE for oral use.

● The myth of laudable pus has long been shattered. As science advances, suppuration and the underlying pyogenic infection, exposed as major impediments to wound healing, become more amenable to control.

Now that TYROTHRICIN is available, wound contamination with gram-positive pathogens is still less likely to preclude early tissue repair. Streptococci, staphylococci, pneumococci and other gram-positive bacteria are inhibited by this highly potent, topical bactericide. TYROTHRICIN by irrigation, instillation and wet packs affords better antibiotic therapy to topical and accessible infection—in contaminated wounds, various types of ulcers, abscesses, osteomyelitis, and certain infections of eye, nasal sinus and pleural cavity.

TYROTHRICIN, Parke, Davis & Company, is one of a long line of Parke-Davis preparations whose service to the profession created a dependable symbol of significance in medical therapeutics—MEDICAMENTA VERA.

TYROTHRICIN is available in 10 cc. and 50 cc. vials, as a 2 per cent solution (20 mg. per cc.) to be diluted with sterile distilled water before use.

PROTECT YOUR EARNING CAPACITY WITH LONG TERM NON-CANCELLABLE DISABILITY INSURANCE

The policy provides the following features:

NON-CANCELLABLE. Guaranteed renewable to age of 60.

INCONTESTABLE. Incontestable after 2 years, similar to your life insurance policies.

WAIVER OF PREMIUM. After 90 days of total disability, premium payments are waived until such disability terminates.

NO HOUSE CONFINEMENT. It is never necessary to be confined within the house to receive the indemnities provided.

BODILY INJURY. Indemnity is paid on the basis of the result of the injury, not the manner in which it occurred.

NON-AGGREGATE. The full policy limits payable for each new disability.

TOTAL DISABILITY. Covers inability to engage in the insured's regular occupation for 4⅙ years and thereafter any gainful occupation up to 8⅓ years. In case of disability by accident, coverage is for life.

GRACE PERIOD. In the payment of premiums, you are permitted a grace period of 31 days.

FULL MEDICAL EXAMINATION—required.

Eminent critic . . . . dietary dub!

At meal time his renowned judgment deserts him. Eating only the food he likes, a choice of notably limited range, he thrice daily produces a burlesque on proper nutrition. Inevitably, this perennial first-nighter makes his entrance into some physician's reception room—the victim of a self-made, borderline vitamin deficiency. In the same cast, you will find other familiar types. Included in it are the ignorant and indifferent, people "too busy" to eat properly, those on self-imposed and badly balanced reducing diets, excessive smokers, food faddists and alcoholics, to name a few. First thought in such cases is dietary reform, of course. Along with that, a dependable vitamin supplement may well be in order. When you prescribe an *Abbott* vitamin product, you are assured that the patient will receive the full vitamin potencies intended. Your pharmacy carries a complete line of Abbott vitamin products in a variety of dosage forms and package sizes, and will be pleased to fill your prescriptions. ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS.

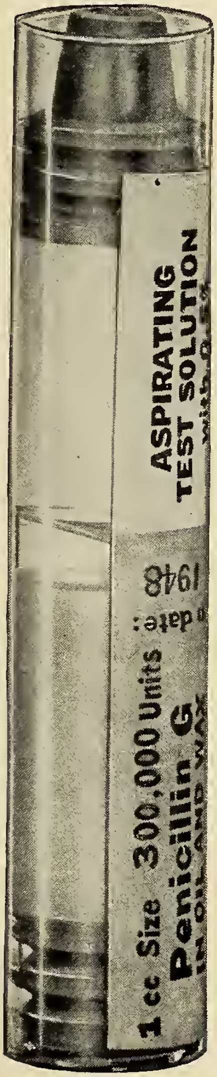
New plastic cartridge

for

CRYSTALLINE PENICILLIN G SODIUM SQUIBB

in Oil and Wax



300,000 units in 1 cc. double-cell *plastic* cartridges for B-D* Disposable Syringes or in B-D* permanent syringes.

*T.M. Reg. Becton, Dickinson & Co.

You get these advantages with Squibb's New Double-Cell *Plastic* Cartridges for B-D* disposable or permanent syringes:

- New *Plastic* Cartridges minimize breakage hazards
- Sterile Aspirating Test Solution guards against accidental intravenous injection
- Crystalline Penicillin G Sodium Squibb in Oil and Wax at room temperature requires no heating
- Improved lubrication of stoppers further decreases breakage—speeds injections

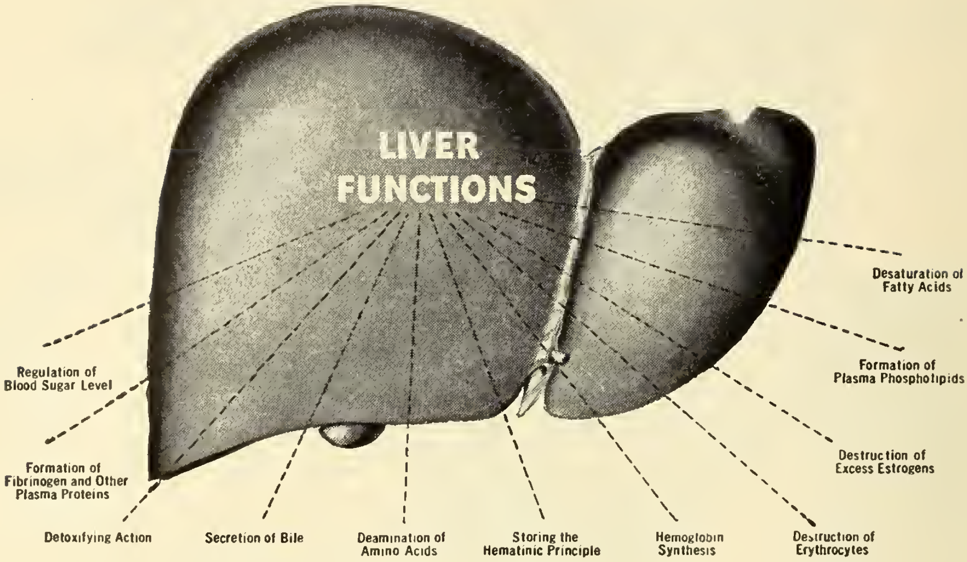
CRYSTALLINE PENICILLIN G SODIUM

SQUIBB IN OIL AND WAX

NOW comes in the new *plastic* double-cell cartridge which minimizes breakage hazards.

One cell of the double-cell cartridge contains 300,000 units of crystalline penicillin G sodium in refined peanut oil and 4.8% bleached beeswax (Romansky formula). The other cell contains Sterile Aspirating Test Solution. Therapeutic serum concentration levels are maintained for 24 hours with a single injection. In overwhelming infections, the dose may be doubled but the frequency need not be. Ambulatory treatment is practical for many diseases formerly requiring hospitalization.

For real convenience in administering penicillin in the home, office or emergencies try Crystalline Penicillin G Sodium Squibb in Oil and Wax in the new *plastic* double-cell cartridge.



LIVER FUNCTIONS
Desaturation of Fatty Acids
Formation of Plasma Phospholipids
Destruction of Excess Estrogens
Regulation of Blood Sugar Level
Formation of Fibrinogen and Other Plasma Proteins
Detoxifying Action
Secretion of Bile
Deamination of Amino Acids
Storing the Hematinic Principle
Hemoglobin Synthesis
Destruction of Erythrocytes

To Guard the Functional Integrity of the **LIVER**

The complex nature of the manifold functions of the liver is reflected in the diagram shown above. To maintain its functions in an efficient manner, the liver must be adequately protected against toxic influences. Parenchymatous damage with ensuing decreased functional capacity can lead to severe metabolic derangements.

Protein deficiency is an important factor in precipitating impaired liver function. Hence an adequate intake of biologically complete protein, ordinarily in the form of protein foods, is indispensable as a safeguard of liver competency.

Among man's protein foods, meat ranks high not only because of its generous content of protein, but also because its protein is complete, capable of satisfying all protein requirements. Furthermore, all meat is 96 to 98 per cent digestible.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

DESIGN

CAMP design is dedicated to meeting the physiological, surgical and maternity needs of the patient with the utmost in comfort and aesthetic appeal. Each specific design is further refined for the variety made necessary by the multiplicity of body builds and figure irregularities. The unique CAMP adjustment feature establishes a firm foundation about the pelvis as an "engineering" base for the distribution of regulated support. This makes it easy for the fitter to follow with precision the physician's recommendations for indicated firmness about the pelvis and controlled support of the abdomen, spinal column and gluteal region without pressure or compression.

CAMP ANATOMICAL SUPPORTS

Camp Anatomical Supports have met the exacting test of the profession for four decades. Prescribed and recommended in many types for prenatal, postnatal, postoperative, pendulous abdomen, visceroptosis, nephroptosis, hernia, orthopedic and other conditions. If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent upon request.

NOW IN TWO FORMS
Fisher

Pyribenzamine

High-concentration Elixir Pyribenzamine hydrochloride now provides a second administration form of this proved antihistaminic. Containing 20 mg. of Pyribenzamine hydrochloride per 4 cc. (teaspoonful), the Elixir has obvious advantages in special cases, notably in infants and children, and in adults who prefer liquid medication.

Scored tablets of Pyribenzamine also facilitate small dosage when indicated—the 50 mg. tablets are easily broken to provide 25 mg. doses.

Council Accepted. PYRIBENZAMINE hydrochloride ® (brand of tripelennamine hydrochloride)

CIBA **PHARMACEUTICAL PRODUCTS, INC., SUMMIT, N. J.**

ACCEPTED COUNCIL ON FOODS AND NUTRITION AMERICAN MEDICAL ASSOCIATION

DRYCO
VITAMIN FORTIFIED INFANT FOOD
THE BORDEN COMPANY

- Nutritional authorities warn that "the possibility of protein deficiency in the diets of children has received some, but insufficient, attention" . . . and that children "with normal values are the exception rather than the rule."**
- Many progressive pediatricians, in prescribing formulas, standardize on the high-protein infant food, DRYCO— since it represents such a rich source of *all* the essential amino acids. DRYCO is also characterized by a high-mineral, low-fat and intermediate carbohydrate content—with more than adequate vitamins A, B_1, B_2 and D. It is quickly soluble in cold or warm water, and may be used with or without added carbohydrates. Special processing facilitates digestion by assuring soft curd formation in the stomach.

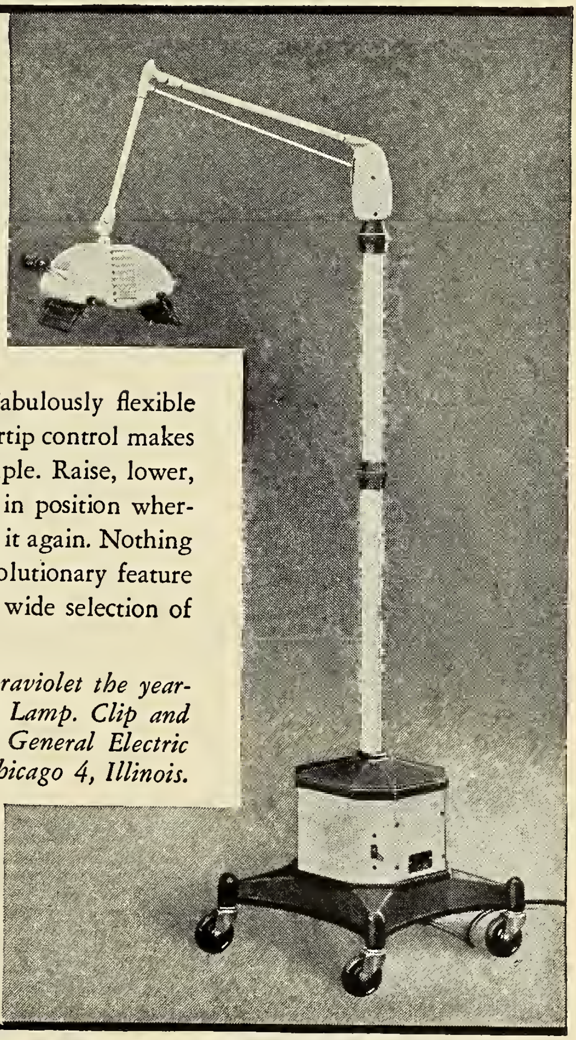
G-E X-RAY PROUDLY ANNOUNCES

THE NEWEST ADDITION TO THE FAMILY

The G-E Prescription Model Ultraviolet Lamp offering you all the famous G-E X-Ray quality and service in a new low cost ultraviolet lamp.



This new, economically priced lamp features the famous G-E Uviarc high pressure mercury quartz burner—economical to operate and with emission characteristics covering the full range of therapeutic ultraviolet. Long familiar to users of G-E professional type lamps, the Uviarc burner emits intense, uniform radiation throughout the spectral bands of proven clinical value.

The compact, sturdily constructed burner housing is mounted on the Dazor Floating Arm. Fabulously flexible and almost human, this remarkable arm with its fingertip control makes the positioning of the lamp amazingly swift and simple. Raise, lower, swing the burner housing through an arc; it freezes in position wherever you stop it—and it stays there too until you move it again. Nothing to tighten, no time consuming adjustments. This revolutionary feature facilitates rapid positioning of the lamp and offers a wide selection of treatment distances.

Plan now to offer your patients the benefits of ultraviolet the year-round with the G-E Prescription Model Ultraviolet Lamp. Clip and mail the convenient coupon today to: Dept. 2667, General Electric X-Ray Corporation, 175 West Jackson Boulevard, Chicago 4, Illinois.

DEPENDABLE PHARMACEUTICALS

- Like a gem, every case in your daily practice presents many facets besides the strictly medical ones—constitution, temperament, environment, AND the reliability of the medication you prescribe.

- Most of these contributing factors are outside your control. Certainly, in these busy days, you cannot take time to trace the manufacturing history of every drug you use.

- What you can do is to prescribe pharmaceuticals of unquestioned reliability—drugs you can depend upon.

- You can depend upon Dorsey products for unvarying purity and potency, for they are made under rigidly standardized conditions. Laboratory and manufacturing equipment, personnel and procedure are constantly protecting your treatment with Dorsey drugs.

MANUFACTURERS OF
PURIFIED SOLUTION OF LIVER-DORSEY
SOLUTION OF ESTROGENIC SUBSTANCES-DORSEY

ACCEPTED
COUNCIL ON PHARMACY AND CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

for use in control of overweight—

Benzedrine Sulfate has been accepted

by the Council on Pharmacy and Chemistry

of the American Medical Association

According to Freed (J. A. M. A., Feb. 8, 1947), "Benzedrine Sulfate . . . is of inestimable value in controlling the desire for food and in reducing the level of satiability to a more normal one. This drug is commonly administered in dosages of 5 mg. three times a day, thirty to sixty minutes before each meal. Occasionally patients will require 10 mg. at one or more times during the day, depending on their response to the drug."

The use of Benzedrine Sulfate alone ordinarily should achieve the desired appetite reduction. Combinations of amphetamine and thyroid serve no useful purpose and may even be dangerous. In this connection, a recent report of the Council (*Drugs for Obesity*, J. A. M. A., June 7, 1947) says: "The fallacy and dangers of overstimulating the body with thyroid and of using laxatives to aid in reduction are well known to the medical profession."

MINNEAPOLIS MINNESOTA

30 day crisis

The first 30 days of life might be called a truly critical period since the greatest number of infant deaths—62.1%—occur during this time. The proportion of infants who die within the first month has, in fact, increased nearly 10% in the past 20 years, while infant mortality on the whole was substantially reduced.*

So much the greater, then, is the importance of providing the most favorable conditions for maximum health during this fatal first month. Considering the role nutrition plays in infant health, a good start on the right feeding warrants special attention.

'Dexin' has proved an excellent "first carbohydrate" because of its high dextrin content. It (1) resists fermentation by the usual intestinal organisms; (2) tends to hold gas formation, distention and diarrhea to a minimum, and (3) promotes the formation of soft, flocculent, easily digested curds. 'Dexin' *does* make a difference.

* Vital Statistics—Special Reports: Vol. 25, No. 12, National Office of Vital Statistics, Washington, D. C. (Oct. 15) 1946, p. 206.

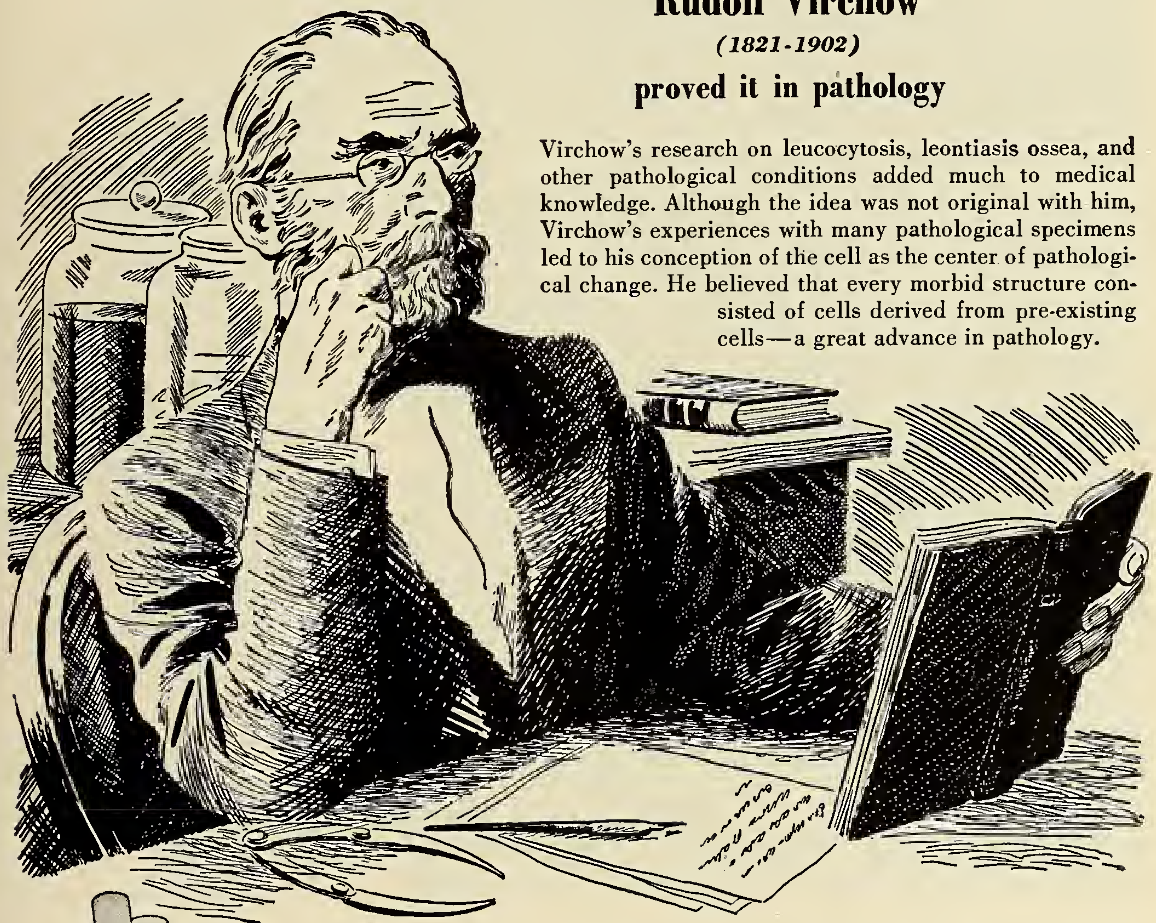
(1821-1902)

proved it in pathology

Virchow's research on leucocytosis, leontiasis ossea, and other pathological conditions added much to medical knowledge. Although the idea was not original with him, Virchow's experiences with many pathological specimens led to his conception of the cell as the center of pathological change. He believed that every morbid structure consisted of cells derived from pre-existing cells—a great advance in pathology.



Yes, and experience is the best teacher in smoking too!

EXPERIENCE during the wartime shortage taught smokers the differences in cigarette quality. Millions of people smoked more different brands then than they would normally have tried in years. More smokers came to prefer Camels as a result of that experience, so that today more people are smoking Camels than ever before.

But, no matter how great the demand, we don't tamper with Camel quality. Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.

ANGINA PECTORIS

and other Manifestations of

CORONARY INSUFFICIENCY

The following episodes may be prevented by appropriately regulated administration of a vasodilator having a *sustained* effect:

FOR THE PERSON

- ***who is compelled to stop and rest when climbing a flight of stairs.***
- ***who suffers "indigestion" and "gas" on exertion, or after a heavy meal.***
- ***who is stricken with precordial pain on unusual exertion or emotion, or when exposed to cold.***

The vasodilatation produced by Erythrol Tetranitrate Merck begins 15 to 20 minutes after administration, and lasts from 3 to 4 hours.

It is generally agreed that the acute attack of anginal pain is most readily relieved by the prompt removal of the provocative factor, and by the use of nitrites. For prophylactic purposes—to control anticipated paroxysms—the delayed but prolonged action *of erythrol tetranitrate is effective. Erythrol tetranitrate, because of its slower* and more prolonged *action, is also considered preferable for the purpose of preventing nocturnal attacks.*

FOR AN ACTIVE MIDDLE AGE

A "PLUS"

The "plus" is the gratifying "sense of well-being" so many menopausal patients experience following "Premarin" therapy. It is the intangible factor which, added to relief of distressing symptoms, enables the middle-aged woman to resume her normal routine of useful and enjoyable activities.

"Premarin" provides naturally occurring, conjugated estrogens for effective therapy by the oral route. Untoward side effects are rarely noted with "Premarin."

"Premarin" is now available as follows:

Tablets of 2.5 mg.	in bottles of 20 and 100
Tablets of 1.25 mg.	in bottles of 20, 100 and 1000
Tablets of 0.625 mg.	in bottles of 100 and 1000
Liquid containing 0.625 mg. per 4 cc. (one teaspoonful)	in bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present as water-soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract.

NURSING *is a proud profession*

. . . and rightfully so. For next to the doctor in service rendered stands the present-day nurse. Into her hands is entrusted the care of the sick, and often the success of the doctor's work depends directly upon her skill.

"Hospital administrators and doctors throughout the country are seriously concerned over the dangerously inadequate nursing care available. Results of a recent survey indicate that 55 to 60 per cent of the required amount is obtainable . . .

"'. . . approved hospitals should provide training for such vocational nurses by means of short courses.'

"The doctor is responsible for the care of the patient. In order to meet this obligation, the medical staff together with the hospital and nursing administrators, are urged to undertake the development and execution of this program."[1]

"It is time that some of the present-day advantages of a nursing career be made known to young women."[2]

Glenwood Hills Hospital—through its school of nursing—is anxious to cooperate with you in your effort to increase the number of nurses in your community. A student from your locality will result in increased nursing assistance to you in the near future. Your help is greatly needed in recruiting candidates for this profession. A one-year course in psychiatric nursing is currently being offered to eligible applicants. Tuition is free. Regular classes begin in January, June and September. For full information write Miss Margaret Chase, R.N., B.S., Director, School of Nursing.

DO YOU KNOW WHAT THESE SYMBOLS STAND FOR ?

Rexall

DRUGS

REXALL FOR RELIABILITY

For centuries the owl has symbolized great knowledge and superior wisdom. "Wise as an owl" was a quip of Caesar's time. The canny bird was sacred to Minerva, Roman goddess of learning and of science. The natural assumption was that the owl acquired wisdom from his patroness.

For many years, the familiar Rexall symbol has denoted excellent standards of pharmaceutical science. From coast to coast more than 10,000 selected, independent pharmacies display this sign. It assures you that fine, laboratory-tested Rexall drug products and skilled pharmacists are at your service.

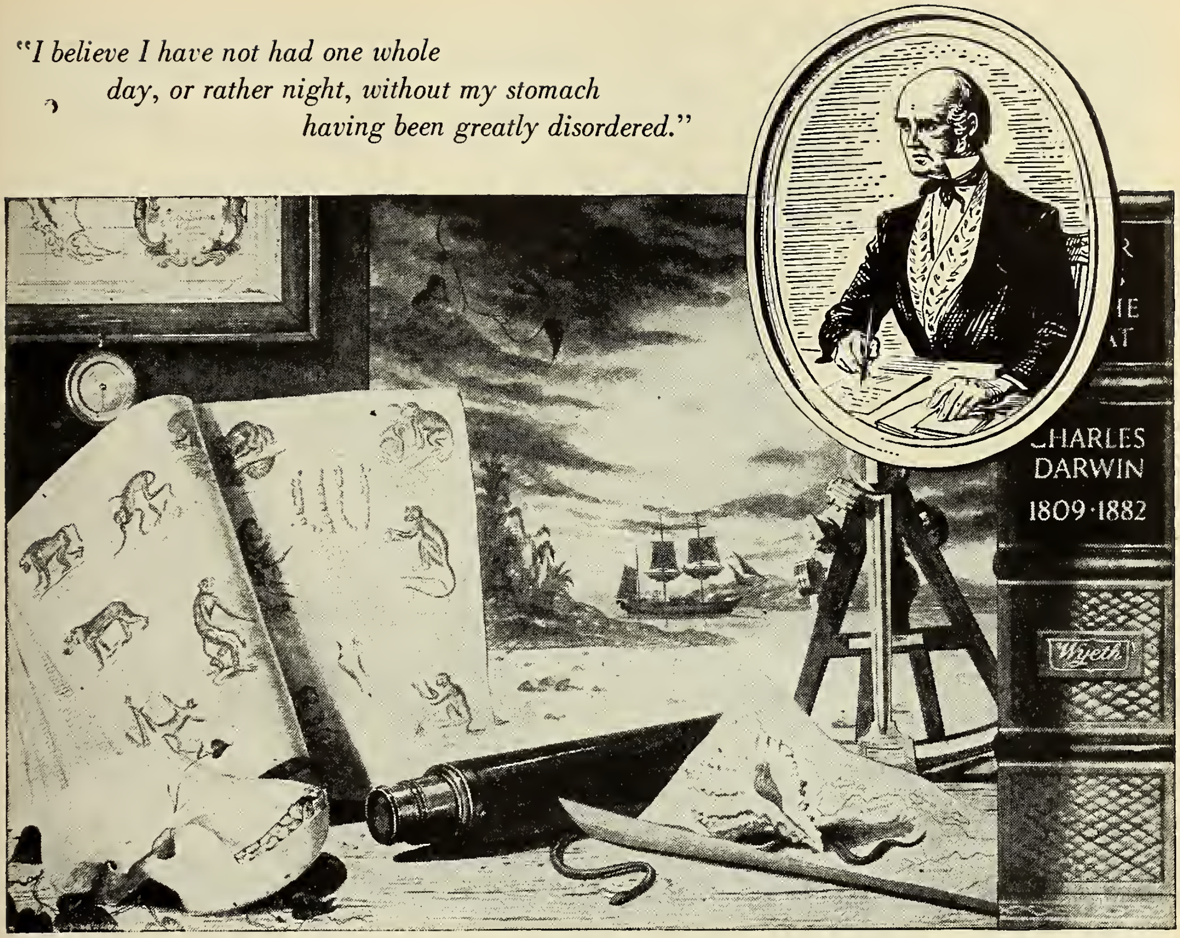
*"I believe I have not had one whole
day, or rather night, without my stomach
having been greatly disordered."*



During the most productive years of his life, Charles Darwin was a victim of peptic ulcer.[1] His might be called the *average* case of peptic ulcer. Had modern medical understanding of ulcer treatment been available to him, his life could have been far more comfortable—and even more productive!

Proper use of an alumina gel antacid and an occasional sedative would doubtless have carried him through his most active years without suffering.

PHOSPHALJEL, Aluminum Phosphate Gel, Wyeth, is unexcelled in the treatment of "average" ulcer cases as well as in stubborn or complicated ones. It provides quick relief from pain . . . lays a protective coating over the inflamed mucosa . . . *safely* buffers gastric acidity with no danger of alkalosis or "acid rebound." Phosphaljel permits a liberal bland diet—patients are more contented during treatment, gain strength and weight more quickly.

When patients on soft, smooth diets require high protein intake

Swift's Strained Meats

specially prepared—offer an appetizing, natural source of complete, high-quality proteins

Swift's Meats
FOR BABIES
Strained BEEF
WITH BEEF BROTH ADDED

Many doctors now recommend Swift's Strained Meats for patients on soft, smooth diets where a high-protein intake is required. These specially prepared meats provide a highly palatable source of biologically complete proteins, B vitamins and minerals in a form desirable for a soft oral diet. Swift's Strained Meats may easily be used in tube-feeding, too—the minute particles of meat are so fine.

Tempting variety of 6 different kinds

The wholesome meat flavors in Swift's Strained Meats are readily accepted by most patients—even when appetite is impaired. The variety includes: beef, lamb, pork, veal, liver and heart. Prepared with expert care from selected, lean U. S. Government Inspected Meats, Swift's Strained Meats are carefully trimmed to reduce fat content to a minimum. Each tin of Swift's Strained Meats contains three and one-half ounces.

All nutritional statements made in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association.

ACCEPTED

PROLONGED LABOR, WITH SPECIAL REFERENCE TO POSTPARTUM HEMORRHAGE

ALEXANDER M. WATSON, M.D.

Royalton, Minnesota

PROLONGED labor is always a cause for anxiety on the part of the obstetrician and as time passes without the completion of delivery, he may be apprehensive of serious complications. Labor that extends beyond thirty hours in a primipara or twenty hours in a multipara suggests the presence of complications.

The causes of prolonged labor can be divided into two main classes.

1. In the first class are those variations in the shape and size of the pelvis that obstruct the passage of the fetus and anomalies of the fetus itself, such as hydrocephalus, monstrosities, et cetera.

In this class can be placed also those cases of faulty presentations, such as brow and face, impacted occipitoposterior and transverse positions.

There are still other conditions in this class that can prolong labor, such as fibromata of the uterus, other tumors or cysts in the pelvis, bicornate uterus and a long rigid cervix.

This first group of conditions that tend to prolong labor will not be considered in detail in this paper. If careful and repeated prenatal care is carried out, it will be possible to detect the majority of these causes of prolonged labor before labor starts, and the obstetrician can then be prepared to carry out the proper treatment. This should include x-ray examination to determine the pelvic measurements and the shape and size of the fetal parts. It has been said that early exposure of a three-month fetus to x-ray may cause damage. I have not seen any such damage myself; however, I think that the x-ray of the maternal pelvis and the fetus should be carried out in the last month of pregnancy, as one can then get a better idea of the relative size of the fetal head and the mother's pelvis.

I want especially to emphasize the great importance of a complete and careful prenatal examination. There is no one thing the physician can do for the expectant mother that will be of more value to her than complete and careful prenatal examinations during her pregnancy.

2. The second cause of prolonged labor is the condition of inertia uteri. In inertia uteri there is a failure of the uterus to contract frequently enough or forcibly enough to carry on the labor. This condition I shall discuss in some detail, as it is a common cause of postpartum hemorrhage.

Inertia of the uterus may develop during labor and continue into the postpartum period. It may appear without warning, and in the postpartum period it may be the cause of hemorrhage.

Inertia uteri has been divided into secondary and primary inertia.

Adam G. Sheddon, in the *Medical Journal of Australia,* says: "Secondary inertia is a condition of temporary uterine exhaustion usually appearing in the second stage of labor and resulting from an obstruction, which however is not insuperable." This, he says, is really a protective mechanism. He defines primary inertia as a complication of labor characterized by uterine contractions, which from their onset are sluggish, infrequent and inco-ordinate. This classification seems to define

---

Read in a symposium on Obstetrics in General Practice at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1947.

the condition clearly. He notes that this condition is prone to develop in the older primipara with a rigid os.

John W. Harris, in the *American Journal of Surgery* for February, 1937, says that primary inertia of the uterus is a common type of dystocia and is next in frequency to the dystocia from contracted pelvis. The pains are severe enough to make the patient very uncomfortable, and the physician is often forced by the patient and relatives to hasten or interrupt the labor. Thus, many cases are mismanaged.

Many medical men have observed that primary inertia only becomes evident during labor and that a means of detecting the probability of primary inertia during the last month of pregnancy would be of great value.

In many cases of primary inertia, a diagnosis is made of rigid cervix that cannot dilate, whereas the reason for dystocia is not the cervix but rather the inadequate contraction of the uterus. This false conception of the condition frequently results in mismanagement. A careful examination during the pains which are often apparently severe, will show that the fetal head does not engage or push down during the pain. Instead of attempts at forcing delivery, the patient should be given several hours of complete rest and adequate nourishment; then labor may be resumed.

The cause of primary inertia has not been established.

There are many theories as to the cause of normal labor, among which are the following: (1) increased venosity of placental blood; (2) mechanical distention of the uterus; (3) senility of the placenta; (4) maturity of the fetus; (5) the influence of hormones.

It has been suggested that a disturbance or non-functioning of one or more of these may be the cause of inertia. However, we do know that this occurs more frequently in elderly primipara and in multigravida who are emotionally unstable and apprehensive, so every effort should be made to gain the patient's confidence and reassure her.

In connection with a method or means of foretelling the possible development of primary inertia, some interesting work has been done with the tocograph. The tocograph is an instrument for measuring uterine motility. Many methods have been tried to measure the power of uterine contractions, mostly by some sort of bag inserted in the uterus, vagina or rectum, and attached to a recording device. Obviously, this is not a practical method and exposes the patient to many hazards.

Sandor Larand in 1936 published a description of the second model of his tocograph. The instrument consists of a series of levers actuated by a rod that projects about 5 mm. from the bottom of the box in which the apparatus is contained. The graph strip revolves on a drum, and the writing lever inscribes the graph on the paper. The whole thing is a little larger than a deck of cards. It is placed on the abdomen at the most prominent area and held in place by an elastic belt.

Dr. Douglas P. Murphy, working in hospitals in Philadelphia and in the University of Pennsylvania, has carried out a series of 3,154 tocograph readings in 1,153 individuals. Of the 3,154 readings 1,936 were made before the onset of labor.

This year he published a book on this subject, and he says that he undertook this work because one of the chief problems of the obstetrician is created by inadequate uterine pains, which prolong labor and jeopardize the life of the mother and child. As a result of his tocograph readings, he has made certain observations:

1. He has established a normal graph, both prenatal and during labor.
2. He has established a graph of the normal uterine tension during labor and between pains.
3. He has been able to detect inadequate and irregular contractions in prenatal readings that during labor developed into inertia of the uterus.

He has come to several other interesting conclusions, but as this paper is not a review of the book, I can only say that the book is of great interest and will well repay the reader.

I can remember the time when we had no blood pressure instrument, when there was no electrocardiograph, when there was no basal metabolism machine, when a roentgenogram was a curiosity, obtained only from a static machine or Vulcan coil. So I consider it possible that the tocograph for measuring uterine motility may become a useful and valuable instrument to the obstetrician.

The diagnosis of primary inertia is not difficult when it is established. The pains are irregular, cause a great deal of discomfort, and no progress is made. The fetal parts do not engage and the os does not dilate; all this, notwithstanding the fact that previous prenatal examinations have shown that there are no abnormalities of position, pelvis or fetus that would obstruct labor. We can sometimes anticipate the condition in an elderly primipara or a multipara who has had many children close together. One thing which all patients with inertia uteri have in common is a nervous condition of apprehension and a feeling that it is impossible for them to deliver their babies.

These patients can usually be detected during the earlier prenatal calls, and it is then that the physician should do everything to gain their confidence and build up their morale. This is of vast importance.

The treatment during the progress of labor consists in trying to establish normal labor, and this can often be done. First, the patient should have long rest periods of several hours with the use of sedatives. My favorite is demerol, 100 mg. with 1/100 grain of hyoscin hydrobromide gr. 1/100 and I repeat it if needed in an hour or two. In many cases, following the sedative, labor becomes normal and progresses to a favorable termination. I prefer demerol to the barbiturates.

Brodie C. Nalle, in *Southern Medicine and Surgery* in 1941, discussing the subject of prolonged labor, states that the cause of inertia of the uterus may be due to: (1) a disturbed autonomic system; (2) calcium deficiency; (3) a combination of the two.

The autonomic nervous system, consisting of the sympathetic and parasympathetic nerves is an involuntary system and innervates the uterus. This nervous system is susceptible to emotions of anger, fear, anxiety and suppressed emotions. Thus the emotional instability of the patient will affect the work of the uterus.

He was impressed by the fact that the demand for calcium during the last ten weeks of pregnancy was very great and that the patients often exhibited clinical evidence of calcium deficiency such as cramps in the calves of the legs, frequent periods of false pains, and paresthesias. The estimation of diffusible blood calcium is difficult, but the clinical evidence is reliable. Normal blood calcium which is available for use has a sedative effect on the sympathetic system, and if adequate, the uterus contracts in a normal manner. On this basis, he gives the patient calcium gluconate with vitamin D from the third month on. It has been my practice for several years to give calcium gluconate grs. 30 daily for the last trimester, with vitamin D. In the majority of cases, I am satisfied that this is of great benefit and the incidence of nervous, apprehensive patients, with inertia uteri is not so great as formerly.

The use of oxytocic drugs in prolonged labor, due to primary inertia, deserves mention. These drugs are potentially very dangerous to both mother and child and therefore should not be used unless the cervix is fully dilated and it is certain that there is no mechanical obstruction to the delivery of the child. This should be the rule in the use of these potent medicines. The oldest of the oxytocics is ergot. It was first described one hundred years ago by Prescott. The alkaloid ergonovine or ergotrate is the preparation used. It is used almost entirely postpartum. In England and Europe this alkaloid is called ergometrine. In 1906 Dale discovered that the extract of the posterior pituitary gland had a remarkable action as an oxytocic. Since then it has become universally used. Given by intramuscular or intravenous injection, it produces strong and regular uterine contractions. The following rules, however, must be followed or the uterus may rupture:

1. Pituitary extract should not be used if the intrauterine tension is high or if the uterus is in a state of tetanic contraction.

2. It should not be used if the os is not fully dilated, or easily dilatable.

3. It should not be used if there is any obstruction to labor such as a deformed pelvis, or anomaly of, or excessive size of, the fetus.

4. The dose should be small (about 2 minims) of obstetrical pituitrin.

With these precautions, pituitary extract is a very useful drug and will often cause normal strong contractions that will terminate the labor, in the presence of primary inertia.

There are other oxytocic drugs, such as estrogens and quinine but ergot and pituitary extracts are the most commonly used.

In many cases of primary inertia, due to the condition of the mother or fetus, it may be inadvisable to use oxytocics, so some form of obstetrical operation may be needed. Forceps in the midpelvis or at the outlet are familiar to all of us and are generally successful. Using high forceps is an operation that is dangerous to mother and child and in my opinion a podalic version is preferable. This has its dangers but if done carefully is preferable to high forceps. In these cases, due to the long labor and probable examinations and loss of the liquor amnii, I would consider cesarian section contraindicated as the danger of sepsis is great and peritonitis is very likely to occur.

The most serious complication that occurs as a result of prolonged labor from primary inertia, is postpartum hemorrhage. This is the direct result of weak and ineffectual contractions of the uterus, extending into the postpartum period. Postpartum hemorrhage is second only to sepsis as a cause of maternal mortality. This may result in a great loss of blood in a short time or a steady trickle that may not be alarming, but may eventually result in death, if not checked.

Odell, Randall and Scott, in an article published in the *Journal of the AMA* of March 15, 1947, on this subject, state that when the total loss of blood (measured and estimated) exceeds 600 c.c. or more, postpartum hemorrhage is diagnosed. In a long series of cases they found the majority of those listed as prolonged labor were in the inertia group. They further stated that the incidence of postpartum hemorrhage was higher in the mothers who had operative interference of any sort to conclude the labor, than in those who delivered spontaneously. In such instances they give early a 5 minim dose of pituitary extract followed by ergotrate. If this is not successful, they advocate douching the uterus with cold sterile water and tamponade. In the treatment of postpartum hemorrhage it is well to review the proper procedure notwithstanding the fact that it is a familiar subject.

If hemorrhage develops after the delivery of the placenta, the uterus should be grasped firmly and massaged to induce contractions. Often one can feel the uterus relax and become soft, when the contraction fails. The nurse is instructed to give pituitary extract 5 minims intramuscularly, followed by ergotrate 1/320, by the same method. If the bleeding continues, the birth canal is explored for lacerations of the vagina and cervix. If found, they should be sutured, which will control the bleeding. If, however, the bleeding is from the uterus, the hand should be inserted into the uterus and any secundi that are present should be removed. I found a placenta succenturia in one instance. In case the patient is still bleeding, it will be necessary to pack the uterus. In our delivery room we have, at all times, a sterile pack seven yards long and three inches wide consisting of several thickness of gauze. This is enough to pack the uterus tight as well as the vagina. If the mother has reached this stage of bleeding, she is in more or less shock from loss of blood, so plasma is given and arrangements are made for blood transfusion. The patient's blood should be typed and the Rh factor ascertained so that suitable blood can be used. Some writers have stated that packing of the uterus is an outmoded procedure, but I think that it is often a life-saving treatment and is the only method for controlling some cases of hemorrhage. It has been said that it is very liable to cause infection. This is not so likely to occur if conducted in a modern hospital. Also the infection can usually be controlled by the use of penicillin, sulfonamides, and blood transfusions. I therefore continue to pack the uterus if the need arises.

Postpartum hemorrhage occurring before the delivery of the placenta is equally formidable. The first thing to do is to deliver the placenta. The Crede method of expulsion should be tried but as this often fails, it becomes necessary to do a manual separation. John B. Pastore, in an article on postpartum hemorrhage in the *American Journal of Surgery*, states that the placenta should be separated by the ulnar side of the hand, starting at the top of the fundus and separating from above downward. In this way, the uterus contracts on the retreating hand and placenta and avoids the bleeding that occurs in the reverse procedure. He says, further, that if in case of inertia, the placenta has separated but is not expressed, clots accumulate and blood loss is great. He states that many cases are mismanaged at this stage. First, it is not recognized that the placenta has separated while a perineal repair is being carried out. Second, efforts are made to express the placenta by pressing the uterus down into the pelvis and causing pressure on the uterine veins, thus increasing the bleeding. He says no repairs should be attempted till the placenta is expressed, and he condemns the practice of using the uterus as a piston to express the placenta. When the uterus changes from a discoid shape to

(Continued on Page 996)

THE MANAGEMENT OF OBSTETRIC EMERGENCIES

F. L. SCHADE, M.D.
Worthington, Minnesota

NOWHERE in the entire field of medicine can dire emergencies develop as suddenly and acutely as in obstetrics. Twenty-five years ago there were few specialists in this field. Most women were delivered by the family doctor or kindly neighbor women. Today, a growing number of women in the United States recognize the better care provided by physicians especially trained in obstetrics, and the demand for maternity care by specialists is increasing. However, the general practitioner today is conducting and, I think, always will conduct the vast majority of childbirths in the United States. Therefore, the management of obstetric emergencies lies in our hands as well as in the hands of specialists.

When we, as practicing physicians, accept the responsibility of taking care of a woman through her prenatal care and labor, it behooves us to be adequately prepared for any emergency that may arise. The phrase, "Too little and too late," applies all too often to tragedies occurring in the delivery room.

As many obstetric emergencies involve hemorrhage and/or shock and transfusion; and as time is such an important factor in these conditions, the Rh status of every pregnant woman should be determined during the early part of her pregnancy. The pregnant woman's blood should be tested for hemoglobin content, Rh factor, and Wassermann reaction, the first time she presents herself for prenatal care. If the patient is Rh negative, an Rh negative donor in the proper group must be found and the name of the donor put on her record. Some centers go so far as to determine the blood group of each pregnant woman. When a woman goes into labor, plasma should be on hand to combat shock and hemorrhage while blood is being obtained for transfusion.

Let us quickly review the emergencies which well may arise!

Placenta Previa

This condition occurs in at least one of 300 obstetric patients. When the placenta is implanted in the region of the internal os, partial detachment with hemorrhage results from the tissue realignment incident to formation of the lower uterine segment. The initial hemorrhage appears at or before the onset of labor, and every patient with placenta previa must be considered as a candidate for fatal hemorrhage; thus—

1. A patient with suspected placenta previa should be immediately hospitalized.
2. Her blood should be typed and cross matched.
3. A donor should be selected and ready for immediate blood transfusion.

Cystography in the diagnosis of placenta previa was introduced in 1934 by Ude, Weum, and Urner, who outlined the soft tissue space between fetal presenting part and bladder by filling the latter with an opaque medium. The technique used is as follows:

1. Empty bladder with a catheter.
2. Introduce 40 c.c. of sodium iodide solution into bladder, clamp catheter.
3. Anteroposterior film with tube centered on bladder and table tilted, feet down ten degrees from horizontal.
4. Unclamp catheter, allow bladder to drain. Remove catheter.

The interpretation of the roentgenogram in vertex presentation may be difficult, and in breech and transverse presentations it is virtually impossible.

Dipple and Brown, in 1940, were able to visualize the placenta with a single roentgenogram in about 90 per cent of 200 pregnant women by using a soft tissue technique. Interpretation and x-ray technique requires experience for accuracy. The x-ray method represents a distinct advance in diagnosis but for accuracy cannot displace sterile vaginal examinations. There is only one absolute diagnosis of placenta previa—namely, digital palpation of the placenta through the cervical os. When the gloved finger introduced through the os cannot feel placenta, the patient does not have placenta previa.

A note of warning! Digital examination must

Read in the symposium on Obstetrics in General Practice at the annual meeting of the Minnesota State Medical Association, Duluth, Minn, July 1, 1947.

never be performed until the delivery room is completely set up for emergency delivery, since palpation of the placenta occasionally produces more bleeding.

Delivery is mandatory after repeated bleeding. The method of delivery may be vaginal or abdominal and the choice of procedure depends largely upon the probability of fetal salvage.

If the fetus is viable, a cesarean section should be performed on all cases of complete placenta previa. If the placenta previa is marginal or incomplete or if the fetus is not viable, one may resort to vaginal delivery. Acceptable vaginal methods include:

1. Spontaneous labor with or without rupture of membranes. Spontaneous labor may be brought about by medical means and artificial rupture of membranes.
2. Scalp traction. Personally I have never resorted to this means of delivery.
3. Insertion of a hydrostatic bag.
4. Braxton-Hicks version. This, of course, should never be attempted before full dilation of the cervix.

Except for the spontaneous labor with or without antecedent rupture of membranes, all these methods increase the fetal hazard.

Premature Separation of the Normally Implanted Placenta

(Ablatio or abruptio placenta)

These terms are reserved for the separation of all or part of the normally implanted placenta occurring after the twenty-eighth week of gestation and prior to the onset of the third stage of labor. The incidence of premature separation is variously reported between 1:100 and 1:500.

Symptoms.—A moderate amount of vaginal bleeding usually associated *with pain* indicates partial placental separation. If the placenta is implanted on the anterior wall of the uterus, there is frequently a circumscribed area of uterine tenderness.

Vaginal examination, again under sterile precautions, revealing no evidence of placenta previa, confirms the diagnosis by exclusion.

Treatment.—As with placenta previa, the value of blood transfusion cannot be overemphasized. Even with mild vaginal bleeding, the physician must make preparation even though subsequent events render transfusion unnecessary. In every case, management depends upon the rate of bleeding and the condition of the cervix. Minimal bleeding requires little or no treatment. When bleeding is at a rate demanding delivery for hemostasis, whether we use the abdominal or vaginal route depends upon the condition of the cervix. With an uneffaced, firm and tightly closed cervix, cesarean section is mandatory.

Cervical effacement and partial dilation generally motivate vaginal delivery. Artificial rupture of the membranes institutes labor and the bleeding is controlled by the contracting uterus. If necessary, small doses of pitocin may be administered with relative safety. Never give more than one minim of pitocin for the initial dose! If these measures do not control the bleeding, insertion of a Voorhees bag to produce compression on a possible low-lying placenta, and the occasional employment of an abdominal binder, to raise intrauterine pressure to parity with the blood pressure, may be beneficial.

Uteroplacental Apoplexy or the Courvelaire Uterus

This rare accident is too dramatic to omit, although the average practitioner will probably never encounter it. Retroplacental hemorrhage is sudden, extensive and forceful, and produces acute symptoms of profound shock and boardlike uterus. The typical boardlike uterus is not simulated by any other condition. Immediate cesarean section is the treatment of choice; despite known presence of a dead baby. Why cesarean without fetal salvage? In this condition blood infiltrates directly into the uterine muscle, dissociates the muscle fibers and inhibits uterine contractility. If the uterus will not respond to oxytocic drugs, a hysterectomy must be done.

Postpartum Hemorrhage

One just cannot discuss obstetric emergencies and omit postpartum hemorrhage. As we are bringing the toxemias of pregnancy and the puerperal infections under control, hemorrhage is assuming a relatively more important role in maternal mortality.

It is unfortunate that accumulated experience is not as impressive as personal experience and that some women must die to make some of us "hemorrhage conscious."

The emergency tends to appear at a time the attendants are relaxing. The baby is born, the labor is all but concluded, when suddenly a desperate fight to save the patient's life ensues.

Preparedness and the prompt institution of treatment can all but eliminate one of the most frequent causes of maternal mortality. Deaths from hemorrhage are largely preventable.

As a prophylactic measure, especially in hospitals without blood banks, the routine practice of typing all obstetric patients prenatally is recommended. Also, the Rh status of each obstetrical patient should be established and special precautions taken should the patient be Rh negative.

Prolapsed Cord

Prolapse of the cord in vertex presentation is usually an indication for immediate delivery, provided the child is alive and the cervix is dilated enough. This implies six to seven centimeters dilation in multigravid and eight to nine in primigravid women. With dilations less than these, hasty extraction of the child usually leads to severe cervical lacerations and seldom results in a living child. Delivery by forceps is justifiable only if the head lies at mid-plane or below. With higher stations, the procedure of choice may be podalic version and extraction.

If the cord has prolapsed and the proper dilation has not been obtained, the patient should be placed in a deep Trendelenburg's position and closely watched until the cervix is dilated sufficiently to permit the necessary maneuvers. Replacement of the cord through a partially dilated cervix is almost universally unsuccessful and I believe should not even be attempted. Prophylactic doses of penicillin or one of the sulfa drugs should be given to each patient with cord prolapse to prevent ascending infection.

Prolapse of the cord occurs once in approximately 150 deliveries and its occurrence depends upon three factors: the presence of an excessively long cord; inadequate filling of the pelvic basin by the presenting part; and ruptured amniotic sac.

Tetanic Contraction of the Uterus

Tetanic contraction of the uterus is a possible sequel to administration of pituitary extract. Doses as small as one minim may produce tetanic contractions enduring as long as five minutes. Other factors, including long or obstructed labors, are operative in causing this condition unless the uterus can be relaxed. Two dangers become imminent, rupture of the uterus and asphyxia of the child. The time-honored remedy is ether anesthesia. Magnesium ions have a relaxing effect and the intramuscular administration of 2 c.c. of a 50 per cent aqueous solution of magnesium sulfate may be of benefit.

Bandl's Ring or Contraction Ring

The upper active contractile segment of the uterus and the lower passive segment are separated by a physiologic ring of muscle which normally is of little significance. In mechanically obstructed labors, the upper segment progressively becomes thicker and the lower thinner. This produces a gradual elevation of the physiologic ring above the symphysis.

In rare instances pathologic constriction of this physiologic ring about the child occurs. In these cases a spastic stricture of uterine muscle is produced. Diagnosis is made by internal palpation. The ring will probably not disappear but may be sufficiently relaxed to permit delivery following the intravenous injection of five minims of 1:1000 epinephrine solution. Deep ether anesthesia also has a relaxing effect.

Uterine Rupture

Rupture of the uterus occurs once in 2000 to 3000 cases and may be incomplete or complete. Despite its infrequency, discussion of the accident is included because of its dramatic nature and potential dangers.

The fetal mortality approaches 100 per cent and the maternal risk is considerable.

The principal etiologic factors include: previous cesarean section; previous cervical operation or repair; obstructed labor with overdistended uterine segment and operative procedures, especially internal version.

The diagnosis of uterine rupture is based upon sudden, acute and lancinating pain, with abrupt cessation of uterine pain and cessation of labor, and the rapid development of hemorrhage and profound shock.

The rupture of a previously intact uterus may cause a dire obstetric emergency from shock and hemorrhage, and death within the hour unless heroic measures are applied.

Two methods of treatment are current: conservative and radical. Conservative treatment consists of either uterine and vaginal tamponade, or laparotomy with suture of the rent. Hysterectomy represents the radical method of treatment. The latter is much preferred and is the generally accepted treatment. Its advantages are numerous and offers the best chance of recovery for the mother. Nowhere in the entire field of medicine is there such vital need for rapid mobilization of facilities and early administration of plasma and blood as in the emergency of acute uterine rupture with severe hemorrhage. Sometimes rapid hysterectomy is demanded despite falling blood pressure. Plasma and blood must be given while the operation is being performed.

Inversion of the Uterus

Inversion of the uterus is a rare obstetric complication but mention is made here because it appears with sufficient frequency to make it necessary for anyone doing obstetric practice to familiarize himself with therapeutic procedures for this condition. Reported incidence in various parts of this country has ranged between 1:740 to 1:16,000 deliveries.

Attempts to expel the placenta before its separation either by pushing from above or by pulling on the cord may be a predisposing cause although the fundamental etiologic factor is unknown.

The symptoms are shock and hemorrhage associated with absence of the uterine body from the abdominal cavity and its presence in the vagina as a rounded tumor, a mass whose upper end is constricted by the encircling cervix.

Active and long-continued shock therapy is all-important! The immediate replacement of the inverted uterus under deep anesthesia has given the unfavorable mortality rate of 10 to 43 per cent. A few writers have pointed out that this is a dangerous and unnecessary procedure.

Recent treatment has been to deal with the inversion *per se* at any suitable time after the patient is restored to normal health, preferably four to twelve weeks following the acute episode. The inverted uterus may be left entirely alone unless the extent of the bleeding from it is such as to require the application of a tight vaginal pack. Treatment of the shock is the all-important thing. If it is not present, it should be anticipated. Multiple blood transfusions may be required not only to combat the shock but also to hasten the restoration of normal hemoglobin levels. Systemic chemotherapy should be instituted at once as a prophylactic agent. Local infection should be further combated with daily application of local antiseptic vaginal packing. After four to six weeks in the hospital, the well-involuted uterus may then be restored surgically to its normal position or removed.

In conclusion, I wish to place emphasis on being prepared for the emergencies that may be expected in an obstetrical practice. We, as general practitioners, conduct the vast majority of childbirths. Emergency is a *sudden* condition—calling for *immediate* action, and time is an all-important factor. By its very nature, we cannot place the care of emergencies in the laps of specialists.

DOES IT PAY TO WORK HARDER?

Does it pay to work harder? For the man who earns $4,000 above his exemption, it manifestly pays to work harder and earn $2,000 more, for Uncle Sam lets him keep three dollars out of every additional four that he gains by his hustling. The man making $8,000 above his exemption will probably feel it worth while to add $2,000 to his income, for he is still privileged to keep two out of every three added dollars. However, for the man having an income of $15,000 above his exemptions, the worthwhileness of striving to take in another $5,000 raises serious questions in his mind, for, in his case, the Federal Government takes more than half of the added gains. One can hardly expect the man receiving $100,000 to be much interested in doubling his income, for, if he does, he can only keep for his own use one dollar out of every additional seven.

Obviously, the present income tax law constitutes an effective device for preventing the most efficient business and professional men from fully utilizing their talents. The law acts, therefore, as a damper on production, and hence lowers the income of the average citizen.

In addition, it prevents him from accumulating capital, and thus hampers not only his progress, but that of the nation as a whole. These are the results which advocates of progressive taxation persistently refuse to consider. There are none so blind as those who will not see!

THE GENERAL PROBLEM OF ANESTHESIA IN OBSTETRICS

EDWARD B. TUOHY, M.D.
Rochester, Minnesota

THE problem of providing anesthesia to women in childbirth and of performing the safe delivery of newborn infants is a major responsibility, especially for the general practitioner. In hospitals where obstetric facilities are readily available the teamwork between the anesthesiologist and the obstetrician simplifies somewhat the general problem of handling the parturient mother.

There are certain factors which should be considered in the choice of any general or local anesthetic, analgesic or amnesic agent. They are as follows:

1. What is the physiopharmacologic action of the agent on both maternal and fetal structures?
2. What fetal or maternal diseases or abnormalities exist which may alter the selection of certain agents?
3. What agent or agents and method are best suited to the emotional and physical status of the mother?
4. Is the method used one which will afford the greatest safety to the mother and the infant?

Certain criteria should be present in the choice of any agent or method. These agents should possess adequate properties to obtund the pains of labor without any untoward systemic reaction. Secondly, the agent should be reasonably prompt in its action and should not possess cumulative effects. Thirdly, effective means of counteracting an overdose or idiosyncrasy to the agent should be available.

It might be pointed out at this time that the wisdom or advisability of the attempts to relieve the pains of labor totally have been seriously questioned by some authorities on this subject. De Lee and Greenhill have emphasized repeatedly the price that is paid to make childbirth painless. Heaton in writing on obstetric anesthesia and analgesia commented: "Perhaps, as the psychiatrists have suggested the inordinate demand for painless childbirth is symptomatic of the anxiety and insecurity existing among certain groups in our culture today. It is questionable from a psychologic standpoint whether the passive role assigned to women in painless childbirth is a desirable one."

Opinions of various investigators with respect to the effects of certain agents are occasionally controversial, so that the comments made here are a composite opinion and not one individual's conviction.

Many methods of analgesia and anesthesia have been proposed but some of these are limited in their practical application because they are too technical and complex. Continuous caudal anesthesia might be mentioned as an example of a highly technical procedure which is very valuable but has limited application. In the conduct of the average uncomplicated labor and delivery the obstetrician and the anesthesiologist, singly or together, focus their attention on amnesic, analgesic and anesthetic agents which will obtund pain and produce at least relative amnesia. In the first stage of labor analgesic and amnesic agents are usually sufficient. In the second and third stages of labor anesthetic agents are required, as a rule.

First Stage of Labor—Amnesic and Analgesic Agents

At present, scopolamine in conjunction with a barbiturate such as pentobarbital sodium is one of the most effective combinations. The dose of scopolamine is 1/150 or 1/100 grain (0.00043 or 0.00065 gm.) hypodermically administered when labor pains are well established and regular and there is effacement and beginning dilatation of the cervix. Simultaneously 1½ to 3 grains (0.1 to 0.2 gm.) of pentobarbital sodium are given orally. The administration of scopolamine is repeated about one hour after the initial injection. Some authorities recommend three doses of 1/100 grain (0.00065 gm.) of scopolamine alone subcutaneously administered at intervals of half an hour when labor is established. The duration of action of scopolamine is about two hours in the dose mentioned. In prolonged labor additional amounts of scopolamine may be required at intervals of two hours. At least one drawback to this method is the occasional occurrence of extreme excitability and stimulation of the patient, necessitating constant nursing attention.

From the Section on Anesthesiology, Mayo Clinic, Rochester, Minnesota.

Read in the symposium on Obstetrics in General Practice at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1947.

Another combination of agents which has more analgesic effect as well as amnesic action is the use of scopolamine, barbiturates and demerol. The experience of several investigators has shown that the combination of demerol and scopolamine causes less fetal respiratory depression than scopolamine and demerol plus a barbiturate. A suggested regimen with these agents is the hypodermic injection of 100 mg. of demerol along with 1/150 grain (0.00043 gm.) of scopolamine when the labor pains are strong and regular. If these two agents are not quite sufficient a barbiturate can be given orally or rectally as a supplement. The administration of demerol and scopolamine may be repeated at intervals of three to four hours.

At this point a word should be said about morphine and pantopon. In general, these opiates should not be used within less than two hours from the time of delivery, since they cause fetal respiratory depression, and when a general anesthetic agent follows in sequence the incidence of asphyxia neonatorum is definitely increased. This is particularly true when one is dealing with premature infants.

Rectal analgesia should be mentioned because it is liked by many obstetricians and is a well-accepted method of producing analgesia in labor. Ether in oil (65 per cent ether—35 per cent oil), the original Gwathmey technique, has been modified to include paraldehyde, avertin, chloral hydrate and pentothal sodium as rectal analgesics. The use of intravenous anesthesia is not recommended, as a rule, in labor because of the rapid and concentrated action of the agent on both fetal and maternal respiration.

Of the inhalation anesthetic agents for obstetric analgesia both the volatile agents, such as ether, chloroform and divinyl ether, and gases, such as nitrous oxide, ethylene and cyclopropane, are employed. Whereas various techniques of administration of these agents have been described, including self-administration, they are usually administered during the second stage of labor when anesthesia rather than analgesia is required.

Analgesia and Anesthesia in the Second and Third Stages of Labor

Multiparous women give birth frequently spontaneously without the addition of any agent other than the basal analgesia supplied. In most cases, however, some form of general anesthesia or regional anesthesia is required. Time-honored drop ether and chloroform are used extensively, particularly in deliveries at home. In hospitals where the assistance of an anesthesiologist is available many combinations of agents may be used. During delivery when the presenting part distends the perineum the depth of general anesthesia should be carried to plane 1 or 2 of the third or surgical stage of anesthesia. Uterine contractions are not abolished at this level of anesthesia but such procedures as episiotomy and application of forceps can be done without pain to the patient. Nitrous oxide will usually require the addition of ether vapor to provide safe anesthesia in the second and third stages of labor. One should avoid using any concentrations of nitrous oxide greater than 80 per cent along with 20 per cent oxygen. Cyclopropane and ethylene are best suited for the terminal stages of labor and should be administered carefully by the closed technique.

Regional Anesthesia

Many procedures have been and are being used, including pudendal block, transsacral block, paravertebral block, caudal block, local infiltration and low spinal anesthesia. Certain techniques require specific training, skill and experience; others, such as local infiltration and pudendal nerve block require minimal specialized technique. Tucker and Benaron, Cleland, Lull and Hingson, Lundy and Tovell and others have described their techniques, and the merits of these techniques are well established. For example, pudendal nerve block is a successful type of block anesthesia for many obstetric operations, including spontaneous delivery, low forceps application, episiotomy and perineorrhaphy. The contribution of Hingson and his associates has shown that the continuous caudal method has a definite place in obstetric anesthesia. It should be performed only by those persons familiar and sufficiently trained in regional anesthesia to know the indications and contraindications to this method. Caudal anesthesia is applicable chiefly to hospitalized patients. Low spinal or saddle anesthesia with hyperbaric solutions is becoming more and more widely used. Any one of several local anesthetic agents may be used; for example, procaine hydrochloride or pontocaine hydrochloride. If procaine hydrochloride is used 50 to 75 mg. are dissolved in 2 c.c. of 10 per cent solution of dextrose. After a lumbar puncture at the level of the third and fourth lumbar interspace, this mixture is diluted with an equal volume of spinal fluid and injected slowly. The injection is made with the patient in the sitting position. Anesthesia is established quickly and lasts for one to one and a half hours. Postpartum bleeding is diminished and the babies have little, if any, respiratory or circulatory depression.

Cesarean Section

Cesarean section presents a difficult problem as far as the choice of anesthesia is concerned. What may be best for the mother may not be best for the fetus. Prolonged general anesthesia leads to marked fetal respiratory depression and often to death of the fetus. Improperly controlled spinal anesthesia has led to disastrous results. Local infiltration or block anesthesia of the lower abdominal wall in combination with inhalation anesthesia or intravenous anesthesia at the time the uterus is opened has been advocated by many authors. If the timing of the general anesthetic agent is correct, little, if any, depression of the unborn child occurs. The objection to this procedure by the mother is the main obstacle.

Hingson has advocated continuous caudal anesthesia utilizing posture to advance the anesthesia high enough to permit incision of the abdominal wall above the umbilicus. The continuous spinal technique has offered another method of anesthesia which, if performed carefully, will permit safe and satisfactory results for the mother and child. There is usually less loss of blood in cesarean section with local, caudal or continuous spinal anesthesia than with inhalation anesthesia. Of the inhalation anesthetics, if they alone are used, cyclopropane is best as far as the baby is concerned but resuscitation procedures are much more common in these cases than with regional methods or combinations of regional and general methods.

Anesthesia in Complications of Pregnancy

Several outstanding complications are noteworthy; namely, (1) hypertensive cardiac disease, (2) nephritis, (3) pre-eclampsia and eclampsia, (4) pernicious anemia, (5) leukemia, and (6) other blood dyscrasias, including hemorrhagic diathesis. In the presence of these complications local or regional anesthesia is to be preferred to general anesthesia, particularly with ether, chloroform or avertin.

Conclusions

If I may quote from an anonymous editorial:[3]

"The obtundation of pain and discomfort incidental to parturition must necessarily occupy a secondary role in most obstetricial deliveries. It does not follow, however, that the pains during labor and delivery usually do not belong in the same category as pain associated with disease or that caused by surgical operation. Labor is not a disease, and expulsion of the fetus is not always a surgical operation. They usually constitute a physiologic process.

"The medical profession and its scientific allies have not ignored the pangs of the parturient. In fact efforts have been so generous at times that pain relief seems to be exalted from its secondary role in obstetrics to a place equalling the more essential functions of the accouchement.

"During all the anesthesia years every new drug or method introduced to facilitate surgery or allay pain has found its way into obstetric practice. The use of ether and chloroform during childbirth had a formidable place in early controversies surrounding the acceptance of anesthesia but the drugs have played an important role in obstetrics since. The lay press and non-medical benefactors formulated and expressed opinions on the merits of the early pain-relieving procedures. They have followed through with similar journalistic efforts with the advent of every new departure. Not infrequently obstetricians have resented the publicity and particularly the inaccuracies published for public edification. Their remonstrances have led the modern accredited press to more conducive reporting based upon statements that may claim authority. However, enthusiasm may often obscure the acumen of the physician as well as the journalist."

It should be our aim to make pain of the parturient as easy as possible, constantly keeping in mind the safety of the newborn and the mother.

MEDICAL THERAPY IN ULCERATIVE COLITIS

P. G. BOMAN, M.D.

Duluth, Minnesota

THE term ulcerative colitis has been used in connection with a variety of lesions of the colon characterized by inflammation and ulceration. Many writers[7,9,10,13] do not attempt to classify or to differentiate these conditions except along general lines, but Bargen and associates[1,2,3] have long contended that only by classifying them according to etiology can we properly understand and treat these situations. It is obvious that an etiological basis can be found and demonstrated in many cases of ulcerative colitis, i.e., those due to tuberculous, amebic, bacillary and venereal lymphogranulomatous infections.

There is considerable uncertainty about the largest group which Bargen has classified under the term, "streptococcic ulcerative colitis" and which he differentiates from the regional colitis and the colitis of unknown origin. Others classify these conditions under one heading, contending that they are different manifestations of the same disease. Kiefer and Jordan[10] have defined this type as "a chronic disease of unknown etiology in which there is a diffuse inflammatory reaction involving all coats of the colon and rectum, either as a whole or as a part—subject to unexplainable remissions and exacerbations—and complicated by varying degrees of sepsis, ulcerations and necrosis of the mucosa which often results in extensive fibrosis of the intestinal wall." Bockus[9] defines it as "a clinical syndrome ushered in with a suppurative, ulcerative inflammation of the colonic mucosa with or without a recognizable initial specific bowel infection, but associated with a bacterial or toxic invasion of the bowel wall, conditioned by varying immunologic, allergic, nutritional and nervous phenomena." It seems obvious that no single etiologic agent obtains and that various factors enter in. Influence of nutritional and emotional states[4,6] and allergic manifestations[14] must be given consideration along with infectious and toxic factors. The one consistent and constant fact about this type is that the reaction in the wall of the bowel, viewed through the proctosigmoidoscope or demonstrated by the roentgenogram, is characteristically diagnostic and not usually confused with other clinical conditions. The lesions begin in the most distal portion of the rectum and progress upward. Whether a small part of the colon or the entire colon is involved, the lesions are continuous, uninterrupted and affect the entire wall of the bowel. In the early stages the mucosa presents a diffuse congestion and edema with tiny submucosal hemorrhages. In the chronic stages the mucosa has a dull red appearance with a rough granular surface which bleeds with the slightest trauma. Necrosis, ulceration and sloughing of the mucosa are only seen in the most severe forms. Anal and peri-anal lesions are common complications and polypoid changes in the mucosa are late sequelae. Malignant changes undoubtedly take place in some of these. Adenocarcinoma of the bowel has been reported by Kiefer and Jordan[10] in 7 per cent of chronic cases of ulcerative colitis. Polypoid changes probably different from the usual colonic polyps had developed in these cases. The relationship of real polyps to carcinoma is well known.

Because of the extensive involvement of the wall of the bowel, the roentgen picture is characteristic, especially in the chronic form. There is a narrowing of the lumen, loss of haustral markings and a shortening of the colon, giving it in the later stages the appearance of a smooth tube. In the early and mild cases where the disease is limited to the rectum, the roentgen findings may be normal.

The clinical manifestations are extremely variable, depending upon the stage of the disease and the extent of the involvement of the colon. In the mild cases with involvement of the rectum or rectosigmoid, general systemic symptoms may be mild or absent. There may be normal bowel movements with additional purulent bloody discharges occurring two to three times a day. As the disease progresses, the rectal discharges increase until diarrhea results and, correspondingly, general systemic effects become apparent. In the severe fulminating form the disease progresses rapidly, with severe local and systemic effects.

From the Department of Internal Medicine, the Duluth Clinic, Duluth, Minnesota.

Read in Symposium on Gastrointestinal Ulcerative Diseases at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 30, 1947.

There may be high fever, frequent bloody discharges from the rectum, great prostration and rapid decline. The disease may progress slowly or remain latent for long periods, only to become active again. Often the insidious form may become fulminating following some intercurrent infection or emotional disturbance.

Regional ulcerative colitis and ulcerative colitis of unknown origin are considered by Bargen[2] as being separate and distinct from the streptococcic variety. Others[5] feel that they are atypical manifestations of the same disease. In the regional type any part of the colon may be involved, ranging from 6 to 12 inches in length and with normal adjacent bowel. The disease may be acute or chronic, occasionally fulminating in character. The symptoms will vary according to the severity and chronicity of the disease. There is usually diarrhea which may be mild or moderately severe and is often preceded by abdominal cramps or pain localized in the lower abdomen, more often in the lower right quadrant of the abdomen. The cramps and pain are usually relieved by evacuation of the bowel. The stools are as a rule mushy, liquid or mucoid in character and may or may not contain blood. Gross hemorrhage, while rare, may occur. General manifestations are generally apparent and at times are more severe than those seen in the average diffuse type. In the more severe cases they are characterized by fever, weight loss, anemia and occasionally by ocular, joint and cardiac complications. The etiology is obscure and may well be similar to that of the generalized form of chronic ulcerative colitis. The diagnosis depends on the clinical picture, characteristic roentgen findings, and the absence of a specific etiological factor.

Amebic ulcerative colitis caused by the Endamoeba histolytica involves primarily the cecum and the flexures of the colon although the entire bowel may be involved, in which case the lesions are visible through the proctoscope. They present a characteristic picture of punched-out areas with raised margins surrounded by a hyperemia and covered by mucus. Between the ulcers the mucosa appears normal. The involvement is mainly in the mucosa and not in the wall of the bowel. While the symptoms as a rule are mild and general systemic effects are not noted, severe manifestations may be observed. Bleeding occurs relatively late in the disease instead of being present as one of the early symptoms. The roentgen findings are usually characteristic and a great help in the diagnosis. Early in the disease there may be some narrowing and irritability of the cecum and ascending colon. Later the cecum becomes coned or narrowed and irregular narrowing may be noted in the entire ascending colon, differing from the smooth diffuse narrowing encountered in the streptococcic type. The demonstration of the Endamoeba histolytica in motile or cyst form will confirm the diagnosis.

Ulcerative colitis due to the virus of venereal lymphogranuloma involves the distal portion of the colon and the rectum. The disease attacks the entire wall as well as the mucosa and the lymphatics around the bowel, producing a rather stiff, thickened tube. Multiple small sinuses from the mucosa to the deeper structures may result. Symptoms are minimal and complaints concern mainly, rectal discomfort. The diagnosis is made from the proctoscopic appearance, the history of previous venereal infection and the positive Frei test.

Chronic bacillary infection of the intestinal tract may produce ulcerative lesions. The lesions are regular as to size and shape and are disseminated. While the roentgen findings may be characteristic, the diagnosis depends on positive stool cultures or positive agglutination tests. Specialized technique employed by experienced laboratory personnel is essential in making these stool cultures if reliable results are to be obtained. The agglutination tests may be unreliable because of antigenic variants.

Tuberculous ulcerative colitis, while usually associated with tuberculous disease in the small bowel, may occur as a primary entity. It is usually secondary to tuberculosis of the lungs or tuberculosis in some other part of the body. The ulcers are distributed irregularly and are associated with lesions visible on the serous surfaces of the bowel and with miliary tubercles. The disease progresses from the ileum downward and involves most frequently the proximal portion of the colon. Seldom are the lesions visible through the proctoscope, and one must rely on the roentgen evidence to make the diagnosis.

While it is not generally accepted that intestinal allergy is a primary factor in the development of true ulcerative colitis, Rowe[14] believes that chronic ulcerative colitis may be caused by severe allergic reactivity in the colonic mucosa similar to that responsible for atopic dermatitis. Ulceration, fibrosis, scar tissue formation and bowel perforation may arise from superimposed secondary infections from various bowel bacteria. Bargen is of the opinion that intestinal allergy should be considered as a condition quite apart from ulcerative colitis. He states that it may play a part in many ulcerative intestinal inflammations, but that it is not necessarily causative in any of them.

The proper medical management depends on classifying the various types of ulcerative colitis from the standpoint of etiology and on a careful differential diagnosis. While it is doubtful that any medical regime can bring about a permanent cure of this disease, much can be done to promote a remission or an arrest of the active disease. If organic changes, such as fibrosis and scarring, have occurred, these are as a rule permanent and irreversible, and surgical treatment may be indicated. However, under these conditions, medical management may produce improvement in bowel function and in the general health of the patient as the active phase of the disease is arrested.

Medical management might well be divided into (1) general supportive measures and symptomatic relief, and (2) the use of specific measures best suited to the individual case. In the idiopathic or streptococcic type of ulcerative colitis, rest plays an important part. In mild cases rest in bed may not be necessary. However, in the more severe cases total body rest is indicated. Increasing recognition of the role played by mental and emotional stress as the precipitating or aggravating factor merits our attention.[6,7,9] Due consideration should be given to this factor and attempts should be made to eliminate it as far as possible. Oftentimes psychiatric approach and treatment may be necessary. In many instances, assurance and the use of simple sedation will be sufficient.

Likewise, rest for the colon in the form of relieving intestinal peristalsis should be secured; this can best be obtained by the selection of a proper low-residue diet, the use of adsorptive powders, such as bismuth and kaolin, the use of antispasmodics and, at times, opium and its derivatives.

Dietary considerations are important both from the standpoint of preventing irritation in the lower bowel as well as that of correcting malnutrition. The diet should be high in calories, proteins and vitamins and low in residue. The amount and type of food will depend upon the patient's ability to tolerate it. It may be necessary to begin with small feedings, increasing the food intake cautiously until an optimum amount can be taken. Supplemental vitamin administration is indicated in nearly all cases. In the more severe and fulminating cases, if malnutrition and hypoproteinemia are present, whole blood, plasma and intravenous amino acids are indicated. When allergic manifestations or deficiency states are present, special consideration must be given to these factors.

As anemia is almost invariably present and in many instances may be severe, this must receive careful attention. The more severe anemias must be treated by blood transfusions, using a series of small transfusions rather than a few of larger amounts. Iron should be given in minimal amounts and administered with caution because of the irritating effect often produced on the intestines.

Chemotherapy in ulcerative colitis has shown varying results. Many optimistic reports on its use have been noted, especially in the acute and septic phases, but often it has proven of little or no demonstrable value. While there does not appear to be any specific effect upon the primary cause of the disease, there is undoubtedly considerable value in the control and prevention of secondary bacterial invasion. Various drugs of the sulfonamide series, such as azosulfamide (neoprontosil), succinlysulfathiazole (sulfasuxidine), sulfaguanidine, sulfathaladine, nisulfadine and nisulfazole have been used with varying success. Azosulfamide and succinlysulfathiazole have received the most favorable mention.[2] In the acute septic cases a more absorbable form, such as sulfadiazine, may be indicated. Average amounts may range from 50 to 100 grains daily, given in divided doses. Careful consideration must be given to the reaction of the individual patient and the administration governed accordingly.

Penicillin and streptomycin have shown promise in certain cases, especially when used in the acute cases.[11,12,15] However, they have not been given adequate trial to fully evaluate them. It seems probable that their effect will be similar to that of the sulfonamides. Bargen has long been an advocate of the use of antistreptococcus vaccine and feels that it is of distinct value in prolonging remissions and in preventing recurrences. Fever therapy produced by the intravenous administration of typhoid vaccine has been used in the chronic form with results comparable to those obtained with other forms of medical therapy.[16]

Recently A. Morton Gill[8] of London has reported on the use of a preparation extracted from the mucosa of the small intestines of pigs. While the results were encouraging, further study is necessary to evaluate this form of therapy.

There has been considerable difference of opinion as to the use of surgical measures in nonspecific or streptococcic ulcerative colitis. Bargen believes that this form of therapy should be reserved for complications and for use in certain patients who do not react favorably to a careful medical regime. In his experience the mortality, especially in the acute severe cases, has been lower under medical management than where surgery has been employed. Kiefer and Jordan and associates believe that well directed and aggressive surgical measures will save many lives, especially in the acute septic cases, and that it will also rehabilitate chronic colitis invalids. They state that total colectomy can be called the only actual cure of ulcerative colitis now available.

Ileostomy, which is employed to place the colon at rest, seems indicated in acute febrile cases as an emergency measure where medical management has failed, in impending perforation and in instances of gross hemorrhage. The mortality in these cases will be high, especially if it is done as a last resort. If the procedure is carried out early before the patient's resistance has become too low, the mortality is reduced.[10] In the chronic cases where recurrences are frequent and severe and where complications are developing, ileostomy should be considered. It is seldom that an ileostomy is of a temporary nature and must be considered as a permanent measure or as preliminary to complete colectomy. Partial or complete colectomy will in certain instances restore chronic invalids to a useful existence. Considered judgment and surgical skill are necessary to obtain a low mortality.

In regional ulcerative colitis, medical management of the type described above may bring about remissions and apparent cure. However, it is largely confined to the problem of rehabilitation for future surgical treatment. Because of the high incidence of recurrence and the unpredictable manner in which this disease behaves, radical surgical excision is the treatment of choice. This should only be carried out after a careful and proper rehabilitation of the patient and the reduction of infection to a minimum.

In amebic ulcerative colitis, a combination of general supportive measures and the administration of suitable preparation of ipecac, arsenic and iodine will usually control or cure the disease. Continued observation of the patient with examination of the stools is necessary in order to ascertain whether the treatment has been effective. The drugs usually used are emetine hydrochloride, carbarsone, diodoquin and chiniofon.

In the chronic bacillary type of colitis, the sulfonamide preparations, particularly sulfadiazine, succinylsulfathiazole and sulfaguanidine, have given very satisfactory results. In the acute stages sulfadiazine alone or in conjunction with succinylsulfathiazole or sulfaguanidine should be used. In the more severe chronic cases sulfaguanidine given in large doses has been most effective.

In ulcerative colitis due to the virus of venereal lymphogranuloma, chemotherapy, especially the sulfonamide compounds, has proven of the greatest value. Here again succinylsulfathiazole and sulfaguanidine appear to be the most useful because of their lack of toxicity and because of the minimal systemic absorption.

In tuberculous ulcerative colitis, the newer forms of chemotherapy, especially streptomycin and some of the newer sulfonamide compounds, undoubtedly will prove of great value in the management of this disease. This must be supplemented with adequate care in a sanatorium with all of the known therapeutic measures usually used in the treatment of tuberculosis.

Summary

1. Ulcerative colitis is a disease of known and unknown etiologies characterized by specific changes in the colon and influenced by various infectious, toxic, allergic, nutritional and neurogenic factors.

2. Classification according to etiology is necessary to properly understand and treat this disease.

3. Medical management is dependent on a careful differential diagnosis and the proper application of known effective theraputic measures.

4. Surgical measures complementing medical management are indicated in severe, intractable cases and in the presence of complications.

MEDICAL TREATMENT OF PEPTIC ULCER

J. ALLEN WILSON, M.D., Ph.D.
Saint Paul, Minnesota

IN considering the medical treatment of peptic ulcer, the treatment of the patient and his problems, conflicts and habits is fully as important as the treatment directed at the ulcer. Bockus[1] has emphasized that the mental conflicts and anxieties common to all of us contribute to the development, chronicity, and recurrences of peptic ulcer. Business or financial worries, marital incompatibility and domestic unhappiness are common factors.

We all know how the stresses of this last war caused a tremendous increase in the incidence of ulcer. One authentic striking example occurred in the crew of an American submarine which was submerged and under heavy depth charging by a Japanese destroyer squadron for forty-eight hours. When that submarine finally limped into port, 40 per cent of the crew had developed severe gastrointestinal syndromes and 14 per cent of the crew were found to have definite peptic ulcers.

Many a patient first notices ulcer symptoms after vainly trying to perform the duties of a job for which he is not suited or qualified. The treatment of those patients includes an effort by the physician or psychiatrist to help remove the nervous tension or conflict. Where domestic unhappiness exists, the patient should be removed from that environment to a hospital for the first part of his treatment. A talk with the patient's employer may straighten out the worry about his job. Getting the patient to take a much needed vacation or to go off on fishing or hunting trips or to develop a hobby are all means of helping the nervous background for ulcer. Encouraging the patient to develop regular hours of eating and sleeping and to eat slowly are all important parts of treatment. Excessive use of alcohol and tobacco must be stopped, and there is no doubt that complete abstinence from both agents is essential in the majority of patients. In this country we rarely see deficiencies of diet or of vitamins playing a role in ulcer development or recurrence.

In treatment directed toward the peptic ulcer itself, what are some of the factors required to produce healing?

1. The motor and secretory activity or work of the stomach must be reduced. Physical inactivity of the patient reduces his appetite and subsequent hunger contractions. A bland diet without stimulating meats or irritating foods reduces the chemical and hormonal phase of gastric secretion. Vagus depressants and central nervous system sedatives help also to modify motor and secretory activity.

2. Bed rest, preferably in a hospital, for the first three weeks of an ulcer management undoubtedly helps all ulcer patients to make a good start on healing the ulcer and in educating them to their medical regime. Hospitalization is absolutely essential in patients with intractable pain, or with bleeding, obstruction or symptoms suggesting early penetration or possible perforation of the ulcer. Actually, however, I find that in office practice, especially now when hospital beds are extremely difficult to obtain without a considerable delay, that probably not more than 10 to 15 per cent of ulcer patients urgently need to be hospitalized. A satisfactory ambulatory medical regime can be very effective in the majority of uncomplicated duodenal ulcers or small gastric ulcers of the lesser curvature.

3. Diet is of great importance in the healing of an ulcer. It should consist of frequent small feedings of milk and cream, or other bland feedings, avoiding regular sized meals at first in order to avoid gastric distention with its increased secretion of acid gastric juice. The addition of cream to the milk adds calories and inhibits the secretion of acid, as well as tending to hold the mixture in the stomach long enough to allow neutralization to take place. I usually have the patient take 3 ounces of two-thirds milk and one-third cream each hour between meals, carrying a thermos bottle to work with him if he is on an ambulatory regime. No milk or food is to be used after 7:00 P.M. in order to cut down the continued secretion of acid gastric juice after bedtime. In an uncomplicated ulcer, on an ambulatory schedule, I allow three bland meals, in addition to milk and cream, insisting that the evening meal be the smallest of the three in volume, again in an effort to reduce continued secretion through the night, and thus to

---

Read in Symposium on Gastrointestinal Ulcerative Diseases at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 30, 1947.

reduce night pain. I believe it is bad practice to allow milk at bedtime. Chicken, fish or tender lamb or beef may be allowed at the noon meal, but not in the evening. In hospitalized patients, where there is a suspicion or definite evidence of obstruction, one must, of course, be much slower to add regular meals or to increase the bulk of food intake until obstruction due to spasm and edema has been relieved or until it has been established that there is an organic obstruction. In rare instances, where an ulcer patient is allergic to milk, one can often use evaporated milk, junket, milk with lime water added, powdered skim milk, or protein hydrolysates. Goats' milk or soy bean milk at times can be helpful. If none of these are helpful, one must then depend on a two-hourly schedule of feedings with cooked cereal, egg, gelatin, soups with flour thickening, et cetera.

4. There is much divergence of opinion as to the need for antacids in the management of the uncomplicated ulcer, yet almost all recognized authorities use some form of antacid in ulcers complicated by severe pain, obstruction or hemorrhage. Many writers feel that hourly feedings of milk without antacids are as effective in producing symptomatic relief and ulcer healing as the Sippy method of complete neutralization. Hollander[6] found that peptic activity ceases at a pH of 4.5 to 5; yet complete neutralization requires an elevation of pH to 7. He felt that the acid-peptic factor is the important one in ulcer genesis and healing—not just free acid alone. However, it is this speaker's experience that pain, especially night pain, will disappear sooner, and healing will begin more rapidly, and that bleeding will stop more promptly, if an antacid is used on an hourly schedule throughout the day (halfway between milk feedings) and at half-hourly intervals after 7:00 P.M. (when all milk is stopped) until bedtime. In hospitalized patients, if night pain is persistent, the stomach is emptied at 9:30 P.M. and antacid is given at hourly intervals until midnight and at two-hour intervals throughout the night for the first few nights until the pain disappears. The antacid used has been a colloidal suspension of aluminum hydroxide alone or with magnesium trisilicate added. Tests of patient's gastric contents at various times of the day have shown that free acid is very low or absent when 3 ounces of milk and cream are used on the hour and 2 teaspoonfuls of colloidal aluminum hydroxide are taken on the half hour. On an ambulatory regime I allow patients to use tablets of aluminum hydroxide, which can be easily taken at work. Milk of magnesia may be required once or twice daily to prevent constipation. Soluble alkalies are now rarely justified because of the danger of alkalosis, which is not found with aluminum hydroxide or aluminum phosphate. Occasionally aluminum hydroxide has been found to combine with a large mass of blood clots to cause bowel obstruction during a hemorrhage, though this is, fortunately, very rare. I have never observed such a complication.

5. Tincture of belladonna or atropine given at four- to six-hour intervals will be of considerable help in relieving intractable pain and reducing spastic obstruction to emptying of the stomach. In the latter cases, atropine should be given by hypodermic. In ambulatory patients, tincture of belladonna, with sodium bromide or phenobarbital or pavatrine tablets containing phenobarbital are very helpful in the ulcer management. Atropine, belladonna and pavatrine, whereas not as effective as vagus resection, at least do put a strong brake on vagus action. The bromide or phenobarbital helps to slow down and relax the tense, driving individual with whom we usually have to deal. In the early stages of an ulcer diet, especially when milk and cream alone may be used, vitamins B and C are advisable. Ferrous sulphate should be added if the hemoglobin is low, for an ulcer diet is poor in iron.

There are various procedures which may be of considerable aid in the medical treatment of peptic ulcer. Gastric aspirations at bedtime, probably by means of an Ewald tube, are of great help in determining the presence of clinical gastric retention. If such evening aspirations done at 9:30 P.M. with no milk or water intake after 7:00 P.M. yield much more than 200 c.c. of gastric contents night after night for two weeks, with no gradual decrease in the amount aspirated, one may be quite sure he is dealing with organic pyloric obstruction and the patient should be referred for operation. However, if the evening aspirated gastric contents increase gradually under treatment from 800 to 1,000 c.c. down to less than 200 c.c., one may be sure the retention has been due to spasm and edema at or near the pylorus. Continuous aspiration of the night secretion of the stomach through a nasal tube may be helpful in questionable cases. Sandweiss et al[10] have shown that after a well-balanced meal, taken at 6:00 P.M., an average amount of 446 c.c. of gastric juice was obtained on continuous suction from 12:00 midnight to 7:00 A.M. in normal persons and in uncomplicated duodenal ulcer cases. In ulcers, accompanied by pyloric obstruction, the amount is much greater. Jejunal feedings, by means of a nasal tube which has been passed through the pylorus into the small bowel, may rarely be needed to reduce pyloroduodenal motility in cases of intractable pain. The gastric acidity can be controlled by continuous suction through another tube introduced into the stomach, or by using small hourly oral doses of aluminum hydroxide. Continuous nasal drip of alkalinized milk or of aluminum hydroxide has been recommended especially for bleeding ulcers. This has the advantage of continuous protection of the ulcer from acid but is irritating to the patient and thus may cause more harm than good, as a result of vagus effects on the stomach.

In the past twenty years innumerable other agents and regimes have been suggested and tried and usually found ineffective or inferior to the acid neutralization method. Gastric mucin was discarded because it had little neutralizing power for acid and was difficult to administer. Innumerable substances for parenteral injection have been introduced including aolan B. prodigiosus, lipoproteins with emetine, and many vaccines. It has been shown that almost any form of protein shock may ameliorate the symptoms of ulcer but have no effect on the healing of the ulcer. Histidine injections have had wide usage and popularity in many quarters. The writer, in 1938-39, studied a series of eighteen duodenal and gastric ulcer patients who were given full courses of injections of histidine (Larostidin). Many of the patients reported considerable relief of pain but in not one patient were the x-ray findings of an active ulcer (with crater) improved at the end of the course of treatment. Bockus[1] states: "I know of no scientific basis for the use of histidine parenterally in ulcer therapy." He also found no clinical justification for its use in these cases. Deep x-ray has also been used in ulcer therapy but has dangerous side effects and its only value would seem to be in intractable duodenal ulcer and some cases of jejunal ulcer, where the temporary achlorhydria has been helpful.

Two other newer adjuncts in the treatment of peptic ulcer may be briefly described. Greengard, Atkinson, Grossman and Ivy[4] have reported that parenterally administered enterogastrone, a highly purified mucosal extract of the first few feet of the small bowel of the hog, has an inhibitory effect on gastric secretion. It has protected Mann-Williamson dogs from death or ulcer recurrence, often for one to five years after cessation of ulcer management and the authors have now confirmed the beneficial effect on fifty-eight human ulcer patients. The material is effective only on parenteral injection and was administered three to six times weekly for a year. This method as yet is still in the experimental phase, and it is unlikely that enterogastrone will ever become a widely used adjunct in the treatment of peptic ulcer, though it may find limited use.

The second newer adjunct in ulcer treatment is the use of protein hydrolysates. Reports by Co Tui et al[2] in 1945, and by Kimble[7] and Hodges[5] in 1947 have pointed out the value of protein hydrolysates obtained from milk or beef in supplying a concentrated easily assimilable food for frequent-feeding schedules which correct the protein deficiency which has been found to exist in the blood of many ulcer patients. Solutions of these protolysates can be given intravenously, by continuous intragastric drip, or by hourly or two-hourly feedings (alone or alternating with a standard milk-cream feeding. The use of amino acids in the treatment of ulcers was first suggested by Levy and Siler.[8] Co Tui found ulcer craters disappeared (by x-ray) in from ten to thirty days. Recurrences of the ulcer promptly occurred if no further dietary regime was followed. Kimble found the average serum proteins before nine days of treatment was 5.3 gms. per cent and increased after treatment to 6.2 grams per cent. In nine of fifteen cases, x-ray evidence of ulcer disappeared after an average of nine days of treatment. These patients were then placed on a partial ambulatory ulcer regime at the end of this protolysate treatment. Hodges, in a series of twenty-six patients, selected largely patients who had had no benefit from, or had had a recurrence of ulcer symptoms while on "adequate" conventional dietary therapy. The average patient received 285 gms. of protein and 2,900 calories daily. This regime proved more effective in producing ulcer remissions than was conventional treatment but the frequency of relapses after treatment (two to three weeks) was not decreased. The present writer has had experience with this method, using Parenamine and glucose intravenously without oral feedings or using a mixture of Essenamine (a protolysate), glucose, sodium chloride and water in hourly oral feedings. Both methods have the same advantages over conventional ulcer treatment but are much more expensive to the patient and necessitate careful observation in a hospital. As Hodges reports, protein hydrolysates may be a useful adjunct in the medical treatment of peptic ulcer, but as now used are no panacea.

How long is it necessary to continue a medical regime for peptic ulcer in order to insure healing of the ulcer? The criteria usually used for healing of an ulcer are disappearance of the duodenal or gastric ulcer crater and loss of irritability or spasm of the duodenal cap. Using these criteria Cummins, Grossman and Ivy[3] found the average "healing time" in sixty-three duodenal ulcers to be thirty-seven days (range thirteen to sixty-eight days) and in six gastric ulcers to be forty-two days (range eighteen to sixty-eight days). Several gastroscopic studies have shown gastric ulcer to heal in three to six weeks in some cases and in over twelve weeks in others. Gastroscopic check on x-ray studies has often found re-epithelization soon after disappearance of the niche. In other cases, a shallow crater still remained after the niche had disappeared. Recently, Pollard, Bachrach and Block[9] have reported on the rate of healing of a series of 100 gastric ulcers (judged by disappearance of the crater on x-ray). Thirty-eight benign gastric lesions failed to heal under hospital treatment in an average stay of twenty-three days; thirty-three patients were left in the hospital until a negative x-ray was obtained. This required an average of twenty-five days (range of ten to fifty days). The authors found that, in general, the ulcers which did not heal had a higher acidity than had the "healed" group. I am strongly of the opinion that x-ray evidence of healing of an ulcer, especially a duodenal ulcer, is not adequate evidence of clinical healing, and my ulcer patients are advised to follow a full ambulatory management for a minimum of four to six months, depending on the location of the ulcer and its chronicity. Partial neutralization is carried out for several months more. Surveys made in the past of several thousand ulcer patients treated by the Sippy method have revealed that the highest percentage of ulcer recurrences followed cessation of a strict medical regime in one or two months, and those who remained on it for six months up to a year had a very low percentage of ulcer recurrences. The factors which are most prone to produce an ulcer recurrence are too early discarding of the careful medical ulcer regime; periods of anxiety, mental conflict or nervous tension; heavy smoking; and more than occasional use of alcohol.

The space allotted for this paper will not allow more than bare mention of the medical treatment of the complications of peptic ulcer. Perforation and its sequellae, penetration, organic pyloric obstruction, all require surgical treatment. The medical treatment of obstruction preliminary to surgical procedures includes correction of the dehydration, hypochloremia, alkalosis and hyperazotemia, as well as building up the blood proteins by intravenous amino-acid or protolysate administration. Keeping the stomach empty or from overdistention, by means of morning and evening aspirations or at times by constant nasal suction, is very important. The presence of or recent history of hematemesis or melena is not an indication for operation unless bleeding cannot be checked by a medical regime. Usually a second episode of bleeding, while under medical management, is an indication for prompt surgical treatment if the patient is in the arteriosclerotic age group. In younger patients a medical regime, particularly complete acid neutralization day and night by means of aluminum hydroxide (in addition to protolysate or merely milk and cream feedings hourly throughout the day) has promptly stopped the hemorrhage and yielded stools free of occult blood within seven to ten days. Liver function tests should be done if hepatic cirrhosis is suspected of being the cause of the bleeding when a patient is first seen. Carcinoma is responsible for not over 5 per cent of all massive gastric hemorrhages. Bockus[1] states that a patient with upper gastrointestinal hemorrhage who is not in shock should not be treated for shock and that unnecessary blood transfusions may be disastrous. This is very true but such patients can go into shock quickly at times so they must be very carefully watched by very frequent pulse and blood pressure readings. Hypodermoclysis or a slow intravenous drip of glucose in saline or of protolysate may be all that is needed to restore the blood volume gradually. Massive hemorrhage, of course, requires blood plasma or repeated blood transfusions. The mortality in massive hemorrhage has been given as not over 10 per cent—probably no greater than the average operative mortality when surgical intervention is attempted in the case of hemorrhage.

The medical management in these cases should include careful neutralization of acid through the night hours—otherwise it differs little from that of nonbleeding ulcers. The Meulengracht diet has never seemed rational to this speaker since it use defeats the entire principle of acid neutralization and motor rest for the stomach.

Carcinomatous ulcer of the stomach becomes at once a surgical problem. It has been my practice to treat medically any gastric ulcer of the upper two-thirds of the lesser curvature which on x-ray and gastroscopy appears probably benign and where free acid is present in the gastric contents. The ulcer is observed by both methods at two-week intervals until the lesion has completly disappeared. Stools are watched for occult blood. If the progress of healing ceases at any time, surgical consultation is requested. It is felt that the number of carcinomas whose prompt diagnosis is delayed by this method is no greater than the number of surgical fatalities among benign lesions unnecessarily operated upon.

In conclusion it is emphasized that the medical treatment of peptic ulcer must primarily treat the patients, his habits, and the factors in his nervous make-up and in his domestic and economic environment which have contributed to development of his ulcer. In treatment directed at the ulcer itself, the motor and secretory work of the stomach must be reduced and the gastric acidity must be largely, if not completely, neutralized by hourly feedings and non-absorbable antacids. The importance of controlling the night secretions of acid is stressed, especially in bleeding ulcer cases. Protein hydrolysates have been briefly discussed and are found valuable especially in ulcers complicated by non-organic obstruction or by hemorrhage.

VAGOTOMY IN PEPTIC ULCER

WALTMAN WALTERS, M.D., HAROLD A. NEIBLING, M.D., WILLIAM F. BRADLEY, M.D.,
JOHN T. SMALL, M.D., and JAMES W. WILSON, M.D.
Rochester, Minnesota

BECAUSE of space and time limitations, we shall be able to present only an outline of the results of our studies on vagus nerve resection for duodenal, gastric and gastrojejunal ulcer.

Recently[4] we presented our studies of the anatomic variations in the vagus nerves of human beings from a point well above the diaphragm to the stomach. It suffices to say that in 92 per cent of cases, the nerves, in the vicinity of the diaphragm, consisted of two main trunks which could be isolated and resected as well below as above the diaphragm. In 8 per cent of cases the nerves were multiple and variable in their positions so that it probably would have been difficult to dissect all the branches regardless of the surgical approach made to them. On previous occasions we also reported in detail the early results of vagus nerve resection for gastroduodenal and jejunal ulceration, first in a group of sixty-six cases[5] and later in a group of eighty-three cases[3] which included the original sixty-six cases.

It is interesting to note in our cases, as well as in those reported by Dragstedt, that in at least 8 per cent of cases, results of the insulin test made subsequent to the operation indicated that all the branches had not been divided.

Emphasis hardly needs be placed on the fact that if one is to evaluate scientifically the results of vagus nerve resection, it is necessary to present proof, other than that obtained by visual inspection or palpation of the esophagus, that all the nerves have been resected. It would seem that the Hollander insulin test, the mode of action of which has been previously reported elsewhere,[2] is an essential part of the study of the patients if one is to be sure that a complete surgical procedure has been carried out, and the tissue removed must be examined microscopically to determine whether it is nervous tissue. It is likewise very important that one ascertain by inspection, palpation and, if advisable, by biopsy that a peptic ulcer exists, that it is not malignant and that there are or are not other associated intra-adbominal lesions.

One of our patients who gave a good history for ulcer and positive roentgenologic evidence of duodenal ulcer presented no evidence of ulcer when the duodenum and the lower part of the stomach were opened. He obtained complete relief of symptoms after pyloroplasty. Another patient had an associated Meckel's diverticulum and a diseased appendix. In the fifty cases in which the senior author performed vagus nerve resections, it was thought necessary and advisable to do additional intra-abdominal operations, other than on the stomach, simultaneously in seven cases.*

Moreover, it is necessary, in studying the results of vagus nerve resections done by various surgeons, to be sure to determine what percentage of the total number of patients with proved duodenal ulcer underwent the operation. In the series of 170 cases in which Dragstedt performed the operation, 86 per cent were done on patients with duodenal ulcer, 9 per cent on patients with gastrojejunal ulcer and 5 per cent on patients with gastric ulcer. In the Mayo Clinic series in which the operation was performed, 65 per cent of the patients had duodenal ulcer, 29 per cent had gastrojejunal ulcer and 6 per cent had gastric ulcer.

The results reported by Grimson, Moore and Colp closely parallel those which we have reported from the clinic.

In 1928 approximately 40 per cent of the patients with duodenal ulcer who came to the Mayo Clinic were operated on. Many of these patients had a small duodenal ulcer for which the operation of pyloroplasty or gastroduodenostomy gave satisfactory results. In 1946, 13.7 per cent of the patients with duodenal ulcer were operated on. Most of these patients had a large, chronic, perforating or obstructing duodenal ulcer; they were the types of patients on whom both medical men and surgeons were convinced that surgical procedures, probably partial gastrectomy, were indi-

*Of the seven patients two had associated cholecystectomy and four had associated appendectomy. One additional patient had a mesenteric mass removed which microscopically proved to be fat necrosis.

cated. It is because of the large size of these ulcers and the danger of occurrence of serious gastric retention as a result of the gastric atony that follows this operation that vagus nerve resection alone without other operations on the stomach was performed in but seventeen of the fifty cases in the senior author's cases (Series 1). In Series 2 (patients operated on by our colleagues) vagotomy was performed but thirty-one times without other gastric operations in their sixty-eight cases.

If vagotomy is combined with a drainage operation on the stomach, whether gastroenterostomy or partial gastrectomy, it is quite apparent that it is difficult to determine just how much of the result obtained is attributable to vagotomy, gastroenterostomy or partial gastrectomy. It will require the passage of time to determine whether patients who have had vagotomy and gastroenterostomy will have anastomotic ulcers. Although it has been stated that complete division of the vagus nerves causes an immediate cessation of the pain of ulcer, three of our patients who gave negative reactions to the insulin test which indicated complete vagus nerve resection, either had continuation or recurrence of distress from ulcer. The presence of a recurring ulcer was demonstrated roentgenographically in two of these cases and pathologically in the third case when partial gastrectomy was performed for a large recurring, perforating gastric ulcer.

The most troublesome sequelae of the operation have been disturbances in gastrointestinal motility. These occurred in the immediate postoperative period in 40 per cent of our cases; in follow-up studies they were found to be present in 12 per cent of the cases nine months after operation. These symptoms consist of a distressing feeling of fullness, nausea, belching of foul-smelling gas, and abdominal distention. Some patients had vomiting and diarrhea. The use of urethane of β-methylcholine chloride (urecholine) in the treatment of these disturbances of motility has been too recent to permit formation of a definite opinion as to the value of this drug. That it does promote gastric peristalsis can be demonstrated in some cases by roentgenologic examination. Two recent patients, however, obtained no clinical benefit from administration of the drug, and gastric retention remained unchanged. Both of the patients had considerable retention for approximately two and a half weeks after removal, four and a half days postoperatively, of the indwelling tube in the stomach.

The atony of the stomach which results from complete vagus nerve resection and which is responsible for retention of food and gastric secretion within the stomach is, we believe, the main reason for the relief of pain from ulcer which these patients experience. In several such cases roentgenologic examination before the patient's departure from the clinic revealed the ulcer still to be active. Necropsy carried out in one of our colleagues' cases, in which death occurred on the fourteenth day after vagotomy and gastroenterostomy, revealed an unsuspected perforated duodenal ulcer with a subdiaphragmatic abscess. Weeks has reported a similar unsuspected perforation of duodenal ulcer following vagotomy.

The favorable results of the operation seem to be in the cases of recurring ulceration after partial gastrectomy and in cases of gastrojejunal ulcer. The senior author has performed the operation in a group of seven patients who had such recurring ulcers. In one of these it was thought advisable to do a resection of the stomach in addition to vagotomy because the large jejunal ulcer had its base on the transverse colon and there was impending perforation into the latter. Rather than take a chance that the vagotomy might be incomplete or that the ulcer might not heal, it was thought advisable to remove the ulcer and an additional amount of the stomach. In four cases of gastrojejunal ulcer, the gastroenteric stoma was removed and the gastrojejunal ulcer excised because of the fear that with healing of the ulcer, if healing did occur, the gastroenteric stoma would be occluded, as did occur in one of Dragstedt's cases in which Cole performed partial gastrectomy to relieve the obstruction. Two additional cases included one gastroduodenal ulcer and one gastrojejunal ulcer, each of which followed a Finsterer type of gastric resection (allowing the pylorus to remain). In these two cases only vagotomy was done. With the procedures which have been outlined the immediate results of the operation have been very satisfactory.*

In our Series 1, insulin tests were made in thirty-nine of fifty cases. Failure to carry out the tests in the other eleven cases occurred for the most part during the months of May, June and

---

*Since this paper was presented, one of the patients has returned because of weight loss and loss of appetite. He has no pain but a roentgenogram of his stomach ten months after operation shows a recurring duodenal ulcer with a crater.

July, 1946, when we were feeling our way along in the performance of the procedure and in a study of the results, for there is some risk in a test which requires that the blood sugar be lowered to a value below 40 mg. per 100 c.c., preferably to 30 mg. per 100 c.c. In the past nine months insulin tests have been carried out in thirty-six of thirty-eight cases. A positive reaction to the insulin test occurred in thirteen, or 33 per cent, of the thirty-nine cases, indicating that all the branches of the vagus nerves had not been divided. Interestingly enough, however, all of these patients were relieved of distress from ulcer after operation, and the incidence of achlorhydria and disturbances of motility practically paralleled that observed in the group in which the insulin test gave negative results, indicating that all vagus fibers had been cut. Roentgenologic examinations of the stomach showed atonicity in seven patients, in five of whom clinical evidence of disturbances of motility developed. Gastric acidity was reduced to an achlorhydric level in six of the thirteen patients who gave positive reactions to the insulin test and three additional patients had significant reductions of gastric acidity.

In the fifteen patients who gave definitely negative reactions to the insulin test after the blood sugar was reduced to a level below 40 mg. per 100 c.c., three patients had distress from ulcer postoperatively, two of whom had definite ulceration on roentgenographic examination two and a half months and six months respectively after operation. Likewise approximately a half, or seven of the fifteen patients, gave evidence of achlorhydria. The other five patients had a reduction of gastric acidity.

There is a third group of eleven additional patients who gave a negative reaction to the insulin test and whose blood sugar level did not go below 40 mg. per 100 c.c. during the insulin test; in seven of these, however, the value for blood sugar went well below 50 mg. per 100 c.c. None of this group of eleven patients had postoperative distress from ulcer although four complained of disturbances of motility. Ten patients in this group had postoperative roentgenograms, four of which showed an atonic stomach and one showed a gastric ulcer still present one month postoperatively. Eight of the eleven patients obtained an achlorhydria and another had a reduction of gastric acidity. Still another patient in this group, when studied four months after operation, although free of symptoms of ulcer, had fullness and belching of foul-smelling gas. The roentgenogram showed dilatation of the stomach with a small recurrent gastric ulcer.

The following deductions are evident: (1) Relief of the symptoms of ulcer has not been dependent on the completeness of the division of the vagus nerves, if the Hollander insulin test can be assumed to be an accurate method to determine the completeness of the dissection. (2) Disturbances of motility have occurred almost as frequently in the group of patients who gave a positive reaction to the insulin test as in the group in which a negative reaction to the insulin test was obtained. (3) Reduction of acidity occurred in approximately 69 per cent of the cases in which a negative reaction to the insulin test was obtained and in 93 per cent of the cases in which a positive reaction was obtained; the reduction reached an achlorhydric level in 46 per cent of the cases in the former and in 60 per cent of the cases in the latter.

Space does not permit discussion of the cases in Series 2 (sixty-eight cases) in which vagotomy with and without other operative procedures was carried out by other surgeons at the Mayo Clinic. References have been made to this series in previous papers presented by us and the cases will be reported in detail later by the surgeons themselves.

Summary and Conclusions

On previous occasions we have reported in detail our studies on the variations in the anatomy of the vagus nerves and the early results which have followed the performance of vagus nerve resection for gastroduodenal and jejunal ulceration, first in a group of sixty-six cases and later in a group of eighty-three cases which included the original sixty-six cases.

The results of vagus nerve resection in human beings in the treatment for peptic ulcer are inconstant, variable and, in most cases, unpredictable as regards disturbances of motility. Three of our fifty patients have had distress from ulcer postoperatively; two of these gave evidence of ulceration on roentgenologic examination two and a half months and six months, respectively, after operation. Gastric resection for a large gastric ulcer was later performed on one of these patients. A fourth patient was thought to have an ulcer four months postoperatively although dilatation of the stomach, food remnants and retention of secretion made the examination not entirely satisfactory. In addition, the roentgenogram of a fifth patient made one month after operation showed evidence of a considerable amount of jejunitis. In all these cases all the vagus nerve fibers had been resected, as indicated by the fact that the reaction to the insulin test was negative.

Of patients who gave negative reactions to the insulin tests in Series 2, one who had undergone vagotomy elsewhere several months previously, showed roentgenologic evidence of jejunitis. This patient was found at operation at the clinic to have a large gastrojejunal ulcer that had not healed subsequent to the previous vagotomy. Removal of the gastroenteric stoma, excision of the ulcer-bearing area and resection of the stomach were performed.

In evaluation of the results of the operation of vagus nerve resection, it must be proved that an ulcer was present at operation and that the vagus nerves were completely sectioned. It is our opinion that the best approach in most cases in which vagotomy is contemplated is by means of an abdominal incision, for such an approach allows both examination of the ulcer and exploration of the intra-abdominal structures, especially the gastrointestinal and biliary tracts, and the performance of such procedures as might seem necessary to supplement the vagotomy.

The greatest field of usefulness for vagotomy seems to be in the treatment of recurring ulcers after partial gastrectomy and gastroenterostomy and in certain patients with non-obstructive duodenal ulcers in which the cephalic phase of gastric secretion is marked and pain is intractable. If the operation is used in the treatment of gastrojejunal ulceration which follows gastroenterostomy, the possibility of obstruction at the stoma and at the site of the healed or reactivated duodenal ulcer must be considered. It has no place in the treatment of chronic gastric ulceration for which the results of partial gastrectomy are excellent unless the ulcer cannot be removed with safety, in which event the edges of the ulcer should be excised and the tissue examined for evidence of malignancy. When vagotomy is performed simultaneously with other gastric operations, the relative value of each procedure may be difficult of interpretation unless several years elapse without recurrent ulceration.

In view of the inherent ability of the gastrointestinal tract of human beings, like that of the gastrointestinal tract of animals in the experimental laboratory, to regain through autonomic and compensatory mechanisms its function after operative procedures which disturb neuromuscular continuity, and since restoration of gastric acidity and gastric motility has occurred within a two-year period in dogs in which vagotomy has been performed, the possibility of such a return in human beings must be kept in mind constantly.

The operation of vagus nerve resection continues to be in the investigative stage and the effects of the operation should be carefully studied and should be further evaluated by all those interested in the progress and advancement of surgery.

TUBERCULOSIS AND THE GENERAL HOSPITAL

Whenever a considerable number of tuberculosis deaths occur in the homes of the community, a serious source of tuberculosis infection exists and undermines other control measures.

The general hospital has an important role in reducing this hazard. By expanding facilities for care of tuberculous patients, particularly for patients during the pre-sanatorium period, the latter institution will be able to utilize its facilities for all patients needing long term care, or palliative treatment. The general hospital can provide the diagnostic service and short term care required by the large number of persons in whom case-finding programs discover minimal tuberculosis.—Jacob Yerushalmy, M.D., *Hospitals,* August, 1946.

LUMBAR RETROPERITONEAL GANGLIONEUROMA

Review of Literature and Report of Case

LAWRENCE M. LARSON, M.D., Ph.D. (Surg.)
Minneapolis, Minnesota

GANGLIONEUROMATA, whatever their location, are rare tumors, but they seem to occur especially infrequently in the abdominal retroperitoneal area. These tumors have been reported in the central nervous system, cranial nerves, nerve roots, ganglions, neck, thorax, mesentery, appendix, pelvis, suprarenal glands, intestine, cervix, ovary, uterus and knee. They no doubt occur with much greater frequency than reported cases would indicate, the reason being that they usually do not produce symptoms until a vital structure is encroached upon. They rarely become malignant, they practically never metastasize, and consequently many are not noted until found at autopsy.

The first description of a ganglioneuroma was given by Loretz in 1870, but the first one noted in the lumbosacral retroperitoneal area was described by Chiari in 1898 and a year later a similar case was reported by Cripps and Williamson. Up to 1931 when McFarland reviewed the literature only thirteen such cases had been reported, and in a similar review through 1943 Clayton found only seventeen cases. However, practically all of these were presacral or precoccygeal in origin and only about eight cases of those actually in the lumbar area could be found in the literature. Because of the war it has been impossible to obtain copies of isolated case reports in many foreign languages, such as Russian, Japanese, Czechoslovakian and so forth, so it is not known just how many such cases are in the literature. As a matter of fact, Reynolds and Cantor stated there were probably fewer than fifty up to November, 1946. Perusal of the files of the Pathology Department, University of Minnesota, both those from operative and autopsy records, fails to reveal a single case of a retroperitoneal ganglioneuroma. Also, in a review which the author made with Dr. Judd in 1934 of all retroperitoneal tumors at the Mayo Clinic, of which there were forty-six, not a single case of this type was found. There was one ganglioneuroma, but its origin was the suprarenal gland and not the lumbar sympathetics.

These tumors occur more frequently in the thorax where they have been found in the posterior mediastinum and chest wall. Several descriptions of these have emphasized the fact that they may be of the "dumb-bell" or "collar button" type, in which extension of the tumor through the intervertebral spaces to the other side occurs. In this type, complete removal is difficult or impossible, and recurrence of the tumor may be expected.

Symptomatically, these tumors all behave more or less similarly. They occur usually in young adults, and due to their slow growth and the fact that they rarely encroach on vital structures, they usually go unnoticed for a long period of time. They seem to occur more frequently in females, although this may be relative more than actual, since pelvic examinations are more frequent in women. Pain and the presence of a mass seems to be the main complaint, although other symptoms occur depending upon structures encroached upon, such as the bowel, kidney, ureter, bladder, and so forth.

The physical signs are mainly those of a moderately soft or firm mass, fixed posteriorly, usually smooth, and located on one side or other of the vertebral column. They are usually painless and have been present for many years without symptoms. They are practically always single, although two case reports of multiple ganglioneuromas have been noted. In their surgical removal most authors comment on the dense adhesions surrounding the tumor; in fact, in several cases the ureter or large arteries and veins, such as the iliac, have been torn, and operative death has ensued.

Differential diagnosis from sarcoma, lipoma, fibroma and so forth, at the time of operation is usually impossible, and only microscopic section will reveal the true nature of the tumor.

Pathologically these tumors usually are more or less encapsulated, they are firm and somewhat elastic, and vary in size up to 12 inches in diam-

Presented before the Minneapolis Surgical Society, March 6, 1947.

eter. On section, the capsule retracts and the incised edges become everted, while the appearance of the interior is usually pale yellowish or pink, with many connective tissue septa dividing the substance into lobules.

Microscopically there are nerve and connective tissue elements. Bundles of nerve fibers in longitudinal and transverse sections are surrounded by a connective tissue stroma. Mature ganglion cells are present singly or in groups, and extending from the cell body, one or more nerve processes may be seen. Their cytoplasm is granular and the nucleus may be single or multiple, and occasionally vacuolar degeneration is present. The stroma may be dense or fine and usually consists of many neurofibrils, along with areas of degeneration.

It is obvious that these tumors are derived from specific nerve tissue, being the result of hyperplasia of ganglia, and consisting of medullary and non-medullary nerve fibers and of ganglion cells. Reynolds and Cantor have described the method of development of this tumor. Their description indicates the fact that in the migration of the ganglionic crests during embryonic life, certain cells become displaced or miscarried. The sympathetic ganglionic organization, as is well known, is the result of migration of individual cells from the neural crest substance down to the dorsal nerve roots and peripheral trunks to form paired ganglionic clusters. These migrating cells may never reach the ganglionic mass, and no doubt most frequently never give rise to any difficulty. However, they may begin to proliferate at any time along the line, and the type of tumor that is formed by these cells depends on the level of differentiation that has been attained. The ganglioneuroma represents the tumor formation from the mature cells, or from the neurocyte that has reached the end stage of its development. They therefore are undoubtedly congenital in origin.

With complete removal of these tumors, often difficult, the prognosis is usually good, although recurrences have been noted. Evans and Francona have recorded rare instances of metastases, but these must be exceedingly uncommon. Roentgen therapy, as one would expect from the nature of this tumor, is of no value.

Case Report

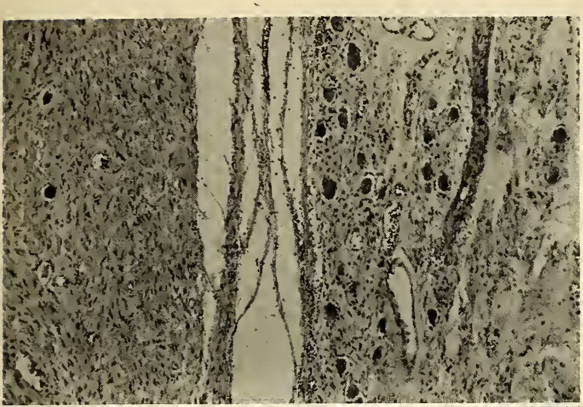
The patient is a white woman, twenty-eight years of age. Her past history is essentially irrelevant except for that recorded. Whether many of the details pertain to this case is problematical, but due to the bizarre nature of many of the symptoms, it was considered best to record them as they occurred in the progress of the case.

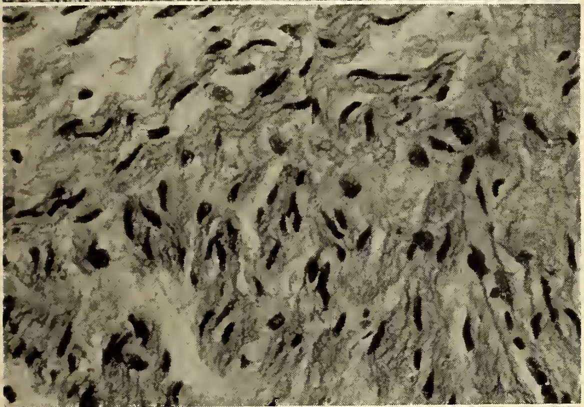
The patient started early in childhood with an indefinite pain in her right lower abdomen and lower back, severe enough that she avoided stepping on her right foot. In fact, her mother was constantly scolding her because she continually wore out her left shoe long before the right. These pains at first were intermittent but soon became so frequent as to keep her in bed for several days at a time. In 1933, at the age of eighteen, she was examined completely at a large clinic because of these pains, and an orthopedic consultant advised that her symptoms were due to a mild scoliosis which she had had for many years. Other causes of this pain were excluded, especially appendicitis or pelvic disorders. Treatment of the scoliosis by exercises resulted in considerable improvement in her symptoms, but she still was confined occasionally to bed because of the pain. She found that when she was the most active, such as when she was playing baseball, swimming or dancing, she felt better. Periods of inactivity always made the pain more severe. She stated that the better condition in which she kept her muscles through athletics, the more infrequent and the less severe her symptoms were.

She was married in 1938 and in 1940 the left tube was removed for ectopic pregnancy. At this time appendectomy was also done. Convalescence was normal but no change in her backache resulted, and she continued to have the same right-sided pain. This was uninfluenced through four normal pregnancies.

The pains continued to recur in this same fashion until August, 1946, when she for the first time developed severe constant pain in the left lower abdomen. This was most pronounced in changing from a standing to a sitting position. It radiated through to the lower left lumbar area of the back but was not associated with genito-urinary symptoms and there was no nausea or vomiting. As long as she lay quiet, the pain was present but not severe.

Physical Examination.—Her appearance was not that of an acutely ill individual. Her temperature was 98.6° F., pulse rate 74 per minute, blood pressure 100 systolic and 64 diastolic in millimeters of mercury. The head, neck and chest were normal. The abdomen was normal except for the following: There was a low midline scar, solidly healed. The patient located the pain in an area to the left of the midline and just below the umbilicus, and on palpation of this area a firm fixed smooth mass could be made out measuring about 6 cm. wide and 12 cm. in length. It lay alongside the vertebral column at the level of the third and fourth lumbar vertebrae and on pressure, pain was produced locally radiating through to the back. Movements of the spine in this area also produced similar distress. Vaginal examination gave essentially negative results and the tumor could not be reached through the pelvis. The reflexes, both superficial and deep, were all





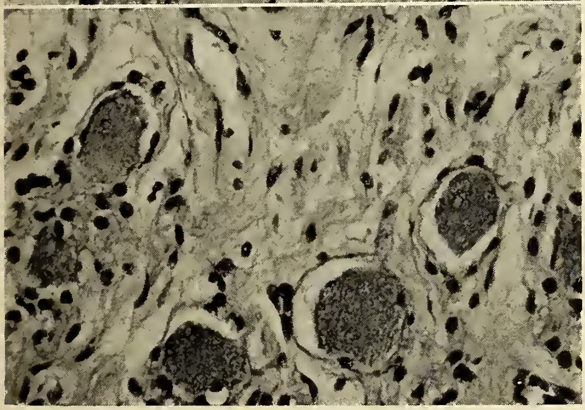


Fig. 1. (*above*) Low power view of section of tumor. The left half shows mainly connective tissue stroma while that on right presents many ganglion cells and nerve processes.

Fig. 2. (*center*) High power view of connective tissue and nerve process elements.

Fig. 3. (*below*) High power view of ganglion cells with nerve processes.

normal and equal. The remainder of the examination was essentially negative.

Laboratory Data.—The value for hemoglobin was 15.2 grams per 100 c.c.; white cells 4,600 per cubic millimeter, with 51 per cent neutrophiles, 38 per cent lymphocytes, 5 per cent monocytes and 6 per cent eosinophiles. Urinalysis gave negative results. The blood Wassermann reaction was negative. Roentgenographic examination of the dorsal, lumbar and sacral spine gave negative results. The outline of the kidneys was normal, and apparently there was no connection between them and the mass.

A diagnosis of a tumor of uncertain nature and most likely retroperitoneal in origin was made, and exploration was done on August 6, 1946. At this time the tumor was found to lie alongside the left vertebral margin, measuring about 12 by 6 cm., being smooth and oval in shape, and firmly attached posteriorly to the vertebrae. The overlying peritoneum was incised and reflected medially and the tumor removed in one mass. Considerable difficulty was encountered in its removal due to its vascularity and its firm and dense adherence to the surrounding structures, especially posteriorly to the vertebral column. The ureter was isolated and retracted so that no damage could be done to it. The tumor was completely removed, a Penrose drain was inserted in the cavity and peritoneolization was completed. Her immediate postoperative condition was good and her convalescence was normal except for the condition to be described.

Pathological Data.—The tumor removed measured 10 by 4 cm. It was fairly well encapsulated, rounded, smooth and of pale grayish color, firm in consistency and with a nerve structure apparently passing through its substance. On microscopic section the picture was that of a fibromatous mass with many scattered sympathetic ganglion cells. The portion of tumor resembling a nerve was a sympathetic ganglion structure (Figs. 1, 2, and 3).

Immediately postoperatively, as soon as the patient became conscious, she complained of abnormal warmth of the left leg as compared to the right, and on examination this was found to be the case. The temperature of the left leg from then on, and to the present, has been constantly one or two degrees above that of the right. After further discussion of this symptom with the patient, she stated that she had always had abnormally cold feet, and she noticed that for the first time the left one was of normal temperature.

Up to the present, ten months postoperatively, she has had no recurrence of the pain of which she has complained for many years. Whether this tumor was the cause of her right-sided pain is a matter of conjecture. At any rate, she has remained completely free of this distress, so that one must feel that the ganglioneuroma must have had some bearing on this symptom. The left leg has continued to remain warmer, by one or two degrees, than the right leg in spite of changes in the environment. It is obvious that with the removal of this tumor the sympathetic chain has been partially removed on this side, and the equivalent of sympathectomy has been done, such as that done for the relief of high blood pressure. No changes in her blood pressure have occurred, probably because it was not elevated preoperatively and also because only one extremity was involved.

Summary

A case of retroperitoneal ganglioneuroma of the left lumbar sympathetic system is reported in

(Continued on Page 977)

MINNESOTA SEROLOGICAL EVALUATION STUDY

H. E. MICHELSON, M.D.

Chairman of the State Serologic Committee
Minneapolis, Minnesota

A REPORT of the first evaluation study of serological tests for syphilis as performed in Minnesota was made in 1941.[2] A brief review of the national evaluation studies since 1934, as well as the organization of the Minnesota study, was included. A second report, covering the evaluations as conducted in 1941 and 1942, was made in 1943.[1] The plan and arrangements for conducting the evaluation studies in the state since that time, i.e., 1943 to 1946, inclusive, have been changed somewhat, but retain the original purpose, namely, to supply specimens and compile the findings, so that the methods of performing serological tests in the state may be evaluated.

As can be seen from Table I, the number of laboratories participating increased considerably during the first three years. The number remained almost constant from 1943 to 1946 in spite of the huge problems of equipment and personnel encountered during that time. There was also an increase in the number of laboratories that use three or four procedures per specimen. These laboratories generally are in larger institutions and reflect the trend of using multiple tests, including a complement-fixation test, in solving the diagnostic problems of patients with doubtful or slightly positive serological reactions but no historical or clinical findings to explain those reactions.

The number of serological techniques used by the participating laboratories in the state has decreased from twelve in 1941 to nine in 1946, while at the same time there was an increase in the number of laboratories using the tests recommended by the United States Public Health Service on the basis of author-evaluation studies.[3] Table II gives the number of participating laboratories using the various techniques.

Total No. of techniques	12	11	11	10	9	9

†Techniques used by Minnesota Department of Health; Eagle discontinued in 1946.
*Techniques recommended by U. S. Public Health Service.

The State Department of Health laboratories have participated in the national evaluation of serological tests for syphilis since 1936. In these evaluation, 125 to 160 specimens from nonsyphilitic persons and 190 to 235 specimens from syphilitic patients are tested. The results are evaluated on the basis of percentage sensitivity and percentage specificity. The formula for calculating sensitivity is:

$$\frac{\text{Positive results } + \tfrac{1}{2} \text{ doubtful results}}{\text{Syphilitic specimens}} = \text{percentage sensitivity}$$

The formula for calculating specificity is:

$$\frac{\text{Negative results } + \tfrac{1}{2} \text{ doubtful results}}{\text{Nonsyphilitic specimens}} = \text{percentage specificity}$$

Criteria of satisfactory performance are that participating laboratories must have a sensitivity rating of not more than 10 per cent below the author serologist, and a specificity of not less than 99 per cent.

Table III shows the sensitivity and specificity ratings of the Minnesota Department of Health laboratories in the national evaluations. The specificity of the Kline exclusion, used as a screen test only, is usually slightly below suggested

---

Original members of the State Serologic Committee were: N. H. Lufkin, M.D., Francis W. Lynch, M.D., Paul A. O'Leary, M.D., Arthur H. Sanford, M.D., Lucy Heathman, Ph.D., M.D., (ex officio), R. R. Sullivan, M.D., (ex officio).

Margaret W. Higgenbotham, D.Sc., Anne Kimball, Ph.D., and Henry Bauer, M.S., Minnesota Department of Health, Division of Preventable Diseases, assisted in these studies.

standards. The specificity of all the other tests evaluated was well above the suggested minimum. The sensitivity ratings of each technique have been satisfactory every year except for the Kolmer-Wassermann in 1943 and 1946.

For comparative purposes, in the state evaluation studies, the various procedures as carried out by the Department of Health laboratories may be considered control performances such as those of the author-laboratories in the national evaluations. Tables IV and V summarize the number of procedures showing satisfactory performance, according to the suggested criteria, for the years 1941 to 1946, inclusive. Table IV shows comparisons for the techniques routinely in use at the state laboratories, namely, Kline-exclusion-Kline-diagnostic, Standard Kahn, Kolmer-Wassermann, Eagle, and Hinton. In Table V the performance of other techniques, i.e., Mazzini, Rytz, et cetera, are compared to the S.B.H. Kline-diagnostic. Admittedly, this record does not give a true comparison of performance, but for economic reasons, it was impossible to conduct all techniques in the state laboratories.

TABLE VI. PERFORMANCE OF KLINE-DIAGNOSTIC TEST ONLY

	1941		1942		1943		1944		1945		1946

Total No. of labs	9		14		13		13		14		12	

†A. Using 99% or above for satisfactory specificity.
††B. Using 97% or above for satisfactory specificity.

It is noted in Tables IV and V that the larger number of techniques have satisfactory sensitivity ratings only, and are low in specificity performance. Because a relatively small number (100 or fewer) of nonsyphilitic sera were tested by each technique, one false positive or two false doubtful reactions would reduce the specificity below the required 99 per cent. Therefore, in the second column under each year in the tables, the numbers of techniques showing satisfactory performance under a slightly reduced specificity rating (97 per cent) are tabulated. It is readily seen that the number of procedures meeting the amended criteria of satisfactory performance in sensitivity and specificity is thus increased.

In Table VI are listed the performance ratings of the Kline-diagnostic procedures as carried out in the participating laboratories. This procedure in general shows good sensitivity performance, but seems to be poor in specificity, i.e., only nine of thirty-two meeting the satisfactory specificity criterion of 99 per cent in 1946. As will be seen, there has been some improvement in the specificity performance of the Kline-diagnostic procedures in the 1946 study.

It is shown in Table VII that the Standard Kahn procedures gave relatively good ratings in the state evaluations, but that the percentage of satisfactory performances in regard to specificity as well as sensitivity has decreased somewhat in 1946.

In general, the performance of serological tests for syphilis has shown improvement in the state as reflected by the evaluation studies recorded, and it is hoped that this improvement may be extended and increased.

We wish to thank the pathologists and technicians of the participating laboratories for their interest and cooperation in these studies. The facilities of the Minnesota Department of Health are available to any laboratory in the state wishing to use them. We also wish to thank Miss Jennie Schey of the Department of Dermatology, University of Minnesota Hospitals, for assistance in arranging for the donors.

ROENTGEN THERAPY OF BRONCHIOGENIC CARCINOMA

EUGENE T. LEDDY, M.D.
Rochester, Minnesota

IN the treatment of bronchiogenic carcinoma the radiologist's lot is not a happy one. His patients are usually feeble men who are in or past the sixth decade of life, and the malignant lesion has progressed beyond the stage of operability, either through their own fault in not seeking medical attention earlier or because, for various reasons, the diagnosis was not made in an early stage of the disease.

For these patients, "cure" is out of the question. Since the hopelessness of their situation might have been prevented by diagnosis at a time when pneumonectomy might have offered a good chance of complete cure, it may be well to review some of the warning signs of bronchiogenic carcinoma. The data have been drawn mostly from a recent paper by Moersch and Tinney.

Perhaps the reason why an early diagnosis of bronchiogenic carcinoma is seldom made is because of the failure to think of carcinoma.

Cough, which is the most frequent symptom, occurred in 81 per cent of the 448 cases reported by Moersch and Tinney; however, because many patients who suffer from other diseases complain of this symptom, its importance often is misinterpreted. As the tumor increases in size, obstruction to drainage of the bronchus occurs, the retained secretions become infected, and the cough becomes more productive and purulent. Chills and fever ensue, and such an episode is often mistaken for pneumonia. In this regard, a carefully taken antecedent history is very important in all cases of pneumonia, lest the diagnosis of bronchiogenic carcinoma be missed.

In about half of the 448 cases the patients had expectorated blood. Because hemoptysis often had been associated with cough and fever, an erroneous diagnosis of tuberculosis had been made in some of the cases. In this connection, it is only fair to state that the differential diagnosis of bronchiogenic carcinoma often is very difficult.

The degree of dyspnea may be out of proportion to the size of the lesion and to the amount of atelectasis which it produces. Usually, dyspnea develops gradually, but occasionally it develops suddenly and, when it is associated with wheezing respiration, it may be mistaken for asthma. Dyspnea may be due to pleural effusion, which results from invasion of the pleura by carcinoma cells. A pleural effusion was present in 15 per cent of the 448 cases.

Pain occurs in about half the cases, and occasionally is the first symptom. Pain indicates that carcinoma has spread to the pleura, to the thoracic cage, or to the mediastinum and neighboring nerves. It usually indicates that the tumor has reached an advanced stage. The intensity of the pain may vary from a mild, easily tolerated discomfort to a constant severe or agonizing pain which requires morphine for relief.

Other symptoms, including hoarseness, loss of weight and clubbing of the fingers, may be encountered. Their presence is not characteristic of bronchiogenic carcinoma but they should arouse suspicion of this lesion.

In the 448 cases reported by Moersch and Tinney, the average duration of symptoms from their onset until the diagnosis was made was eight and a half months. For this delay in diagnosis they gave three important reasons: (1) the lack of specificity of the symptoms; (2) failure to suspect the presence of carcinoma of the bronchus, and (3) difficulty in making a positive diagnosis even when the presence of bronchiogenic carcinoma is suspected.

Although the roentgenologic and physical signs of bronchiogenic carcinoma are very important, they will not be considered in detail in this paper. In 73 per cent of the cases reported by Moersch and Tinney, the roentgenologic findings caused the roentgenologist to suspect the presence of bronchiogenic carcinoma.

The early diagnosis of bronchiogenic carcinoma is most easily and most accurately made by bronchoscopy. This procedure was used in 399 of the 448 cases reported by Moersch and Tinney, and the results of biopsy were positive in 368 (92 per cent) of the cases. However, attention should be called to the fact that when the results of bronchoscopic examination are negative, or when a pathologist reports that tissue removed is not malignant, this does not eliminate the possibility of bronchiogenic carcinoma.

From the Section on Therapeutic Radiology, Mayo Clinic, Rochester, Minnesota.

Read at the meeting of the Buffalo Radiological Society, Buffalo, New York, February 4, 1946.

Another reason why the prognosis is bad in cases of bronchiogenic carcinoma in which the patients are referred to the radiologist for treatment is that about 80 per cent of the lesions are of the highest grade of malignancy, and more than half of them are squamous cell epitheliomas.

I have omitted from this consideration both the so-called Pancoast tumor and "adenoma" of the bronchi, because both of these neoplasms usually are considered to be special lesions which are different from a bronchiogenic carcinoma.

In 1940, Moersch and I reported the results of a review of 250 cases of bronchiogenic carcinoma. Of the 125 patients who did not receive roentgen therapy, none lived more than a year after the diagnosis was made. Follow-up data were available in 315 (70 per cent) of the 448 cases reported by Moersch and Tinney. In the 315 cases, the average duration of life after the diagnosis was made was six months. The authors did not state the type of treatment that was employed in these cases. They said that the prognosis in cases of adenocarcinoma was the same as it was in cases of squamous cell epithelioma, regardless of the grade of malignancy.

It is very seldom that a young, vigorous patient who has bronchiogenic carcinoma is referred to the roentgenologist for treatment. When such a patient is referred to the roentgenologist, he usually has refused to undergo an operation. As I have already said, most patients who have bronchiogenic carcinoma are debilitated and dyspneic, have a chronic cough and often have fever; their physical condition is so poor that only mild, or palliative, roentgen therapy can be employed. Regardless of all other contraindications to intensive treatment, a danger sign on which I place particular emphasis is fever. I regard fever as especially dangerous when it is accompanied by bleeding.

From what has been said about the physical condition of the patients, it is self-evident that large doses of roentgen rays rarely are administered, particularly by the administration of protracted fractional doses. Nevertheless, at the Mayo Clinic, we have administered doses of 3,000 r or more per field in a carefully selected group of cases in which the physical condition of the patients was comparatively good. In these cases, the roentgen rays were administered through four thoracic fields. The beam of rays was directed so as to cross-fire the lesion. The roentgen rays were generated at 200 kilovolts and a filter equivalent to 2 mm. of copper was used. A target skin distance of 50 cm. was used routinely. The results obtained by this technique have given little cause for enthusiasm. Not only were the results no better than those which we have obtained by the method usually employed but the patients did not tolerate this kind of treatment well. The protracted fractional method of treatment may not have been suitable for the patients; the technical details of the method may have been faulty, or we have been unduly impressed by the reactions we have seen. Whatever the reason for the unsatisfactory results, I have abandoned, for the time being, all doses greater than 1,500 r per field, and I now prefer other doses and techniques which I think are safer.

I realize, of course, that the term "safe dose" is inaccurate, ambiguous, indefinite and no more capable of precise estimation than are the doses of many medicaments in clinical use. It perhaps is easier to state what the dose is not than to state what it is. A safe dose of roentgen rays may be regarded as one that will not produce a permanent or a severe temporary reaction. The time required for the course of roentgen therapy should not be so long that it will prove a hardship for the patient, and the cost of the treatment should not be excessive.

In the cases of bronchiogenic carcinoma which I have observed, I have found that it is safer to employ two courses of relatively mild doses of roentgen rays than it is to employ one course of relatively strong doses. It seems very important to distinguish roentgen therapy that is curative from roentgen therapy that is at best palliative. The dose of roentgen rays should depend on the age of the patient, the physical condition of the patient and the stage of development of the malignant lesion. At present, radiologists do not know nearly as much about the radiosensitivity of adenocarcinomas and squamous cell epitheliomas of the bronchi as they do about the radiosensitivity of similar tumors in other parts of the body. In cases of bronchiogenic carcinoma, the role of the tumor bed is, so far as I know, quite unknown.

In the cases of bronchiogenic carcinoma which I have observed, any thought of cure is senseless. The most that can be obtained is palliation of an indefinite degree. In outlining the type of treatment to be employed in such cases, the most important consideration is to determine the smallest doses of roentgen rays that will be efficacious.

As a rule, provided there is no contraindication, most patients receive treatment through four fields, which are laid out so that the beam will cross-fire the bronchial lesion. Each field generally receives a dose of 500 r. The roentgen rays are generated at 200 kilovolts and are filtered through 0.75 mm. of copper. This treatment is usually given in four days. When the patient is in much better than average physical condition, the total dose may be increased to 1,000 r for each of the four fields, the treatment being protracted for sixteen days. This technique, it should be emphasized, is used in cases in which the physical condition of the patients is exceptionally good.

In cases in which cachexia or fever is present, less intensive treatment is employed. In such cases, a dose of 250 to 500 r, depending on the clinical findings in the individual case, may be administered through an anterior and a posterior field. If the physical condition of the patient is very poor, or if there is any suspicion that the lesion may be a lymphoblastoma instead of a bronchiogenic carcinoma, the roentgen rays are generated at 130 kilovolts.

Since palliative results are the best that can be expected in most cases, the selection of the method of treatment in a given case requires precise clinical judgment. In the average case, it seems more sensible to err on the side of undertreatment. In this connection it has been my experience[1] that the results obtained by simple cross-firing of the bronchial lesion with moderate doses of roentgen rays have been as worth while as those obtained by the more radical methods. My own results have not been at all proportional to the magnitude of the dose employed. Nevertheless, roentgen therapy, if judiciously administered, is an excellent method of palliation. I think that any patient whose physical condition is not precarious should receive at least one course of roentgen therapy; otherwise, his life expectancy is at most a year. After the completion of roentgen therapy the radiologist sees an outstanding result just often enough to rekindle the dying fire of enthusiasm. Possibly, the radiologist's lot would be a less unhappy one if he treated more favorable lesions or if some refinement of treatment could assure a happier outlook to the patient with bronchiogenic carcinoma.

LUMBAR RETROPERITONEAL GANGLIONEUROMA

(Continued from Page 971)

a twenty-eight-year-old white woman. This tumor had produced definite severe pain locally on the left side and possibly on the right side of the abdomen and lower extremity. Complete relief of these symptoms followed its surgical removal. An interesting postoperative sequelae of permanent increase in temperature of the lower extremity on the same side is noted, similar to that occurring with sympathectomy for hypertention.

A review of the literature has been made, and a description of the symptoms, findings and pathologic nature of this tumor are recorded.

Clinically and grossly these tumors are indistinguishable from neuroma, fibroma, sarcoma and so forth, and it is only by microscopic examination that the true nature of the tumor can be made out. They are no doubt congenital in origin and probably arise from cell nests displaced in embryonic life. They rarely recur when completely removed and practically never metastasize.

The rarity of this lesion is indicated by the fact that there are probably less than fifty similar cases recorded in the literature and there are no similar tumors recorded in the files of the Department of Pathology, University of Minnesota.

CLINICAL-PATHOLOGICAL CONFERENCE

DIAGNOSTIC CASE STUDY

BERNARD J. TERRELL, M.D., ARTHUR. H. WELLS, M.D., and HAROLD H. JOFFE, M.D.
Duluth, Minnesota

Dr. A. H. Wells: A good tough diagnostic problem always has its teaching points when the answers are known.

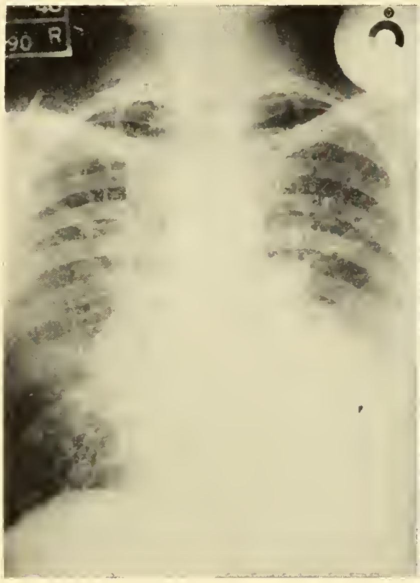

Fig. 1. Anterior-posterior roentgenogram of thorax.

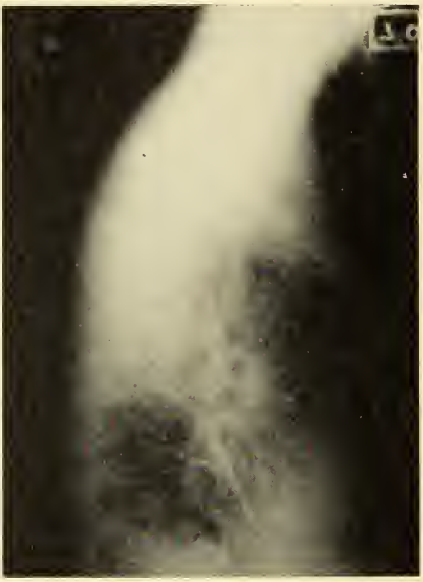

Fig. 2. Lateral roentgenogram of thorax.

Dr. B. J. Terrell: A forty-year-old white miner and lumberjack (Nopeming Sanatorium No. 20990) was first admitted to the hospital on November 18, 1946, complaining of a cough. Two months before admission while working in a sawmill he caught a "cold." At this time he became somewhat short of breath and thereafter orthopneic. This condition did not appear to be progressive, but it was continuous. The symptoms were noticed mostly at night and there was a moderate amount of frothy sputum and some pain in the left side of the chest. There was also some wheezing, but no night sweats, noticeable fever, ankle edema, weight loss or abdominal pain. His appetite was fairly good and his bowel movements were normal. One sister had died of tuberculosis in 1914. The father died of a stroke and the mother died from cancer of the stomach. The patient's induction radiograph at Fort Snelling revealed "healed primary complex" in the right lung. He had been an underground miner for eight years, prior to 1931.

His physical examination revealed dullness in the left base and crackling rales in the lower one third of both lungs. Also, there was a grade II cyanosis. Chest films revealed a diffuse disease process in both lungs (Figs. 1 and 2) and also some cardiac enlargement and mild pleural effusion. His blood pressure was 134/94, temperature 99 degrees and pulse 75. Multiple sputum examinations were negative for acid-fast bacilli. The Wassermann test was negative. His hemoglobin was 15 grams, red blood cell count 5,100,000 and white blood cell count 9,900 with neutrophiles 72 per cent, lymphocytes 22 per cent, monocytes 4 per cent, and eosinophiles 2 per cent. The red blood cell sedimentation rate was 19.5 millimeters per hour (Cutler), and the urinalysis was essentially normal.

He was obviously seriously ill and not a fit subject for drastic diagnostic procedures. Based on the history of familial tuberculosis, a positive Mantoux test, diffuse pulmonary disease in the x-ray picture and a history of underground mining, our tentative diagnosis was that of silicotuberculosis with pulmonary congestion and questionable pleural effusion.

His underground mining experience proved to consist of the repair and maintenance of electric motors and had nothing to do with hard rock mining. This experience we did not feel was compatible with silicosis

---

From the Nopeming Sanatorium and Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

and the x-ray picture was not typical of this disease. Further delving into the patient's past history revealed that he was a heavy drinker and that he had been working in a lumber camp cutting "deadheads" that had been removed from lake bottoms several months before. Some of this wood was still wet. His work was close to the saw, and he was exposed to a spray of material from the logs for one month preceding the apparent onset of his illness. Rotten logs are a quick prey to various fungi, and spores liberated while working in this sort of material were long ago reported as a cause of pneumonitis. Again flukes are found in the snails in lakes hereabouts which would lodge in deadheads, and should be kept in mind.

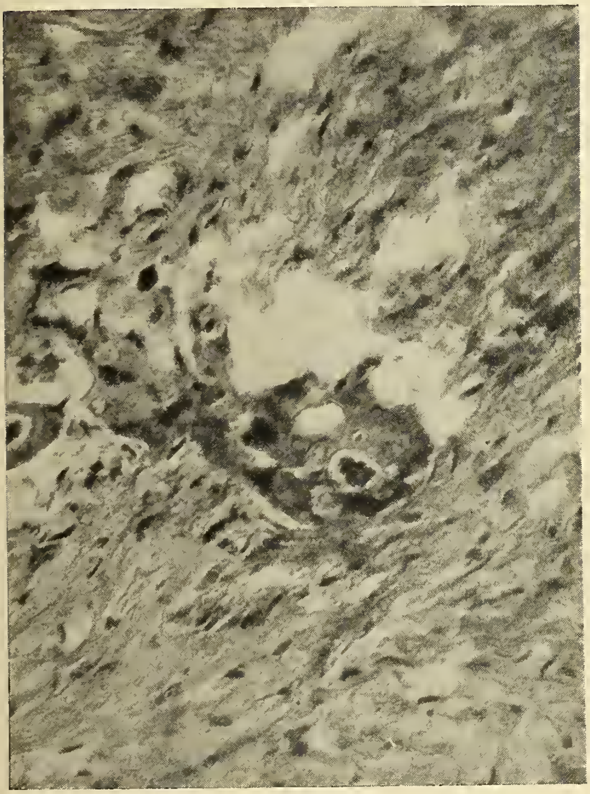

Fig. 3. Photomicrograph of dense fibroblastic reaction about small clumps of highly anaplastic epithelial cells frequently found in lymphatics.

We felt that the outstanding diagnostic possibilities included the following diseases: pulmonary congestion on the basis of myocarditis, valvular disease or pericarditis, Ayerza's disease, bronchopneumonia, metastatic or local infiltrative neoplasms, miliary tuberculosis, rare infiltrates due to yeasts, molds, actinomycosis, blastomycosis, histoplasmosis, et cetera, and interstitial pneumonitis of rheumatic origin.

An extensive search was made for tubercle bacilli, fungi, parasites, et cetera, in the sputum by inoculation of appropriate culture media and an examination of multiple smears with appropriate stains. Skin test was negative for histoplasmosis. His pleural reaction increased and, accordingly, we aspirated fluid from the left thorax three times a week totaling up to 700 c.c. at a sitting. The bloody exudate was examined for neoplastic cells; cultures and smears were made for organisms.

In the meantime, fluoroscopic examination revealed very little cardiac motion and the blood pressure fell from 134/94 to 100/80, leading us to suspect pericardial effusion or adhesive pericarditis despite the lack of dependent edema and the forceful cardiac sound. The cardiac silhouettte was enlarged in all diameters. The conus was not particularly prominent. Electrocardiograms were interpreted as indicating myocardial disease of undetermined type, and there was no evidence of cor pulmonale. The patient's temperature curve revealed a few peaks of one degree above normal during the first week, and from then on it remained normal. His pulse varied from 72 to 95, and the serial red blood cell sedimentation rate read consecutively 16.5, 16.5, 12, 12, and 1.

We felt that his clinical course was pointing away from an infectious process since all of the bacteriological studies failed to reveal etiologic agents, and his temperature and white blood cell count remained normal. This left us with the most likely possibility of either a constrictive pericarditis or neoplastic process. The patient's prostate was normal, and his gastrointestinal tract functioned quite well until five days before his death, when he developed nausea and vomiting of copious quantities of mucoid material which gradually assumed a coffee ground character. There was no obstruction, however, as he continued to have normal appearing bowel movements. In addition, his chest pains became more and more marked; rather more than the effusion would be likely to cause. His dyspnea increased and he sat up all of the time, securing very little rest. He expired on the night of February 8, 1947, almost three months after admission to the sanatorium. Very slight edema was noted on the lower extremities about two days before his death.

Dr. A. H. Wells: The case is now open for diagnosis.

Physicians: Miliary tuberculosis, pulmonary mycosis, carcinomatosis of hidden origin, silicotuberculosis with cor pulmonale and chronic congestive right heart failure, carcinoma of the stomach with pulmonary metastasis.

Autopsy Findings

Dr. A. H. Wells: The postmortem examination revealed four outstanding disease processes or complications. There was a moderately severe diffuse (1) fibrous pancreatitis of long standing with (2) a small (2 cm. in diameter) carcinoma in the slightly enlarged head of the pancreas associated with metastatic carcinoma to the adjacent retroperitoneal lymph nodes about the head of the pancreas and to the lungs and adrenals, (3) cor pulmonale with congestive right heart failure and (4) acute gastric dilatation. The metastatic carcinomatous infiltration of the lungs was particularly interesting in that there was a dense network of fibrous connective tissue throughout all parts of the lungs. These coarse strands of scar tissue could be easily seen on the cut surfaces and the lungs were firm, fibrous and rubbery throughout. Microscopically (Fig. 3), the fibrous trabeculae in the lungs revealed scattered clumps of highly anaplastic gland forming epithelial cells similar to those in the pancreas, located primarily about the margins of the broad areas of fibrous scarring and in lymphatics. The prominent dense scarred areas were obviously originally the site of carcinoma cells which subsequently became atrophic or disappeared due to the density of the connective tissue. These fibrous trabeculae were located primarily along the blood vessels and the disease process is obviously the cause of increased pulmonary tension and resultant cor pulmonale with some evidence of chronic congestive right heart failure in the form of periphereal edema and chronic passive congestion of the liver and spleen.

The huge stomach half filled the abdominal cavity. It weighed 2450 grams and contained approximately 400 c.c. of gas beside the bile-stained mucous containing watery fluid. The walls were relatively thin and there was no organic obstruction at the pyloric valve and no significant dilatation of the duodenum or esophagus.

Cor Pulmonale

For years the generally accepted definition of cor pulmonale (pulmonary heart) has been right ventricular strain due to pulmonary hypertension resulting from pulmonary diseases with either or both clinical and anatomical evidences of this strain on the right heart. More recently a new concept originated by Brill[1] has been widely accepted by cardiologists and internists.[4,6,14,18,22] This new interpretation of the meaning of cor pulmonale includes a host of diseases of the heart, lungs, and great blood vessels causing right heart strain. Theoretically, these lesions are all supposed to cause hypertension in the pulmonary circulation. Therefore, the logic of using the term cor pulmonale is to express their effect on the right side of the heart. With this interpretation, cor pulmonale becomes practically synonymous with right heart strain or pulmonary hypertension. Why not call right heart strain or pulmonary hypertension just that and specify the cause when possible but not distort well-established medical nomenclature and the English language any more than it is. Because of its widespread acceptance, I would like to predict that this new concept of the term cor pulmonale will be a constant handicap in medical intercourse for decades to come.

I would like to call on Dr. J. P. Tetlie for a discussion of cor pulmonale and later Dr. H. M. St. Cyr might briefly summarize the subject of acute gastric dilatation for us.

Dr. J. P. Tetlie: Cor pulmonale has been fairly logically divided into the acute, subacute and chronic types. The acute form[16] is generally due to embolism of the pulmonary arterial tree but may rarely result from pulmonary thrombosis, rupture of an aortic aneurysm into a pulmonary artery, spasm of arterioles due to irritants and allergy, and possibly to a diaphragmatic hernia suddenly compressing the lungs.[15] Animal experimental methods[9] have revealed a critical level of acute obstruction of the pulmonary artery circulation at approximately 60 per cent of its volume flow. Beyond this, serious right heart failure rapidly supervenes.

Subacute cor pulmonale[5] has been considered due in most instances to cancer metastasis to the lungs. This carcinomatous invasion results in obstruction of pulmonary blood flow by cicatricial constriction of small arteries and arterioles because of a diffuse involvement of the adjacent lymphatics (carcinomatous lymphangitis). Carcinomatous endarteritis and numerous small carcinomatous emboli in the small pulmonary arteries[14] may also seriously impede the circulation. The primary site of this cancer is most often in the stomach, but may be in any of the visceral organs. The usual duration of the clinical evidence of cor pulmonale due to cancer is from two weeks to two months. Sickle cell anemia with its vascular obstruction has been included in the subacute group of pulmonary heart diseases.

The chronic form of cor pulmonale is by far the most common variety causing right heart strain. It has been described as having resulted from various lung conditions constricting the pulmonary circulation such as the different causes of emphysema,[21] fibrous scarring and lung tissue destroying lesions as well as pulmonary arteriolar sclerosis. A list of these pulmonary diseases would include: Emphysema, chronic bronchitis, asthma, pneumonectomy, reduction of thoracic volume due to deformities of the chest and spine, thoracoplasty, multiple lung cysts, bronchiectasis, pneumoconiosis, tuberculosis, unresolved bronchopneumonia, fungus and parasitic invasion and Ayerza's disease.

Among the sixty selected cases of cor pulmonale studied at autopsies by Spain and Handler[20] the distribution was as follows: Emphysema—40; bronchiectasis—6; bronchial asthma—6; silicotuberculosis—3; pulmonary tuberculosis—2; kyphoscoliosis—1; pulmonary arteriosclerosis—1; and organized thrombi—1.

Brill and those who agree with his "broader sense" or "physiologic concept" of cor pulmonale would include practically all causes of right heart tension except those diseases which affect the heart as a whole such as beriberi, hyperthyroidism, acute myocarditis, myxedma, anemia and arrhythmias. For instance, his "primary cor pulmonale" includes interventricular or interauricular septal defects and tricuspid, mitral or pulmonary valve stenosis. In fact, any disturbance of the circulation of blood from the vena cavae to the mitral valve which causes any right heart strain regardless of the site of the disease constitutes "primary cor pulmonale." His "secondary cor pulmonale" includes practically all diseases which first cause left heart failure including hypertension, coronary disease, et cetera.

The clinical manifestations of chronic cor pulmonale can be divided into two phases: that due to the pulmonary disease, and that resulting from right heart failure. The general symptoms of the pulmonary phase include dyspnea, cough, hemoptysis, cyanosis, polycytemia, and clubbing of the fingers. Right heart failure is evidenced by engorgement of neck veins, swelling and tenderness of the liver, ascites, peripheral edema, orthopnea, et cetera. These are ominous signs in cor pulmonale and generally appear only a few weeks or months before exodus.

Accentuation of the pulmonic second sound due to a more forceful closure of the leaflets is a most important sign of increased pulmonary tension in adults. Inconstant findings include cyanosis, clubbing of fingers and toes, and the various physical signs of chronic pulmonary diseases usually complicated by cor pulmonale. Roentgenoscopic and roentgenographic studies[17] in all positions frequently reveal characteristic enlargement of the pulmonary artery and the right ventricle before there is any other evidence of right heart strain. The electrocardiogram generally reveals right axis deviation[19] due to hypertrophy of the right ventricular musculature. It is hoped that the new catheterization technique of obtaining blood pressures in the right ventricle might be of great aid in this diagnostic field.

Acute Gastric Dilatation

Dr. H. M. St. Cyr: Acute dilatation of the stomach occurs most frequently following laparotomies and other major surgical procedures or after any type of operation in which general anesthesia is used. It is also found after blows to the abdomen and spine, and also in patients confined to bed with severe wasting diseases such as pulmonary tuberculosis, diabetes, cancer, and chronic heart disease. The condition is frequent enough so that its recognition and therapy must be constantly kept in mind.

There appears to be a fairly general agreement that an initial loss of gastric tonus is followed by an accumulation of secretions and gas, resulting in ballooning of the stomach. Why gastric motility is decreased may not always be apparent. General and spinal anesthesia can depress the stomach musculature.[11] Reflex alteration of the vagus and splanchnic innervation[8,13] may possibly be of fundamental importance. Individual predisposition,[11] aerophagia,[7] duodenal constriction by the superior mesenteric artery,[2] morphine and atropine premedication,[11] debilitation and senility, severity of traumatic injury and the depth of anesthesia may all be important factors in selected cases. Much argument fills the literature concerning the etiology of acute gastric dilatation and it may be some time before the various factors can be properly evaluated as to their importance.

The symptoms are restlessness, epigastric discomfort and the signs of beginning shock. There is eructation and a regurgitation of large amounts of brownish-black fluid. Examination of the abdomen reveals a fullness in the hypochondrium with obliteration of the normal concavity at the costal margin, and there is a succusion splash. Shock and dehydration may be severe. The high blood urea nitrogen, low chlorides and high carbon dioxide combining power are characteristic.

Treatment is aimed at relieving the distention and replacement of the lost fluids and electrolytes. Decompression is best accomplished by a Wangensteen type of nasal suction and frequent lavage of the stomach. Replacement of the lost fluid by intravenous saline and glucose solution is essential. A modified knee-chest position should be encouraged to relieve the pressure of the superior mesenteric artery on the duodenum. Joseph[12] feels that getting the patient to stand up or walk is of great benefit.

At the autopsy, the stomach is found enormously distended with gas and 1500 to 4000 c.c. of fluid. There may be no other pathological change found.

Summary

A difficult diagnostic case study of a forty-year-old underground iron miner and lumberjack is presented. He suffered from a continuous cough productive of frothy sputum associated with dyspnea and orthopnea for five months preceding death. In addition, there was chest pain, pleural effusion, wheezing, familial tuberculosis, positive Mantoux test, crackling rales in the chest, cyanosis and a diffuse x-ray shadow through the lungs. Cyanosis, orthopnea, and edema of the extremities were prominent late manifestations. During the last five days, copious vomiting was severe.

The autopsy revealed a primary carcinoma of the pancreas associated with severe metastatic carcinomatous lymphangitis of the lungs resulting in cor pulmonale with right heart failure. In addition, there was an acute gastric dilatation.

There is a brief discussion of cor pulmonale and acute gastric dilatation.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from August issue)

Lafayette Redmon, born in Ohio in 1833, a member of the regular school of medicine and one of the earliest of pioneer physicians of Fillmore County, for twenty-six years or more played a prominent part in the social, civic and professional life of Fillmore County, chiefly in Preston Township, and the contiguous communities and, for a time in the middle and late seventies, in Lanesboro, Carrolton Township.

Dr. Redmon arrived in Preston in the fifties, from Indiana, it is believed, and various subsequent references to him which were made editorially in the local newspapers from time to time lead to the conclusion that he was one who had come seeking the much-vaunted salubrious climate of Minnesota. The first appearance of his name observed was in the *Chatfield Republican* of September 19, 1857, in which, as of August 8, Dr. Redmon published a notice as administrator of an estate at Forestville, a village near Preston. Often thereafter, especially in the *Preston Republican*, there were items and notices that have served as an index to his activities. In 1861 it was stated: "We regret to learn that Dr. Redmon who, since his residence here has done much to acquire the good will of the people, is now dangerously ill and we hope for the best, but have some fears. He has suffered considerable hemorrhage of the lungs." In the following summer, however, when steps were being taken "toward celebrating in a manner creditable to the village the coming anniversary of our national Independence," Dr. and Mrs. L. Redmon and Dr. and Mrs. J. W. Crees were in the forefront of making arrangements, and on July 4 Dr. Redmon acted as officer of the day. In that autumn he took over locally for Dr. Luke Miller, of Chatfield, who was surgeon for the county, in the examination of applicants for exemption from military duty. And on October 10, 1862, there appeared an item which, in view of the participation of Mrs. L. Redmon only three months earlier in the celebration of the Fourth of July, is arresting: "Dr. L. Redmon has lately returned from Indiana. He was married in Noblesville in that state to a fair lady and returned not alone. We welcome him back with his help mate. Long life and much happiness to them both." This congratulatory statement was substantiated by a notice of the marriage, on Monday, September 29, at the residence of the bride's father, of Dr. La Fayette Redmon, of Preston, Minnesota, to Miss Mary E. DeMoss, of Noblesville, Indiana. Pioneer residents of Preston have recalled that Dr. Redmon had a daughter, Callie.

On April 29, 1863, Dr. Redmon extended his associations in the community by joining the Masonic Blue Lodge of Preston. About a year later, evidently having just returned after an absence, or an illness, he announced to the citizens of Preston, again through the *Republican,* that he would continue to reside in the village, that he intended to make it his permanent residence, that he was grateful to the people of the village and vicinity and that he trusted that he might be able to deserve a continuance of the same. And this hope he attempted to make good by additional study, for in the spring of 1865 he had returned from "having spent the winter east rehearsing at the Medical Institution." He was then in residence at the Stanwix Hotel (which was established by an early and solid citizen, John Kaercher) and was giving special attention to medicine and surgery.

It was in the period from 1855 to 1867 that promotion of the Southern Minnesota Railroad was at its height and Dr. Redmon was actively participating in the program; in 1867 he was one of a committee of citizens of Preston appointed to investigate the possibility of securing the right of way for the road, which presumably would pass through Preston. The village was disappointed, as were many other settlements; it was not until 1879, as has been told, when Caledonia, Mississippi and Western was extended from Caledonia, that Preston had railway facilities.

That this physician had scientific imagination and forethought was evidenced by his initiative in helping to organize the Fillmore County Medical Society; the organizational meeting was held in his office on October 17, 1866, and there were present besides himself, Drs. R. W. Twitchell and A. H. Trow, of Chatfield; H. Wilson and G. M. Willis, of Carimona; and T. E. Loop of Spring Valley. Other charter members were added soon afterward.

In 1868 Dr. Redmon assumed an additional professional responsibility by serving as Examining United States Pension Surgeon for Fillmore County to succeed Dr. E. J. Kingsbury, of Spring Valley, who had resigned. And in the autumn of 1869, perhaps in consideration of the attempt made that year through the legislature to regulate medical practice in the state, he again left Preston temporarily to take a course of postgraduate study, as did Dr. O. A. Case also. It was because of the departure of these two practitioners that Dr. John A. Ross, a young and well-trained Scotch physician, newly out of Rush Medical College, came to Preston. In January, 1870, Dr. Redmon returned and was re-established, finding his old home more attractive than ever.

It should be said here that early in 1869, at the first semi-annual meeting of the recently reorganized Minnesota State Medical Society, Dr. Redmon had been elected a member of the Board of Censors and he continued on the board into 1870; in 1871 he was a member of the Committee on Obstetrics and Gynecology; he aided the Committee on Surgery, as one of the seventeen physicians in the state to send in reports of cases and statistics for the year ending February, 1871; and in this year, again, in a report to the Committee on Surgery, he observed that goiter was "quite prevalent among Norwegians," of whom there were many in Fillmore County, and expressed the belief that high altitudes were productive of the disease; his treatment for the disorder was giving soft water to drink and administering iodides internally and externally. It should be noted also that this pioneer physician co-operated in due time with the State Board of Health, which was organized in 1872; in 1880 he was one of the eleven physicians, so aften mentioned in this paper, of Fillmore County to respond to an inquiry from the board as to the local incidence of diphtheria in the preceding years.

Apparently Dr. Redmon was one who recognized the value of sound medical publications in the advancement of scientific medicine, for in September, 1870, the *Northwestern Medical and Surgical Journal* published a note of "sincere thanks and gratitude," to Dr. Franklin Staples, of Winona, and Dr. L. Redmon, of Preston, "for having not only sent us many a cheering word, but canvassing successfully in their neighborhoods, sending more than one subscriber and the accompanying needful on which our journal lives." And still another manifestation of his constructive interest in his profession was his encouragement, through preceptorship, of sound preparation for medical practice. In 1869 and 1870 and perhaps into 1871 he took into his office as a student Albert Wentworth Powers, of Fountain, who subsequently studied at Rush Medical College, and it seems a fair assumption that other young aspirants to medicine came under his influence.

Although he had returned to Preston in 1870, by October of 1871 Dr. Redmon was moving and was to be replaced by Dr. A. C. White, lately of Muskegon, Michigan, who had just arrived. Late in November, 1872, however, the following note appeared in the *Preston Republican:*

> RETURNED: After a few months residence in Cedar Rapids, Iowa, where he and his family stood an immense amount of shaking up with fever and ague, Dr. L. Redmon has returned to Preston with his entire household, hoping to regain health and happiness. The doctor says he has tried to find a better place to live in than Fillmore County and failed. He thinks no man can afford to exchange a Minnesota home for one anywhere in any other state in the Union. His old friends welcome him back most heartily.

This was followed early in January, 1873, by two statements: first, that he and his family were improving; second, that he had sufficiently regained his health to be able to enter upon the practice of medicine and surgery with reasonable assurance of being able to attend to all cases promptly at all times. The editor went on to say: "If he has a specialty, it is surgery, in which we know he possesses superior skill. He is a close student and keeps well posted in the science of medicine, an indispensable requisite to success in the healing art. His old friends and patients are glad to welcome him back to Preston." Dr. Redmon then had his offices in the Carpenter Building (still standing in 1944) south of the Court House.

Nevertheless, Dr. Redmon departed yet again, in the early spring of 1874, and in April was building a fine new residence in Lanesboro where, it is believed, he remained for some years. And yet again he returned to Preston. In late December, 1881, he was announcing that he had supplied himself with pure bovine vaccine for vaccinating all who desired permanent protection from smallpox.

His medical contemporaries in Preston were many. In addition to the physicians already named, there were in the village at different periods during Dr. Redmon's long residence the following men, to mention only a few, who are given in chronological order of their coming, from the early sixties into the early eighties; at all times there were more than one physician in the village: J. W. Eighmy, —— Huffman, Lyman Viall, S. Wallace, C. H. Jacobson, Henry Jones and George A. Love.

In May, 1882, well liked though he was both personally and professionally in Preston, Dr. Redmon made his final departure from the village and moved to Winona, Winona County, attracted by the larger field. Regrettably, the story of his later years has not been learned.

If emphasis, perhaps undue, has been placed in these paragraphs on Dr. Redmon's minor removes and changes of residence, it has been done with reason. He was typical, it is believed, of a fairly large group of the earliest physicians in Minnesota, Fillmore County and elsewhere, of better preparation and broader professional viewpoint than the average practitioner of the day, who had come to the state for the benefit of their health in its superior climate. It has been observed in reading of many physicians who were obviously of this group that each of them strove to find the place that would meet his threefold problem of maintaining his health, supporting his family and advancing his profession.

Lewis Reynolds, one of the earliest physicians of Fillmore County, was both practitioner and innkeeper in Granger, Bristol Township. ". . . In 1865 Dr. Lewis Reynolds built the State Line House. . . . Dr. Reynolds was the first resident physician in Granger." Other reference to this pioneer has not been observed.

Hogan J. Ring, born Haaken J. Fjörkenstad and named for his paternal grandfather, was born on February 17, 1851, at the farm home of his parents, Jens Haagensen Fjörkenstad and Helene Fjörkenstad Fjörkenstad (daughter of Johannes Fjörkenstad; the two families were not related), near Lake Mjosen on a large estate, Ringtogen. The boy was the fourth of ten children.

In 1863 Johannes, the eldest of the children, immigrated to the United States and to Minnesota. In the new country he soon found that the family name of Fjörkenstad was too hard for the Americans to pronounce and he therefore cast about for a new surname; at first he tried Jensen, but because, as he said, that name was on practically every corner in the community of Preston, where he had settled, he shortened the name of his birthplace, Ringtogen, and thereafter was known as Johannes (or John) Ring.

These two brothers, Johannes and Haaken, were musicians, playing violins that their father had made and performing ably on other instruments also. Hogan Ring could not remember, his children have quoted him, when he first started to play the violin; he took lessons from his brother until the pupil was playing better than the teacher. In Norway the two boys played for family and guests at home and for dances in their neighborhood. It happened that after Johannes had left Norway, Haaken's playing attracted the attention of Ole Bornemann Bull, the great Norwegian violinist, who would have educated the boy at the University of Stockholm. The stories of American wonders that came home from Johannes were more attractive, however, than the prospect of a musical career under Bull's sponsorship, and in 1865 Haaken, aged fourteen, took passage on the sailing vessel, the Emerald, to Canada and earned his way by playing his violin for dances on shipboard. Arrived in Canada, he traveled by waterways the St. Lawrence River and the Great Lakes, and overland, probably by railway from Chicago, to La Crosse, Wisconsin, and thence to Preston, Fillmore County, Minnesota. Once more the brothers made music together, and the younger by means of his violin earned his way through school. It was in Preston, soon after his arrival, that Haaken J. Fjörkenstad became *Haaken J. Ring* and later, when he became a citizen of the United States, that *Haaken* was changed to *Hogan.* Johannes, never strong, lived only a few years after coming to America.

For several years Hogan Ring in the summer worked on farms near Preston and in the winter went to school in the village. After he had left school, he worked four and a half years as apprentice and clerk in the drugstore of Albert Weiser in Preston until, in 1872, he went into partnership with Mr. Weiser in a new store in Whalan. At about this time a newspaper item, giving an account of the Whalan Cornet Band, stated that "H. J. Ring fingered the 1st B flat." In December, 1873, he was appointed postmaster in the village, in place of G. G. Walker, resigned, and the *Preston Republican* commented, "Hogan is a reliable young businessman and will no doubt make a good postmaster." The village of Whalan, on the Root River and the Southern Minnesota Railroad, was named for John Whaalahan, an early settler; common usage reduced the number of letters in the name. In the days when Hogan Ring first lived in Whalan, the settlement had 160 residents, "three flour mills, telegraph and express," various stores and the drug shop of Weiser and Ring.

From boyhood Hogan Ring had dreamed of becoming a physician but it was not until he had been several years in Whalan that he accumulated sufficient money with which to realize his ambition. In the middle seventies he enrolled at the Bennett College of Eclectic Medicine and Surgery in Chicago and in 1877 he received his diploma. In the last year of his medical course he was married, on August 15, 1875, to Ida Orcelia Lowe, daughter of Mr. and Mrs. Garrison A. Lowe, of Belvedere, Illinois, and immediately after his graduation he brought his wife to Whalan, where they lived for about two years. In Whalan Dr. Ring practiced medicine and continued in the drugstore, of which he became sole owner; subsequently he sold it to A. Backman. In Whalan, also, on December 21, 1877, was born Dr. and Mrs. Ring's first child, Johannes Glenellyn. When the baby was ten months old, Hogan and Ida Ring started with him for Nebraska, traveling by horse and buggy. In Grand Island, Hall County, Nebraska, they made their home for nine years, and there became the parents of two daughters, Verna Helene, born on September 13, 1882, and Mildred, on May 14, 1887. In Grand Island Dr. Ring advanced his medical career and for two years served as county coroner.

In the autumn of 1887 the Ring family left Nebraska for the Pacific Coast and late in December arrived in Ferndale, Humboldt County, California, where Dr. Ring at once began his forty-three years of service in the village and community. In Ferndale two more sons were born to Dr. and Mrs. Ring, Ronald Lowe, on January 31, 1894, and Arden Garrison, on October 31, 1899. Mrs. Ring died on June 7, 1901, from carcinoma of the breast. Two years later Dr. Ring was married to Eleanor Black Andreasen, a widow, of Ferndale; of the second marriage there were two children, Harlan J. and Ingwald M. Ring.

Early in 1930 Dr. Ring, because of rapidly failing health, was taken to San Francisco for temporary hospitalization and special medical care; he died in that city from carcinoma of the rectum on April 26, at the home of his stepson, Dr. Olaf Andreasen, survived by his wife, his children, two stepchildren, one brother, Jacob H. Ring, and a sister, Mrs. Pauline Helgestad, all of whom were in the West, and a sister, Mrs. Oliane Backman, of

Whalan, Minnesota. In 1943, of this group there were living the brother, J. H. Ring, of Ferndale, and the seven children: J. Glen Ring, of Willits, California; Verna (Mrs. Paul W. Hunter), of Fortuna, California; Mildred Ring, of Covelo, California; Ronald L. Ring, of Denton, Texas, colonel in the United States Army; Arden G. Ring, of Seattle, Washington, lieutenant (S. G.) in the United States Naval Reserve; and Harlan J. Ring and Ingwald M. Ring, of Berkeley.

Dr. Ring became a member of the Eclectic Medical Society of California in 1888, and also was a member of the Masons, Odd Fellows, Knights of Pythias, Woodmen of the World and other fraternal orders. He was a good and useful citizen, a faithful and valued physician and a respected and loved resident of his city, where his name is honored and where there are many memories of his kindness and ability. He never failed a patient; and although he has been gone seventeen years, many of his techniques and prescriptions are still in use. A scholarly man, Dr. Ring not only kept abreast of his own profession but he also studied other sciences than medical and wrote of his observations. Early in the century an article of his on astronomy was published in one of the current scientific journals. In his later years he was engrossed in a study of the effect of winds, air pockets and other aerial phenomena on aviation.

Soon after his death the citizens of Ferndale erected a memorial to this beloved physician, a flagstaff that stands on the lawn of the Carnegie Library. Its inscription reads:

In Memory of
Hogan J. Ring, M.D.
in
Recognition of Forty-three Years
of Unselfish Service
to this Community
1851 1930

(To be continued in October issue.)

President's Letter

IN 1943 eight out of ten citizens of the United States claimed that their physicians had a personal interest in them and their welfare, and 74 per cent felt that there were sufficient physicians, nurses and hospitals to meet all needs. In 1947, 79 per cent complain of shortages of nurses, hospital facilities and physicians, and 47 per cent have found it difficult to pay a doctor's fee or a hospital bill. Seventy per cent believe that something might be done to make it easier to meet such expense. In 1943 the term "socialized medicine" was known to about four out of ten persons but in 1947 the percentage of these individuals has increased to 55 per cent.

Nine out of ten physicians are familiar with the Wagner-Murray-Dingell National Health Bill. Eleven per cent consider that the Wagner-Murray-Dingell Bill would be a good thing from the standpoint of the general public. Nine per cent think it would be a good thing from the standpoint of the physicians of the country.[1]

Many physicians believe that their worries concerning the threat of socialized medicine came to an end when the composition of the Congress was altered in the last election. They are familiar with the effort which has been made to pass legislation which might place the Federal Government in control of the practice of medicine, but they feel that there is no need, at this time, for concern about this vital matter. Possibly this is a normal reaction. However, if physicians knew of all of the activities in which proponents of the Wagner-Murray-Dingell Bill are engaged during this period of apparent inactivity, they would realize that their sense of security is unjustified and that this is no time for lethargy.

Recently the Committee on Expenditures in the Executive Departments[2] completed an investigation through a subcommittee authorized to investigate publicity and propaganda of Federal officials in the formation and operation of health workshops. In this report it was stated that "on the basis of hearings held on May 28 and June 18, 1947, it (the Committee) finds that at least six agencies in the executive branch are using Government funds in an improper manner for propaganda activities supporting compulsory national health insurance, or what certain witnesses and authors of propaganda refer to as 'socialized medicine' in the United States." The statement goes on to say:

"The departments, bureaus and agencies now participating in this campaign are:

1. The United States Public Health Service
2. The Children's Bureau
3. The Office of Education
4. The United States Employment Office
5. The Department of Agriculture; and
6. Bureau of Research and Statistics, Social Security Board."

The Committee called attention to "the extraordinary executive pressure" exerted on the staff of the United States Public Health Service to further the campaign for socializing medicine by publishing a portion of a letter written under date of December 10, 1945, by Thomas Parran, Surgeon General of the United States Public Health Service, to all field men and staff operatives throughout the country. This letter referred to the message sent to Congress on November 19, 1945, by President Truman, urging enactment of a national health program. The quotation from Surgeon General Parran's letter is as follows:

> "The appropriate executive agencies of the Government have been specifically instructed by the President to assist in carrying out this legislative program. . . . Every officer of the Public Health Service will wish to familiarize himself with the President's message and will be guided by its provisions when making any public statement likely to be interpreted as representing the official views of the Public Health Service."

All of the evidence presented before this Committee indicated that "health workshops were planned, conducted and largely financed with Federal funds by a key group on the Government payroll who used the workshop method of discussion subtly to generate public sentiment in behalf of . . . socialized medicine. It is evident from the record that most of the planning was done by the Federal officials in Washington prior to each workshop conference." These conferences were organized "to agitate for compulsory health insurance, as then pending in Congress."

---

[1] Opinion Research Corporation's official tabulation on surveys of opinions of the public on selected issues and opinions of physicians on selected issues.

[2] Third Intermediate Report of the Committee on Expenditures in the Executive Departments, House Report 786 of the First Session, 80th Congress, submitted July 2, 1947, to the Committee of the Whole House on the State of the Union.

It was found that the Bureau of Research Statistics of the Social Security Board prepared pamphlets and propaganda literature for the C.I.O., the A.F. of L., and the Physicians' Forum (the propaganda agency for the Wagner-Murray-Dingell Bill). This material, prepared at Government expense, supported "socialized medicine in every approach and dismissed contemptuously all arguments controverting the fixed position of the Social Security Board."

Also, attention was called to the fact that the Chief of the Medical Economics Section of the Division of Research Statistics of the Social Security Board had "charted, arranged and conducted the Jamestown (N.D.) Health Workshop," and that this Federal employe had helped draft the Wagner-Murray-Dingell Bill.

The Committee showed that thirteen of these workshops had been planned and carried out. Two of these meetings were held in Minneapolis, the first one on December 20, 1945, and the second on January 9, 1946, and from February 6 to 10, 1946, one of the largest workshops was held in Saint Paul. On that occasion, seven Federal agencies were represented by fifteen Federal employes.

The method used in the workshops is impressive. "A hand-picked group of leaders from various local societies were brought in for the purpose of being trained in workshop procedure. This training program was handled entirely by the employes of the Federal Government. . . . The hand-picked group from the local societies were designated as delegates and in training them they were seated around a conference table with the twenty-one consultants (Federal representatives) lined up behind them." It was urged that "letters be written to senators and representatives advocating immediate action on the Wagner-Murray-Dingell Bill. . . . It was very interesting to note that when left to themselves the delegates seemed unable to think of any particular health problems in the State."

Among the topics listed in the procedures of these meetings are: (1) Technics for the organization of citizen groups; (2) formation of pressure groups; and (3) methods of bringing about group action.

Testimony demonstrating the efficacy of this indoctrination of delegates by the Federal officials was found in the formal summary of the Jamestown Workshop, as presented by the United States Public Health Service. One section urged that congressional candidates and incumbents be polled by the Committee on their stand on the national health program and that their opinions be sent to the State organizations for publication. It was shown clearly that Federal employes arrange the meetings, invite the delegates, train the delegates, preside at the meetings, and then frame the formal summary of resolutions and actions.

One portion of this report calls attention to the fact that it was the activities of the Group Health Association of Washington, D. C., which led to the filing in 1937 of the antitrust proceedings against the American Medical Association under the Sherman Antitrust Act. It is well known that this legal action by the Department of Justice was carried to the Supreme Court of the United States on the basis of the original complaint and accusation of the Group Health Association of Washington, D. C., serving effectively to "intimidate and restrain the activities of the American Medical Association in resisting the Federal propaganda."

In the report it was stated that "for the fiscal year 1946 total expenditures in the executive branch for publicity and propaganda activities were 75 million dollars. During that fiscal year 45,000 Federal employes were engaged, full or part time, in such activities. . . . An increase of approximately 300 per cent in Federal expenditures for publicity and propaganda in a period of five years is deemed by your Committee to be a proper subject for inquiry by the Congress." And the recommendation of the Committee was summed up in these words: "We have, therefore, brought these matters to the attention of the Department of Justice with the request that the Attorney General at once initiate proceedings to stop this unauthorized and illegal expenditure of public moneys."

These are not doubtful or hypothetical inferences. They are not matters of opinion which may be disputed, but are stubborn certainties supported by irrefutable testimony. Having seen these evils, the knowledge which we have obtained should create in us a determination to provide a remedy. We cannot accomplish this by a continuance of complacency.

PERTUSSIS IMMUNITY AND MIXED ANTIGENS

IN AN earnest effort to simplify immunization procedures and minimize the number of doses of antigens employed, biological manufacturers have recently fostered the preparation and use of "triple" antigens (pertussis, diphtheria, tetanus).

Ramon[5] showed that the immune response to a toxoid (in the form of antitoxin) was enhanced by a mixture of toxoids. Bordet recommended pertussis vaccine and diphtheria toxoid in combination. A number of reports on mixed immunization have since appeared.[2,9] Bigler[1] and others now believe that the degree of immunity to pertussis, tetanus and diphtheria correlates best with the total dosage of antigen used. Lapin[3] has shown that 80 billion Phase I pertussis organisms modify active pertussis whereas 120 billion prevents the disease in older infants. Since the recent increase in pertussis, it has become apparent that bacterial counts in previously used mild antigens have been very inadequate. At Stanford University Clinic, Miller[4] reports the need of additional pertussin antigen when triple "D-P-T" vaccine is used in babies.

The problem before manufacturers is still that of mixing enough pertussis antigen without producing severe local and general reactions. Moreover, the "small volume" alum precipitated pertussis vaccine now available has been shown by Sako[6,7] to be capable of protecting babies as young as two months of age with doses of only 0.2 c.c., 0.3 c.c., and 0.5 c.c. (40 billion A-P).

This has stimulated trials at immunity to other diseases at younger age levels and a number of studies are now in progress in various parts of the country. In young infants it begins to appear[8] that alum-precipitated antigen is superior, whereas in the older infant and child, plain vaccine is effective and more prompt in its recall of "booster" rôle. Although mixed antigens may be used for babies if extra doses of pertussis are given, it would seem best in the light of present knowledge to reserve the triple antigen for booster purposes in the previously immunized child starting kindergarten.

Until a more efficient and reaction-free mixed antigen is available, it may be better to immunize against pertussis alone at the third, fourth, or fifth months, and diphtheria-tetanus at the sixth, seventh, or eighth months with triple mixtures reserved for use as reinforcing agents. As greater improvement occurs in the manufacture of mixed antigens, it is hoped that an ideal preparation for small infants will evolve which will adequately protect against all three diseases.

Erling S. Platou, M.D.

CANCER

THE public has become cancer-minded as evidenced by the millions contributed to the American Cancer Society and the additional millions appropriated out of taxes for cancer research. While money is necessary for research, it is not necessarily true that if enough millions of dollars are available the cause of cancer will be found and the cancer problem solved. Medical discoveries in the past have been the result of the work of a few scientists who have not had much financial backing but who have had that rare type of mind which characterizes research workers.

In facing the problem of cancer, not only is it highly desirable to discover the cause of cancer, but it is also very important to detect the presence of cancer in its early stages when it can be

more likely cured by our present methods of treatment.

In attaining this later objective, we hear more and more about the desirability of Cancer Detection Clinics composed of a group of specialists. Wangensteen* in a recent article states, "There is need for Cancer Detection Clinics set up at strategic places with competent specialists in the various branches of medicine and surgery. Moreover, there is need for the co-operation of all men and women in attending such clinics, when established, approximately three times a year. If the support in funds and of the public in attendance on such clinics is forthcoming, I believe that it will represent the best use of the available knowledge in dealing with the problem of cancer."

The author is doubtless impressed with the number of patients in whom cancer of the stomach is diagnosed too late for operative cure. He apparently believes that if everyone in the cancer age were examined frequently by competent specialists, more cancer would be detected early enough for cure. This is true. The same would be true if everyone consulted his physician three times a year. But is such a suggestion realistic?

Some 20 per cent of the 140 million people in the country (28 million) are over fifty years of age. At three examinations a year, that would mean 84 million examinations a year—examinations not for cancer of the stomach alone but for cancer of all the organs.

With the chance of perhaps one in a thousand of detecting cancer in this age group, would it be reasonable to expect normal individuals to go to the expense of such frequent examinations? The number would be few. To operate to any extent, such Cancer Detection Clinic would have to be tax supported; and who would advocate loading the present burden of the taxpayers with a possible 84 million examinations?

We do not wish to decry wholly the idea of the Cancer Detection Clinic. It is quite likely that physicians would welcome the establishment of such clinics to which they could refer patients in whom they suspected cancer. We are not convinced, however, that periodic examination of large numbers of normal individuals at Cancer Detection Clinics would contribute valuable additional knowledge to what we now have as to early symptoms.

The problem of cancer and its early detection presents a distinct challenge to the profession today, as it has in the past. Physicians should always be cancer-minded. Every patient, and particularly those in the later age groups, should be approached with the possibility of cancer as well as tuberculosis, cardiac disease, diabetes, and the innumerable other diseases flesh is heir to. It should not be necessary to have separate clinics for the diagnosis of these diseases—whether privately or publicly supported. With consultation easily accessible, the profession should be able to diagnose cancer as early as scientific methods permit, and we question the practicality or necessity of the establishment of Cancer Diagnostic Clinics on a wholesale scale.

LIFE INSURANCE FOR STATE ASSOCIATION MEMBERS

THE opportunity for active members of the Minnesota State Medical Association to add a $5,000 policy to their life insurances has been presented in detail to each member. Each member would do well to consider the proposition seriously in view of his particular needs. The group policy is offered by the Northwestern National Life Insurance Company of Minneapolis, and being a term as well as a group policy, the rates are low. Term policies are convertible at any time, the age rate to apply at the time of conversion.

This proposed group policy is recommended by the Council of the Association and should prove particularly attractive to the younger members. To them, the cost of adequate life insurance is an important item at a time when their practice is being built up and unfortunate possibilities are ever present. After all, the main purpose of life insurance is protection for dependents in case of death. Endowment policies protect against the further possibility of reduced income in advanced years and are valuable but more expensive.

The rates of the proposed group policy are contingent on 75 per cent of our State Association membership taking out a policy. Most members should welcome the opportunity to add $5,000 to their life insurance protection. It would seem that the success of the proposition should be assured.

MEDICAL ECONOMICS

George Earl, M.D., Chairman

PREPAID MEDICAL AND SURGICAL CARE FOR MINNESOTA PEOPLE

MR. DON C. HAWKINS
Chairman, Liaison Committee of Insurance Underwriters
Saint Paul, Minnesota

If there were no differences of opinion, there would be no problem in providing Minnesota residents with a plan for budgeting the cost of medical care. However, there are at least two points on which there is no disagreement: first, that the best medical care is and *should be* available; and second, that no matter what method is evolved for providing this care, the doctor is the one who is going to render the service.

If one wants a haircut, one goes to a barber; when one needs his tonsils removed, the logical procedure is to consult a doctor. And when it comes to the method of providing medical and surgical care on a prepayment basis, the question is one of insurance and one should look to a recognized licensed insurance company, which is represented by regular agencies and is capable of providing reliable coverage. It is through this method that the greatest good can be done for the greatest number.

Under a plan utilizing the facilities of recognized insurance companies, coverage provides payment for care wherever it may be rendered, irrespective of the nature of the care, thereby eliminating disappointing experiences arising from limited coverage in a limited area, as when coverage can be provided only within state borders.

The medical profession has always recognized the fact that they have a duty to perform; and every clear-thinking individual should realize that the social uplifter has, in reality, proved of little value, and has, rather, impeded progress in the development of medical care programs. More attention could well be paid to education, sanitation, housing and the like, while special services pertaining to medical care could be left to those who are qualified.

It has been a pleasure and an education to work with the Liaison Committee of the Minnesota State Medical Association. In all of this work, we have not changed from our original objective. There have, however, been a few changes which are beneficial to the public and to the medical profession as well. As the plan progresses, and with the full co-operation of the members of the State Medical Association, additional improvement will be made; and, while other states have plans in effect, we in Minnesota have had opportunity to profit by their mistakes. It may appear to some that this plan is slow in developing, but the reverse is true. Minnesota still leads the field in many phases of the development of prepayment plans.

In seeking to establish a means of providing the people of the state of Minnesota with a plan of prepaid Non-occupational Hospital, Surgical and Obstetrical insurance, at the lowest possible cost, there are certain phases of the plan which are fundamental:

First, it is believed at present that the public interest is best served through the medium of voluntary insurance, underwritten by insurance companies duly licensed by the state insurance commission.

Second, the Minnesota State Medical Association is willing to permit any such licensed insurance company to state that a specific policy or policies are accepted and approved by the Association, provided the benefits in such a policy or policies meet the minimum standards set forth by the Association and the company will co-operate towards the attainment of the objectives of the Association.

In carrying out the instructions of the House

Mr. Hawkins' article presents a review of work done by the Liaison Committees of the Minnesota State Medical Association and the Insurance Representatives toward setting up a plan for prepayment of medical and surgical care, underwritten by private insurance carriers.

of Delegates, the Liaison Committee of the Minnesota State Medical Association has set forth the following Minnesota standards as a recommendation to insurance companies operating in this state:

1. Surgical Expense

Reimbursement for surgeon's fees up to the amounts provided in the schedule of surgical benefits offered on the $150 schedule (schedule offering top benefits of $150 for major surgery) of the former group conference.

2. Medical Expense

The minimum standards for medical service rendered for employed persons shall be:

$3.00 beginning with the fourth call in the home
$2.00 beginning with the fourth call in the office
$2.00 beginning with the first call in the hospital
$20.00 limit on any one disability
$100 limit in any twelve consecutive months

Minimum standards for dependents' medical care:

$2.00 beginning with the first call in the hospital
$60.00 limit in any twelve consecutive months

3. Obstetrical Expense

Up to $50.00 for delivery.

4. General Recommendations

(a) There is to be no interference by the insurance company with the physician-patient relationship.

(b) There is to be no interference by the Association in the operation of the insurance company, although reasonable reports may be requested from time to time as to claim experience and enrollment.

(c) The plan must be flexible; that is, medical expense benefits may be written without surgical and obstetrical benefits, and *vice versa.* Individuals may be insured without including dependents, but insurance companies would be expected to have complete coverage available.

(d) Freedom of contract—an insurance company may use its own forms, may provide higher benefits than the minimum standards specify, and may issue other forms in conjunction with the approved plan.

(e) The Association is to have full control in granting approval and shall retain reasonable rights to withdraw approval.

(f) The plan should be competitive as to its provisions with any other plan in the state, and participating physicians should agree to accept the fees in the schedule as full payment for services rendered to the "low income group."

(g) Co-ordinating Committee—the Liaison Committee—is to act as a Committee to consider problems arising in connection with the plan and to hear complaints of physicians, the public and the insurance companies.

In preparing this report, we have not drawn any unwarranted inferences. There have been no promises made which cannot be performed. We have not confused reality with wishful thinking. Your insurance companies are continually interested in the development of constructive programs for medical care and trust they can at least keep abreast of the needs of the public, if not ahead of them.

EMERGENCY MATERNAL AND INFANT CARE PROGRAM TO END GRADUALLY

By voting just enough funds to wind up activities, Congress has assured the eventual liquidation of the Emergency Maternal and Infant Care Program, which has been in effect since July 6, 1943. Appropriations include only those necessary to permit mothers and babies to complete the medical and hospital care for which they were eligible on June 30, 1947.

No one who was not eligible or potentially eligible for benefits on June 30 can become eligible after that date. However, an eligible wife, who became pregnant prior to June 30 may receive benefits; and her baby can receive medical care under the program up to the age of one year.

Because babies born to mothers who are still eligible may receive care until they are a year old, it is estimated that the program will not be terminated entirely until nearly two years from now. There is a maximum of twenty-one months of care possible—nine months maternity care during pregnancy plus twelve months for the infant after birth.

29,840 Mothers, Infants Receive Care

In Minnesota, operation of EMIC has provided a total of 29,840 wives and infants of servicemen with the best medical and hospital services available. Of this number, 22,810 mothers received prenatal, delivery and postnatal care, while 7,030 babies were provided for when ill and also given immunizations against smallpox, diphtheria and whooping cough. The steady decline of maternal and infant mortality during the period of the program's operation would indicate that this service has had an important bearing on the saving of life and health.

As of last December 31, the operation of this program in Minnesota has cost the federal government in specialists' and general practitioners' fees, as well as hospital charges and nursing services, a total of $2,219,062.27. Federal funds have been administered in Minnesota by the State Department of Health, under the direction of Dr. Viktor O. Wilson, chief of the Section of Special Services. Dr. Wilson says that EMIC "storks" costs in this state have averaged $107.10 a baby, and $46.92 for each sick infant.

The main objective of EMIC was to provide necessary medical care for infants and pregnant wives of men in the four lowest grades of the armed services (including aviation cadets). Wives and children of veterans were also eligible when pregnancy occurred while the men were still in service.

Program Stirs Controversies

Although no responsible men of medicine questioned the basic necessity and desirability of the EMIC program, many of the details of policy and method were often the subject of heated controversy. The feeling that the program was too strongly weighted in favor of specialists labeled it a "specialists' program." Too little recognition was given to the problems of the general practitioner in the rural areas.

The controversy narrowed down to one point, however, and that was the inability of the physician attending a case under the program to exercise his own choice of physician for consultation when complications occurred. The arbitrary policies laid down by the federal administration in Washington, the "Blue Book" and the fact that organized medicine was not consulted at any point in the designing of the program were all sources of dissatisfaction and disagreement.

And now the EMIC program is on the way out. At one time or another the program exemplified nearly every fault or failing that can be expected in a nationally sponsored plan for medical care. A large share of the credit for the ultimate success of the program can be given to the patient co-operation of the physicians of Minnesota, to the administrative handling of the Health Department, to the services of the professional advisory committee and the Academy of Pediatrics which worked so hard to iron out difficulties as they arose.

EMIC has taught many lessons that will be profitable should a comparable national medical program be necessary in the future.

FEDERAL FUNDS USED TO PROMOTE COMPULSORY HEALTH INSURANCE

At least six federal agencies in the executive branch have been found guilty of using Government funds in an improper manner for propaganda activities supporting compulsory national health insurance.

Unlawful use of federal funds was uncovered in a recent investigation in Washington of the participation of federal officials in forming and conducting health workshops. The investigation was carried on by a subcommittee of the Committee on Expenditures in the Executive Department known as the Subcommittee on Publicity and Propaganda.

Hearings were held by the Subcommittee on May 28 and June 18 of this year, which revealed that employes of the U. S. Public Health Service, the Children's Bureau, the Office of Education, the Employment Service, the Department of Agriculture, and the Bureau of Research and Statistics of the Social Security Board has been sent at government expense to a series of "Health Workshop Conferences" held throughout the country during the last two years.

These health workshops, planned and conducted with the aid of federal funds by a key group on the government payroll, were subtly aimed to generate public sentiment in behalf of health insurance legislation such as the Wagner-Murray-Dingell Bill.

First Workshop Held in Saint Paul

Following three meetings held to plan the series of workshop conferences in November and December, 1945, two in Washington, D. C., and one at the University of Chicago, the U. S. Public Health Service launched the series in Saint Paul, Minnesota, February 6-10, 1946. Eighty persons attended this first meeting, 15 of whom were government employes representing seven different federal agencies.

The second health workshop was held in Jamestown, North Dakota, September 27-30, with ninety-eight participating, eighteen of whom were federal employes representing seven agencies. Apart from federal personnel, there were no doctors of medicine in attendance as delegates. No registered doctor of medicine was invited to participate. Other conferences in connection with the workshop series were held at Fargo, Aberdeen, Great Falls (Montana), and at Minneapolis. It is evident from the record that most of the planning for these conferences was done by the Federal officials in Washington prior to each meeting and that the primary aim was to organize pressure groups to agitate for compulsory health insurance then pending in Congress.

Executive Pressure Asserted

That pressure for a national health program was exerted from the top down within the U. S. Public Health Service was apparent even before the current investigation. For concrete evidence of this, one need look no further than a letter sent to Health Service officials and employes by Surgeon General Thomas Parran. The letter referred to the President's November, 1945, message to Congress, which urged enactment of a national health program.

Calling the Presidential message "a subject of highest importance to every citizen," the Surgeon General suggested that "every office holder of the Public Health Service will wish to familiarize himself with the President's message and will be guided by its provisions when making any public statement likely to be interpreted as representing the official views of the Public Health Service."

Through testimony given at the investigation, it can be seen that Health Service employes and officials have been consistently intolerant of honest discussion or debate of issues in their attempts to high-pressure certain legislation through Congress.

Security Board Pays for Literature

Testimony before the Committee reveals that the staff and resources of the Bureau of Research Statistics of the Social Security Board were freely and frequently lent to the preparation of pamphlets and other propaganda literature for the CIO, the AFL, and the Physicians' Forum (a propaganda agency for the Wagner-Murray-Dingell Bill). Much of this was in support of the national health program.

In preparation for the Jamestown Workshop, the Public Health Service distributed to all delegates a packet of pamphlets published by the CIO, AFL and Physicians' Forum, at government expense, urging that letters be written to Senators and Representatives advocating immediate action on the Wagner-Murray-Dingell Bill.

Other evidence before the Committee revealed that the Bureau of Research Statistics of the Social Security Board also prepared pamphlets in behalf of the national health program and sent them out as Government literature through the Department of Agriculture's Interbureau Committee on Postwar Programs.

Committee Recommends Action

Citing from the United States Code (Section 201, title 18) that the use of federal funds for the purpose of influencing opinion on legislation before Congress is unlawful, the Committee brought its findings to the attention of the Department of Justice, requesting that the Attorney General at once initiate proceedings to stop this unauthorized and illegal expenditure of public moneys.

Its report stated that a comparison of figures of the Budget Bureau in 1941 and 1946 shows an increase of approximately 300 per cent in federal expenditures for publicity and propaganda in the five-year period. Such an increase, the report declared, was a "proper subject for inquiry by Congress."

The Committee summarized its purpose in future interim reports as follows: "To examine this expenditure in detail by departments and agencies, with particular reference to illuminating those activities which are directed primarily to influencing the decisions of Congress on pending legislation."

UNIVERSITY RECEIVES GRANT FOR MENTAL HEALTH STUDIES

Expansion of the mental health training program of the University of Minnesota will now be possible following a grant from the United States Public Health Service of $89,363, made available under the National Mental Health Act.

Of the total, the University will use $40,241 to train nurses in the field of psychiatry; $23,936, for an advanced mental hygiene program, and $22,786, for training psychiatric social workers. Another $2,400 will be used for other psychiatry training.

The Mental Health Act authorizes Congress to appropriate $7,500,000 for setting up mental clinics and $400,000 for research and training throughout the United States.

Minneapolis Man Sentenced to Three-Year Prison Term for Criminal Abortion

Re. State of Minnesota vs. Richard Almsted

On August 19, 1947, Richard Almsted, forty-two years of age, 2017 18th Ave. So., Minneapolis, was sentenced to a term of not to exceed three years at hard labor in the State Prison at Stillwater, by the Hon. Lars O. Rue, Judge of the District Court of Hennepin County. Almstead had entered a plea of guilty on July 17, 1947, to an information charging him with the crime of abortion. At that time the Court continued the matter for sentence and ordered the probation officer to make a pre-sentence investigation. Following the investigation made by the probation officer, Judge Rue imposed the three-year sentence.

Almsted, who has no medical training of any kind and gave his occupation as a millwright, was arrested by Minneapolis police officers on July 11, 1947, following the admission of a twenty-nine-year-old married woman to Minneapolis General Hospital suffering from the after-effects of a criminal abortion. In the investigation made by the Minneapolis Police Department and the Minnesota State Board of Medical Examiners, it was learned that Almsted was paid $100 for performing the abortion. The defendant used a catheter but the first attempt was not successful and the procedure was repeated on two subsequent occasions, the last time being July 5, 1947. On July 9, the patient became seriously ill and was removed to the hospital. She has since recovered.

Judge Rue refused to place the defendant on probation, pointing out that the defendant jeopardized the life of the patient, and in addition, had a previous conviction for a felony. The records in the office of the Clerk of the District Court of Hennepin County show that Almsted entered a plea of guilty on June 3, 1940, to a charge of attempted carnal knowledge. For that offense he was sentenced to the State Reformatory at St. Cloud and was released on parole in June, 1944.

Mankato Dentist's License Revoked Following Plea of Guilty of Abortion Charge

Re. State of Minnesota vs. W. A. Groebner

On June 21, 1947, the Minnesota State Board of Dental Examiners revoked the license to practice dentistry formerly held by Dr. W. A. Groebner of Mankato, Minnesota. The action by the Dental Board was taken following Dr. Groebner's plea of guilty on May 24, 1947, in the District Court of Blue Earth County, to an information charging him with the crime of abortion.

Dr. Groebner was arrested on March 25, 1947, following the filing of a complaint in the Mankato Municipal Court charging him with the crime of abortion. According to evidence obtained in an investigation made by the legal authorities of Blue Earth County and the Minnesota State Board of Medical Examiners, Dr. Groebner was paid the sum of $75.00 to perform an abortion on March 21, 1947, on a twenty-four-year-old unmarried Fairmont, Minnesota, woman. The patient died on March 24, 1947, at Fairmont. A postmortem examination was conducted by pathologists of the University of Minnesota, who stated the cause of death to be "acute endometritis and hemorrhagic pneumonia due to an attempted induced abortion." Groebner, twenty-four years of age, graduated from the School of Dentistry of the University of Minnesota, in 1944, and was licensed to practice the same year. At the time Dr. Groebner was given a suspended four-year sentence in the State Reformatory at St. Cloud, the Court forbade Dr. Groebner to practice dentistry either in Mankato or in North Mankato. However, the action of the State Board of Dental Examiners revoking Dr. Groebner's dental license, precludes his practicing anywhere in the State of Minnesota.

PROLONGED LABOR

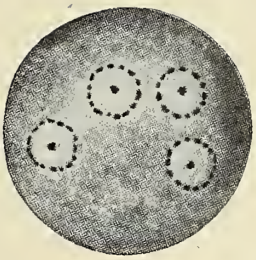
(Continued from Page 948)

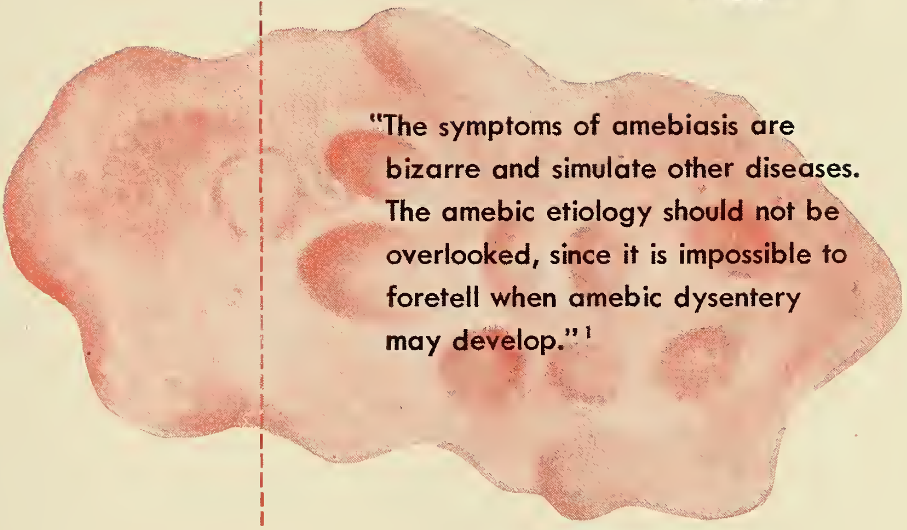
a globular shape, the placenta has separated and should be delivered. The rise of the fundus in the abdomen is rather the sign of the descent of the placenta than of a separation, and indicates the accumulation of clots in the uterus. The propper procedure in expression is for the assistant to grasp the fundus in his right hand with the fingers behind and the thumb in front of the fundus. The uterus is then gently massaged, but there should be no downward pressure. The left hand of the assistant is then placed flat on the abdomen just at the symphysis and pressure is exerted with the right hand while the left hand prevents the uterus from entering the pelvis. As the placenta passes through the cervix, the uterus is lifted up as far as the umbilicus. With this method, there is no danger of inversion of the uterus.

This paper has stressed things that are probably elementary but nevertheless should be reviewed from time to time. I have dealt chiefly with primary inertia and would like to stress chiefly in summation:

1. Prenatal care as a means of prevention.
2. Use of calcium and vitamin D during pregnancy.
3. Care in the use of oxytocics.
4. In postpartum hemorrhage, Pastore's advice on expression of the placenta.
5. Murphy's work with the tocograph.

AMEBIASIS





"The symptoms of amebiasis are bizarre and simulate other diseases. The amebic etiology should not be overlooked, since it is impossible to foretell when amebic dysentery may develop."[1]

The nonirritating, orally administered, high iodine amebacide —Diodoquin (5,7-diiodo-8-hydroxyquinoline)—"is well tolerated. . . . The great advantage of this simple treatment is that in the vast majority, it destroys the cysts of *E. histolytica* and is, therefore, especially valuable in sterilizing 'cyst-carriers.' It can readily be taken by ambulant patients. . . ."[2]

RESEARCH IN THE SERVICE OF MEDICINE

◆ Reports and Announcements ◆

AMERICAN COLLEGE OF ALLERGISTS

The American College of Allergists will hold a full week of graduate instruction in the many phases of allergy from November 3 to 8, 1947, at the Medical School of the University of Cincinnati. The course is intended not only for those especially interested in allergy but for general practitioners as well. The week will be devoted to addresses by allergists from throughout the country.

Reservations for the course, fee $100.00, and for hotel accommodations should be made with Dr. Fred W. Wittich, 423 La Salle Medical Building, Minneapolis 2, Minn.

VAN METER PRIZE AWARD

The American Association for the Study of Goiter again offers the Van Meter Prize Award of $300.00 and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The award will be made at the annual meeting of the Association which will be held in Toronto, Canada, May 6, 7, 8, 1948, providing essays of sufficient merit are presented in competition.

The competing essays may cover either clinical or research investigations; should not exceed three thousand words in length; must be presented in English; and a typewritten double spaced copy sent to the corresponding secretary, Dr. T. C. Davison, 207 Doctors Building, Atlanta 3, Georgia, not later than February 1, 1948.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

A meeting of the Minnesota Society of Neurology and Psychiatry will be held in Duluth, Minnesota, Saturday, September 13, 1947. The scientific program will be presented at 10:00 a.m. in St. Mary's Hospital, as follows:

A Case for Diagnosis—J. J. Call, M.D.

Chordoma, with Case Report—A. H. Wells, M.D., and A. O. Swenson, M.D.

Cerebellar Abscess, Recovery Following Chemotherapy —C. M. Jessico, M.D.

Treatment of Involutional Problems—L. E. Schneider, M.D.

The Use of Xanthydrol to Demonstrate Urea in Brain Tissue—Wm. V. Knoll, M.D.

Alzheimer's Disease, with Case Reports—L. R. Gowan, M.D., and J. E. Seitz, M.D.

Luncheon will be served at 1:00 p.m. in the Kitchi Gammi Club, and will be followed at 2:30 p.m. by deep sea fishing on the North Shore.

GRANTS FOR SCIENTIFIC RESEARCH

The American Allergy Fund has announced grants in aid for research, available to investigators in the biological sciences, both medical and non-medical, whose problems meet the requirements of the Scientific Advisory Council. Preference will be given problems with immediate relationship to allergy, although investigations in physiology, biochemistry, pharmacology, immunology, genetics and other basic sciences are solicited.

Applications should contain the following information:

1. Statement of specific research problems and an outline of the method or methods of procedure to be followed.
2. Description of research facilities in the institution where investigator will employ the grant.
3. A tentative budget.
4. Statement of the applicant's research record, accompanied, if possible, by publications or reprints.

Grants will be made for one year in amounts not to exceed $3,500.00, and may be renewed from year to year, if the progress report warrants continuation.

Applications (seven copies) should be addressed to the American Allergy Fund, 525 Erie Building, Cleveland 15, Ohio, Attention: Scientific Council.

AT YOUR CONVENIENCE, DOCTOR . . .

you are cordially invited to visit our new and modern prescription pharmacy located on the street floor of the Foshay Tower, 100 South Ninth Street.

WELL TOLERATED by the NEWBORN

Clinical experience establishes that CARTOSE* is especially well tolerated by newborn infants.

CARTOSE supplies carefully balanced amounts of non-fermentable dextrins, with maltose and dextrose. These offer the advantages of: spaced absorption because of the time required for hydrolysis of the higher sugars ; less likelihood of distress due to the presence of excessive amounts of fermentable sugars in the intestinal tract at one time.

CARTOSE is liquid; formula preparation is simple, rapid, and accurate. It is compatible with any formula base: fluid, evaporated, or dried milk.

In Memoriam

ALFRED N. BESSESEN

A. N. Bessesen

Dr. Alfred N. Bessesen, a practicing surgeon of Minneapolis since 1893, passed away August 19, 1947, at his home.

He was the son of John and Delia Bessesen and was born January 18, 1870, in Freeborn County, Minnesota. He attended public schools in Albert Lea, Minnesota, and was active in Christian Endeavor, the Y.M.C.A. and the Lutheran church As a student at Rush Medical College where he received his M.D. degree, March 28, 1893, he took part in establishing the first Intercollegiate Y.M.C.A. chapters.

Dr. Bessesen is said to have been the first intern at St. Mary's Hospital, Minneapolis, where he worked under Dr. James H. Dunn.

Along with A. A. McRae and others, he helped organize the South Side Commercial Club and later conceived and was active in forming the Commonwealth Club. He was a charter life member of the Minneapolis Club and was also a member of Lodge 19, A.F. and A.M.

Dr. Bessesen was a life member of the Fairview Hospital United Church Hospital Association, helped organize, locate, name and build Fairview Hospital, Minneapolis, and served on its first Board of Trustees. He was also the first chief of staff at Asbury Hospital and was on the staff at Deaconess Hospital. It was he who interested Mrs. George Christian in building Thomas Hospital for Fairview, to be devoted to the care of tuberculosis patients.

He was a member of the American College of Surgeons, the Hennepin County Medical Society, the Minnesota State and American Medical Associations. He retired from practice several years ago on account of ill health but resumed practice during the war on account of the shortage of physicians.

Dr. Bessesen was married to Dr. Florence E. Holland of Chicago on August 6, 1895. He is survived by his wife and four children—Dr. Alfred N. Bessesen, Jr., Dr. Daniel H. Bessesen, Grace and Florence, all of Minneapolis: three brothers—N. D. Bessesen, H. J. Bessesen, and Dr. William A. Bessesen, all of Minneapolis; five grandchildren, and one great-grandchild.

On the cover page of his first account book was placed the following which shows better than other words his character:

My Guide

To respect my country, my profession, and myself. To be honest and fair with my fellowmen, as I expect them to be honest and square with me. To be a loyal citizen of the United States of America. To speak of it with praise and act always as a trustworthy custodian of its good name. To be a man whose name carries weight with it wherever it goes.

To base my expectations of reward on a solid foundation of service rendered; to be willing to pay the price of success in honest effort. To look upon my work as an opportunity to be seized with joy and made the most of and not as painful drudgery to be reluctantly endured.

To remember that success lies within myself, in my own brain, my own ambition, my own courage, and determination. To expect difficulties, and to force my way through them; to turn hard experiences into capital for future struggles.

To believe in my own proposition, heart and soul; to carry an air of optimism in the presence of those I meet; to dispel ill temper with cheerfulness, kill doubts with a strong conviction, and reduce active friction with an agreeable personality.

To keep my future unmortgaged with debts; to save as well as earn. To cut out expensive amusement until I can afford them. To steer clear of dissipation and guard my health of body and peace of mind as a most precious stock in trade.

Finally, to take a good grip on the joys of life, to play the game like a man; to fight against nothing so hard as my own weaknesses, and endeavor to grow in strength, a Christian, a gentleman.

"So I may be courteous to men, faithful to friends,
True to my God, a fragrance in the path I trod."

GEORGE T. AYRES

Dr. George T. Ayres of Ely died July 17, 1947, at Halifax, Nova Scotia, while on vacation.

Dr. Ayres was born at Kalida, Iowa, February 1, 1875. He attended Wooster College at Wooster, Ohio, and the medical school of Western Reserve for two years before obtaining his M.D. degree from Rush Medical College in 1897. He interned at Presbyterian Hospital in Chicago.

Dr. Ayres became associated with the late Dr. Charles G. Shipman at Ely and when Dr. Shipman retired about forty-one years ago, Dr. Ayres and Dr. P. M. Parker took over the Shipman Hospital. When Dr. Parker retired, Dr. Ayres operated the hospital until 1944 when he retired. For the past year he had resided in Phoenix, Arizona.

A former member of the Ely city council, Dr. Ayres was one of the leaders of the Ely Chamber of Commerce and was associated with Dr. H. N. Sutherland for forty-one years. Dr. Ayres was also a member of the Ely school board, was active in Masonic circles, the Rotary Club and other fraternal and civic organizations.

He is survived by his wife and a daughter, Mrs. Victor Roterus of Flint, Michigan.

NORBERT GEORGE BENESH

Dr. N. A. Benesh of Minneapolis passed away June 29, 1947, at the age of thirty-nine.

Born at Ely, Iowa, December 1, 1907, Dr. Benesh obtained his M.D. degree from the University of Nebraska Medical School in 1931. He interned at Asbury Hospital in Minneapolis.

Dr. Benesh started his general practice on the East Side in 1932, and worked in that district until the

time of his death. He was a member of the staff of the Deaconess Hospital and was treasurer of the Lutheran Deaconess Hospital Medical and Surgical Society.

Dr. Benesh was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations. He was also a member of the Cataract Lodge No. 2, A.F. and A.M. and the Calhoun Beach Club.

Surviving are his wife, Margaret Ann Benesh, and two brothers, Dr. Louis A. Benesh of Minneapolis and Lester H. Benesh of Battendorf, Iowa.

Dr. Benesh was an ardent sportsman. He was especially fond of hunting and fishing and spent his spare time in South Dakota or northern Minnesota.

JOHN E. CREWE

Dr. John E. Crewe, a practicing physician in Rochester for many years and a former coroner of Olmsted County, died on his seventy-fifth birthday, July 22, 1947.

John Crewe was born at Hoboken, New Jersey, July 22, 1872. He attended the University of North Dakota at Grand Forks for two years before he attended the University of Minnesota from which he obtained his medical degree in 1896. After interning at Minneapolis General Hospital and the Deaconess Hospital at Grand Forks, North Dakota, he practiced from 1897 to 1902 at Zumbrota, Minnesota.

He located at Rochester, Minnesota, in 1902, and served as coroner of Olmsted County for thirty-six years before his retirement last year. He was a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State and American Medical Associations.

Dr. Crewe is survived by his wife, two daughters, Mrs. Dorothy Bishop of Minneapolis and Mrs. C. H. Slocumb of Rochester, and a son, Charles W. Crewe of Minneapolis.

JOSEPH WILLIAM GAMBLE

Dr. J. W. Gamble, a practicing physician for twenty-five years at Albert Lea and head of the Gamble Clinic, died August 6, 1947.

Dr. Gamble was born at St. Cloud, Minnesota, December 23, 1891. He attended South High School in Minneapolis and Rochester High School before studying medicine at the University of Minnesota where he was graduated in 1918. After interning at the University Hospital and the U. S. Naval Hospital, Great Lakes, Illinois, he practiced at Rochester, Minnesota, from 1919 to 1921 and was located at the Veterans Hospital, Minneapolis, from 1921 to 1922.

After being located in Albert Lea for two years he was joined by his two brothers, Dr. Ross M. Gamble and Dr. Paul M. Gamble, and the Gamble Clinic was formed. Dr. Gamble was a member of the Freeborn County Medical Society, the Minnesota State and American Medical Associations. The region of Albert Lea has always known Dr. Gamble as "Dr. Will." He has

always been intensely interested in civic activities and has shown leadership in civic betterment projects and in boys' work. Since 1929 he had been a director of the Albert Lea Y.M.C.A. He was a member of numerous other organizations including the American Legion, the Albert Lea Kiwanis Club, the Chamber of Commerce, A.F. and A.M., and Toastmasters International. He was also a long-standing member of the First Baptist Church.

Dr. Gamble is survived by his widow, a son, Elbert J. Gamble, at present attending the University of Minnesota, and a daughter, Mrs. Owen Beard, who, herself, is a physician and who lives at Little Rock, Arkansas. Dr. Paul Gamble also survives. Dr. Ross Gamble died in 1934.

Dr. Will had been in poor health since March of 1947, when he suffered a coronary occlusion.

KRISTIAN JONASSON

Dr. Kristian Jonasson, a fellow in obstetrics and gynecology at the Mayo Foundation from 1943 until 1946, died by suffocation from a fire at Reykjavik, Iceland, on July 27, 1947.

Dr. Jonasson was born May 12, 1914, at Saudarkrokur, Iceland. He received his M.D. degree from the University of Iceland in 1941, interned at several hospitals in Iceland and practiced at Isafiord, Iceland, before going to Rochester. He practiced at Reykjavik before his death.

HAROLD E. MARSH

Dr. Harold E. Marsh of Madison, Wisconsin, died on July 12, 1947.

Dr. Marsh was born October 11, 1892, at Quincy, Massachusetts; received the degree of M.D. in 1913 from Tufts College, Boston, Massachusetts; and was an intern at the Malden Hospital, Malden, Massachusetts, from July, 1913, to July, 1914. He entered the Mayo Foundation as a special student in medicine, April 1, 1915. From April, 1918, to July, 1919, he served as first lieutenant in the Medical Corps. He left the Mayo Foundation May 29, 1920, to practice internal medicine at the Jackson Clinic, Madison, Wisconsin. Dr. Marsh was a member of the American Medical Association and the Mississippi Valley Medical Society.

REINHART GILBERT OLSON

Dr. Reinhart G. Olson of Minneapolis died July 12, 1947, at his home, aged sixty-seven years.

Reinhart Olson was born at Nicollet, Minnesota, February 24, 1880. He received his medical degree from Hamline Medical College in 1908 and served his internship at Swedish Hospital, Minneapolis. Until 1917, when he joined the army, he practiced at Nicollet. He enlisted in World War I and was stationed at St. Armand, France, and after the Armistice, went to Germany with the Army of Occupation. After discharge from the army in August, 1919, he became established in Minneapolis.

Dr. Olson took postgraduate work in eye, ear, nose and throat diseases in Chicago in 1914, and at the New York Postgraduate Hospital in 1919-1920.

He was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations, a Knight Templar, and a member of the Zuhrah Temple of the Shrine. He was also a member of the staff of the Swedish Hospital.

Dr. Olson is survived by his wife, and daughter, Mrs. William C. Droge of Saint Paul.

JOSEPH H. VOGEL

Dr. Joseph H. Vogel, a prominent physician and surgeon of New Ulm, died July 21, 1947, from a heart attack. He was sixty-eight years old.

Born in New Ulm, March 28, 1878, he graduated from Rush Medical College in 1903 and began practice at New Ulm. He took postgraduate work in Chicago in 1914 and in Vienna in 1928. A number of years ago he and Dr. Otto Seifert established the Vogel-Seifert Clinic.

Dr. Vogel was a member of the Redwood-Brown Medical Society, the Minnesota State and American Medical Associations, and the Southern Minnesota Medical Association. He was a staff member of the Union and Loretto Hospitals.

His hobby was roses, and he was nationally known as an expert in the growing of roses. In 1941, he was elected president of the Minnesota Rose Society.

Dr. Vogel had considerable real estate holdings including buildings in the heart of New Ulm. He was president of the Farmers and Merchants Bank of New Ulm and director of the State Bond and Mortgage Company and the American Artstone Company.

OTTO J. SEIFERT.

CHARLES D'ARCY WRIGHT

Dr. Charles D'Arcy Wright, a physician for fifty years in Minneapolis, died July 23, 1947, at his home.

Dr. Wright was born at Chatham, Ontario, November 22, 1863. He attended the University of Wisconsin before obtaining his medical degree from the University of Michigan in 1887. He took numerous postgraduate courses in Paris, London, Berlin, and Vienna, where he specialized in the special senses.

After practicing in Norway, Michigan, from 1887 to 1895, he became a member of the faculty of the University of Michigan from 1895 to 1897.

Dr. Wright captained the football team at the University of Michigan and became a well-known golfer, at one time winning the senior golf tournament.

He came to Minneapolis in 1897 and became an eye, ear, nose and throat specialist. He was a member of the American College of Surgeons, The American Society of Ophthalmology, the Hennepin County Medical Society, and the Minnesota State and American Medical Associations.

Dr. Wright is survived by a daughter, Mrs. Muriel Wright Fould, wife of Maurice Fould of France, a grandson, John D'Arcy Wright, and a brother, G. M. Wright of Denver.

Of General Interest

Dr. Silas C. Andersen, Minneapolis, has been elected a trustee of Dana College and Trinity Seminary in Blair, Nebraska.

* * *

A former fellow in the Mayo Foundation, Dr. Glen G. Gibson has been advanced to the post of professor and head of the Department of Ophthalmology, Temple University of Medicine, Philadelphia.

* * *

On July 31, Dr. J. T. Anderson discontinued his medical practice in Red Lake Falls. At the time he had no immediate plans for the future beyond a vacation trip with his family.

* * *

Dr. F. J. Braceland and Dr. P. H. Heersema, Mayo Clinic staff members, attended a meeting of the governor's Advisory Council on Mental Health held in Saint Paul on July 21.

* * *

Dr. George H. Hall, formerly of Minneapolis, has been named chief of the surgical service at Veterans Hospital in Fargo, North Dakota. He succeeded Dr. John J. Tyson, who was transferred to Des Moines, Iowa.

* * *

"The Role of Psychiatry in Probation and Parole Service" was the title of an address delivered by Dr. M. N. Walsh, Rochester, at a meeting of the Minnesota State Probation and Parole Association held in St. Cloud on July 21.

* * *

Dr. Ellis N. Cohen, who is serving a fellowship in the Department of Anesthesiology at the University of Minnesota, was married in Chicago on August 9 to Miss Sylvia Rosenfeldt, former psychologist in the Division of Public Institutions for the State of Minnesota.

* * *

In Blue Earth, Dr. J. A. Broberg has resigned as city health officer after almost forty-five years of service. First appointed to the office in 1902, Dr. Broberg has held the position to the present time with the exception of two short intervals when he was out of the state.

* * *

At the annual meeting of the American Medical Association, this summer, Dr. Arthur B. Hunt, Rochester, was elected secretary of the Section on Obstetrics and Gynecology, and Dr. F. P. Moersch, Rochester, was re-elected secretary of the Section on Nervous and Mental Diseases.

* * *

At the meeting of the American Society of Oral Surgery held in Boston in late July, Dr. John B. Erich of Rochester presented two motion pictures entitled, "Treatment of Soft Tissue in Facial Injuries" and "Treatment of Patients with Multiple Fractures of All the Facial Bones."

Dr. Charles G. Sheppard, Hutchinson, has been elected president of the Crow River regional chapter of the American College of Physicians and Surgeons, while Dr. Kenneth Peterson, Hutchinson, has been named vice president, and Dr. J. D. Selmo, Norwood, secretary-treasurer.

* * *

Physicians from nine southwestern Minnesota counties met in Worthington on July 23 to discuss organization of a district public health unit for their area. Representatives present were from Nobles, Rock, Pipestone, Murray, Jackson, Cottonwood, Lincoln, Lyon and Redwood counties.

* * *

On August 1, Dr. F. B. Schleinitz moved from Battle Lake to Hankinson, North Dakota, to become the only physician in that town. Dr. Schleinitz was formerly associated with Dr. C. A. Boline in Battle Lake, where he had practiced since 1938. During the war he served in the army medical corps for four years.

* * *

The Interim Commission of the World Health Organization has appointed a former fellow in medicine in the Mayo Foundation, Dr. Thorstein Guthe, to the secretariat as a specialist in veneral disease. Dr. Guthe, who was with the Mayo Foundation in 1940, has been assistant to the surgeon general of public health of Norway.

* * *

At the Red Wing Chamber of Commerce meeting on August 5, a proposal was made to stage a county-wide x-ray survey to detect cases of tuberculosis and other diseases in their early stages. The proposal was referred for further study to the organization's Education and Public Health Committee, which is headed by Dr. Royal V. Sherman of Red Wing.

* * *

During August, while Dr. M. G. Flom of Zumbrota was on vacation, his medical practice was conducted by Dr. Frederick W. Engstrom of Wanamingo. Dr. Engstrom, a graduate of the University of Minnesota Medical School, recently completed his internship at Detroit Receiving Hospital in Detroit, Michigan. He is the son of Dr. and Mrs. F. A. Engstrom of Wanamingo.

* * *

Visiting in the United States while studying health conditions and therapeutic methods, Dr. Sigrid Holm, chief assistant at a chest clinic in Copenhagen, Denmark, praised the mass chest x-ray survey being conducted in Minneapolis. "The city is doing a very good job," stated Dr. Holm.

The Danish physician said that last year, Copenhagen x-rayed about 80 per cent of the population in the fifteen to thirty-four age group, and this year plans are to x-ray the persons over thirty-four years of age.

On August 15, Dr. Merrill E. Henslin of Le Roy moved to Cresco, Iowa, to enter a partnership with Dr. Walter Bockhoven of that city. Dr. Henslin did not completely close his medical practice in Le Roy, however, for he is maintaining office hours there on Tuesday and Thursday afternoons and Saturday evenings each week. His father, Dr. A. E. Henslin, is continuing to practice in Le Roy.

* * *

Dr. J. E. Henry, who recently completed a fifteen-month internship at Minneapolis General Hospital, has joined his brother Dr. C. J. Henry in practice at the Henry Clinic in Milaca. A graduate of the University of Minnesota Medical School, Dr. J. E. Henry was married in Foley on June 23 to Miss Dolores Wessner, who has been a nurse at the Henry Memorial Hospital in Milaca for the past three years.

* * *

Dr. B. E. Hall, Rochester, participated in a symposium on "Radioactive Isotopes in Therapy of Malignant Disease" at the Chemical Research Conference conducted by the American Association for the Advancement of Science in New London, New Hampshire, August 10 to 15. Dr. Hall's subject was "Radioactive Phosphorus." He also participated in a round-table discussion on "Methods and Results in Chemotherapy of Malignant Disease."

* * *

Dr. W. Henry Hollinshead, former professor of anatomy at Duke University School of Medicine, has joined the staff of the Mayo Clinic as consultant in anatomy and professor of anatomy in the Mayo Foundation and Graduate School of Medicine of the University of Minnesota. In addition to directing graduate training in anatomy, he will continue research on the peripheral nervous system and mechanisms in the reflex control of respiration and blood pressure.

* * *

After forty-five years of practice in Saint Paul, Dr. P. H. Bennion announced in August that he was retiring from active medical practice and planned to move to Ismay, Montana, to make his home with his daughter. A civic-minded person, Dr. Bennion has been active in the development of the Midway district in Saint Paul. He has been a staff member of Midway Hospital and a member of the Osman Temple of the Shrine, the Midway Club, and the Merriam Park library board.

* * *

In Mankato, Dr. R. G. Hassett recently announced that Dr. Norman F. Stone, formerly of Minneapolis, has become associated with him in medical practice. A graduate of the University of Minnesota Medical School in 1944, Dr. Stone served for two years in the navy in the south Pacific. Upon his release from military service in July, 1946, he took postgraduate work at the University of Minnesota for one year before joining Dr. Hassett in Mankato.

* * *

Heron Lake recently acquired another physician when Dr. Harold Williamson, formerly of Cleveland, Ohio, joined the Heron Lake Hospital staff and opened a

medical practice with Dr. J. Roger Nickerson. The two physicians are cousins and for many years have planned to practice medicine together in Minnesota. Dr. Williamson is a graduate of Western Reserve Medical School and served his internship at Akron City Hospital, Akron, Ohio. After three and one-half years in the army medical corps, he returned to be chief resident physician in the Cleveland City Hospital before accepting an invitation to practice in Heron Lake.

* * *

Dr. William Black, who recently completed a three-year Mayo Foundation fellowship in general surgery, is now associated with Dr. O. J. Seifert and Dr. L. H. Domeier in New Ulm.

A graduate of Temple University Medical School, Dr. Black served his internship and a residency at St. James Hospital in Butte, Montana. He then began his fellowship with the Mayo Foundation but interrupted it to serve for two years in the army medical corps. Following his release from military service, he completed the surgical fellowship and then joined Drs. Seifert and Domeier in New Ulm.

* * *

Dr. Alfred G. Sherman, a former naval flight surgeon with six years of military service, has joined in medical partnership with Dr. Carleton S. Strathern of St. Peter.

A native of Glencoe, Dr. Sherman received his medical degree from the University of Minnesota Medical School and served his internship at Minneapolis General Hospital. In 1939 he began his medical practice in Ajo and Kingman, Arizona, and in 1941 he entered the navy, specializing in aviation medicine.

In joining Dr. Strathern in St. Peter, he is replacing his partner's father, Dr. F. P. Strathern, who has announced his semi-retirement from the medical profession.

* * *

Members of the medical and nursing professions, plus several hundred lay citizens of Cloquet, gathered on July 24 to pay tribute to Mathilda C. Backes, Cloquet community nurse, for the outstanding work she had done since her arrival in the city in 1924. The honor ceremony took place one week before her departure for Cold Spring where she had accepted a position as industrial nurse.

Master of ceremonies for the event was Dr. C. E. Norberg of Cloquet, while one of the speeches of praise for Miss Backes was delivered by Dr. N. O. Monserud, Cloquet, who represented the medical profession. The nurse was presented with a watch and a purse as tokens of appreciation of Cloquet residents.

A new member of the Hedemark Clinic in Ortonville is Dr. Robert P. Gallagher, who has just completed a year of postgraduate study at the University of Minnesota Medical School.

A Minnesota graduate, Dr. Gallagher served his internship at Queens Hospital in Honolulu, T. H., and then spent more than two years in the army medical corps. After his discharge from military service he returned to Minnesota for postgraduate training before joining Dr. Truman Hedemark and Dr. Homer Hedemark in Ortonville.

* * *

At a forum at the University of Minnesota on July 31 the medical profession was attacked by Fred Gram, public relations director for Group Health Mutual, Inc.

"Restrictive state laws urged on legislatures by the medical profession make it exceedingly difficult for co-operative health organizations to function," he complained.

He alleged the medical profession was badly organized, and stated: "Doctors are afraid to join clinics in smaller cities and rural areas for fear of facing the wrath of the American Medical Association."

He asserted that co-operative medical plans would result in a healthier population.

The meeting was sponsored by the campus chapter of the American Veterans Committee.

At the grand banquet of the International Congress of Pediatrics, held in New York in July, Dr. Henry F. Helmholz, former chief of the Section on Pediatrics in the Mayo Clinic and professor of pediatrics in the Mayo Foundation, was awarded the Carlos J. Finlay gold medal by the president of Cuba. During the previous week, at the Pan American Congress of Pediatrics in Washington, D. C., Dr. Helmholz was given honorary membership in the Latin American division of the American Academy of Pediatrics and the Brazilian Pediatrics Society. The awards were made to the Rochester physician in recognition of his work in furthering pediatric education and practice in Latin America by establishing

In an article in a recent issue of the *Journal of the American Medical Association,* Dr. Owen H. Wangensteen, head of the Department of Surgery in the University of Minnesota Medical School, stated:

"The public is willing to spend unlimited funds to conquer the scourge of cancer. . . . Establishment of cancer detection clinics, staffed by specialists, affords the best promise of early recognition of cancer. Women over forty and men past fifty should report regularly to such clinics."

In regard to the long-range cancer problem, Dr. Wangensteen advocated the setting up of a cancer commission to spearhead research. "This commission should be given adequate funds and authority to draft competent workers with research experience," he declared.

* * *

At a reunion of former interns of St. Mary's Hospital in Duluth, Dr. E. L. Tuohy was honored as the oldest ex-intern present. A portrait of Dr. Tuohy was unveiled at a special luncheon meeting, and Dr. W. J. Ryan of the hospital's intern committee paid tribute to the honored physician.

Dr. Tuohy, who is now chief of laboratories at St. Mary's Hospital, entered the hospital as an intern in 1905 and remained as a resident in 1906. He was instrumental in setting up the hospital's pathology department and later organized the hospital's program of clinicopathological conferences.

Among the guests at the honor luncheon was Dr. Tuohy's son, Dr. Edward B. Tuohy, former staff member of the Mayo Clinic and now professor of anesthesiology at Georgetown University in Washington, D. C.

* * *

Community clinics—possibly even traveling clinics—might help in the control of alcoholism as a social problem, Dr. Stanley B. Lindley recently suggested. As superintendent of the Willmar State Hospital, which was established for inebriates, Dr. Lindley is convinced that the problem of keeping alcoholism within bounds is too large to be handled by any state institution.

"Lots of persons who are drinking too much would never think of coming here for treatment," he said, "but they might seize the opportunity to drop in at a local clinic to get the trouble straightened out."

Psychiatrists and social workers, operating from such a clinic, could prevent a large amount of future difficulty and could ease the daily pressure on courts and jails.

"But the cost would be considerable," Dr. Lindley stated. "Men of experience don't come cheaply. And one of the essentials would be the selection of a competent man to head the program."

* * *

Two Mayo Clinic staff members resigned their positions this summer to join the faculty of Georgetown University Medical Center, Washington, D. C.

Dr. Edward B. Tuohy, a member of the anesthesiology staff of the clinic since 1935, became professor of anesthesiology at Georgetown University, while Dr. Paul C.

Kiernan, a member of the clinic surgical staff for four years, became an associate professor of surgery at the school.

Dr. Tuohy received his medical degree at the University of Pennsylvania in 1932 and interned at Roosevelt and New York Hospitals in New York and at Ancker Hospital in Saint Paul. He began a fellowship in the Mayo Foundation in 1933, and in 1936 he received an M.S. degree from the University of Minnesota.

Dr. Kiernan, a graduate of George Washington University, Washington, D. C., began a fellowship in surgery in the Mayo Foundation in 1940 and received an M.S. degree from the University of Minnesota in 1943.

A prediction that Tokyo would soon be only twenty-three hours distant by air was made by Dr. Jan H. Tillisch in a talk, July 17, before the Rotary Club of Rochester.

In addition to being assistant professor of medicine in the Mayo Foundation and consultant in medicine in the Mayo Clinic, Dr. Tillisch is also medical director of Northwest Airlines. In his talk to the Rotary Club he described a trip to the Orient which he had just made by air to observe personally the physical conditions under which pilots must fly.

Illustrating his words with projected color photographs, Dr. Tillisch described conditions in Alaska, the Aleutian islands, Tokyo, Seoul in Korea, Shanghai and Manila.

"When the Boeing Stratocruiser passenger planes are put in operation, you'll be able to fly from here to Tokyo in as little as twenty-three hours," he stated. (Present time, Rochester to Manila: forty-five hours.) "It will be a very easy trip," he added. "Ocean flying is much smoother than flying over land."

Captain Louis H. Roddis (MC), USN, Chief of the Publications Division of the Bureau of Medicine and Surgery and Editor of the *United States Naval Medical Bulletin*, Navy Department, Washington, D. C., has been awarded the Navy Commendation Ribbon for the excellent service he rendered in World War II as Senior Medical Officer of the U.S.S. *Relief*.

The citation reads:

> "For excellent service in the line of his profession while serving as Senior Medical Officer of the U.S.S. *Relief* from 4 March to 9 September, 1944. His professional skill and devotion to duty contributed materially to the smooth and efficient functioning of the Medical Department. During Fleet concentrations he rendered invaluable consultation service and dealt with many medical problems, both in disease prevention and evacuation of the sick and wounded. Under his direction, during the capture of Saipan and Tinian, large numbers of serious casualties were embarked and transported, many directly from the beachheads. His performance of duty was outstanding and his conduct was at all times in keeping with the highest traditions of the United States Naval Service."

Captain Roddis graduated from the University of Minnesota Medical School in 1913 and entered the Naval service in 1914. He is considered an outstanding Medical Historian and has written several books on the subject. Captain Roddis' professional specialty is internal medicine and he is a Fellow of the American College of Physicians and a Member of the American Board of Internal Medicine.

Dr. Paul R. Hawley, head of the Veterans Administration Department of Medicine and Surgery, arrived in the Twin Cities on August 9 to spend a week inspecting VA hospitals in the area as part of a nationwide tour of veterans' hospital facilities.

With Dr. Hawley on the tour were Miss Dorothy Wheeler, national director of VA nursing service; Dr. John Barnwell, chief of the tuberculosis division, and Dr. Harvey Tompkins, of the neuropsychiatry division.

* * *

New visiting regulations have been adopted by three Duluth hospitals, Dr. Mario Fischer, city health director in Duluth, has announced.

The regulations, which, Dr. Fischer said, are "in the interest of better health," have been approved by the St. Louis County Medical Society, and are in effect at St. Mary's, St. Luke's and Miller Memorial Hospitals.

Visiting hours both in wards and private rooms are now between 2:00 and 4:00 p.m. and 7:00 and 8:30 p.m. on week days, Sundays and holidays, with only two persons permitted to visit a patient at any one time. Children under fourteen years of age are not permitted to visit in the hospitals, and all persons under sixteen years of age are barred from the obstetric floor.

* * *

The Hunt Hospital, founded in Fairmont thirty-three years ago by the late Dr. F. N. Hunt and his son, Dr. R. C. Hunt, closed on July 15.

Since 1940 the hospital has been conducted by Dr. R. C. Hunt and his son, Dr. Robert S. Hunt, who are continuing to maintain offices in the building while using the Fairmont Community Hospital for patients needing hospital care.

In regard to the closing of the Hunt Hospital, Dr. R. C. Hunt said, "In view of conditions—which includes a shortage of nurses — we feel that the interests of the public will best be served if we centralize our efforts in one location, where the greatest possible use of personnel and equipment will be realized."

* * *

At a round-table conference at Fort Snelling in July, leading medical men from six states met with representatives of the Veterans Administration and the Minnesota American Legion to analyze medicine in relation to the veteran.

Conclusions of the group were that "veterans' medicine" had advanced tremendously in the past year, that the future looked "very bright," but that VA hospitals were badly overcrowded and new buildings and facilities were needed.

Dr. Charles W. Mayo, member of the Medical Advisory Committee of the VA, said that the high standards originally set for the Upper Midwest area are now being approached generally in the nation. Dr. Harold S. Diehl, dean of Medical Sciences at the University of Minnesota and chairman of a committee that aids in selection of medical personnel for the VA, pointed out that physicians of high ability are now working with the VA whereas a year ago they tended to "shy away."

The meeting was held to bring a better understanding between the Veterans Administration and veterans' organizations.

Communication

September 2, 1947

To the Editor:

Those of us who were once accustomed to appreciate and marvel at the remarkable clinical acumen displayed by the clinician of two or three decades ago at ward rounds and at autopsy table, will heartily agree with the sentiment expressed in the first two paragraphs of the editorial entitled "Laboratory Abuse" which appeared in the July issue of Minnesota Medicine. We must combat the strong tendency toward the dependence which is more and more being placed on laboratory and x-ray findings in the care of the patient, at the expense of clinical observation and judgment, which the young physician should learn to acquire.

I am not, however, in accord with the statements made in the third paragraph, wherein the writer, referring to the uncontrolled use of laboratory facilities, declares that "one does decry their unstinted use, particularly in the private hospital and office" and then, commenting on the need for reducing laboratory expense by some form of a cushion, asserts that "a practical example of this type of cushion is the State Board of Health Laboratories."

Speaking only for the private hospital, it must be remembered that in most of them in Minnesota, the laboratory fees are charged by individual tests, and no tests are performed without the request from the attending physician, except for the obviously necessary minimum routine admission procedures and the histologic examination of surgically removed specimens. I find the average attending physician to be quite conservative about the use of the laboratory facilities, even in the best of the private hospitals, and on many occasions, the laboratory contributes its services free of charge in the study of unusual or difficult cases, for the sake of scientific interest and in order to relieve the financial burden on the patient. I do not believe that there exists, to any alarming degree, the laboratory abuse which the writer deplores, in the majority of the private hospitals. It is where the laboratory facilities are free and easily accessible and where the residents and interns are allowed to assume a greater degree of responsibilities in the diagnosis and treatment of the patients, as in the public and teaching hospitals (or perhaps, where a flat rate is charged for all laboratory tests) that the abuse is likely to exist.

The high cost of laboratory service is, therefore, attributable, not so much to the abuse, but largely to the high cost of maintenance; that is, the cost of the equipment and the salaries of the technicians. The latter are no longer the mechanical robots of two decades ago, but college-trained experts who are especially trained in medical technology, bio-chemistry, bacteriology, hematology, et cetera, who are equipped to meet the demands of modern medical diagnosis. Their salaries must be adequate enough to justify their professional training. This trend, of course, is not peculiar to the laboratory workers, but shared alike in all phases of medical practice, in nursing, in anesthesia, in x-ray service, as well as in all other specialties as, indeed, in all present-day human endeavors.

Therefore, it is difficult to comprehend how a physician would single out the practice of clinical pathology and have the State Board of Health Laboratories perform clinical laboratory procedures, other than those directly related to the control of communicable diseases and public health, in order to bring down the cost of laboratory service. Since the performance of laboratory procedures is primarily a part of the function of the clinical pathologist who is a practicing physician, the delegation of this function to the State would be to allow the state to compete with the licensed physician. If this were allowed to happen, even in the name of economy, would it not be logical to suppose that any part of any specialty of medicine might be taken over by the State in the name of economy or public health? Could one not imagine the State taking over a part, if not all, of the nursing service in order to "cushion" the high cost of medical care?. Why should not the State go into obstetric practice and infant care in competition with the physician? To advocate that the State Board of Health Laboratories might extend its laboratory service to include routine diagnostic procedures (including the Rh determination and tissue diagnosis) would seem as illogical as to sanction a proposition that the State might "cushion" or share the expense of the practice by members of any other specialties of medicine.

Diagnosis by laboratory methods is a sphere of clinical pathology. A clinical pathologist would view with concern any suggestion that the State Board of Health Laboratories might "cushion" or share the expense of any laboratory procedures (other than those dealing with the control of communicable diseases and public health) not only for the sake of his own practice, but for the future of his fellow practitioners, for it may represent another step toward a deeper and firmer control by the State upon the practice of medicine in general.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

MILK AND FOOD SANITATION PRACTICE. H. S. Adams, B.Sc., Chief, Bureau of Environmental Hygiene, Division of Public Health, Minneapolis, and Lecturer of Public Health, University of Minnesota. 311 pages. Illus. Price $3.25. New York: The Commonwealth Fund, 1947.

This book is a practical text covering in detail the field of milk and food sanitation. The author states in part, "It is intended that it should be useful in orienting the public health student who plans to work in the field of environmental sanitation, and that it should serve as a guide for health officers, public health engineers, and sanitarians whose work in a local health department involves routine but important duties in the sanitary supervision of milk and food supplies. The book endeavors to present essential and fundamental principles of milk and food control, but it does not attempt to discuss theory exhaustively."

The first part of the book is devoted to milk sanitation. After pointing out that the cash income derived from the sale of milk is larger than that of any other farm commodity including grain crops, and represents twice the cash return from cotton, the author systematically describes the steps involved in planning and administering a milk control program. Essentials of sanitary milk production, undesirable flavors in milk, pasteurization, laboratory procedures, and the sanitary control of frozen desserts are discussed in a way to be of practical use to milk sanitarians. A bibliography on milk provides an extremely valuable source of supplementary reference material.

18 North 8th Street
Minneapolis MAin 1768

The second part of the book is concerned with the food control problem, essentials of food establishment sanitation, and instruction and training of food handlers. Practical helps for the food sanitarian include such items as a floor plan typifying many desirable features in a medium-sized restaurant; basic features of various kinds of dish washing machines; recommended retail storage temperatures for various fresh fruits, fresh vegetables, meats, and other products; and sample review questions for a health department food handlers' school. A bibliography on food here also supplies vital reference sources.

An unusual feature of this book is provided by the appendix, in which there appears a well-organized and well-presented series of sections which milk and food sanitarians may use much as they would a field handbook. The supplementary source material refers to such sources as publications of various kinds, and organizations and commercial institutions interested or engaged in the milk and food industry. Field equipment for the food sanitarian is described in detail. Analytical procedures for detection of cyanide in metal polish, sulphites in meat products, and arsenic spray residue are typical of the specific testing procedures outlined. A suggested course of instruction for food handlers is presented and might well be studied by all health departments contemplating or engaged in this vital practice.

This worthwhile book, which certainly cannot fail to be of value to both student and sanitarian alike, ends with an index so organized as to fulfill admirably its intended purpose.

THE PHARMACOPOEIA OF THE UNITED STATES OF AMERICA NO. XIII. Easton, Pennsylvania: Mack Printing Company, 1947. Price $8.00.

The thirteenth United States Pharmacopoeia became official April 1, 1947. Sheet supplements which may appear from time to time may be obtained from the U.S.P.

The Birches Sanitarium, Inc.
2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Psychiatrists in Charge
L. R. Gowan, M.D. L. E. Schneider, M.D.

headquarters, 4338 Kingsessing Avenue, Philadelphia 43, Pennsylvania. The United States Pharmacopoeia XII became official in 1942, but so rapid was the development in drugs during the war and so many were the supplements needed that another revision was deemed advisable.

For the first time the titles are arranged alphabetically according to their English titles instead of Latin, and this facilitates reference.

Revision XIII, as well as recent revisions, represents an enormous amount of investigation and compilation which would have been impossible to handle with present resources had it not been for the gratuitous assistance given by many groups and individuals. Through the cooperation of the chairman of the National Formulary Committee of Revision, it has been possible in these two official books of standards to develop uniform methods in related fields.

Each Pharmacopoeia is revised by a general Committee on Revision, elected at each decennial meeting by the members of the U.S.P. convention, made up of representatives of medical and pharmacal colleges, state and national medical, dental, chemical, drug and veterinary associations, Army, Navy, and U. S. Public Health Service, and a number of other organizations too numerous to mention.

Ever since the first Pharmacopoeia was published in 1820, it has been the standard followed by all who have to do with drugs. If it says so in the U.S.P., it must be so!

HOSPITAL CARE IN THE UNITED STATES. American Hospital Association, 18 East Division Street, Chicago 10, Illinois. Price $4.50.

The American Hospital Association announces publication August 25 of *Hospital Care in the United States,* the complete report of the Commission on Hospital Care. This 700-page volume, published by the Commonwealth Fund, redefines the functions of the general hospital and outlines a long-range program for the improvement, development and co-ordination of American hospitals. It summarizes the findings of the Commission's intensive two-year study of hospital facilities and lists 181 specific recommendations for the expansion and improvement of hospital care in the United States.

MEAD JOHNSON & CO.
EVANSVILLE IND. U.S.A.

COUNCIL-ACCEPTED

AMIGEN
for parenteral administration of amino acids

The function of Amigen and Protolysate is to supply the amino acids essential for nutrition. Both can be given in place of protein when protein cannot be eaten or digested, or in addition to protein when the protein intake is insufficient. Administered in adequate amounts, they prevent wastage of protein, restore previous losses, or build up new body protein.

COUNCIL-ACCEPTED

PROTOLYSATE
for oral and tube feeding of amino acids

1 LB. NET (454 GM.)
MEADS
PROTOLYSATE
For Oral Administration
A dry enzymic digest of casein containing amino acids and polypeptides, useful as a source of readily absorbed food nitrogen when given orally or by tube. Protolysate is designed for administration in cases requiring predigested protein. The mode of administration and the amount to be given should be prescribed by the physician.
MEAD JOHNSON & CO.
EVANSVILLE, IND., U.S.A.

1 lb. cans at drug stores

Like Amigen, Protolysate is an enzymic digest of casein and consists of amino acids and polypeptides. Like Amigen, Protolysate supplies the nitrogen essential for maintenance, repair and growth.

Unlike Amigen, which may be employed both orally and parenterally, Protolysate is designed only for oral use.

MEAD JOHNSON & CO., EVANSVILLE 21, INDIANA

There is no shortage now of AMIGEN for parenteral use. There is no shortage now of PROTOLYSATE for oral use.

pillary hemorrhage, defying control by hemostat and ligature, edily yields to THROMBIN TOPICAL. Seconds after local plication, the operative field can be cleared of capillary bleeding.

ROMBIN TOPICAL affords prompt, on-the-spot clotting action. It is of a long line of Parke-Davis preparations whose service to the fession created a dependable symbol of therapeutic significance— DICAMENTA VERA.

ROMBIN TOPICAL (Bovine Origin) is
ilable in 5,000-unit ampoules, each packed with a
. ampoule of sterile, isotonic saline diluent.

Your Ability to Earn

is your

Greatest Asset

Is your disability policy incontestable?

Does it contain the following clause?

"After this policy has been continuously in force two full years during the lifetime of the Insured it shall become incontestable as to the accuracy of the representations contained in the application and as to the physical condition of the Insured on the date thereof."

No one would purchase life insurance that was contestable. The disability insurance carried on one's income should certainly be safeguarded by an incontestable provision.

Your policy should not be a part of the hazard of disability.

Protect your earning capacity with long term, non-cancellable, incontestable disability insurance.

The First Experimental Physiolog

For Both Medicine and Dentistry, the value of the first truly scientific dissections by Galen, the Greek who lived in Rome (130-200 A.D.), was equaled only by the scientific *method* propounded 600 years earlier by Hippocrates.

Working only with pigs and apes (but urging his students to be on the alert for human bones protruding from graveyards), Galen was first to recognize the different kinds of nerves, most muscles, the brain as the center of the nervous system and the fact that arteries, containing blood rather than air, were *somehow* connected with the veins (1500 years before Harvey).

A new concept of the doctor's legal liability was evolving then, too. Before, malpractice had been punishable only as a crime. But, under the *Lex Aquilia,* damages could be assessed. Malpractice had become a civil, as well as a criminal, offense.

There Are Few Who Experiment Today with the risks of unprotected practice. Most doctors enjoy the Medical Protective policy's *complete* coverage, *preventive* counsel and *confidential* service.

THERAPEUTIC DIVIDENDS

beyond the relief of

vasomotor symptoms

AMNIOTIN DIVIDEND → *Therapeutic follow-through:* A heightened sense of well-being, increased strength and vigor, and general relief are inherent in Amniotin therapy — therapy beyond the relief of vasomotor symptoms.

AMNIOTIN DIVIDEND → *Safeguarded by nature:* Amniotin therapy does not interfere with physiologic safeguards regulating estrogen metabolism. Side effects such as dizziness, fatigue, nausea and vomiting are infrequent with Amniotin therapy.

AMNIOTIN DIVIDEND → *At nature's pace:* Amniotin is administered in essentially the same manner as the ovary itself elaborates estrogens — in relatively small amounts at a relatively constant rate.

AMNIOTIN DIVIDEND → *Three convenient forms:* Therapy with Amniotin is flexible, easily adapted to individual therapeusis. Its oral and intramuscular forms are in potencies readily adjusted to the pace of estrogenic activity established by the ovary itself. Amniotin is also available in capsule-suppositories for intravaginal administration.

Now . . . a brighter outlook for the child with petit mal

No longer must the slow and uncertain processes of nature be depended on to bring relief to *petit mal* patients. Tridione—discovered and developed by Abbott Laboratories—offers the prospect of immediate improvement in the majority of cases. Here's further evidence added to the growing literature: In a recent investigation[1] Tridione was given to 166 patients suffering from *petit mal* (pyknoepilepsy), myoclonic jerks or akinetic seizures. None of the 166 had secured relief from any previous treatment. With Tridione, 31% became free of seizures; 32% had their seizures reduced by more than three-fourths; 20% improved to a lesser extent; 13% were unchanged, and only 4% became worse. *Thus 83% showed definite improvement.* In some cases the seizures *did not return* after Tridione was discontinued. Tridione has also been reported beneficial in certain cases exhibiting psychomotor seizures when combined with other anti-epileptic therapy.[2] Tridione is available through your pharmacy in 0.3-Gm. capsules and in pleasant-tasting aqueous solution containing 0.3 Gm. per fluidrachm. If you wish literature, just drop a line.

Abbott

with accent on the positive

Positive results form the keynote of clinical reports on "Premarin." Prompt remission of distressing menopausal symptoms with comparative freedom from untoward reactions may usually be anticipated with "Premarin."

This symptomatic relief "plus" the accompanying sense of well-being or emotional uplift —so frequently reported by clinicians—give the middle-aged patient a new positive outlook on life.

"Premarin" provides effective estrogenic therapy through the oral route and is available as follows:

Tablets of 2.5 mg.	bottles of 20 and 100
Tablets of 1.25 mg.	bottles of 20, 100 and 1000
Tablets of 0.625 mg.	bottles of 100 and 1000
Liquid, containing 0.625 mg. in each 4 cc. (1 teaspoonful)	bottles of 120 cc.

Ayerst

CONJUGATED ESTROGENS*
(equine)

*While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present in varying small amounts, probably as water-soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract.

WHENEVER THE NUTRITIONAL STATE MUST BE IMPROVED

The food drink made by mixing Ovaltine with milk finds frequent application whenever underpar nutrition is encountered. It is equally valuable whether the need for dietary supplementation arises from the ravages of acute infectious disease, from dietary limitations made necessary by surgery, or from faulty food selection over a prolonged period.

This nutritional supplement is delicious in taste, readily digested, and thoroughly bland. It may be taken either hot or cold, as the patient desires, and is appealing to both children and adults. It supplies a wealth of virtually all essential nutrients including ascorbic acid and B complex and other vitamins. Its proteins are biologically complete, a feature of importance in the correction of debility states. Three glassfuls of this delicious food drink daily round out even an average diet to full nutritional adequacy.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

chemically similar to natural estrogens

ESTINYL (ethinyl estradiol) is "chemically similar to natural estrogen."[1] It is more active *orally* than any other synthetic or natural estrogen known today. ESTINYL is the first estradiol preparation that is efficacious by mouth in really minute amounts. It provides the economy inherent in low dosage. Five-hundredths of a milligram daily is sufficient to relieve the average menopausal patient. ESTINYL, closely allied to the primary follicular hormone, does more than mitigate vasomotor symptoms. ESTINYL quickly relieves the common nervous manifestations and bodily fatigue, and replaces them with a sense of emotional and physical fitness.

ESTINYL

tablets

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

Average menopausal symptoms: One 0.05 mg. ESTINYL Tablet daily. Severe menopausal symptoms: Two or three 0.05 mg. ESTINYL Tablets daily. Many patients may be maintained in comfort with 0.02 mg. ESTINYL Tablet daily after initial control of estrogen deficiency.

Packaging: ESTINYL TABLETS of 0.05 mg.—pink, coated tablets and 0.02 mg.—buff, coated tablets, bottles of 100, 250 and 1,000.

MARK OF Ramses DEPENDABILITY

Experience is the Best Teacher

Joseph Lister (*1827-1912*) **proved it in surgery**

Lister's researches on infection in surgery led him to apply Pasteur's findings to the operating room. His antiseptic doctrine required that everything used in the surgery, including the atmosphere, be antiseptically treated. Lister lectured widely on his doctrine, but it was his own experience with antiseptic methods that forced universal acceptance.

Yes, and experience is the best teacher in smoking too!

The wartime cigarette shortage was a real experience to smokers. That's when more and more people—smoking any brand that was available—learned the big differences in cigarette quality. So many smokers came to prefer Camels as a result of that experience that more people are smoking Camels than ever before. But, no matter how great the demand, we don't tamper with Camel quality. Only choice tobaccos, properly aged, and blended in the time-honored Camel way, are used in Camels.

Pyribenzamine

High-concentration Elixir Pyribenzamine hydrochloride now provides a second administration form of this proved antihistaminic. Containing 20 mg. of Pyribenzamine hydrochloride per 4 cc. (teaspoonful), the Elixir has obvious advantages in special cases, notably in infants and children, and in adults who prefer liquid medication.

Scored tablets of Pyribenzamine also facilitate small dosage when indicated—the 50 mg. tablets are easily broken to provide 25 mg. doses.

Council Accepted. PYRIBENZAMINE hydrochloride ® (brand of tripelennamine hydrochloride)

CIBA **PHARMACEUTICAL PRODUCTS, INC., SUMMIT, N. J.**

"Man that is born of a woman is of few days, and full of trouble." Job XIV, 1

Even in the face of great advances in medical knowledge, the lives of many infants are still literally "of few days and full of trouble," for 62.1% of the total infant mortality occurs within 30 days after birth.* During this fatal first month, every precaution must be taken to ward off troubles of early infancy.

Adequate nutrition, resistance to disease and freedom from hazardous diarrhea, colic or digestive upset all may be materially advanced by giving special attention to the first feedings.

'Dexin' has proved an excellent "first carbohydrate" because of its high dextrin content. It (1) resists fermentation by the usual intestinal organisms; (2) tends to hold gas formation, distention and diarrhea to a minimum; and (3) promotes the formation of soft, flocculent, easily digested curds.

Simply prepared in hot or cold milk, 'Dexin' brand High Dextrin Carbohydrate provides well-taken and well-retained nourishment. 'Dexin' *does* make a difference

*Vital Statistics—Special Reports: Vol. 25, No. 12, National Office of Vital Statistics, Washington, D. C. (Oct. 15) 1946, p. 206.

Reminding people of the value of

PROMPT AND PROPER MEDICAL CARE

To an audience of over 23 million people, in LIFE and other national magazines, Parke-Davis presents a message on a timely subject (shown below). It is No. 207 in the "See Your Doctor" series published in behalf of the medical profession.

A reproduction in full color will be sent on request. Write to Parke, Davis & Company, Detroit 32, Michigan.

Some things you should know about **sleeping pills**

No. 207 in a series of messages from Parke, Davis & Co. on the importance of prompt and proper medical care.

USED wisely, under the guidance of a physician, sleep-inducing drugs are one of modern medical science's important aids.

In many cases marked by a temporary anxiety, nervousness or physical discomfort, your doctor relies on them to supply the sleep or relaxation so vital to proper treatment.

Before an operation, these sleep-inducing drugs are often used to save the patient from a wakeful night of apprehension. These drugs are also used to prevent toxic reactions to local anesthesia, to inhibit convulsions, to make the pain-deadening action of other drugs more effective.

Many types of sleep-inducing drugs have been developed. Your doctor chooses among them according to the individual case.

Sleep-inducing drugs can be of great value. Like any beneficial product these drugs can be abused. Taken without your doctor's express orders, they may be dangerous. You have probably seen newspaper accounts of deaths or serious poisoning caused by excessive misuse of these drugs.

Taking sleep-inducing drugs—when there is no *medical* reason for you to do so—is an extremely foolish habit to acquire. For if you become accustomed to using them to put you to sleep, it may eventually become almost impossible for you to sleep without them.

SEE YOUR DOCTOR. If you have trouble going to sleep, or sleeping through the night, consult your doctor. Let him find the *reason* for your sleeplessness and suggest the proper treatment.

If he should prescribe a sleep-inducing drug, follow his instructions accurately. He is the one person whose advice you should take in any matter that concerns your health.

is vitamin-fortified

A product of National Dairy research, FORMULAC Infant Food is fortified with all the vitamins known to be necessary for adequate infant nutrition. Incorporating the vitamins *into the milk itself* reduces the risk of human error or oversight in supplementary administration.

FORMULAC is a concentrated milk in liquid form. It contains sufficient vitamins of the B complex, Vitamin C in stabilized form, Vitamin D (800 U.S.P. units), copper, manganese and easily assimilated ferric lactate—rendering it an adequate formula basis both for normal and difficult feeding cases. *No carbohydrate has been added to* FORMULAC. It contains only the natural lactose found in cow's milk.

FORMULAC is promoted ethically, to the medical profession alone. It has been tested clinically, and proved satisfactory in promoting normal development and growth. Manufactured under the Sealtest system of quality control, FORMULAC is available in drug and grocery stores from coast to coast.

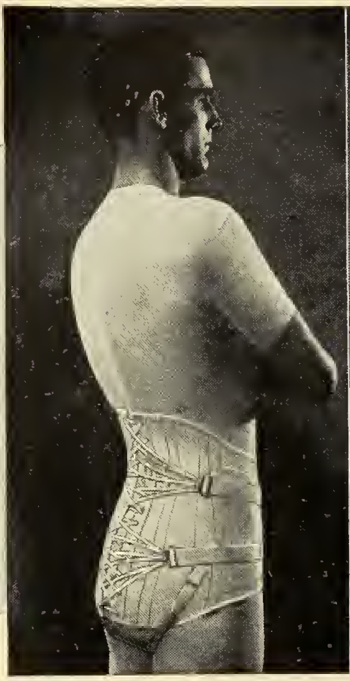

FIGURE 1 — Patient — thin type of build with beginning faulty body mechanics. The Camp adjustment provides a more stable pelvis, allowing patient to "draw in" the abdominal muscles thus gradually acquiring a gentle lumbar curve.

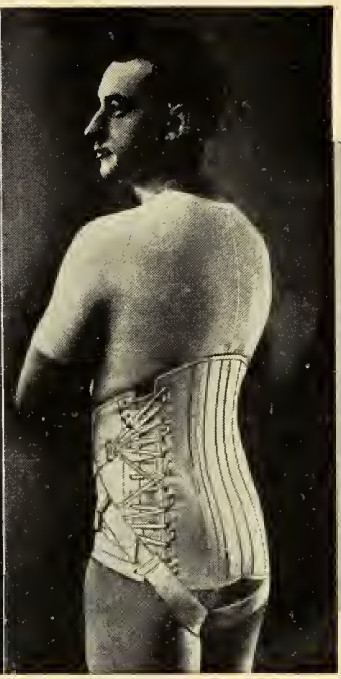

FIGURE 2 — Patient — intermediate type of build. Strain of lumbosacral joint predisposes to other strains. For protection of the joints in the lumbar region from recurrent strain and also as an aid in relieving the pain of acute conditions, Camp lumbosacral supports have proved effective.

In the Conservative Treatment of
The Lumbosacral and Lower Lumbar Regions

CAMP SUPPORTS offer advantages

• • • Give firm support to the low back; the support is easily intensified by re-inforcement with pliable steels or the Camp Spinal Brace.

• • • Afford a more stable pelvis to receive the superincumbent load.

• • • Allow freedom for contraction of abdominal muscles under the support in instances of increased lumbar curve (fig. 1).

• • • Are removed easily for prescribed exercises and other physical procedures prescribed by physiatrist or physician.

A PHYSIOLOGIC APPROACH TO CARDIOVASCULAR ROENTGENOLOGY

MARCY L. SUSSMAN, M.D.
New York, New York

MY subject concerns the possibility of and the need for the roentgen study of the heart to be made in terms of pathologic physiology. I do not mean to deprecate the importance of anatomic diagnosis but rather to emphasize that since pathologic anatomy is only an end result of altered dynamics, much of our attention should be focussed on the disturbed physiology.

The function of the heart is to propel sufficient adequately oxygenated blood to the tissues and to handle it efficiently on its return. We are concerned therefore in the efficiency and adaptability of the heart in maintaining a proper pressure head and volume output. Pressure and volume are related through Starling's law[15] which states that, within certain limits, the volume output per beat is directly related to the diastolic size of the ventricle. To put it another way, the greater the initial pressure, which is a function of the length of the muscle fiber, the greater the pressure developed and therefore the larger the volume of blood ejected. This law comes into play when the venous return is augmented, when the ventricle is unable to empty as the result of increased pressure in its outflow artery, as well as when the ability of the myocardium to contract is impaired. Long continuance of an augmented contraction based on increased initial length leads to hypertrophy, which still permits efficient contraction until the elastic limits of the fibers are overstrained. Then the diastolic pressure begins to rise and, with further increments to diastolic filling, the output falls.

The atria probably do not follow this pattern. If, as is likely, they act like large veins[16] there will be a pressure level below that associated with clinical failure, at which a slight increase in pressure will cause a marked increase in volume.

The important factors in cardiac dynamics, therefore, are the pressures in the individual cardiac chambers, including details of their change during the cardiac cycle, the changes in the volumes of these chambers, and their output. As Cournand and his colleagues have shown,[7] pressures can be recorded in the right heart and femoral artery in humans, but this technique is not applicable to all patients. The ordinary x-ray examination tells us only about the over-all size of the heart, and this not too accurately because the upper and lower borders must be guessed and because the geometric shape varies unpredictably in different physiologic and pathologic conditions. Furthermore, the volume of individual chambers is not given quantitatively except in a condition like mitral stenosis where the left auricle is unusually dense. The only method which regularly demonstrates individual chambers is angiocardiography,[20] but this also is a procedure which cannot be applied universally.

Roentgenkymography, or more recently electrokymography, by recording cardiac pulsations affords modified data concerning volume change and, indirectly, pressure change.[11,18] This method is easily applied and, therefore, will be considered first, using the effects of respiration on cardiac dynamics as an illustration.

The pressure gradient between peripheral and central veins is an important factor in right

---

The Russell D. Carman Memorial Lecture presented at the annual meeting of the Minnesota State Medical Assocition, Duluth, Minnesota, June 30, 1947.

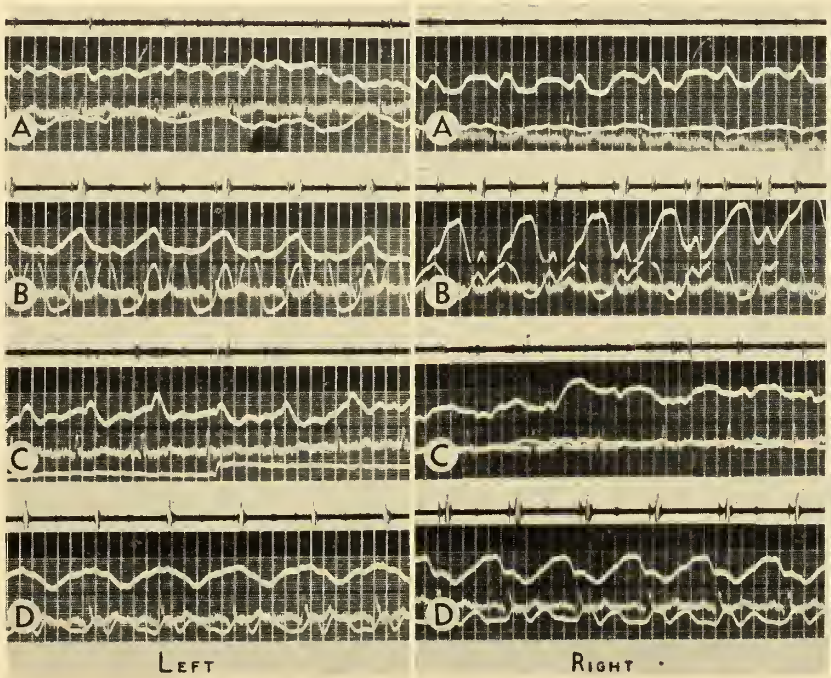

Fig. 1. Electrokymographic recordings of the pulsations of the left and right heart borders (postero-anterior view) in a normal hypersthenic man. Each record consists, from above down, of simultaneously recorded heart sounds, electrokymogram, electrocardiogram (distorted by 60-cycle interference) and apex beat. Camera speed, 50 cm. (A) Deep inspiration. (B) Deep expiration. (C) Valsalva experiment. (D) Mueller experiment.

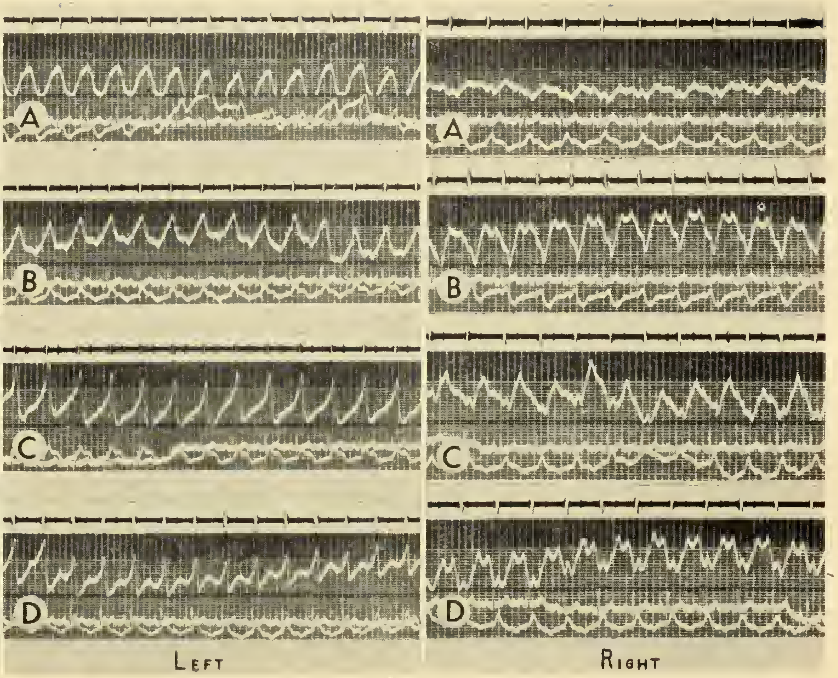

Fig. 2. Electrokymographic recordings of the pulsations of the left and right heart borders (postero-anterior) in a hyperthyroid woman. Each record consists, from above down, of simultaneously recorded heart sounds, electrokymograph, electrocardiogram, apex beat. Camera speed, 25 cm. (A) Deep inspiration. (B) Deep expiration. (C) Valsalva. (D) Mueller.

atrial filling and, therefore, in the dynamics of the rest of the circulation. Since this pressure gradient can be affected by ordinary and exaggerated respiration, we have a simple method by which to change these conditions. For example, roentgenograms made during Valsalva and Mueller experiments may show a change of 20 per cent or more in the volume of the heart.

It has been shown by direct inspection of the heart in dogs, that the decrease in intrathoracic pressure that occurs with deep inspiration results in augmented right atrial filling,[2] and in right ventricular dilatation.[17] According to Starling's law, this produces an increase in right ventricular output. Lauson et al,[12] from intracardiac pressure recordings, made similar deductions in the human. They showed also that for a few beats there is a decrease in the left ventricular output in inspiration and an increase during expiration. However, they emphasize that this basic pattern can be varied by changes in the following: depth of respiration, relative duration of inspiration and expiration, respiratory rate, kind of respiration (abdominal or thoracic), pulmonary vascular capacity (as the result of disease or therapy), distensibility of the ventricles in diastole (as in pericardial disease), and venous return as in peripheral or central failure. While, as I noted, it is difficult to study the absolute volumes of the cardiac chambers in the human, the timing and the speed of volume change can be recorded during the cardiac cycle from the heart border. Morelli[14] carefully investigated this subject in 1939 using a concentric kymogram. The electrokymogram, however, permits a rather more precise analysis, particularly because other circulatory functions can be simultaneously recorded. At present we record heart sounds, electrocardiogram, electrokymogram and either the carotid or venous pulse, or the apex beat.

The electrokymogram, as described by Chamberlain and his group,[11] records the movement of the cardiac contour through a photocell. As the contour moves to and fro in front of the cell, the amount of light from the fluorescent screen and the current from the photocell vary proportionally. The current is amplified and activates a recording galvanometer. The final tracing is much like a pulse tracing. As the right or the left heart border moves towards the midline of the chest a downstroke is recorded. Similarly, movement away from the midline is recorded as an upstroke. Therefore, when systole occurs, the left border contracts towards the midline, more fluorescent light enters the photocell, and a downstroke is recorded.

The timing of the events of the cardiac cycle is obtained from one of the other recorded functions since these have been well known to physiologists and cardiologists for many years. The timing of systole can be taken from the first sound or from the carotid pulse. The preliminary vibrations of the first sound correspond to atrial systole; the first large component of the sound corresponds to isometric contraction; the second large component to ejection. In the case of the carotid pulse, a slight presystolic peak may be seen corresponding to atrial systole. The acute rise of the anacrotic limb corresponds to ventricular ejection. The semilunar valves close at the time of the second sound and the dicrotic notch of the carotid pulse. When the apex beat is satisfactorily recorded, or more regularly from the venous pulse, the rapid inflow phase of diastole is easily distinguished.

In general, the time relations of mechanical and electrical activity of the heart are not constantly correlated. However, when other activities are not well recorded, and this occurs frequently in experiments with respiration, the electrocardiogram may be the only available frame of reference.

The electrokymogram is analyzed therefore by determining when certain phases of the cardiac cycle have occurred, and deciding from the movement of the cardiac contour what is happening to the chamber that forms the contour at the point being investigated.

Case 1 was a normal hypersthenic man of fifty years. The left ventricular contraction is larger in expiration than in inspiration (Fig. 1). Exaggerated respiratory motions demonstrate profound alterations in ventricular ejection and filling. In the Valsalva experiment, which is forced expiration against a closed glottis, systolic contraction is much more rapid than in expiration. Diastolic expansion is slow and steady until presystole, when there is a sudden sharp filling. In the Mueller experiment (forced inspiration against a closed glottis) systolic contraction is very slow, and diastolic filling, after a fairly rapid start, progresses slowly to its presystolic maximum.

Lauson et al[12] made intracardiac pressure studies during the Valsalva and Mueller experiments. Their evidence suggests that the strong compression of the thoracic contents produced during the Valsalva impedes venous return and, as a consequence, the right ventricular stroke volume decreases. After a short delay, the left ventricle follows suit. This will explain the slow diastolic filling of the left ventricle which is noted in Figure 1. The rapid systolic contraction is perhaps accounted for by a smaller systolic residue in the ventricle or by the lower pressure outside of the thorax than within it.

The Mueller experiment produces a marked fall in the intrathoracic pressure. Lauson et al[12] found here that there was a sharp drop in right atrial and right ventricular pressures. However, the net right ventricular pressure was increased, slowly returning to normal as the effort continued. This was taken to indicate increased output of the right ventricle and, therefore, after a few beats, of the left. Since the right atrial pressure in relation to the extrathoracic veins falls during the Mueller experiment, we can account for the steady diastolic filling of the left ventricle by this increased pressure gradient. The slow ventricular contraction on the left side is more difficult to understand unless there is a larger systolic residue and therefore a greater initial pressure. Perhaps also there are changes in the activity of the vasomotor centers during this experiment which alter the systolic pressure and secondarily the ventricular pressure.

Recording of the right heart border during the Mueller experiment shows a very rapid filling of the atrium during ventricular systole (Fig. 1).

The influence of heart rate, and therefore of the duration of the cardiac cycle, was studied in a patient with hyperthyroidism and a heart rate of 120 beats per minute. Intracardiac pressure recordings,[12] suggest that the duration of diastole may be of some importance in determining the mode of filling of the left heart. In our present case (Fig. 2), diastole was shortened to 0.30 seconds. During the Mueller experiment, the right atrial filling occurred rapidly and steadily from shortly after the onset of ventricular systole until the atrioventricular valves opened. Atrial systole is well defined; however, during the Valsalva when the right heart pressure is low, atrial systole is barely recorded. In both experiments, nevertheless, as well as in deep expiration, atrial movements are of large amplitude, which is probably to be related to the shortened diastole.

The contractions of the left ventricle are much like those in Case 1. However, rapid systolic ejection in both Valsalva and Mueller experiments is noted. In all likelihood a large systolic residue cannot accumulate in the ventricle during the Mueller experiment in this case because of the rapid heart rate. The rather remarkable difference in the shape of the ejection curve under these conditions is of great interest. I suggest that the apparent expansion of the ventricle in late systole during the Mueller might be due to the decreased pressure in the intrathoracic vascular structures as compared with the arteries outside of the thorax, since, while the semilunar valves are open, they are in free communication with the aorta and left ventricle. However, such explanations are mere speculations until, as we intend, simultaneous pressure recordings are made. I regret that space does not permit an elaboration of the clinical use of this technique. For simplicity, I have omitted from discussion the effect of the wringing motion of the heart during contraction, the side-to-side motion and the pull of the base towards the apex.

I shall pass on now to another interesting type of problem. After an arteriovenous aneurysm has been corrected or an acute anemia treated, the heart rapidly becomes smaller. This difference in size cannot be accounted for by a change in the stroke output alone. Fahr and Buehler computed[9] from observations on a heart-lung preparation that there would be an increase of about 125 c.c. in the diastolic volume of a normal human heart (assumed 600 c.c.) when the stroke output was increased fourfold. This corresponded to an increase of 7 mm. in the transverse diameter, whereas I have shown you differences of at least 11 mm. in one instance and 24 mm. in the other, in diseases in which the stroke output was at most doubled.

To explain this discrepancy, Nylin[13] postulated a change in the systolic residue in the heart. Cournand[5] showed that normally there is a systolic residue in the left ventricle through pressure recordings made during an extrasystole. These showed that although contraction occurred before filling could have taken place from the atrium, there was an ejection of blood from the left ventricle. Angiocardiography shows clearly that there is residual diodrast in the right ventricle at the end of systole and a smaller amount ordinarily in the left. This can be seen both from the exposures made at the end of systole (Fig. 3) and from a motion picture following the course of diodrast through the heart.* Chavez et al[3] recently agreed that the right ventricle does not empty completely in systole. They show films suggesting that the left does, but I am inclined to attribute this to a difference in technique, such as an unintended Valsalva experiment.

A discussion of systolic residues immediately leads us back to the problem of pressures, the importance of which I have repeatedly emphasized. Pressure recordings can be made in the right auricle, right ventricle and pulmonary artery as well as simultaneously in the femoral artery. The catheter is passed under fluoroscopic control by the roentgenologist. Pressure recordings are made and blood samples taken for oxygen content analysis at various points in each chamber. The oxygen content, along with the oxygen consumption, permits a calculation of the average stoke output.

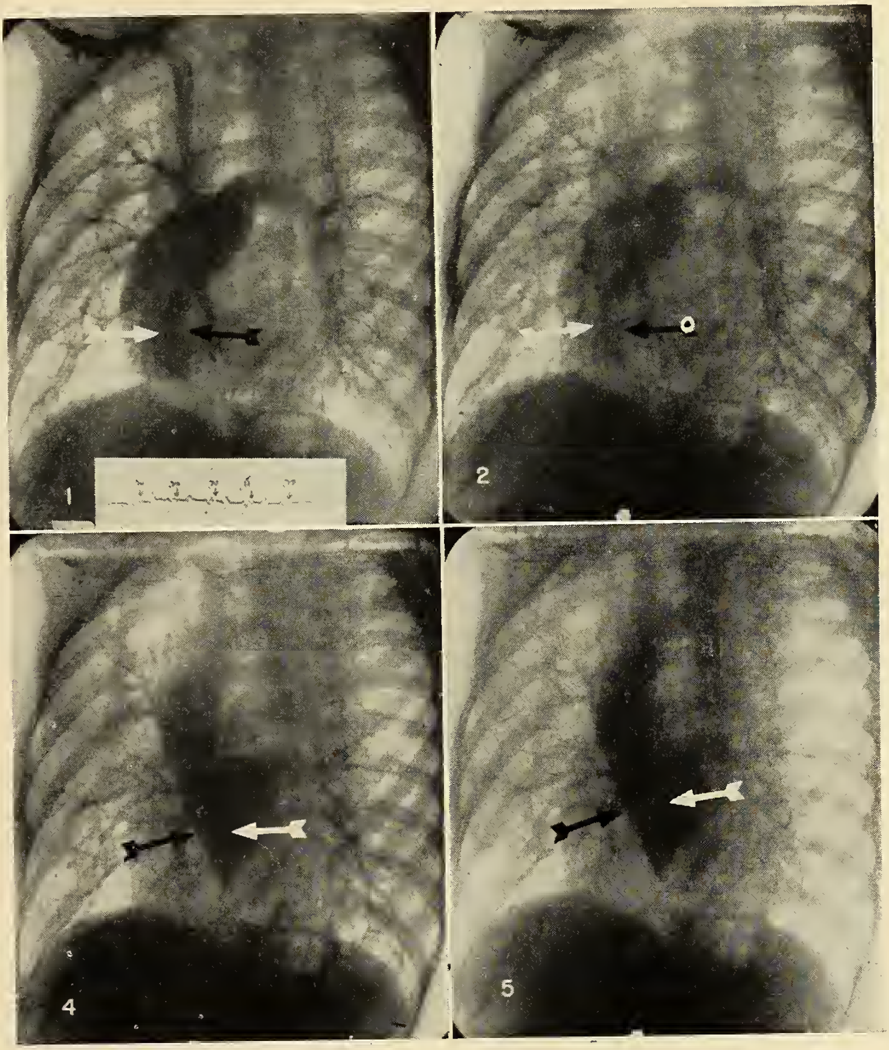

Fig. 3. Systolic residue. No. 1 and No. 2 show the residual diodrast in the right ventricle at the end of systole; No. 4 and No. 5 show the left ventricular residue. The exposures were controlled through an electrocardiographic lead (illustrated in No. 1).

When pressure determinations can be correlated with volume measurements, a maximum of information is available. For this reason, and also because of the anatomic data which is made available, angiocardiography also is employed. In the following cases, therefore, the results of such a correlation are presented. However, since we have only recently begun to catheterize the heart, while we have performed over one thousand angiocardiographies during the past few years, I have not hesitated to draw freely from the literature for the pressure data.

---

*The motion picture mentioned was shown after the presentation of this paper at the state meeting.

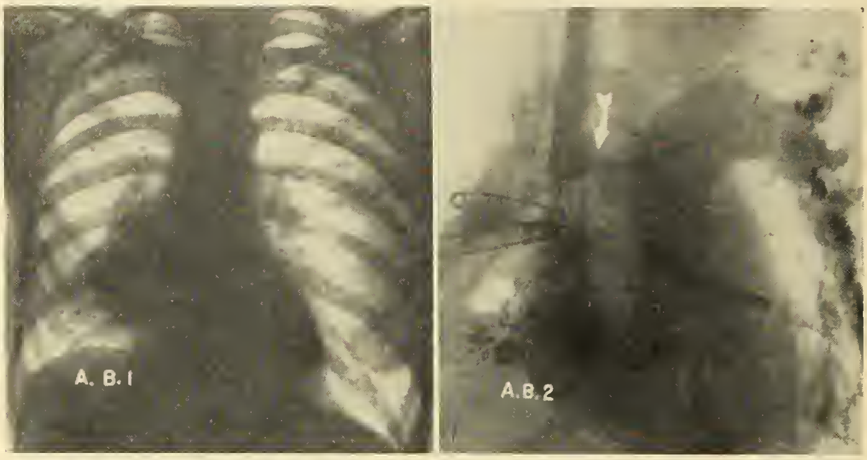

Fig. 4. (*Left*) Carcinoma of the right lower lobe bronchus (AB1). (*Right*) Angiocardiogram after right pneumonectomy. Arrow points to stump of right pulmonary artery. The left pulmonary artery and its branches are not significantly dilated.

Postpneumonectomy

The capacity of the pulmonary vascular bed is great. Removal of one lung so that the entire blood flow is through the remaining lung has very little effect upon right ventricular pressure because there is no change in vascular resistance. Cournand[6] also found the blood flow normal. The systolic pressure in the right ventricle was slightly elevated in one of his cases where there was a coincident chronic emphysema. The overall size of the heart remains normal, and the right ventricle, by angiocardiography, is normal in size (Fig. 4). The pulmonary artery, the remaining main branch and its smaller branches are not enlarged, the preservation of normal pressure-flow relations probably being maintained by an increase in the number and, to a slight extent, the size of the capillaries in the remaining lung.

Patent Ductus Arteriosus

In spite of the increased pulmonary flow in this condition, Dexter and Burwell[8] found the mean pressure in the pulmonary artery to be normal even when, in one case, the shunt through the ductus was estimated to be eight liters per minute. We have performed angiocardiography in about eighty cases of this condition, and the right ventricle regularly was normal in size; the serration of the trabeculae was unchanged, and the apex was pointed normally.[19] Sometimes the right ventricle appeared compressed by the large left ventricle (Fig. 5). However, it is anticipated that right ventricular dilatation and hypertrophy will be found if the pressure in the pulmonary artery rises, as was found in one case by Cournand (55/39 mm. mercury, as against a normal of 25/8).

Chronic Pulmonary Disease

In four cases of emphysema with a moderate increase in residual air, Cournand[6] found normal pressures in the right ventricle. In four cases with a larger residual air, the systolic pressure was elevated. In both of these situations, the heart was not definitely enlarged. However, when right heart failure was present, and this is defined by Cournand as occurring when there is diastolic as well as systolic hypertension, dilatation was found regularly. This experience is comparable to our findings with angiocardiography, with this addition. Angiocardiography has shown how difficult it is to determine the size of the right ventricle by ordinary x-ray means.[8] The first changes take place in the position and direction of the interventricular septum. The apex of the right ventricle is rounded instead of pointed. These changes are wholly undetectable by cardiac measurement or by inspection of the cardiac contours. When enlargement of the heart occurs, it is found to the left. However, the pulmonary artery is usually dilated, and this is demonstrated in the conventional roentgenogram.

When there is diastolic hypertension in the right ventricle, the mean right atrial pressure is elevated and this chamber enlarges. It is then that frank cardiac enlargement to the right is noted.

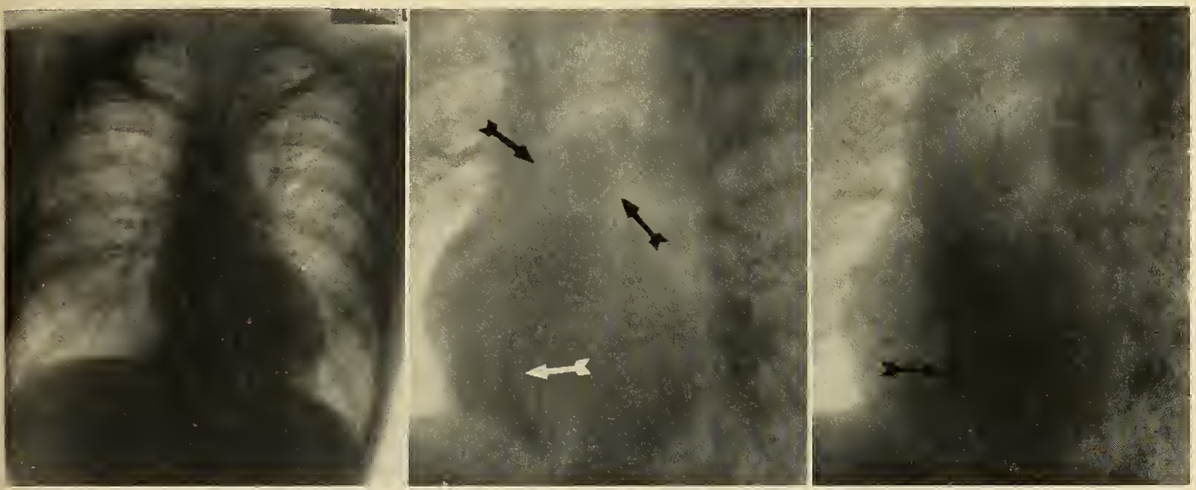

Fig. 5. Patent ductus arteriosus. Angiocardiograms made in left oblique position. (*Center*) White arrow points to left border of compressed right ventricle which is otherwise normal in size. Pulmonary artery (two black arrows) is not dilated. (*Right*) Black arrow indicates right border of very much dilated left ventricle.

Mitral Disease

We have been impressed with the finding, by angiocardiography, that the right ventricle is not grossly dilated in cases of mitral disease even when the heart is quite large.[10] The right ventricle on the other hand has been found displaced anteriorly, the pulmonary artery anteriorly and cephalad, by the large left auricle. The straightened, elongated middle left cardiac contour is due chiefly to the left auricle and not, as some have thought, to a dilated elongated pulmonary conus. It is apparent from angiocardiographic analysis, that it is very difficult or impossible to determine the size of the right ventricle in the usual case of mitral disease by ordinary roentgen means. The explanation for this is to be found in a report by Bloomfield et al.[1] In a case of rheumatic heart disease, they found a normal diastolic pressure in the right ventricle as long as the patient was not in failure. A systolic hypertension of 57 mm. mercury was present, but I have already indicated that significant ventricular dilatation does not take place until the diastolic pressure rises. The same patient when in failure revealed pressures of 103/29 in the right ventricle. It is these pressure changes that account for the marked change in the size of the heart that is found when a patient with mitral disease passes in and out of failure.

Eisenmenger Complex

This case is presented to demonstrate the integrated type of examination that can now be made. In this case, a girl of twenty-two, moderately cyanotic and with progressive impairment of cardiac reserve, the mean right ventricular pressure was 22 mm. mercury. The right atrial pressure also was substantially elevated. The pulmonary artery could not be catheterized but the pressure was undoubtedly high because pulsations were very active fluoroscopically and, when recorded, suggested pulmonary insufficiency. Angiocardiography showed considerable dilatation of the right auricle and right ventricle (Fig. 6). A shunt of diodrast from the right ventricle into the aorta clearly is present but most of the diodrast passed into the dilated pulmonary artery. This accounts for the high oxygen saturation of arterial blood that was found (82 per cent). In spite of moderate cyanosis and increasing impairment of cardiac reserve, this was not a case for the Blalock-Taussig operation.

Summary

I have very briefly touched on some of the phases of cardiac roentgenology which have interested me. I selected for presentation particularly those facets of cardiovascular physiology in which the roentgen ray can play an important role. It has been my intention to provoke consideration of these thoughts:

1. It is no longer necessary for roentgenology

to confine itself to a questionable static analysis of cardiac topography.

2. The roentgenologist has a tool which is particularly suited to a physiological approach to cardiac dynamics. However, his participation in a team will permit an integrated study which cannot be achieved by one individual alone.

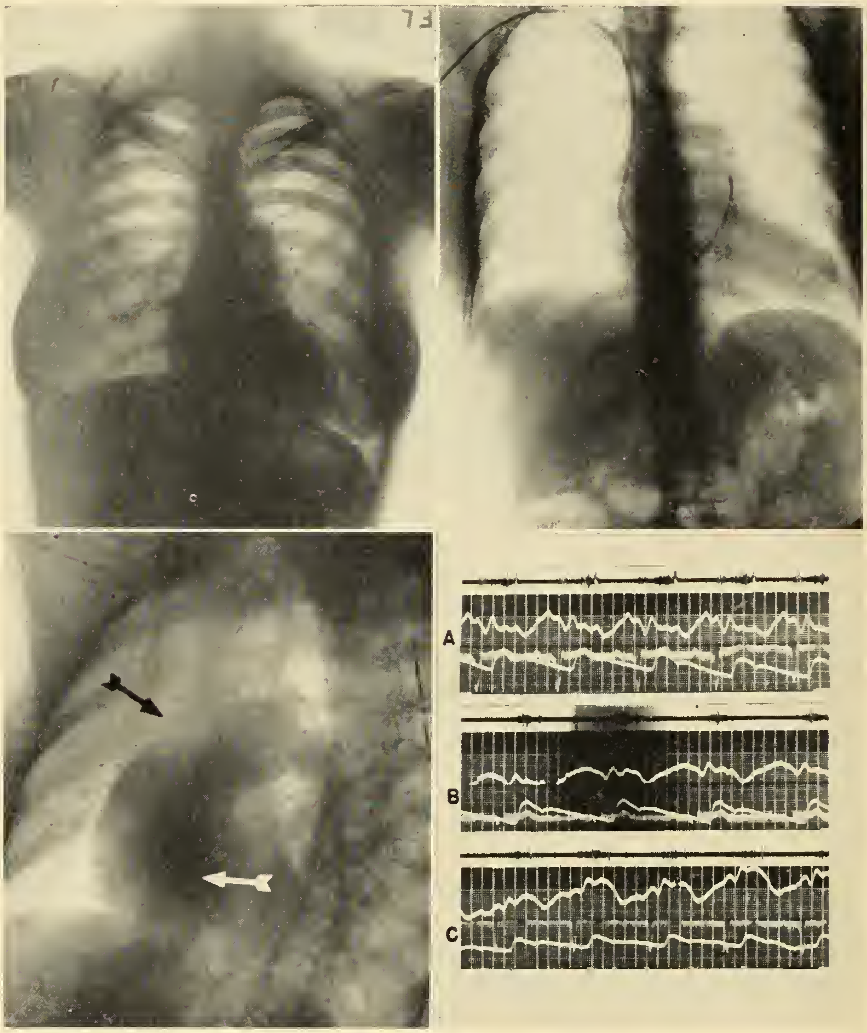

Fig. 6. Eisenmenger Complex. (*Above, left*) Conventional roentgenogram shows heart enlarged to the left, with the pulmonary artery segment convex. (*Above, right*) A catheter was passed into the right ventricle but could not be passed into the pulmonary artery. (*Below, left*) Angiocardiogram shows enlarged right ventricle (white arrow) and a dilated pulmonary artery. Diodrast enters the aorta from the right ventricle (black arrow). (*Below, right*) Electrokymogram of the left ventricular pulsations during a Valsalva experiment showed a lateral movement 0.06 seconds after the onset of ventricular ejection.

3. Newer techniques permit the study of the individual and his cardiac function. This is the fundamental development in clinical physiology. Reliance on prototypes in the postmortem room or on the experimental animal has become less necessary than heretofore.

In the preface to his book, Dr. Carmen said, "Opposing views have been considered with fairness and without conscious implication that the statements herein recorded should be considered final. Because of the lessons they may teach, mistakes have been recorded unsparingly, but these errors should not be regarded as reflecting on the efficiency of roentgen diagnosis in general."

Clearly if we follow Dr. Carman's precepts, knowledge must advance.

Credit is accorded to the teams with which I have worked in obtaining the data I have presented: Dr.

(Continued on Page 1081)

THE PLAN OF ACTION FOR FARM COMMUNITIES

MRS. CHARLES W. SEWELL
Administrative Director, Associated Women of the American Farm Bureau Federation
Chicago, Illinois

IN any discussion of rural health problems, one is reminded of the ancient recipe for rabbit stew, which began, "First you must catch the rabbit." In this case, the rabbit is public opinion, and perhaps the most important step in a series of steps looking toward improvement of rural health conditions is an awakening of the residents of a given community and an awareness of the problems that exist.

Next in order would be a meeting of interested people. Farm organizations, extension service, civic clubs, school authorities, church representatives and the nursing profession should meet with their county medical and dental societies and public health departments, and plan programs designed to answer three pressing questions: "How shall the sick be helped?" "How shall the doctor, dentist, nurse and hospital be paid?" and lastly, "What can we do in an educational campaign to institute preventive measures that will lead to better health?"

The result of such consultation should lead to a general survey of the rural community. The number of doctors and nurses, hospital facilities, condition of the roads, and the average income of the farm people to be served must be ascertained before intelligent planning can be assured.

When the exact report has been compiled, the entire community through its local leadership should be urged to focus general attention upon the findings. Through organization meetings, radio, press and pulpit, people can be informed of the true conditions and urged to assume responsibility in a program that will ultimately effect the much needed changes.

It is most likely that it will be found that there are existing agencies available that are not being used. Perhaps there is duplication of effort in some lines and co-ordination is needed. It is highly possible that a little well directed team work can bring Federal and State assistance of funds and personnel to the aid of local health workers, with remarkable results.

Communities should be made to see that they can well tax themselves to provide better facilities. A campaign of health education designed to explain and extend prepayment plans for medical care and hospital service will do much to disseminate authentic information on this comparatively new and less well-known method of paying some of the bills. Promising students should be assisted in preparation for medicine and nursing through scholarships. Farm organizations and the county medical societies may well plan workshops or discussion groups to carry forward and perfect the definite programs suggested by the surveys and "arousement" preliminaries.

America has her greatest stake in a healthful citizenry. Her economic and cultural advancement as well as her military strength for national defense are inextricably woven together. Today, we must meet this great challenge with the best we have and solve the problem by application of the time-honored American doctrines of self-help and individual responsibility. We can no longer say there is no problem and dismiss it with a shrug of indifference. If we do not present a positive approach and apply what we know and what we have, there are those among us who, restless and discontented, will seek to fasten upon us a system of regimentation and compulsion entirely foreign to American ideas and ideals. The stake is tremendous. We dare not fail.

Read at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

A SOUND PUBLIC HEALTH PROGRAM

HAVEN EMERSON, M.D.

Emeritus Professor of Public Health, Columbia University
New York, New York

RURAL or farm community health is to be achieved only by interested active sharing in objectives and methods entered into heartily by the three parties primarily concerned. These are, in order of importance, the individuals or families of the community, the physicians and dentists in private practice, and the health department of the local government.

Health is a personal achievement, built upon good inheritance, upon an understanding of the laws of living matter, reproduction, nutrition and growth, that is, the principles of human biology, and such control of environment and human relationships in work and play as will reduce or avoid preventable disease.

Without the enlightened and eager self-interest of parents and children, employes, teachers, ministers, editors and all and sundry persons and households of the community in attaining a way of life that is consistent with good health, neither the professions nor officers of local government can create, maintain or improve the state of health of village, town or country.

There are no visible limits to the betterment of health, the enrichment of life, the completeness of the span of human survival, and the depth, breadth and happiness of life, if all we now know of the prevention of disease and the development and promotion of health at all ages is applied, with courage, determination and personal and social unselfishness by people, doctors and their local government.

Health is largely the result, the payoff, the reward, of a quality in persons and their way of life.

No one of the great accomplishments of the past hundred years, this recent century of sanitation, the golden period of the sciences and arts of human existence, would have been possible without the trust of people in their family physicians and the personal influence of these doctors of our nation in the households of our land. Their necessary role in carrying preventive medicine to every patient and family is ever more and more indispensable in the translation of the facts of laboratory and hospital, of medical school and research institution into practical application in homes, shops, farms and public policies.

Why then must we have the participation of local government when we admit the prior importance of the people themselves and their medical and dental advisers?

Because there are some services which can be offered at less expense and with more effect by government than if left to private initiative and individual conscience.

You ask me to describe a sound public health program with special respect to rural or farm community existence.

Let us at once define what we mean by public health services. These consist of the application of the sciences and arts of preventive medicine, by or with the consent of government, in the interest of the community, as distinct from medical services for the individual's personal benefit.

There are four recognized levels of government at which health services are conducted. The international, the national (federal or dominion), the state or province or department, and the local level, that is, the village, town, city, county or multiples of these within the frame of a local or district government.

We cannot separate ourselves from concern with the somewhat remote functions of the World Health Organization or with the duties of national health agencies, for without their protection, hazards from other lands and lack of central authority in commerce and transportation would certainly deprive us of much of our present health security. But they do not reach into our homes or provide persons to protect our water, milk and food supplies, or supervise the sanitation of our villages. At the state level we touch closely upon services that may be, and in Minnesota always have been, about as intimate and personal as are those of the local department of health. In fact, in most of the area of your state and for at least one-third of your population, the state department of health has been the only source of protective health services, outside of the four large cities.

Read at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

But be it always remembered that state, national and international health services and programs can be but partial and largely theoretical unless built upon a structure that brings basic essential health services to every household, through the agents of the public health professions serving each respective community, be it town, county, city or village.

Let us then picture for our immediate goal as a function of every local government, whether separately or in conjunction with adjacent communities within the county, the simplest, most elementary, economical but efficient services for health required to make use of the abundant facts of present day medical knowledge.

It is a privilege enjoyed under your laws for every unit of local government to establish a board and department of health. In all common sense this privilege should be seized upon as an obligation, a duty of every local jurisdiction of government that levies taxes and disposes of such revenue in the public interest. County and lesser units of local government in Minnesota have taken their responsibilities too lightly in this respect, and there are literally hundreds of local health departments unworthy of the name and but mere gestures, serving no useful purpose. It is inevitable that this should be so under the loose and inadequate provisions of state law which do not now facilitate the joint action of small communities and sparsely settled counties to combine for the common purpose of health departments.

I share with all physicians of your state, and with many other citizens of good will and public spirit, a deep chagrin and mortification that your recent legislature allowed a petty political obstruction to frustrate the evident demand of the people for an enabling act permitting the creation of city-county, county-wide and multi-county health departments for efficient public health service at the local level.

But to come back to the substance of the matter. Of what does a sound public health program consist? Certainly it does not include medical care of sickness. It does not invade the recognized field, the traditional and accepted sphere of private initiative and personal relation of family and family physician. A public health program must be conceived in view of four administrative principles. There must be authority under the law for the performance of certain functions; there must be responsibility vested in a professionally qualified medical officer of health appointed by elected officials of local jurisdiction; there must be tax funds authorized and appropriated to carry out the health services; and the health officer must be free to select and employ such professional, technical and assistant personnel within the specification of civil service requirements as may be necessary for the work to be undertaken.

Authority, responsibility, tax money, personnel—these must be assumed if we are to venture upon a service so vital, so indispensable to living and a high level of health.

The basic functions of the local health department are six in number, each long tested and each of proved worth, and each so related to the others as to make a consistent and efficient administrative whole. These six functions are:

1. The accounting for all births, deaths and notifiable diseases, occurring within the local jurisdiction: the vital statistics or human family bookkeeping. This requires verification of each record for completeness and accuracy, the tabulation, analysis, interpretation and publication of the facts to be used as a basis for education, for public policy, for health accounting to the local public.

2. Control of communicable diseases by the use of education, persuasion, and, if necessary, the authority for sanitary law. There is the provision of specific protective immunity to those not so served by the family physician, and of such treatment of infected persons as will shorten the period of communicability of a disease. These services, guided by epidemiological intelligence and resourcefulness, everywhere produce calculable and usually brilliant results.

3. Environmental sanitation including protection of water, milk, foods, and especially the guardianship of all employed persons against any health hazards of their occupation. The control of insects and animal pests capable of communicating or causing disease in humans is included under this part—the sanitary engineering control of man's environment on the material, as distinct from the social or physical, phases of his life. Housing occupancy, as distinct from housing construction, falls within the scope of sanitation also. The measure of success in this function of a local health department is, as is the case in many of the others, the amount of

educational persuasion, rather than the extent of police power or sanitary authority that is used to obtain compliance. The best health services are those that keep the big stick of authority hidden, while teaching has full play to obtain a willing and interested co-operation.

4. The public health laboratory is the servant of the sanitarian, the epidemiologist, the health educator, the health officer within the department of health, and, even more, the collaborator and assistant of the physician, the veterinarian, the dairyman, the food processor and purveyor. The laboratory gives exactness, promptness, decision and irrefutable proof of conditions in persons and in environments that hazard health.

These four functions carry on the earliest basic conceptions of public health service and are supported by long established legal sanctions, supported by the highest courts.

The next two functions involve only educational methods and express the most modern concepts of the role of civil government as the people's friend and counsellor, rather than their master.

5. Only since 1912 have local health departments had bureaus or divisions of maternity, infant and child hygiene, including concern with the health protection of school children. This function, perhaps, in its scope and bearing upon human happiness and survival is the most far-reaching and necessary of all the duties of a health department and might well be thought of as concerned with human reproduction, replacement, growth and development, the whole field of the succession of the generations, the quality and quantity of our offspring, with genetics and eugenics, with inheritance and the up-bringing of children within the family. From the pre-marital state of oncoming youth, through the period of the expectant mother, the dangerous days of early infancy, the delightful personality and exuberance of the runabout, the preschool child, and through the baffling years of adolescence, through high school and into college or employment, the health department stands as a sort of proxy parent to guide, guard and assist in the achievement of maturity with the least possible number of handicaps to the body, mind and spirit of the child. Truly the very principle of human biology, if it becomes part of the way of good life in home and community.

6. And then latest, as a member of the public health family, is the function of health information, instruction and education in all its infinite variety.

Health education is a life-long experience, a sort of biological philosophy, the very essence of common sense. It has always been a function of the family physician. It is the particular province of the visiting and public health nurse. It is a major concern of every member of every department of health from local to international. It is an art that carries the word of science.

No thought of force or compulsion, no threat of authority or law can be tolerated in the relationship between the mother with her children and the public health nurse who is the very embodiment of a traveling encyclopedia of hygiene. Whatever the information sought by the public or specially promoted by the health department in the public interest, the method must be that of the educator who speaks with authority in the field of human health.

These six, then, are the basic, minimum functions of a local health department: vital statistics; communicable disease control; environmental sanitation; public health laboratory; maternity, infant and child hygiene; health education.

If I did not believe each of these to be a proven need for my fellow citizens and a proper and authorized duty of local government to provide, I should not have come so far from my home by the sea to persuade you physicians and you parents of Minnesota to organize your professional and public influence and opinion to the effect that no village, town or county of your state lacks these. We have had these services in New York City since 1865.

Full-time, trained professional medical leadership for such health services is as essential as a lawyer on the bench, an engineer in charge of your highways, an educator at the head of your schools.

Part-time physicians, private practitioners, can no longer play safely the part of local health officers. They should not be asked to.

Of Minnesota's 2,714 counties and cities, villages and townships permitted to set up each a local health department, only 821 of the 1,881 townships had a health officer. Most of the local health officers of Minnesota are on a part-time or fee-for-service basis. Not more than one-fifth of the local health departments in Minnesota, of which there are some 1,635, even report the pay of the health officer.

This is an inexcusably loose and inadequate provision for local health service, for which the remedy was sought at the last legislature.

The chief errors which have developed unnoticed over the recent decades are:

1. Local governmental jurisdictions are too small to support a competent staff to carry out the necessary functions of a local health department.
2. Appointment as health officers of part-time practitioners of medicine and surgery, whose time and interest are fully engaged in caring for the sick.
3. A small penuriousness of local government, which in the main makes wholly insufficient appropriations for human life-saving.

The necessary steps to make Minnesota lead the states in eradication of tuberculosis and syphilis and maintain its distinction in local health worthy of its great university schools of medicine and public health and of its distinguished state health department are as follows:

1. Secure passage of the enabling act for creation of consolidated local health units of suitable size.
2. Impress elected officers of local government with their duty to appropriate sufficient tax funds to support at least the minimum basic local health services under trained medical direction.
3. Make certain that no less than one public health nurse is employed for each 5,000 population for administrative and educational services. One for each 2,500 of population will be needed if they are to be required to give bedside care of the sick in the home.
4. Give the local health officer authority to employ other professional and technical personnel as the population may require.

You will have noted, and perhaps with surprise and disappointment, that I have made no reference to the relation of the local health officer to the administration of hospital, outpatient or home medical care services for the sick. Your laws may put the burden upon him, but I assure you that the program of public health I have outlined will require all the ability and time of a trained health officer and that community health will suffer if his talents are devoted to management of medical care programs for the sick.

It is proper to have the state department of health charged with its present and expanding functions in the interest of more and better hospital care, but care of the sick is not a proper function of the local health officer.

Every local jurisdiction of size to justify a full-time health department should have a professional and citizens' health council to serve as a forum, a sort of public conscience and planning body to back up the public health program. One further omission I have been guilty of intentionally. I have not advised that in the establishment of local health units and implementing their half-dozen essential functions there be undertaken clinic services for the aged, for heart disease, for diabetics, for the mentally ill, for multiple sclerosis, for cerebral palsy, for epilepsy, for Hodgkins' disease, for cancer, or for arteriosclerotic and hypertensive patients.

Only so far as the state of medical knowledge offers any sound facts which can be safely and honestly passed on to the general public through educational publicity, can local health departments participate in the prevention of these many serious human ills.

Medical institutions for diagnosis and treatment and research establishments to study origins and causes of chronic, long-time disabilities have the present responsibility with respect to these diseases as causes of individual sickness.

We are deeply ignorant of facts upon which programs of prevention can be based.

Let us, through our health departments, persuade people to obtain competent medical and surgical advice, as the best means of safeguarding their health by periodic health examinations. If they are, in fact, unable to meet the cost of such examination, it is certain that medical institutions and organizations will find ways of providing it.

The health department is not the agent of government or the community which should be charged with establishing clinical facilities for diagnosis and treatment of the sick, unless the sickness of the individual threatens communication to others.

The public health council, the local medical society, the health officer and his staff should be the agencies to discover and correct preventable causes of ill health and create the public spirit of co-operation among all elements of the population

THE HEALTH PROGRAM IN RURAL SCHOOLS

D. F. SMILEY, A.B., M.D.

Consultant in Health and Physical Fitness,
Bureau of Health Education, American Medical Association
Chicago, Illinois

IT is axiomatic that in a democracy such as ours the rural school child *should* enjoy equal opportunities with the urban school child so far as the protection and improvement of his health is concerned. When we look at the record, however, we find this is not the case. Health examinations of rural school children are too often omitted or only hurriedly done; arrangements for following up remediable defects and utilizing all community resources to bring about correction are too often lacking; heating, lighting, ventilating and cleaning facilities in the rural school are too often inadequate, and planned and progressive health teaching too rare.

Correlated with these inadequacies (but probably not the direct result of them), we find that though rural and urban children start life with about the same number of remediable physical defects, urban children manage to get many more of their defects remedied during their school life than do rural children. We also find that the health habits of rural children, particularly in respect to matters of diet, dental care, and communicable disease control, are generally inferior to those of urban children.

While fresh air, sunshine and physical activity are health boons almost automatically afforded rural children, they do not of themselves guarantee a high level of health or physical fitness, nor should their presence be accepted as a reason for excusing an inadequate health program in the rural home, school, or community. If a good home-school health program can be added to what rural children already have in the way of health-promoting factors, our rural population should make rapid strides in improving efficiency, productivity and contentment.

The Basic Problem

The basic problem is created by the wide dispersal of rural children in the thousands of one-room schools. Consolidation of these one-room schools would of course simplify this problem in many respects, but such consolidation is a long and often painful procedure, and the successful efforts of Grout, Lamkin, Greenleaf, Drenckhahn, VanSlyke and many others are proof of the fact that much can be done to improve the health programs in our rural schools without waiting for consolidation.

With perhaps several hundred one-room rural schools scattered through a typical county it is easy to see that the county superintendent of schools will have very limited opportunity to provide guidance and supervision to the individual teacher attempting to carry on an effective school health program. It is just as obvious that the rural teacher with pupils in perhaps all eight grades, and with the whole category of responsibilities extending from planning the school day to supervising the recess period, is not going to have very much time to study the health needs of her pupils and of the community or to collect interesting new health-teaching materials or to make home visits to discuss pupil health problems with the parents.

Some Needed Assistance

If adequate school health programs are to be provided county wide, then it is apparent that the overburdened teachers and county superintendents must be given assistance. That assistance may well consist first of a well trained health education supervisor or health co-ordinator. This worker will bring new teaching materials to the rural teachers, work with them to develop teaching units that will be suited to the needs of the children and adaptable to the limited resources of the one-room school, and give needed assistance in the maintenance of a hygienic and sanitary school room.

Another form of assistance which should be made immediately available to this overworked team of county superintendent and rural teacher is the limited service of a physician and nurse. It is difficult enough for the mother of a family to be responsible for the health of her small children in the isolation of a farm home. She usually has the father with whom to share the responsibility and she knows that in real difficulty she can usually find her family doctor at the other

---

Read at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

end of the telephone line. But to ask the teacher to be responsible for the health of twenty to thirty of other people's children, and without a school physician for consultation and advice, is both unfair and unwise.

If the pupils of a school are receiving their necessary immunizations and health examinations in the hands of their family physician, I would be the last to recommend setting up a scheme of health examinations in the local school. But even in the ideal situation where the family doctor is providing periodic health examination, it would seem to me that there is still need for a regularly appointed school physician to whom the teacher may turn for advice and counsel in such matters as suspected communicable disease, growth and development problems and behavior problems. Whether such health service is provided by educational authorities or by local public health authorities is less important than that it somehow be provided. Similarly, it can be said of nursing service that somehow it must be made available to assist the one-room rural schoolteacher. But because of the distances between schools, and the close connection between disease or infestation of the school child and disease or infestation in the home, it would seem particularly desirable that the nursing service to these rural schools be provided by the local public health nurses who are authorized and equipped not only to work with the child but to carry the work back into the farm home. Upon the request of the teacher, the public health nurse may visit a rural school and, acting upon standing orders written by the health officer under whose direction she works, not only eliminate the pediculosis in the school child but also go back into the home and eliminate the family infestation.

The School Physician

In those rural areas where periodic health examinations are rarely done by the family physician, the need for the school physician is even more urgent. He should not, however, be hired either by the local school or by the local health department just to come in once a year, give every child a rapid examination and then depart with the feeling that "at least that routine job is done for another year." Figures show that school children are at the healthiest period of their lives; in most instances, health examinations done every three years will be adequate, provided parents and teachers are alert to refer the child to the physician when signs of acute illness or handicapping defect appear between examinations. The school physician can therefore make the best use of his time in the school if he gives first priority to those children culled out and referred by the teacher, second priority to health examination of those entering the first grade, those entering fourth grade, and those entering seventh grade. The physician serving the school must be responsible for establishing professional standards for the health examination, and he should refuse to participate in a school health program which lines the children up and parades them by the examining physician so rapidly that he "rarely sees the boy or girl back of the throat." Not more than three or four health examinations should be scheduled per hour, and the time-consuming health history, vision testing, hearing testing, and weighing and measuring should already have been recorded by the teacher and parent with the guidance and assistance of the nurse. The advice which the physician gives the child, and the parent if he is present, at the completion of the examination, is of the greatest importance, first because it is based upon the specific needs of that child, second because it carries the authority of the medical profession behind it. If time is not taken for this summary and advice, the physician is failing to utilize his chief opportunity for health education.

The Teacher

The rôle of the teacher in a one-room rural school is admittedly a difficult one, and what is expected of her is frequently far beyond what any one person can accomplish. It is nevertheless true that in almost every county in this country there are rural one-room schools that can be pointed to with pride by the county superintendent as schools in which health is both taught and practiced. The atmosphere of the classroom is cheerful and bright; each child feels that his individual needs and desires are being given consideration; physical activity alternates with mental activity; health practices jibe with health instruction; health instruction is planned and progressive, and deals with problems that are found in the local school, home, or community; the morning health review is carefully and consistently done; the teacher is thoroughly aware of all of the community's resources for recreation, for remedying defects, for making adjustment to severe handicaps.

In order to bring about such a happy situation it may be presumed that the teacher should have had in her training days courses in child growth and development and in the hygiene of the school child. Most often she has had none. Summer school courses, teachers' institutes and health work shops may have helped many of such teachers but the majority of successful school health programs appear to be largely the result of the teacher's individual interest and effort. With the whole community and its health needs to study, with modern textbooks as tools and with the help of *Hygeia* bringing its monthly contribution of new health facts, every teacher can, if she has the interest and energy, provide an effective if not all-inclusive school health program.

Conclusions

1. Though the rural school child as well as the city child needs and is entitled to an effective program of health education, health protection and health promotion, in many instances he is not getting it.

2. Generally effective school health programs in rural areas may have to await consolidation of rural schools.

3. The three chief assisting services that can be given rural teachers and county superintendents are those of a health co-ordinator, those of a school physician, and those of a public health nurse.

4. Every school should have a physician on call but his time in the school should not be frittered away in doing annual examinations in a superficial way.

5. The school physician by limiting routine examining to every three years will have time to study problem children selected by the teacher and to offer valuable personal advice upon completion of the examination.

6. Some teachers in isolated schools manage to provide effective health programs. Many more could do so if they were interested, encouraged and assisted.

7. Medicine now has a tremendous volume of knowledge as to how to prevent, modify or cure disease. Much of this knowledge is useless unless it is in the minds of the general public. The schools offer the ideal means of putting important health facts at the disposal of the public. It is therefore of vital interest to the medical profession and all those interested in human welfare that our school health programs, both rural and urban, function smoothly and effectively.

HYPERTENSION

Of first priority on the list of causes of physical disability is hypertension, or hypertensive cardiovascular-renal disease. This is not primarily a vascular disease but a definite syndrome caused by kidney dysfunction. It manifests itself in hypertension, cardiac hypertrophy, secondary degenerative changes in the kidney itself due to the circulatory changes, and degenerative changes in other organs, including the brain. Malignant hypertension is merely a severe and terminal stage of the process.

In evaluating the blood pressure, the diastolic is the important factor. A persistent diastolic of over ninety is considered abnormal. Blood pressure may be evaluated most truly just before or after the patient arises in the morning, or while he is asleep. A normal size heart is found with the volatile type of hypertension. An enlarged heart is indicative of a chronic progressive disease. The eyeground picture reveals the state of the capillaries. Concentration tests of the urine will tell the condition of the kidneys. Blood pressure readings alone should not be the sole criterion for the severity of cardiovascular-renal disease.

In the management of real hypertension, the commonly used bromides, barbiturates, and potassium thiocyanate are not effective enough. Properly done, sympathectomy is a severe and radical treatment not on a generally recognized basis. It does not attack the cause of the disease. Its best use is for the malignant type of disease.

At present, the most gratifying relief of the symptoms of headache and "jumping out of one's skin," together with the reduction of the hypertension without danger and great expense, is the maintenance of the sodium chloride in the food to approximately 1.2 gm. a day. With such a low sodium intake the fluid intake may be as liberal as desired. The sodium intake can be checked by the chloride content of the urine. It is essential to keep up the protein intake. Many proteins are rich in sodium. Protein foods extremely poor in sodium are being prepared commercially. With the relief obtained by such a dietary regimen, co-operation of the patient may be expected.

In the meantime, the important search for the specific underlying cause of the kidney disease will go on.—Editorial in *The Journal of the Indiana State Medical Association,* October, 1947.

PHYSICAL EDUCATION IN RURAL SCHOOLS

FRED V. HEIN, Ph.D.

Consultant in Health and Physical Fitness,
Bureau of Health Education, American Medical Association
Chicago, Illinois

PHYSICAL education, when given its rightful place in the schools, can be an adjunct of preventive medicine, a resource for the physiatrist and orthopedist and an ally of the general practitioner. Mutual understanding, appreciation and respect for the status, activities and objectives of closely related professional groups are essential for co-operative relationships. This is why insight by the physician into the problems of physical education and its present professional development will aid greatly in bringing about rapport between the two groups.

The program of health in the schools plays a major rôle in conditioning the attitudes of youth toward health and medical care. The physical educator's eminent place in the school health program makes his relationship with medicine especially important.

Certain fundamental principles of physical education are applicable for rural school programs as well as for urban education. Physical education may be thought of as one of the broad subject areas within the total school curriculum, and physical educators like physicians have come to realize that they cannot deal with one aspect of the child's development without impinging on the factors which make up his total personality. This means that there must be stress on education along with emphasis on the physical.

Modern physical education is concerned with education *through* the physical as well as education *of* the physical. It aims at making a contribution to physical health but is also cognizant of the potentialities that are inherent in its activities for desirable social, mental and emotional outcomes.

Qualities such as loyalty, self-control and cooperativeness can result from physical education under skillful guidance, but these things have to be taught just as arithmetic needs to be taught, and are not the natural accompaniment of the activities themselves. Joyous physical recreation has implications for mental health, in that there may be considerable relief from the tensions that are all too prevalent in the child's life today. Children who become skilled at games, sports and other forms of exercise find opportunity for self-expression in physical activity and at the same time gain a sense of achievement through good performance.

Vigorous, intelligently directed activity can aid in the development and maintenance of strength, speed, agility, endurance and skill, in children who are physiologically sound. Determination of the program and types of activities in terms of games, sports, swimming, rhythmics and prescribed activities can be made only after thorough health appraisal and recommendation by the physician.

Those who are carefully guided in their school physical education experiences should enter adult life with an appreciation of the needed balance between exercise, rest and relaxation.

At the present time there are over 300 colleges offering majors or minors in physical education, health education or combinations of the two. One accomplishment has been the increase in the length of these courses, along with those for other teachers, to four or five years. But curriculum patterns vary to a considerable degree, requirements are far from uniform, and faculty qualifications have not been standardized. In addition, certification standards for the teaching of physical and health education have not been fully developed. But these conditions are no more difficult than those which prevailed in medical education only a few decades ago. Vigorous professional action like that which cleared up the similar situation in medicine is obviously needed.

Problems of inadequate salaries and unsatisfactory teaching conditions further complicate the picture. We cannot expect the needed type of young people to enter the field until the compensation is somewhat commensurate with the training required. Genuine interest in the development of youngsters keeps many good teachers on the job but the economic insecurity they suffer is bound to materially lower their effectiveness.

The medical profession has made great strides in rooting out the quacks who attempt to foist

---

Read at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

unscientific methods, worthless devices and harmful remedies upon the people. Physical education has yet hardly begun the fight against the cultists who seek to invade its ranks. Muscle for muscle's sake theories, exercise prescribed through the mails, useless exercise appliances and "physical culturists" who have never heard of basic science may be wrongly identified with physical education by the public and so undermine the integrity of a developing profession.

Organized medicine has been largely successful in warding off public pressure for premature or ill-advised use of the spectacular. But education has often been unable to resist public demand for sports spectacles by the few at the expense of adequate physical education for the many. Properly administered spectator sports can have a wholesome place in education. The skilled performance of varsity groups should motivate wide participation by our youth on many types and calibers of teams. But an interscholastic sports program which stimulates "spectatoritis" among our boys and girls cannot be classed as educationally sound.

Over a century of socialization of the schools of America has not brought solutions to educational problems in rural areas. There are shortages of physicians in many rural districts but there are shortages of teachers in the same places. Just as better facilities and more adequate personnel for medical service are found in urban areas, so are the personnel and facilities for education.

Well-developed outdoor play areas, gymnasia, swimming pools and other equipment which are the laboratories and clinics of physical education are almost entirely lacking in the rural areas.

Neither the little red school house nor its counterpart in the hospital has been able to provide the conditions requisite to an educational program or medical care of the quality to be found in metropolitan regions. Recommendations of many groups indicate that at least a partial answer to this problem may come about through the consolidated school and the affiliated hospital.

In many rural situations, teachers who might be called general practitioners in education are directing instruction. At the elementary school level in the small schools, the teacher may handle her own physical education as well as all the other subjects. In the smaller high schools we have the P.E. and S. men; that is, the people who teach science, physical education and many other combinations. With adequate background, effective in-service education and helpful supervision, acceptable work may be done. But many practical difficulties stand in the way.

In Minnesota, for example, among about 1,100 men and women teaching physical education, some 300 had a major in the field and only about 130 had a minor. Another 130 were granted permission to teach part-time in physical education by reason of completion of a nine-quarter hour requirement. Over 550 had no certificate but 450 of these attended short-term regional fall training conferences and subsequently were granted permission to teach. Obviously the best prepared of these teachers will be found in the larger communities where teachers like doctors seem to find the opportunities greater, equipment and facilities more to their liking, and living conditions more attractive.

A program for interpretation of physical education to the public and to the home is badly needed. Rural parents may often believe that their children secure enough exercise doing the chores at home and therefore have no need of physical education in school. Nothing could be further from the truth. They often need it more than the city children do. While the country youngster ordinarlily gets plenty of exercise, he too frequently lacks the skill to play and work well with others. He is too often an example of poor co-ordination and awkwardness in the extreme. His posture and body mechanics are apt to be very poor, and his home program of exercise but rarely gives him a background to enjoyment of physical recreation activities.

Understanding physicians, parents and teachers are aware that the play life of children is just as important to growth and development as are work experience and academic learning. They also recognize the necessity for skillful guidance in these activities if their inherent values are to be realized. But many of the opportunities which have been accepted as the natural heritage of the city youngster have been denied to rural youth.

Some teachers and administrators are unsympathetic toward the school health and physical education program. Persons who are primarily academic in their thinking may not sense the tremendous educational possibilities that exist in the wholesome physical education activities which are so close to the heart of the child. The lip service that has been given to the health objective in education must be translated into action, and the real life experiences that are available utilized to their fullest extent.

Courses in teacher education institutions need to be re-evaluated and, when necessary, the offerings in physical education increased and reorganized so that elementary teachers will be prepared to teach physical education effectively under supervision.

In-service education programs, including institutes such as those which have been conducted in Minnesota, workshops, summer school courses and other devices to help teachers in service to become better qualified for instruction in physical education, should be developed.

Supervisors, co-ordinators or consultants in health and physical education need to be provided, especially in rural areas, to help teachers to plan and develop worthwhile programs.

At the secondary level people who can teach health and physical education in our rural high schools and assume responsibility for co-ordinating rural recreation programs can be prepared. This combination will make it possible for a rural community to procure a person with major training in the field. To go into the reasons for securing a specialist to do this important job is unnecessary.

The school program of physical education activities must be broad and varied and take into account the needs and capacities of individual pupils. Classification of pupils for activity as the result of a medical examination is a prerequisite to desirable physical education. There needs to be a program for girls and boys who are capable of enjoying a full schedule of activities, a modified plan for children whose exercise must be restricted, and prescribed corrective activities for those who will benefit from such a routine. The physician's advice in respect to the individual child's place in this program is vital to its success. Then there must be real teaching which places emphasis on individual needs.

Sufficient time for instruction and enough facilities, supplies and equipment to make possible an adequate program are essential. The class period in physical education needs to be regarded as a time for effective instruction and not as an occasion for undirected play. There should also be a chance to practice and enjoy the skills learned in the classes during leisure time. Informal games and a broad intramural sports program within the school, as well as competition against teams from other schools, can provide all students with such an opportunity.

All of this will cost money. So will better medical care, hospitals and public health services. There are ways of planning intelligently to get the most for our money but there is no way to provide the kind of educational program our children need without reasonable financial outlay. Physicians are familiar with the expenditures, present and needed, for medical care, hospitals and public health. It is interesting to note the parallels with educational investment.

At the present time in this country we are spending less than 2 per cent of our annual income on education. Great Britain is engaged in an educational program that will take between 6 and 7 per cent, and Russia is planning to use between 17 and 20 per cent of its national income for educational purposes. Each year in the United States we spend more for amusements, tobacco, liquor or cosmetics than we invest in the education of our youth.

The improvement of physical education in our rural schools cannot be isolated from the enrichment of education in general, and the betterment of public health, medical facilities and medical care. These things can be achieved only when all the professional and lay groups concerned plan and work together as a team. Through wholehearted participation on this team, the medical profession will place itself in a strategic position to provide leadership and guidance in the advancement of rural health and rural living conditions.

HOSPITAL FACILITIES FOR ALL

VIKTOR O. WILSON, M.D.
Chief, Section of Special Services, Minnesota Department of Health
Minneapolis, Minnesota

THE important health objective of reasonably adequate hospital facilities for all the people has become a realistic possibility with the enactment of the Hospital Survey and Construction Law. Under this Act the Congress has authorized an appropriation during each of five years of $75,000,000, or a total of $375,000,000, to assist in the building of needed hospitals and public health centers. Since the law provides that the Federal share shall constitute one-third of the cost and the non-Federal funds the other two-thirds, the law provides for a nation-wide hospital building program in the amount of $1,125,000,000.

Purpose of the Program

The essential purpose of the law is to provide Federal financial assistance to the states for the attainment of "the necessary physical facilities for furnishing adequate hospital, clinic, and similar services to all their people". This purpose is to be carried out through the following activities:

1. The determination of the hospital and public health center needs through state-wide surveys.
2. The development of a state-wide plan for the construction of facilities needed to supplement existing hospitals.
3. The construction of the facilities determined to be necessary and which conform with the construction program which is part of the approved state-wide plan.

The law provides for the construction of facilities for all kinds of patients and the types of hospitals which may be constructed under this program include general, tuberculosis, mental, chronic disease and other types of special hospitals but not those furnishing primarily domiciliary care. Hospital-related facilities including laboratories, out-patient departments, nurses' homes and teaching facilities may be constructed. The building of public health centers established for the provision of public health services authorized by state and local laws, including related facilities such as laboratories and administrative offices, also may be assisted under the law. The term "construction" as used in the law is defined to include the construction of new buildings, the expansion or remodeling of existing buildings, and the initial equipment of the constructed facility.

Administration of the Law

The Federal administration of this program is the responsibility of the Surgeon General of the United States Public Health Service in the Federal Security Agency. The Surgeon General issues regulations governing development and administration of state construction plans. The United States Public Health Service also prescribes minimum standards of construction and equipment of hospitals and assists through development of sample plans and the giving of expert advice on problems. The United States Public Health Service has the assistance of a Federal Hospital Council composed of eight members appointed by the Federal Security Administrator of whom four shall be outstanding authorities in the operation of hospitals and health activities and four members shall represent the consumers of hospital services and be familiar with the needs in urban or rural areas. The Federal Hospital Council has the responsibility of approving the Federal regulations governing the state plan for hospital services and the State Hospital Construction Program. The Council also serves as an appeal body for consideration of the approval of state plans and has advisory functions in the Federal administration of this program.

To qualify for the grant of Federal funds, a state must designate a single agency to conduct the state-wide survey and planning, and a single agency to administer the construction plan. One agency may serve for both functions which must be conducted in conformance with the requirements of the Federal law and regulations. The state agency must have the consultation of an advisory council which shall include "representatives of non-government groups and of state agencies concerned with the operation, construction or utilization of hospitals including representatives of the consumers of hospital services".

Presented at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

Surveys and Planning

The Act authorizes the appropriation of three million dollars to assist the states in surveying their needs for hospitals and related facilities and in the development of plans for the construction of needed additional hospitals and public health centers. Of this authorized amount, $1,791,000 has been appropriated. This fund will be allotted among the states on a population basis and shall be available to defray the cost of state functions only in the making of surveys and planning during the five-year period of the program. Within its allotment each state will receive Federal grants equaling one-third of its expenditure for these purposes. The remaining two-thirds of the survey and planning costs must be provided by the state.

This program has placed difficult responsibility on the state. Under the terms of the law and the Federal regulations, the planning must be concerned with the total number and general method for equitable distribution of hospitals. All categories of patients and all areas of the state must be considered and a plan made to meet the needs in a balanced and coordinated system of hospital service. Factors to be studied include the number and distribution of the population, travel and trade patterns and the physicians and nurses available to staff the proposed hospitals. Plans for construction must be guided by the financial resources available for construction and for maintenance and operation. The minimum functions involved in this work include an inventory of existing facilities, a survey to determine the need for additional hospitals, the development of a construction schedule and a priority system for the allocation of the Federal funds in the order of relative need for the individual project.

For the purposes of the Act facilities are considered to be adequate in the state if hospital beds are provided in the various categories according to the following ratios:

1. *General and Allied Special Hospitals*—4.5 beds per 1,000 population.
2. *Tuberculosis Hospitals*—2.5 beds per average annual death from tuberculosis.
3. *Mental Hospitals*—5 beds per 1,000 population.
4. *Chronic Disease Hospitals*—2 beds per 1,000 population.
5. *Public Health Centers*—1 bed per 1,000 population.

These allowances are for the state as a whole. Within the state the Federal requirements intend that general hospitals be planned on an area basis to provide a pattern for a co-ordinated hospital system. The *base area* with a large teaching hospital serves several *intermediate areas* having smaller general hospitals. Each of these in turn serves neighboring *rural areas* with smaller hospitals. The ratio of beds to population is graded according to the following standards:

Rural Areas—2.5 beds per 1,000 population
Intermediate Areas—4 beds per 1,000 population
Base Areas—4.5 beds per 1,000 population

The Construction Program

The $75,000,000 annual construction fund appropriation authorized by the Act for each of the five years is to be allocated to the states on the basis of factors of population and per capita income. This formula will give higher allotments per capita to low income states. Out of each $75,000,000 appropriated, the Minnesota allotment will be $1,655,175. Since one-third of the construction costs may be met from the Federal funds, there is a possible annual construction program in Minnesota in the amount of $4,965,525. The Congress has not actually appropriated construction funds, but late in its last session it did authorize the activation of the construction work during the fiscal year 1948 through contractual obligations for the Federal share in approved projects within the limitations of state allotments and the total of $75,000,000 for the country as a whole.

However, before a state may receive federal grants for construction purposes it must submit to and have approved by the United States Public Health Service a state plan for construction of needed hospitals which must conform to the described principles of planning. In addition the state plan must provide for the adoption of minimum standards of construction which shall not be less than the Federal requirements and establish the necessary administrative organization and methods. Also, the state must provide the funds to finance the administration.

Project applications may be received for consideration by the state agency only when this work is completed. When that time comes project applications are to be processed in the order of priority of need insofar as local funds are available for construction and operation of the hospital. In establishing priorities, consideration must be given to the relative need in the various categories of hospitals and, for general hospitals and public health centers, there shall be emphasis on rural areas and those with relatively small financial resources. Also, priority is to be given to new hospitals and additions to existing buildings, and projects of a size consistent with efficient and economical operation.

In addition to priority requirements the individual project must meet eligibility factors set forth in the Federal law and regulations. These factors which are designed to promote qualified community hospital service, are as follows:

1. The hospital is needed as shown in the state plan for hospital services.
2. Public or other non-profit ownership of the hospital, which means that no part of the net earnings of the constructed hospital may lawfully inure to the benefit of any private individual.
3. Assurance by the owner that hospital services will be provided in the community without discrimination on account of race, creed, or color.
4. Assurance by the owner that hospital services will be provided in reasonable amount to persons in the community unable to pay therefor.
5. Ability of the owner to finance two-thirds the cost of the construction.
6. Ability of the owner to finance the operation of the hospital for which evidence must be provided.
7. Ownership of a suitable site for the hospital.
8. Development of blue-print plans and specifications for construction of the proposed hospital by a registered architect in conformity with the state and Federal requirements.

Present Status in Minnesota

Under the provisions of existing statutes, the Governor of Minnesota designated the Minnesota Department of Health to conduct a Hospital Survey and Construction Program in cooperation with the United States Public Health Service. A State Advisory Council has been appointed and is functioning in a consultative capacity. An inventory of existing facilities has been conducted and this information is now being prepared for use. A study of total needs for hospitals is under way and it will require a number of months to complete this work and develop the construction schedule and priority system as well as make other preparations for administering the program in the state.

The inventory of existing facilities was conducted by the staff of the Minnesota Department of Health during the period extending from May, 1946, to April, 1947. Although the study of information collected in this survey is not yet completed, certain preliminary data are available. These data relate to the numbers, bed capacities and uses of the various types of institutions and certain conditions of staffing, equipment and physical conditions of these buildings. This information is presented in the series of nine tables included with this report.

TABLE I. NUMBER OF INSTITUTIONS AND NUMBER OF BEDS IN VARIOUS CATEGORIES

	Number of Institutions	Number of beds (complement)
General & Allied Specials	196	12,846
Maternity Homes	32	70
Serve Special Groups	17	706
Nervous & Mental	15	12,107
Tuberculosis & Preventoria	15	1,971
Chronic & Convalescent	128	2,839
Totals	403	30,539

Preliminary Information on Existing Hospitals

As shown in Table I, the inventory revealed 403 institutions with a total of 30,539 beds available for the care of the sick and injured and for obstetrical cases. Approximately five-sixths of these beds are about evenly divided between the general and allied special hospitals and the nervous and mental group. The allied special group is made up of the pediatric, contagious, cardiac, orthopedic and other specialized hospitals for which a separate listing was not prepared. The 1,971 beds in fifteen tuberculosis hospitals are considered quantitatively adequate for the needs of the state. The 128 institutions with 2,839 beds for the chronic and convalescent include a few hospitals and the relatively large number of nursing homes established for the care of these patients. There are only seventy beds in the disappearing maternity home, which is the 1 to 3 bed facility for normal maternity patients estab-

Totals	14,509	114

lished by a nurse in her own home in a community without hospital services. The seventeen institutions serving special groups include the infirmaries and hospitals of institutions such as schools, prisons, and reformatories.

The effect on bed capacities of this period of high hospital service demand is presented in Table II. The general hospitals provide more than 600 extra beds as shown by the difference between a complement of 12,194 available beds and the total normal capacity of 11,561 beds. While the hospitals have also set up extra bassinets for newborn infants, the difference between the complement and normal bassinet counts as shown in this table is due largely to the unusually high floor area standard used in this study for the determination of normal bassinet capacity.

It is interesting to note in Table III the relatively large number of small hospitals existing in Minnesota. Of 354 general and specialized hospitals, 191 institutions have bed capacities of twenty-four or less. This number includes ninety-five nursing homes in the chronic and convalescent category. However, of the 196 general and allied special hospitals, ninety-two have capacities of twenty-four beds or less and an additional forty-nine have capacities in the twenty-five to forty-nine bed group. Seven of the total of fifteen institutions for nervous and mental patients have forty-nine beds or less and six of the total of fifteen tuberculosis hospitals fall in the twenty-five to forty-nine bed capacity group.

Closely related to the large number of small hospitals is the surprising number of institutions reporting a relatively low percentage of occupancy during the report year of the study. Of 193 general and specialized hospitals giving this information, sixty-two reported an occupancy of less than 60 per cent. In the small hospital this is due to the uneven flow of the number of daily admissions and to the inflexibility of accommodations for care of various diseases and the variation of patients as to sex and age. Therefore, the information reported in Table IV does not indicate a surplus of hospital beds.

The data on hospital personnel by departments as reported by 188 general and allied special hospitals are summarized in Table V. These hospitals with a bed complement of 12,760 available beds reported a total of 14,509 personnel. This is a ratio of 114 workers per 100 beds. While hospitals having nursing schools and other teaching programs will have a higher ratio, which may approach two staff members per bed, it is significant that the average Minnesota hospital employs workers in a number more than equal to its bed capacity.

TABLE VII. NUMBER OF HOSPITALS IN CATEGORIES GROUPED BY YEAR OF CONSTRUCTION OF MAJOR BUILDING

	Number of Hospitals	1909 & before	1910-1919	1920-1939	1940 & after
Gen'l. & Allied Specials	184	36	54	74	20
Nervous & Mental	15	10	2	3	—
Tbc. & Preventoria	15	—	10	5	—
Totals	214	46	66	82	20

The number of hospitals in various categories without x-ray and laboratory facilities in the building is presented in Table VI. Twenty-four general and allied special hospitals do not have x-ray equipment and fifty-seven of this group are without laboratory facilities. This preliminary study does not attempt to analyze the extent of the equipment or service provided in the hospitals which do have the facilities. Thirty-two of these hospitals have the benefit of use of x-ray equipment and laboratory facilities in physicians' offices in the same building.

TABLE VIII. NUMBER OF HOSPITALS IN CATEGORIES DISTRIBUTED BY TWO CONSTRUCTION FEATURES

	Fire Resistive Construction		Built as Hospital	
	Yes	No	Yes	No

Chronic & Convalescent	8	120	18	110
Totals	100	254	184	170

TABLE IX. CONTEMPLATED HOSPITAL BUILDING PROJECTS IN MINNESOTA

June 1, 1947

	New Hospitals	Replacements	Additions	Remodeling	Total
Gen'l & Allied Spcl.	61	38	58*	18	175
Nervous & Mental			9		9
Tbc. & Preventoria			3*		3
Chronic & Convales.			5**		5
Totals	61	38	75	18	192

*Includes two nurses' homes
**Includes three planned in conjunction with general hospitals

Certain major features of the physical condition of Minnesota hospitals are presented in Tables VII and VIII. In forty-six of 214 general and allied special, nervous and mental and tuberculosis hospitals, the major building is thirty-seven or more years old and another sixty-six are twenty-seven or more years old. Of the total group of 354 general and specialized hospitals, including those for chronic and convalescent patients, more than three-fifths are not of fire-resistive construction and nearly one-half were not built as a hospital. These figures are influenced by the relatively large number of nursing homes established in dwelling-type buildings. However, only eighty-one of 196 general and allied special hospitals are classified as of fire-resistive construction. Also, 50 per cent of these institutions were not built as a hospital.

Information available to the Minnesota Department of Health on June 1, 1947, indicated a total of 192 contemplated hospital projects in this state. As shown in Table IX, these include sixty-one new hospitals, thirty-eight replacements, seventy-five additions to existing hospitals and eighteen remodeling projects with the majority of the planning in the general hospital category. This information covers all sizes of institutions in the various categories as well as all proposed construction projects irregardless of the stage of development. A number of these hospitals are under construction. This information indicates a state-wide interest in hospital construction which gives the hope for the needed effort and funds to provide the improvements and new hospitals which will give reasonably adequate hospital facilities for all.

RURAL MEDICAL SERVICE

FRANK J. HIRSCHBOECK, M.D.
Duluth, Minnesota

AS one reads current periodicals and newspapers, one might gain the impression that the physicians of this country are in league to debar the American public from adequate medical treatment. Much passion and prejudice is evinced, and the onus of inequality of service is placed on one profession without regard for a sane and dispassionate discussion of all the factors involved. To the credit of the various rural agencies and the participants in the conferences on rural health held under the auspices of the American Medical Association, one is, on the other hand, impressed by the fair-mindedness of nearly everyone in attendance at these meetings. It is evident that so great a problem will require considerable survey and analysis before satisfactory results may be obtained, and I feel it a definite responsibility to bring this matter before you for your consideration and review.

At the present time, I believe it cannot be gainsaid that the type of medical service provided in the United States of America is superior to that of any other country in the world, but it is also admissible that there is, nevertheless, opportunity for improvement. In a prefatory way, it should be stated that physicians, in a large measure, are in full sympathy with any program tending to foster better medical care in rural areas. The need is existent and recognized; the methods of correction must be explored. Critical statements that the AMA seeks to keep the number of medical students at a selfish low level can be refuted by the dean of any medical school, as has been indicated in the words of Dr. Diehl of the University of Minnesota. The problems of medical education and its significance for medical practice are manifold, and it should be remembered that certain obstructive elements, as inadequate educational facilities, lack of teachers, inadequate laboratories in many instances, and insufficient internships, all play a part. An argument for accelerated programs in the schools may be met by the contradiction that such programs are not to the best advantage of the student nor the public, and may prevent participation by worthy students who may be obliged to work for much of their education.

In the *Saturday Evening Post* of May 17, 1947, an article by Albert Q. Maisel entitled SO YOU CAN'T GET A DOCTOR accuses the AMA and the medical schools of the country of practicing a cut-back program favoring a deficit of physicians. He cites Dr. Victor Johnson, of the AMA staff, appearing before the Senate Committee on Military Affairs, where it was stated that the postwar years would require 35,000 additional physicians to permit an adequate supply, and that of 40,000 graduates in six years, 24,000 would be replacements for deceased physicians, allowing only 16,000 to provide for the necessary 35,000. This statement is true insofar as it relates to this specific factor, but the interplay of other elements is not quoted.

There is little doubt that medical service was inadequate during the war years and that adequate medical care was not available to all our citizens. On the other hand, everyone recognizes the inevitable dislocation in all channels of life in the greatest cataclysmic upheaval of all time. It is admitted, I believe, that the armed forces in enrolling 60,000 physicians, or about 45 per cent of all those in practice, took more physicians from civilian practice than may have been necessary, but few of us would quarrel with the exigencies entailed in a struggle for national survival. In many areas where only a few physicians were in practice, the enlistment of some caused medical hardship on the citizenry, but the Committee of Procurement and Assignment, of the American Medical Association, performed a difficult duty with remarkable foresight and success, though frustrated no doubt in many instances by voluntary enlistment on the part of patriotic physicians without due regard for area needs, which unbalanced the per capita alignment.

In his presidential address at Atlantic City, President Bortz of the AMA pointed out that the medical branches of the armed forces have been separating medical men from the services as rapidly as safety permitted, liberating many for the resumption of practice.

From the Department of Internal Medicine, the Duluth Clinic, Duluth, Minnesota.

Read at the Rural Health Conference at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

Many medical veterans, having noted certain advantages of the type of practice in the army hospitals, particularly with reference to specialization, have been imbued with the apparent advantages of specialization in practice, and on discharge have sought residencies and fellowships to further a program for ultimate certification by the specialty boards. Others, planning on returning to general practice, and aided by Federal subsidies, have undertaken graduate training to prepare them more fully for a return to general practice, recognizing the fact that many aspects of military experience were also conducive to professional stagnation through limitation to certain types of medicine, notably among healthy males between the ages of eighteen and forty. Twenty thousand physicians, it is said, who have availed themselves of such graduate training, will in the next few years be searching for a location. A large number of recent graduates have also been inducted in the Army, Navy and Air Forces, a practice which may or may not, depending on national emergency, be abandoned in a year or two, further allowing young men to select a site for practice.

The proper civil reallocation of such personnel is an immediate and urgent problem, to which the various state committees should apply themselves.

Unfortunately, partisan expression on both sides of any problem often leads to discord that defeats the ultimate purpose in view. Proponents of a greater supply of physicians lose sight of the fact that an oversupply of doctors may lead to professional stagnation because of lack of work and opportunity, and those who believe in a restricted number of graduates are not aware of the many needs in the rural areas which involve definite social and economic wants. However, it would seem that, in the present state of international relationships and the need of an adequate medical corps, additional increments of medical men and women are needed, and the medical colleges should be, and we trust are, aware of it. A large army, in peace or at war, will by necessity remove many available men from practice, and the additional 10,000 doctors graduated during the war years by the accelerated program are not enough to make up the deficit. During the war, the medical colleges were free to admit that there was an insufficient supply of physicians. Now that a semiemergency still exists the need cannot have been completely eliminated, a fact which I am glad to say our state university has recognized by permitting an increase in enrollment. It is to be remembered also that there was not only a dearth of physicians but, because of the dislocations of warfare, there was a dearth of personnel in virtually every field of human endeavor. Postwar adjustments will correct many of these problems.

Much has been said about the unequal distribution of doctors in urban and rural areas. Broadly speaking, and in a general way, there is much in favor of the view that physicians tend to gravitate to the more metropolitan areas. In years when there is a relative deficiency in the total number of physicians, such a migration is likely, but many of the estimates given in current popular articles need a more critical review. As Dr. Dickinson has indicated recently, state and county boundaries should not be used in considering the supply of doctors because medical service, in a great measure, bears no relation to governmental boundaries. It is closely akin to trading areas and extends beyond county or even state lines.

Before the war, the per capita distribution of doctors in rural areas was 1:1,700 and in cities 1:650. A ratio of 1:1,500 is, I believe, considered desirable. In rural areas the available hospital beds were 2 per 1,000 instead of 3.5 or 4, usually considered adequate in a community. The per capita difference in cities and rural areas is due to several factors aside from mere choice of location. Cognizance must be taken of the fact that the cities are not overwhelmingly supplied with physicians, since many city physicians are specialists. In Duluth, for example, nearly 50 per cent are specialists who tend to attract patients from more remote communities. Many specialists in the cities likewise are not related intimately to family practice and are engaged in special types of work such as public health, roentgenology, pathology, research work and teaching. On the other hand, many men who are specialists perform some elements of general practice, leading to dilution of practice among the general practitioners, and the law of supply and demand, as in other occupations, tends to prevent oversaturation. Nevertheless, I think it is evident that until saturation occurs in the metropolitan areas, rural areas will find it difficult to maintain an optimal supply of medical personnel.

In his article, Maisel writes of certain states and counties having a sad dearth of physicians but doesn't discuss any of the qualifying elements which must prevail in such localities, because physicians, like everyone else, tend to locate in areas where their services are likely to be needed and where they are likely to receive adequate compensation for their efforts. I do not know the situation in the counties in Florida, Virginia and South Dakota, in which he states there is great lack of medical care, but I do know something of our own state as an index. In a recent letter to the American Medical Association Bureau of Information, Mr. Rosell, the executive secretary of the Minnesota State Medical Association, stated our situation as follows:

> "As to physicians' distribution, Minnesota is quite well provided for, as far as medical service is concerned. There are no areas in the state at the present time where physician needs are distressing. In most areas there are physicians within a radius of twenty miles, and there are no areas at present where one must travel much farther for medical service. At the present time, there are 1,000 physicians, mostly returned medical officers, who are training in Minnesota, i.e., doing graduate work or taking continuation courses, residencies or fellowships. These men will be released beginning July 1 and for the next two years. We presume that at least 50 per cent of these men will remain in this state and will meet whatever urgent demands there are for more physicians."

Seven counties in our state have less than one physician per 3,000 people, using the per capita rate as an example, mostly in the northwestern part of the state where five or six good clinical centers exist which may tend to reduce the practice of local physicians. Mr. Rosell reports that the Minnesota State Medical Association has had twenty requests for general practitioners in the state of Minnesota, eleven of which have come from areas of less than 500 inhabitants and some of which, according to personal information received, have no need of a physician in the area as they are well supplied as a community.

Though the problem may not be so acute in Minnesota, and will very likely be less so in a few years, it would be provincial to deny that medical facilities are not always easily attainable in other states, particularly in the West and South. Areas where there is a sparseness in population, or lack of contact with other physicians and medical centers, as is the case in many regions in the northwest, central and Rocky Mountain states, would almost of necessity have less attraction as a choice of location for doctors. These states also have proportionately fewer medical schools to supply needed physicians in the areas. There are only five medical schools in the vast area of the western plain and Rocky Mountain states. It is well known that graduates from medical schools tend to locate largely in areas contiguous to their alma mater. Also it would seem that there should be more opportunity for the medical education of negroes, particularly for the South, where they are an important part of the population.

Every well-meaning student of the problem must realize that the difficulty in providing suitable medical care in rural areas evolves not only upon the dearth of physicians but upon local factors as well. It is stimulating to note the efforts that are being made in various states to find ways and means of solving the problem of proper medical care, which can be done only by a consideration of all factors concerned.

Mr. Goss of the National Grange has offered several fundamental statements indicating the need of community programs, and one cannot find fault with his conclusions. He points out the need of additional physicians and hospital beds in many of our rural communities. It is also stressed that, though conditions have improved among farmers in regard to income in recent years, financial necessity still precludes the farmers' paying as much for medical service as other classes of workers and, in many cases, often where there is a sparseness of population and a lack of good arable land, it is relatively impossible. Conceivably there may be a few areas where adequate medical care may be impossible also, because of local conditions. To apply general rules to all areas to conform with the needs of such isolated instances would be unsound economics.

Mr. Goss also points out the need of better health measures in rural communities, based on the increased accident rate among farm workers, the increased infant and maternal mortality rate, and the rejection of 41 per cent of farm boys in the Selective Service as compared to 25 per cent in urban areas, purely on physical defects. Wherever the fault may lie, these figures at least indicate that the preservation of health and life is better maintained in urban areas, but rural communities, as has been stated by many, today need more than doctors in order to solve their problems. The latter are social and economic, as well as professional. In order to improve his skill and supply stimulus for good work, the physician would choose to live in a community where good housing facilities, good social and educational relationships, good health education, good sanitation, modern living advantages, adequate laboratory and x-ray facilities, hospital and consultation advantages are available. Otherwise he would serve poorly. These advantages are available in many rural areas and towns, but it is in the smaller and more isolated communities where the lack of adequate medical facilities is encountered.

Each community must survey its own problem by a communion of advisory talent, i.e., by health councils as advocated by Rural Medical Service Committees, which should include local representatives, financial advisors, physicians, health authorities, hospital administrators, medical society representatives of the county and state, nurses and dentists. This is quite in contrast to a recent health workshop where twenty-one consultants were called in, nineteen of whom were Federal and two state employes!

In isolated areas, where few towns are situated, the problem of individual care may be difficult and even impossible of solution. This is apparent to any of us. Physicians might be induced to locate in such a community if a subsidy were provided, but this would still not answer the need for professional contact with other doctors, with diagnostic centers and hospital facilities. At best, such physicians could render only relatively inadequate medical service.

Probably too much has been said about the doctors and not enough thought given to their wives and children, who are, as members of a professional group, more critical of social inadequacies. Also in such areas public health and first aid services would be of help, as they have proved in urban areas. To facilitate better care in such outlying and sparsely settled districts, good roads are essential and satisfactory transportation facilities of great importance. It is frequently more important to bring the patient to the doctor in an organized hospital than to try to bring a doctor to the patient. Ambulance service could be on a wide community basis and staffed by someone skilled in first aid. More seriously sick and injured patients requiring ambulance service usually need the type of treatment only a hospital can supply. After the initial outlay, the cost of maintenance should be relatively small.

The construction of rural health centers, as advance stations in medical care, is desirable. They are as necessary to a community as schools. They would be of educational and therapeutic value.

In some areas on the borderline of economic balance, physicians might be supplied with office space and equipped with an available bed for temporary but necessary care and observation, pending further disposition. A method of partial subsidy might be invoked.

In such locations, if physician service is to be maintained, the physicians must be patronized. In many areas, sick people tend to by-pass their own community physicians and go to doctors in a more remote location, and physicians in smaller towns frequently complain of a lack of loyalty among their clientele. I think this may be illustrated by again referring to the six counties in the northwestern part of the state where there is a low per capita rate of physicians and where it is likely that patients tend to go to the trading areas where clinics exist for their medical care. I think this must be an important factor in this region in view of its noted fertility and financial competence.

Many areas need better hospital service, and, on the other hand, many are well supplied. When the Hill-Burton Act begins to function it is going to be difficult to separate the communities which have adequate hospital service, sometimes privately owned, from those where it is felt that such service may not be adequate. It is certain that only an impartial, unprejudiced analysis for allocation of any funds derived from the Act will be satisfactory. Such an analysis will have to consider state needs, county needs, local needs, transportation facilities, opportunities for consultation and study by the physician, availability of certain specialists and financial responsibility. Dr. Buerke, at the National Conference, stated that the operation of a hospital entails a yearly maintenance cost approximating one-third of the original outlay. This money will have to be forthcoming from hospital operation and/or local taxation because niggardly administration in the operation of a hospital cannot be countenanced. Local responsibilities, as can be seen, are indeed heavy.

The other necessity to any arrangement is a sufficient supply of medical personnel. Let us admit that more doctors are needed for the care of our rural population. I believe that strongly, especially in this period of semiemergency. The medical colleges, as for example the University of Minnesota, should graduate more students, at least for the present. Control may be practiced later if necessary. Students should be selected from the more isolated areas in greater numbers than is the case at present. Where possible, colleges supplying the South and mountain and plain states should be enlarged, and more applicants for medical education accepted from such areas, in the hope they will return to their native state. It has been suggested that some rural areas might be wise to enter a contractual relationship with local students of promise to enable them to study medicine with the provision that they locate in certain towns. From time to time, replacements could be made by more recent graduates working on a similar plan.

I think it would be expedient to consider requirements for placing recent graduates in general practice for three years or so before obtaining residencies. The objection would be raised that men who have an aptitude for research and teaching would be wasting valuable years in such work, but a system of scholarship reward could be made available to obviate insistence on this requirement in their cases. It might, however, be pointed out that even many research men and teachers might profit by contact with actual practice, and there is no doubt in my mind that specialists, who are not teachers or research men, could profit by experience in general practice. The opportunity for reaping the many admitted benefits of small town practice might offset the desire for specialization. Specialty boards could allow certain credits for such experience, as was done in the case of military service. There is also an advantage possibly in creating a residency for men who might choose to specialize in general practice, if one may be permitted to use a Celticism.

It is felt that there are too many specialists being trained. This is probably currently true because of the demand of the returned medical veterans, who have been led toward specialties because of the financial and ranking emoluments incident to their service. Medical men are professionally ambitious and tend to seek the professional glamor of specialism, a will-o'-the-wisp which is not always realized. Dr. Weaver, in his recent report before the Committee of University Relations, stated, however, that there is a trend toward favoring general practice in recent classes. Up to 1946, 80 per cent of the students indicated a preference for specialization, but in the present class, only 50 per cent indicated such a desire. I believe that if medical students were taught the many undeniable advantages of practice in smaller communities they would be prompted to choose such locations more frequently. Discussions by men in rural practice before the undergraduates would be helpful and influential.

In rural areas, on the other hand, where hospitals are located with care, specialists' consultations should be made available to general practitioners. These hospitals should be uniformly open to all general practitioners, but certain limitations according to the capacity should be placed on staff members for the benefit of the public. Like any other professional group, the administration personnel should be specially trained, and schools are now available for this purpose. Such administrators are most competent to help in the selection of material for the physical operation of the hospital, including medical equipment. Physicians who locate in smaller communities should have an opportunity for graduate work and refresher courses, because the lack of such facilities would not be to the advantage of either the medical man or the people who employ him.

Since the cost of medical care is an important problem, a summary of projected plans might be considered. By and large, feeling among doctors and among most consumers is that the method of payment by government taxation to supply the costs is not suited to American methods. It would be platitudinous and out of place in this discussion to enumerate the various ethical, economic and social reasons which impel doctors to be out of sympathy with such a plan involving a huge bureaucratic control, enormous outlay of funds out of proportion to need therefor, or the results obtainable, and the degradation of professional standards affecting all the phases of practice.

Nor are doctors kindly disposed toward the belief that consumer control on a prepayment basis is a satisfactory method, as it is felt that good medical care can only exist with the profession unhampered by restriction imposed on them by lay people whose viewpoint is necessarily based on economic consideration rather than on professional standards.

This leaves for evaluation, then, methods of prepayment which will permit of free choice of physician and leave the methods of ethical practice in the hands of those who, by tradition and training, are best able to judge of the safest method of practice for the common good. Methods of prepaid medical care have been in existence for over sixty years. The more recent impetus supplied by the Blue Cross Hospital Plan, with its tremendously successful program, has brought forward the question of a plan to supply medical care as well, at a rate commensurate with the schedule of the Blue Cross. The additional farm income of recent years has made it possible to foster ideas, in this respect, for the rural communities. Physicians in most states, including Minnesota, have developed similar plans which already are or will soon be functioning.

Since each state, or even community, has different problems, some flexibility in application will be necessary. The potential subscribers need to be instructed in regard to the insurance plans to assure popular acceptance. This is a necessity for its satisfactory operation. Such an organ already exists through the agency of the Blue Cross, which in this state has been employed as sales agents for this program. To work effectively, it needs extensive support, both in the urban and rural areas, so that the two zones may counterbalance each other in regard to various differences which may arise.

Low-income groups may have to be supported by the tax structure. The plan being launched in this state has been displayed at this meeting and it is hoped that you have acquainted yourself with the details of its operation.

As the popularity of the program expands, the benefits and costs will have to be changed to meet the situation. One of the chief difficulties will be the production of a wide sale of policies throughout the state so as to allow good actuarial appraisal and satisfactory operation. It is certainly as important to insure for health as it is to insure against financial loss from fire, automobile accident or crop failure.

In summary, therefore, I wish to point out that the problem of rural service is not one that is restricted to the community nor to the medical profession, but it is one which requires a most careful survey of each community and its needs. Scarcities in one community may not apply to another, and conclusions based on individual and specific interpretations of factors may be delusive.

The medical profession has certain responsibilities, and administrative agencies, like the AMA, medical colleges and the American Hospital Association, have a great responsibility. On the other hand, there is an equal responsibility which is local. It seems to me that at this time the local responsibility is actually the more difficult problem to surmount.

A SOUND PUBLIC HEALTH PROGRAM

(Continued from Page 1053)

for the common benefit of all, including as powerful associates, labor, co-operatives, management, the press, the churches and the schools.

Let me repeat that the purpose of a sound local public health program is such social action as will bring the richest values and longest enjoyment of life which the inherited qualities of each of us makes possible.

Local government is the instrument created by a free and representative democracy to make possible effective social progress which will be best measured by the health status of our people.

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from September issue)

Walter Earl Richardson was born on July 15, 1872, at Elgin, Minnesota, son of Joseph Richardson and Ursula Miles Richardson, "Yankee farmers," both natives of Vermont, who in 1858 had come as pioneer settlers to Wabasha County, Minnesota. Of the seven children of Mr. and Mrs. Joseph Richardson there were living in 1943 Walter E. Richardson, M.D., of Rushford, and Frank, Lenora (Mrs. Filkins) and Clara (Mrs. Ellsbury), all of Elgin, Minnesota.

After completing his preliminary education in the schools of Elgin and by extension work from business and normal schools, Walter E. Richardson studied medicine in 1892 and 1893 under the preceptorship of Dr. Franklin Staples and Dr. Edward D. Keyes, of Winona, in preparation for enrolling at Rush Medical College in Chicago. On his graduation from Rush in 1896 Dr. Richardson began to follow his profession in Preston, Fillmore County. He was licensed in Minnesota by examination on June 22, 1899, and in 1900 he moved from Preston to Slayton, in Murray County, where for nineteen years he conducted his own hospital and carried on a general medical and surgical practice; from 1919 to 1931 he was in Pipestone, in Pipestone County, and from 1931 to 1938 at Philip, South Dakota. In 1938 Dr. Richardson returned to Minnesota, to settle in Rushford, Fillmore County.

Always especially interested in ophthalmology, otology, rhinology and laryngology, Dr. Richardson in 1912 took postgraduate work in these special fields at the Chicago Policlinic and at the Chicago Eye, Ear, Nose and Throat College and Hospital in 1918. In Rushford, with offices in his residence and with the facilities of the Winona General Hospital available to him, he has been in general practice, placing special emphasis on the diagnosis and treatment of diseases of the eye, ear, nose and throat.

During World War I Dr. Richardson was a captain in the Medical Corps of the United States Army, attached to Base Hospital No. 99, American Expeditionary Forces. He is a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State Medical Association and the American Medical Association, attends the Presbyterian Church and is a member of all Masonic bodies. When questioned as to his favorite hobby, Dr. Richardson wrote, "My family."

Walter E. Richardson was married on June 18, 1902, to Fatima Whitney, of Slayton, Minnesota. The four children of Dr. and Mrs. Richardson are

Ursula (Mrs. F. C. Eustis, of Williams Bay, Wisconsin); Walter Whitney, a high school superintendent at Jeffers, Minnesota; William H., formerly a high school instructor, now with the American Red Cross; and Robert J. Richardson, M.D., who in 1939 on his graduation from the Medical School of the University of Minnesota, joined his father in practice at Rushford. Since the beginning of World War II Dr. R. J. Richardson has been in the Medical Corps of the United States Army; in August, 1941, he received his commission as lieutenant and thereafter he took training at Carlisle, Pennsylvania; in September, 1942, he was promoted to captain at Fort Leonard Wood, Missouri.

Calvin Hubbard Robbins was born in St. Lawrence County, New York, on December 20, 1840, the son of Marcus Robbins and Fanny Hubbard Robbins, American citizens of English descent. Marcus Robbins, a native of Wadsborough, Vermont, was a farmer and dealer in real estate and at different times he served as postmaster at Massena, New York, and as customs clerk at Ogdensburg; his grandfather was Dr. Marcus Robbins, of Brattleboro, Vermont, and one of his earlier forebears was George Read, a signer of the Declaration of Independence. Fanny Hubbard was born at Massena, New York, and became a teacher; she was a descendant of Theophilus Eaton, the first governor of Connecticut. Mr. and Mrs. Marcus Robbins were the parents of five children: Marcus, Frederick, Herbert, Hortense and Calvin.

In 1859 Marcus and Fanny Robbins came with their children to southern Minnesota, to settle in Fillmore Township of Fillmore County. Their son Calvin, who had begun his education in the public schools of Norfolk, New York, continued his studies at Fillmore and Chatfield, completing the available courses, and for a year or two after finishing his academic schooling he taught in the rural schools of the community before entering on three years of medical study in the office of Dr. Luke Miller, of Chatfield.

Calvin Robbins' medical study was interrupted by his enlistment in the Fifth Minnesota Volunteer Regiment for service in the Civil War. There exist two handwritten memoranda over the signature of Oscar Malmros, Adjutant General during the administration of Governor Alexander Ramsey, of which the first, dated at the Adjutant General's Office, Saint Paul, on October 15, 1863, notified Calvin H. Robbins as follows: "The Governor having appointed you Lieutent-Colonel [sic] of the 5th Reg. M. S. M. your Commission will be countersigned and immediately forwarded upon your subscribing the enclosed oath of office, and filing the same in this office." The second memorandum, Special Orders No. 135, dated on October 29, 1863, read thus: "The resignation of First Lieutenant [sic; no doubt correct] Calvin H. Robbins the 5th Reg. M. S. M. is accepted to enable him to accept a field office in the Regiment, said resignation to take effect from the 26th day of October, 1863." As it happened, he was taken ill en route to join his regiment and was released from military duty, his certificate of release being signed by Dr. W. W. Mayo, of Rochester, surgeon on the Board of Enrollment of the First Congressional District of Minnesota.

In October, 1864, within a year of his release from the army, Calvin Robbins enrolled at the Medical School of the University of Michigan, in Ann Arbor; in November of 1865, however, he transferred from Ann Arbor to the Medical College of Keokuk (Iowa), sometimes, as early as 1884, designated "The Medical Department of the University of Iowa," from which he was graduated in 1866. Long afterward, there was found among his effects a copy of the twenty-third annual announcement of Rush Medical College, for 1865-1866, perhaps evidence that he had considered matriculation at that school in his final year. At Keokuk his preceptor was Professor E. J. Gillett, M.D., D.D.; the title of his final thesis was "Acute Rheumatism." At that time, in some of the medical schools, and the Medical College of Keokuk was one of them, the faculty determined by vote which students should be graduated, the decision being based partly on the students' scholastic records. Only two in Dr. Robbins' class received more votes than he, and they were men who had had five years of combined training and actual medical practice when they entered the college.

In the year of his graduation, 1866, Dr. Robbins began the practice of medicine in the village of Fillmore and became a charter member of the Fillmore County Medical Society, which was organized in October of that year. In November of the same year he was married to Rosalia R. Mosher, a teacher, formerly of Canton, New York. In Fillmore Village Dr. and Mrs. Robbins made their home for the ensuing nine years. Their five children, all natives of Fillmore County, were Hortense R., Marcus P., Fanny E., Gertrude A., and Calvin Eaton.

Although surgery was his preferred field, Dr. Robbins' practice was necessarily general. In 1870 his professional card in *Western Progress*, published in Spring Valley, announced him as physician and surgeon. And that he endorsed vaccination against smallpox is evident from a Fillmore news item in the same newspaper in March, 1873: "We had a little flurry about smallpox a few days ago, but we guess the danger is past. 'Call' [sic] has been around jabbing his knife into folks generally." Of his activities, professional and nonprofessional, an extract from his diary of 1874 gives various testimony:[*]

Jan. 17	Operated for cancer on ————————.
Feb. 9	Gave chloroform to ———————— for Kellogg.[**]
Feb. 23	Subscribed for Harper's Magazine.
Mar. 2	Started the supervisor's report in the evening.
Mar. 10	Attended election. Got 108 votes to D. H. Hoff's 44 for chairman Board of County Commissioners.
April 7	Bought 4½ cords of wood of Marve Eggleston @ $3.25 a cord.
April 9	Got 20 bushels of oats @ $.40=8.00. The boys went after horse thieves in the evening.
April 14	Went to ————————'s to attend his wife. *Head* and *arm presentation.* Everything all right.
April 24	Received $3.00 from town for fees as supervisor.
April 26	Got ½ pint of *Female tonic* for ————————'s wife (at Wykoff).
May 21	Met Dr. Ross [John A. Ross, of Preston] at ————————'s and performed a craniotomy on child to deliver the woman.
June 2	Met on town board to view the bridge. Resolved to build a new one.
June 12	Met on town board. Gave job to build bridge to H. B. Stewart for $174.
June 23	Went to Spring Valley and bought P. O. order for the New York Sun.

In 1875 Dr. Robbins moved from Fillmore to Wykoff, a larger village a few miles north in the same township, on the railroad and then in the period of its greatest prosperity, and there in the next twenty years his interests of all types continued to widen. In Wykoff he owned his home, as he always did wherever he lived, and in addition to his practice operated a drugstore; in later years he was certified as a registered pharmacist. After 1878, when Dr. James H. Phillips settled in the village, Dr. Robbins took the younger man into partnership with him in the drug store and in general practice, an association which continued until Dr. Phillips removed to Preston in the early eighties.

---

[*] The names of patients have been deleted by the writer.

[**] Evidence has not been found that a Dr. Kellogg resided in the county. This perhaps was Dr. D. W. Kellogg, surgeon-dentist of Decorah, Iowa, who at intervals made professional trips to Preston and other points in the county; "all work done in the most skillful and artistic manner."

In 1871, while in Fillmore, Dr. Robbins had become a member of the Minnesota State Medical Society; in 1874 he was one of the seventeen physicians in the state who responded to the request of the Committee on Practical Medicine regarding the effect of the climate of the Northwest on asthma, and he "reported two cases not affected by ten years' residence." In succeeding years he was appointed a member of the Committee on Finance in 1879, and of the Committee on Obstetrics in 1883. After the passage of the act of 1883 to regulate medical practice in the state, Dr. Robbins received certificate No. 550 (R) given on December 31, 1884. And also during the period of the eighties (1886 and later) he was a member, with Dr. J. H. Phillips and Dr. G. A. Love, of the board of examining surgeons for the Bureau of Pensions of Fillmore County.

A good citizen, friendly and well-disposed, he served the community in various civil capacities. Politically he was at first a Democrat-Republican, but later became a staunch Republican and as such, on one occasion, served as chairman of the Fillmore County Republican Convention. In the early seventies he was a member of the Board of County Commissioners and of the "town board." In 1876 he was elected a representative from his district to the state legislature. He was a member of the Methodist Church and of several fraternal organizations, among them the Masons (A. F. and A. M.), Independent Order of Odd Fellows and the Benevolent and Protective Order of Elks.

In those years of long country drives Dr. Robbins owned a number of horses in which he took great pride, blooded Morgans, superior lightweight American-bred animals that were noted for their speed and endurance on the road. The ability to drive widely through the countryside not only extended his professional interests but also furthered his most absorbing avocation, the study of geology, especially paleontology. In a territory that has been well called a geologist's paradise, he was enabled to observe interesting formations and to collect fossils, and so intelligent was his research that in the nineties it brought his name into the section on paleontology of the official geological and natural history survey of Minnesota, conducted by the University of Minnesota. When Newton H. Winchell, State Geologist, and his colaborers, Wilbur H. Scofield, Edward O. Ulrich, John M. Clarke and Charles Schuchert, in carrying on the survey of the lower Silurian deposits of the Upper Mississippi Province, were in the locality of Wykoff, they received unfailing courtesy and much practical help from Dr. Robbins. From his private collection he lent them rare and unsurpassed specimens of various fossil Crustacea, and in his honor they gave the name *Platymetopus robbinsi* to a genus of trilobite found in the middle beds of Galena limestone and the name *Trochonema (Eunema) robbinsi* to a genus of gastropod discovered in the Fusispera bed, both sites near Wykoff. Mr. Schuchert, furthermore, in the spring of 1892 took some of Dr. Robbins' collection east with him for the Peabody Museum of Yale University. Many of Dr. Robbins' rare specimens are now in the possession of his grandson, Richard Robbins Crandall, of La Canada, California, a geologist and an alumnus of Leland Stanford University.

In 1895, temporarily discontinuing the practice of medicine, Dr. Robbins moved to Spencer, Iowa, where for two years he owned and managed the *Spencer Reporter,* taking especial pleasure in writing political articles for publication in that paper. By 1898 he had left the newspaper field and had settled in Austin, Mower County, where he again successfully followed his profession of medicine and where he was known as "a gentle and courteous physician of the old school."

Dr. Robbins died in Austin on February 28, 1900, from angina pectoris. His brother Marcus, of Grants Pass, Oregon, and his sister Hortense (Mrs. McKinney), of Chicago, had died previously; his brothers, Herbert, of Oakland, and Frederick, of Pomona, California, lived more than thirty years after him. Mrs. Robbins survived nearly forty years; she died on July 19, 1939, at the home of her daughter, Mrs. S. C. Schmitt, of Los Angeles. In 1943 two of the five children were living: Fanny, wife of Dr. Samuel C. Schmitt, of Los Angeles (Fanny Robinson Schmitt died on September 21, 1943); and Calvin Eaton, a salesman, of Berkeley, California. Those deceased were Marcus; Hortense, who at the time of her death was principal of the high school at Marshall, Minnesota; and Gertrude, wife of Dr. W. G. Crandall, a dentist of Los Angeles.

In the collections of his daughter, with whom historical and genealogical research was an avocation, are objects of more than casual interest relating particularly to Dr. Robbins' early medical and surgical practice, among them his surgical instruments, his roll of obstetrical instruments, and his old forceps for extracting teeth, for like most physicians of the day he was on occasion dentist as well as physician. Among his papers are two of his internal revenue licenses to sell tobacco, issued at Mankato, one on May 1, 1866, and one on April 28, 1888, and worthy of note, his diaries, full of information.

John Angus Ross, a native of Scotland, was born in Ross Shire, the Hebrides Islands, on June 14, 1841. His mother was twice married. Of the first marriage, to Mr. Frazier, there were two children, a son Dan and a daughter Ann; of the second marriage, to Mr. Ross, three daughters, Lexie, Isabel and Jessie, and one son, John Angus.

John A. Ross received his early training near home and his formal education in medicine and related sciences at the Universities of Glasgow and Edinburgh, from one of which he was graduated in medicine and chemistry. Of his coming to the United States little is known except that he first was established in Atlanta, Georgia, perhaps having landed at Savannah, and that he undoubtedly was the bearer of letters of introduction which gave him entree to the long-established homes of Atlanta, including that of the governor of the state, whose daughter was gracious to the young Scotch physician. Dr. Ross arrived in the South in the troubled period just before the outbreak of the Civil War and when the crisis came he served the Confederate cause in one of the military hospitals. Shortly after the close of the war he left the South for the Middle West and in Chicago continued his scientific study at Rush Medical College.

The coming of Dr. Ross to Preston, Fillmore County, in early October, 1869, is of itself an interesting story. Dr. LaFayette Redmon and Dr. O. A. Case, the established physicians of the village, in the course of changing conditions of practice found it expedient to improve their professional knowledge—so runs the reminiscence of one who knew the circumstances well—and were about to go back to school. A request to Rush Medical College to send Preston a first-class physician was answered by the arrival of Dr. John A. Ross. Educated in the best medical schools of Britain and America; tall and fine looking, with clear blue-gray eyes, wavy brown hair brushed back from the temples and up from the broad forehead, a mustache and a small flowing beard, narrow and short, that did not conceal the strong lines of the jaw; carefully groomed, and dressed in the formal costume he always affected: a fine broadcloth suit with velvet vest and double-breasted coat and a deep-bosomed white shirt, worn with three studs, stiff collar and dark tie; wearing a high hat and carrying a beautiful mahogany cane, Dr. Ross was a new type in the settlement that was made up for the most part of rugged pioneers. His cane, presented by fellow physicians in Chicago at a banquet given in his honor just before his departure for Minnesota, had an ivory handle and bore a gold band that was inscribed in commemoration of the occasion and in token of his excellent scholastic record. Perhaps the form of the gift was inspired by the tradition of the gold-headed cane of Dr. John Radcliffe (1650-1714); perhaps a cane was merely the currently favored accessory of a dignified young physician accustomed to urban life.

In Preston Dr. Ross was well received. From the first the many Scotch settlers in the community "loved him to death and would not let him leave," and he soon won the confidence of all, regardless of nationality or religious belief. The parish priest within a short time instructed his parishioners to call only Dr. Ross, for the reason, again a comment in reminiscent vein, that certain other physicians made mistakes as to their patients' tenure of life and caused the priest to administer extreme unction unnecessarily. Dr. Ross, skilled in diagnosis and prognosis, made few errors. If he considered that there was hope of pulling a patient through, he would not leave until the outcome was sure, remaining several days if necessary; if he was convinced that the case was hopeless, he would not waste time but would go on to some one who could be helped, and it is remembered that his judgment was sound and that it was honored.

On May 3, 1869, before Dr. O. A. Case had gone to further his medical education, as has been told, Dr. Case and a few other local practitioners organized the Fillmore County Eclectic Medical Society in Preston, and of this group Dr. Ross soon after his arrival became an active member. For several years he was its secretary and in 1876 served as vice president; by that time the activities of the society were dwindling and soon after the association disbanded. There is no reason to wonder why a man of Dr. Ross's training at the medical schools of Glasgow, Edinburgh and Rush and therefore ostensibly of the regular school of medical thought, should have allied himself with an eclectic medical group, especially when the Fillmore County Medical Society, founded in 1866, was functioning.

In the interest of his profession Dr. Ross, in addition to identifying himself with medical organization, early began his life-long custom of writing for medical journals and also acted as preceptor. In 1870 he took into his office as a student, George A. Love, who was preparing for matriculation at the Bennett Eclectic College of Medicine and Surgery in Chicago. There is an interesting note from the *Preston Republican* of May 30, 1873, that Dr. Ross, assisted by Dr. H. Jones, in the presence of Mr. Love, a medical student, performed a postmortem examination; an infant daughter of local people had died of cerebrospinal meningitis. "The facts disclosed by the postmortem examination warrant us in saying that the parents, by overcoming the usual prejudice, did the public and medical profession a great service by permitting it to be done." In 1874, when Dr. Love was graduated, he returned to join Dr. Ross, as stated previously, in a partnership that was to last two years. The following card appeared in the *Fillmore County Republican* of January 8, 1875:

> Ross and Love, Physicians and Surgeons, Preston, Minnesota.
> Office on Main Street Just in rear of post office.
> Open day and night. All calls promptly attended to.

Dr. Ross took a friendly as well as a professional interest in his community, entering into social and civic activities and joining fraternal organizations, among them the Masons (A. F. and A. M., Royal Arch Chapter No. 32) and the Independent Order of Odd Fellows.

The life of this well-endowed physician of great promise was tragically short. In 1877, after two years of disability and suffering from heart disease, Dr. Ross died in Preston at the early age of thirty-six years, leaving his young wife; there were no children. He had been married two years previously, on March 5, 1875, after a romantic courtship, to Julia Ann Kaercher, the daughter of John Kaercher, a leading citizen of Fillmore County, in Fillmore, Chatfield, Preston and Clear Grit (which he founded). In later years Julia Kaercher Ross was married to Mr. Dibble; there were two children of the marriage, Sarah and Arthur, of whom the latter became a lawyer. After the death of her second husband she was married to Dr. Hickman. Of the third marriage there were four children; a son, Beryl, who died in infancy, and three daughters, Lola, Rachel and Ruth. Ruth Hickman Campbell has named her son John Angus, in honor of John Angus Ross.

In the histories of Fillmore county published in 1882 and 1912, tribute was paid to Dr. Ross as an esteemed and valuable citizen of Preston who was known for his kindness and liberality. "He was honest, plain-spoken, open-handed and just."

(To be continued in November issue)

President's Letter

LOCAL HEART ASSOCIATIONS

Until June of this year, the American Heart Association was an organization composed of physicians whose chief purpose was the study and dissemination of knowledge among physicians concerning the science of cardiology and the treatment of cardiovascular disease. It had conducted an annual scientific meeting each year in conjunction with the American Medical Association and had published *The American Heart Journal.* During recent years it had become apparent to the officials of this organization that the problem of diseases of the heart and blood vessels must be attacked on a much greater scale and, finally, at meetings at the various local heart associations, then established, in San Francisco in June, 1946, it was decided to enlarge the aims of the American Heart Association greatly and to revise its administrative structure completely. A committee was authorized to prepare a new constitution and to present it to the Board of Directors at the meeting of the American Heart Association which was to be held in Atlantic City in June, 1947.

When the American Heart Association met this year, the new constitution and by-laws were adopted. Now, the governing board of the American Heart Association is known as the "Assembly" and it consists of not more than 150 members. Of this number, not more than half may be individuals who are not physicians. It is provided that for purposes of representation the United States and Canada will be divided into six geographic regions and seventy-five members of the Assembly will be chosen "on a regional basis." Members of the Assembly who are physicians and members who are not physicians will have an equal voice when policies of the Association are being determined. Groups of physicians interested in special phases of cardiovascular disease, such as peripheral vascular disease, hypertension and arteriosclerosis, will be accorded representation in the Assembly. For example, it is provided that five members of the Assembly shall be elected by the American Council on Rheumatic Fever.

In order to implement the activities of the national body, it was decided that local heart associations should be formed throughout the country as rapidly as possible. The American Heart Association prefers that these local units be organized on a statewide basis and that subdivisions be created in each state in accordance with existing facilities and needs. Many such local heart associations are being formed throughout the country and hereafter membership in the American Heart Association will be obtained through membership in the local heart associations.

The over-all objective of the American Heart Association is to mobilize all resources, on a national scale, in an attempt to combat diseases of the heart and blood vessels more effectively. In order to accomplish this purpose, the national organization formulated certain definite plans. The public must be educated concerning the prevalence of diseases of the heart and blood vessels. It must be informed concerning prevention of heart disease and concerning the treatment and management of those who become its victims. It must know enough about the symptoms of heart disease to be able to consult physicians early. Research must be fostered, and in order to sponsor research money is needed. A tragically small amount has been spent heretofore in research. Because of the need for money to accomplish the plans including the promotion of research, it is proposed that a national campaign for funds will be made during the week of Saint Valentine's Day in February, 1948. That week of each year will be designated as "Heart Week" and during it nationwide publicity will be sought through the radio, newspapers, magazines, motion pictures and other publicity mediums. The American Heart Association calls especial attention to the fact that a "very high percentage" of the funds which are raised will be retained by the local associations for the purpose of promoting research and providing facilities for treatment and management of patients suffering from heart disease in the various localities.

An important function of the local associations will be the education of the lay public. They will show that some forms of heart disease are reversible; others can be arrested and many individuals suffering from heart disease can lead useful, comfortable and fairly long lives, despite their physical limitation. This information will be released through lay educators, such as teachers, physical education instructors, social workers, public health nurses and ministers. Physicians will receive advanced instruction by means of refresher courses and lectures by outstanding authorities. Also the local heart associations will stimulate communities to provide an adequate number of beds for patients who suffer from acute and chronic phases of heart disease. They will see that sufficient nurses and physicians are available. They will provide for the rehabilitation of patients who have heart disease. This phase of their activities will require the assistance of occupational therapists and vocational guidance and often psychologic rehabilitation will be needed. The local heart associations have been termed the "task forces in this crusade" of the American Heart Association.

In Minnesota much interest has been shown by the American Legion, and farm, labor and industrial organizations. The Variety Club has provided funds for a heart hospital on the campus of the University of Minnesota.

The Council of the Minnesota State Medical Association has approved the organization of the Minnesota Heart Association. Temporary officers were elected at a meeting of representatives of industrial, labor and farm organizations and members of the medical profession, held in Saint Paul on July 24. These officials are preparing articles of incorporation and a constitution and by-laws at this time which will provide for statewide representation drawn from members of the medical profession and persons who are not physicians. Soon a permanent organization will be established.

Probably one of the prime functions of this organization will be to enlighten the public regarding the significance of this program. Soon people will be made to realize that one out of three people dies of diseases of the heart and blood vessels and that these diseases account for more deaths than the next six greatest causes of death. It should not be difficult to arouse public support for this outstanding health program.

ACRES OF DIAMONDS

IN the October number of *Pic* appears in full the famous lecture entitled "Acres of Diamonds,"* first delivered years ago at the reunion of Civil War comrades by Dr. Russell H. Conwell, the philanthropist and founder of Temple University in Philadelphia. This inspiring lecture is said to have been delivered over 6,000 times and to have been a source of inspiration to countless individuals who have heard it.

The title is derived from a story told Dr. Conwell in 1870 by a guide on the Euphrates River about a Persian who left his home on the River Indus in a vain search of wealth, when the bed of the stream that flowed in his own yard was covered with diamonds. This is his thesis—that wealth is at your doorstep in this free country of ours and is the reward of the industrious and deserving. He decries the idea that there is something iniquitous in the search for wealth and points out that, according to the Bible, "the *love* of money is the root of all evil" and not money itself. With the acquisition of money comes the power to do good—for your family, friends, community and the world in general. He decries anything that stands in the way of the development and reward of private initiative, be it employer or union, which by standardization of wages prevents compensation commensurate with one's worth.

Apparently, there was a need for such an inspirational speech over the period of years during which Dr. Conwell gave this "Acres of Diamonds" speech. He died in 1925. During these years, Americans with freedom and opportunity, some spurred on by this speech, attained undreamed wealth for themselves and their countrymen. Has this period come to an end?

We have heard of pessimists who as far back as a hundred years ago predicted that no longer could wealth be acquired in our country, only to be proven wrong. We do not wish to be added to the list.

We believe that the present supplies many opportunities for acquiring wealth on the part of those with industry and faith in the future. We maintain, however, that man-made barriers in recent years have removed much of the incentive that was formerly present. The widening of the field of government spending before the war, greatly increased of necessity during the war, and new fields which have opened to replace those contracted during the postwar period—some necessary in the name of humanity, some indicative of the socialistic trend in government and some gross extravagance—have necessitated such an increase in income and inheritance taxes and have resulted in such poor returns from investments that the money incentive to increase production is well nigh gone.

We wish everyone could read "Acres of Diamonds" in order to experience the exhileration it produces in the reader's soul to think that he lives in a country like ours, so rich in opportunities. Certainly, patriotic and thoughtful readers cannot fail to feel that everything must be done to maintain our system of private enterprise in spite of socialistic tendencies in the rest of the world to restore the incentive to work by reducing taxation and government spending. If the country goes to work, supply will more nearly meet demand, and the cost of living will begin to go down, to the benefit of everyone. Concealed or obvious taxes are contained in the cost of everything we purchase today.

---

*The lecture plus the story of Dr. Conwell's life was compiled into book form by Harpers.

AMA FELLOWS

POSSIBLY one in ten physicians in the state understands clearly the difference between being a member of the American Medical Association and being a Fellow in the Scientific Assembly of the AMA. Each active member of a county society is enrolled automatically as a member of the AMA. He pays county and state dues but pays no dues to the national organization. Although the AMA has the right, according to its constitution, to assess each member up to ten dollars, if necessary, this prerogative, to our knowledge, has never been exercised. The AMA derives its income largely from its publications and the commercial displays at its meetings.

It is, therefore, logical for the AMA to insist that only those who support the scientific activities of the Association by subscribing to *The Journal of the American Medical Association* or one of its publications and becoming enrolled as a Fellow can register or take part in scientific discussions at the annual meetings. Simply being a member, with or without subscribing to an AMA publication does not automatically make one a Fellow. Application for Fellowship must be made by members who are not already Fellows as attested by the Fellowship card received yearly from the AMA. Fellowship dues, in the sum of eight dollars, should accompany the application. This amount includes the subscription price of *The Journal.*

Perhaps 20 per cent of members of the Minnesota State Medical Association are not AMA Fellows. Some of these subscribe to *The Journal* and can become Fellows without additional expense by simply applying to the AMA. Those who do not subscribe to one of the AMA publications should support the national association by so doing and should become Fellows.

Aside from qualifying a member to register at an annual AMA meeting, there are certain additional advantages to being a Fellow. In case one moves to another state, a Fellow is eligible to membership in the component society of his new location on presentation of a transfer card. If, however, he does not join the association in the state to which he moves, he forfeits his AMA Fellowship. One who has been a Fellow for fifteen years, has reached the age of sixty-four and is an honorary member of his component society, or the equivalent whereby he does not pay dues, may be elected to Affiliate Fellowship in the AMA by the House of Delegates. As an Affiliate Fellow he will not be required to pay dues; neither will he continue to receive the journal, except upon paid subscription.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

RISKS OF ADMINISTERING BLOOD PLASMA

Possibilities of disease transmission by the injection of human blood derivatives is re-emphasized in a recent report from the American Red Cross.

The report, released through the Minnesota Department of Health, comes from the Committee on Blood and Blood Derivatives of the American National Red Cross Advisory Board on Health Services, which recently reviewed accumulated reports on the administration of surplus dried blood plasma.

Although the Committee does *not* advocate the discontinuance of its use, it does recommend that all physicians consider carefully the potential risk to the patient in the administration of pooled plasma. Because of the possibility of disease transmission, plasma should be used chiefly for serious emergencies, the report says, when a need for it is clearly indicated and when safer agents such as whole blood or serum albumin are not available.

No Other Restrictions

There are no other restrictions on the use of dried human blood plasma. This plasma, derived originally from blood given by thousands of donors throughout the country, to help in the war emergency, has been returned as surplus to the American Red Cross. By agreement with the American Medical Association and the Association of State and Territorial Health Officers, it has been distributed to all state health departments for use in this country.

No longer needed for soldiers and sailors, this plasma is now intended to help save the lives of the people who so generously gave blood originally. It is available to all who request it, as long as it lasts. No charge is allowed for the plasma itself; and to avoid confusion, the Health Department suggests that hospitals might bill patients as follows:

Blood plasma—No charge
Plasma administration—(Prevailing fee)

The plasma is not intended solely for administering to indigents; nor is it to be kept in reserve for disasters. An ample reserve has been set aside for both of these purposes.

15,829 Units Distributed

Since March, 1946, the Minnesota Department of Health had distributed a total of 15,829 units of dried human blood plasma to physicians and hospitals throughout the state. Approximately 11,481 units of 500 c.c., and 4,348 units of 250 c.c. have been supplied between March, 1946, and August 1, 1947.

Co-operation of physicians is urgently sought both in reporting cases of disease apparently spread through plasma administration and in preventing any further spread.

According to the Red Cross Committee, physicians who see patients with hepatitis should make a habit of inquiring about the possibility of their having been injected with blood or its derivatives during the preceding six months and of reporting such cases to the state or territorial department of health.

Furthermore, the Committee recommends, no matter how well a person looks or feels, he should *not* serve as a blood donor if (1) he has been hospitalized during the previous six month, particularly if he has received injections of human blood, blood plasma or serum within that period and if (2) there is a history of jaundice among members of his family or household within the preceding six months' period.

SOCIAL SECURITY MISSION TO JAPAN QUESTIONED

Motives prompting the dispatch on August 28 of certain officials from the Federal Security Administration and the U. S. Public Health Service to Japan "to advise the Japanese government with reference to the co-ordination and application of social security measures" are under heavy fire in Washington.

The big question being asked is this: Does this social security mission to Tokyo represent simply a response to a normal request from the Supreme Command for the Allied Powers in Japan for help in rebuilding the Japanese Government on a sounder basis, or is it an attempt to "put over" a socialistic system in that country?

This question is being posed by the same investigating subcommittee which, under the guidance of Representative Forest A. Harness (Republican, Indiana), recently uncovered a misuse of funds by six agenciees of the executive branch of the U. S. Government for propaganda activities supporting compulsory national health insurance.

Defenders of the mission to Japan maintain there is a very simple explanation for the whole procedure. It all began, they relate, with a request last April from General Douglas MacArthur, Supreme Commander for the Allied Powers, that Mr. Arthur J. Altmeyer, Commissioner of the Social Security Administration, be invited to head a six-man mission to Japan for a period of thirty to ninety days to evaluate and make recommendations for achieving a sound social security system for Japan.

To Help Draft Health Bill

These men are to consult with the Public Health and Welfare Section of the Occupational government (the SCAP) and will offer technical guidance to the Japanese Committee on Social Insurance and the Japanese Council on Medical Care, presently engaged in drafting a co-ordinated national health bill.

Apparently General MacArthur did make this request, although the Harness Investigating Committee insists that they have never seen such a request. What arouses suspicion is the fact that the persons being sent to Japan by the War Department are merely, in the General's own words "presumed to be qualified" since they are "responsible public officials."

This fact has prompted the Harness Committee to probe further into their backgrounds. Each man who will work with Altmeyer is known, according to the Harness Committee, to have an "ideological attachment" to a national health program of the Wagner-Murray-Dingell type. The inference from this is that they were picked for their political convictions and not for their professional competence as health or social security advisers.

Four members of the mission have already been flown to Japan by the War Department. Mr. Altmeyer and two other men will join them later. The advance guard includes Dr. Joseph W. Mountin and Mr. Burnet M. Davis of the U. S. Public Health Service; Mr. Barker S. Sanders, Social Security Administration, and Mr. Francis A. Staten, Public Housing Authority.

See Danger to Medicine

The Harness Committee sees imminent danger in this social security mission, pointing out that if it is carried through, it may establish a precedent for controlling the medical profession in other countries. The selection of the experts by persons known to favor the nationalization of medicine leads the Committee to suspect an attempt is being made to find a "likely spot" to plant the seeds of a socialistic system in view of the fact that such plans have so far failed in this country.

The Committee doubts that MacArthur had any real knowledge of the composition of the mission or of the reputation of its members. It may be that he was guided by recommendations from the War Department, which may in turn have been guided by someone else—someone with strong socialistic leanings. Such is the contention of the Investigating Committee. For this reason, the Committee requested that the departure of the mission be delayed pending further investigation. The request was denied, and the mission left as scheduled.

AMA "GRASS ROOTS CONFERENCE" HAILED AS DECIDED SUCCESS

The first national meeting of county medical society officers, held in connection with the AMA Centennial Convention in Atlantic City, has been hailed as a decided success. The conference, which has been aptly named the "Grass Roots Conference," has been accorded the wholehearted approval of the AMA House of Delegates, and a continuation of these conferences has been recommended.

Employing the question-and-answer method of discussion, with the county officers themselves supplying the questions, delegates exchanged ideas on a variety of medical economic subjects. A panel of experts was on stage to provide facts in answer to the specific questions and to keep the discussions going.

The enthusiasm shown by the delegates and their active participation in the discussions resulted in the coverage of only seventeen major questions from a list of seventy-eight submitted by the county officers.

Receiving most attention were the questions dealing with rural medicine, with the status of the general practitioner in relation to the hospital and the specialist, and with the public relations of the county medical society.

Discuss Physician Shortage

The shortage of physicians, particularly in the rural areas, it was agreed by the delegates, is a number one problem, the remedy of which is the dual responsibility of the public and the profession. The growing interest on the part of rural people to do something about it was noted, together with the firm resolve of organized medicine itself to do its share, by Dr. L. W. Larson of Bismarck, a member of the panel by reason of his work on the AMA Committee on Rural Medical Service.

"Medical schools," Dr. Larson pointed out, "have emphasized specialization in the years past, but there is now evidence to show that the trend is swinging back to more emphasis on the general practitioner. The tendency on the part of the larger rural hospitals to extend their facilities to surrounding territory is also in the right direction."

None of these things alone will solve the problem, he said. He expressed the belief that doctors themselves can do something within the county medical societies in rural areas, and he recommended that physicians help encourage bright young men who might be interested in medicine to get into the field and to settle in rural areas. The county medical society might also foster the development of local health councils in the county. Still another suggestion was the offering of practical help to the rural practitioner—that of making him feel that he, too, is important and that he has friends in the larger centers who stand ready to give him whatever advice or consultation he may need.

Dr. Norman M. Scott, medical director of the New Jersey Medical Surgical Plan, also a panel member, cited another problem particularly applicable in rural areas, that of rural enrollment in prepayment medical care plans. His conclusion was that since such insurance is most successful when written on the group basis, that the solution for the spread of these plans in rural areas is to organize farmers into groups.

Preserve the Family Doctor

If we do not protect the status of the general practitioner our whole system of organized medicine is threatened. This statement was made by Dr. L. H. Bauer of Hempstead, N. Y., during the discussion of the specialist-general practitioner relationship, and it seemed to summarize the feeling of the entire group.

Various ways of preserving "the family doctor" were discussed. Suggestions included increasing hospital facilities to make general practice easier, revamping specialty boards, the establishment of general practice services in hospitals and increasing the number of postgraduate courses, slanted toward the needs of the general practitioner.

Indicative of the line of thought of the conference delegates were such statements as: "Hospitals are for the use of and not the convenience of the specialist"; "The general practitioner has no fight with the specialist—we need him as much as he needs us"; and "Credit should be given on the basis of proved ability to practice."

Some doctors objected to the name "general practitioner," advocating such titles as "general physician" or a return to the name "family doctor." The question of a specialty board for general practitioners was also brought up, but there was disagreement as to need for such a board or the advisability of it, since the original idea of a specialty board was not to make it difficult for a man not in a specialty, but to arrive at comparable standards for different specialties. To avoid unhappiness in the profession from inequality of opportunity, the House of Delegates has already recommended and the Hospital Association has accepted this statement as a guide in the matter of the specialty board: "The individual shall be qualified for a particular place by reason of his particular training and not because he has been certified by a board."

Public Relations Discussed

The proper share of public relations activity which should be assumed at the county society level provided a subject for very active discussion at the Conference. A member of the panel, Dr. L. F. Foster, secretary of the Michigan State Medical Society, cited the development of social consciousness as an important consideration. The rugged individualism, typical of the medical profession, is being discarded, he said.

"Doctors are, in the eyes of the patients, great fellows," Dr. Foster said. "But these same patients seem to feel that medical associations exist for the doctors' own good and not to help the public. But as a corporate institution we are concerned with public welfare and must get this across to the public."

Mr. Thomas A. Hendricks, secretary of the AMA Council on Medical Service, a firm believer that "public relations begin at home," listed for the delegates what he called "the seven sins" to be avoided by a functioning local society: "inertia, reaction, cliques, discord, provincialism, smugness and defeatism."

"To offset these," he said, "the seven characteristics that mark a good medical society are: enterprise, progress, friendship, harmony, vision, leadership and courage."

PNEUMONIA IMMUNIZATION CUTS DEATH RATE OF OLDER PERSONS

A group of New York investigators who made a six-year study of pneumonia in elderly patients, suggest immunization against the disease where high incidence rates prevail, as in epidemics, in institutions, and in persons with a tendency to recurring pneumonia.

Writing in the current issue of the *Archives of Internal Medicine,* published by the American Medical Association, the investigators—Paul Kaufman, M.D., attending physician, Goldwater Memorial Hospital and New York City Home; C. O'Brien, M.D., resident physician and H. Stein, M.D., resident physician, New York City Home—state that they undertook their study in the older age group for several reasons:

First, they have a high incidence of pneumonia, mortality and case fatality rate. Second, repeated attacks of pneumonia occur frequently. Third, there was possibility for continuous observation, hospitalization, and re-examination, since the patients were from the New York City Home and the Medical Division of the former Central and Neurological Hospital and the Goldwater Memorial Hospital, where higher age groups are treated.

During the six-year study, 1937 to 1943, 5,750 patients were immunized against pneumonia, while 5,153 control patients were observed for comparison. Among the immunized group, 99 developed pneumonia, an incidence rate of 17.2 per 1,000, of which 40 died, a mortality rate of 6.2 per 1,000. There were 227 cases of pneumonia among the nonimmunized patients, an incidence rate of 44 per 1,000 with 98 deaths, a mortality rate of 19 per 1,000.

The antigen used in these experiments for immunization is made from a fraction of the pneumococcus, the organism responsible for pneumonia. The antigen, which incites production by the body cells of a substance to fight the bacteria, is a polysaccharide.—*American Medical Association News,* July 11, 1947.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul, Minnesota

Julian F. Dubois, M.D., Secretary

Elkton, South Dakota, Man Sentenced to Three-year Prison Term for Abortion

Re. State of South Dakota vs. Herman V. Feenstra

On August 19, 1947, Herman V. Feenstra, seventy-three years of age, of Elkton, South Dakota, entered a plea of guilty in the Circuit Court at Brookings, South Dakota, to a charge of performing an abortion. Feenstra was sentenced to a three-year-term in the South Dakota State Prison, and is to receive credit for three months that he was confined in the Brookings County Jail following his arrest in May of this year.

Feenstra, who formerly represented himself as a chiropractor, was arrested on May 20, 1947, following the hospitalization of an eighteen year-old Lake Benton, Minnesota, girl at the Hendricks, Minnesota, hospital. The matter was immediately called to the attention of the Minnesota State Board of Medical Examiners, and through the splendid co-operation of the attending physicians, it was learned that the patient had gone to Feenstra on May 2, 1947, for the purpose of having an abortion performed. Feenstra inserted a catheter and was paid $50.00 for his services. The patient became seriously ill and was hospitalized on May 9, 1947, in the Hendricks Hospital.

Feenstra is well known to the South Dakota and Minnesota authorities. On August 10, 1938, Feenstra was sentenced to a four-year prison term in the District Court at Glencoe, Minnesota, following his plea of guilty to a charge of criminal abortion. On November 21, 1938, Feenstra was returned to the District Court at Glencoe, Minnesota, from the State Prison, and sentenced to a term of two to eight years because the investigation, at that time, disclosed that Feenstra had a prior conviction in the Circuit Court at Brookings, South Dakota, for a similar crime. The records of the Circuit Court at Brookings, South Dakota, also show that Feenstra forfeited a $2,500 cash bond in that Court, on January 19, 1938, at which time he was under arrest on a charge of rape. Feenstra has resided at Elkton, South Dakota, for the past thirty years. Prior to that time he operated a cafe at Lake Benton, Minnesota. He then worked as a painter, following which he claims that he studied chiropractic at Davenport, Iowa. Feenstra has never held any license to practice any form of healing in the State of Minnesota.

The Minnesota State Board of Medical Examiners wishes to acknowledge the very fine co-operation that it received in this case from the physicians who took care of the patient while she was hospitalized at Hendricks, Minnesota. The Medical Board also wishes to make known the prompt and efficient services rendered by Mr. W. R. McCann, States Attorney, and Sheriff J. M. Rishoi, both of Brookings, South Dakota.

◆ Reports and Announcements ◆

RESEARCH FELLOWSHIPS

The Surgeon General of the U. S. Public Health Service has been authorized to establish and maintain research fellowships intended to promote the training and development of investigators in the field of medicine and related sciences. Between January 1, 1946, and August 31, 1947, a total of $10,214,174 was made available to investigators in twenty-three different study sections. Research in syphilis received $1,669,793; in cancer, $1,241,510; in physiology, $676,836; in biochemistry and nutrition, $682,358; in malaria, $543,208; in virus and rickettsial diseases, $509,556—to cite the largest grants-in-aid.

The sums are devoted to fellowships, ranging from $1,200 to $3,000 per year, awarded to those with bachelor's, master's or doctor's degrees. The fellowships are for one-year periods, but may be renewed.

Application forms for research fellowships may be obtained from the Division of Research Grants and Fellowships, National Institute of Health, Bethesda 14, Maryland. Applications must be supported by a statement from the department head of the university under whom the fellowship work is to be conducted.

MARKLE FOUNDATION POST-FELLOWSHIP GRANTS

The John and Mary R. Markle Foundation, 14 Wall Street, New York City, has announced that grants of $25,000, payable at $5,000 per year for five years, will be available beginning in the school year 1948-49 to accredited medical schools for the specific purpose of aiding embryo research workers in preclinical and clinical subjects. The grants will total $1,250,000 over the five-year period.

The purpose of the program is to meet the need for financial assistance for young medical students who have completed residencies and have the desire and ability to enter research and teaching. Candidates will have had training in some special field to qualify them to receive a faculty appointment and to conduct original research.

The program is the result of a survey which showed that while there are scholarships and other forms of financial aid for the student in the course of his scientific training and for the scientist once his name is made, there are few sources of help at the beginning of the career of the man who chooses academic medicine.

Persons interested in being considered as candidates are referred to the deans of accredited medical schools for further information.

UROLOGY AWARD

The American Urological Association offers an annual award of $1,000.00 (first prize of $500.00, second prize $300.00 and third prize $200.0) for essays on the result of some clinical or laboratory research in urology. Competition will be limited to urologists who have been in such specific practice for not more than five years and to residents in urology in recognized hospitals.

The first prize essay will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Hotel Statler, Boston, Massachusetts, May 17-20, 1948.

For full particulars write the secretary, Dr. Thomas D. Moore, 899 Madison Avenue, Memphis, Tennessee. Essays must be in his hands before March 1, 1948.

AMERICAN ACADEMY OF ALLERGY

The American Academy of Allergy will hold its annual convention at Hotel Jefferson, St. Louis, Missouri, December 15-17, inclusive. All physicians interested in allergic problems are cordially invited to attend the sessions as guests of the Academy by registering without payment of fee. The program, the scientific, and technical exhibits have been arranged to cover a wide variety of conditions where allergic factors may be important. Papers will be presented dealing with the latest methods of diagnosis and treatment as well as the results of investigation and research. Round table conferences will be held on Monday afternoon, December 15, 1947. Advance copies of the program may be obtained by writing to the chairman on arrangements, Charles H. Eyermann, M.D., 634 North Grand Boulevard, St. Louis, Missouri.

AMERICAN COLLEGE OF SURGEONS

Thirty-two Minnesota physicians were accepted into fellowship in the American College of Surgeons at its thirty-third convocation in New York on September 12.

The Minnesota initiates are Doctors B. Marden Black, Rochester; Theodor E. Bratrud, Thief River Falls; C. Kenneth Cook, Saint Paul; Henry C. Dahleen, Rochester; Charles T. Eginton, Saint Paul; Benjamin A. Gingold, Minneapolis; Gilman H. Goehrs, St. Cloud; Harry P. Harper, Minneapolis; Albert T. Hays, Minneapolis; Gustaf A. Hedberg, Nopeming; Arthur B. Johnson, Minneapolis; Carl E. Johnson, Saint Paul; Edward S. Judd, Jr., Rochester; Leonard L. Kallestad, Brownton; Bernard G. Lannin, Saint Paul; Clarence M. Larson, Minneapolis; Paul R. SEARLE RESEARCH IN THE SERVICE OF MEDICINE

(Continued from Page 1086)

OMAHA MID-WEST CLINICAL SOCIETY

The fifteenth annual assembly of the Omaha Mid-West Clinical Society will be held October 27 to 31, 1947, at the Hotel Paxton in Omaha.

This midwest medical meeting has become one of the larger and more important sectional meetings of the country. Distinguished visitors will participate in the extensive program which includes the various specialties.

A program may be obtained from Dr. J. M. Thomas, Secretary, 1031 Medical Arts Building, Omaha 2, Nebraska.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

Dr. C. L. Sherman, Luverne, was elected president of the Southern Minnesota Medical Association at the annual meeting held in New Ulm on September 8.

Other officers elected at the meeting were Dr. Lewis I. Younger, Winona, first vice president, and Dr. Carl Fritsche, New Ulm, second vice president. Dr. W. A. Merritt, Rochester, was re-elected secretary-treasurer.

Winona was selected as the convention city for 1948.

SOUTHWESTERN SOCIETY

The August 25 meeting of the Southwestern Medical Society was preceded by a dinner at the Worthington Country Club, attended by members of the society and their wives. After the dinner, the women were entertained at the home of Dr. and Mrs. B. O. Mork, Jr., while the society members conducted the regular meeting at the club. The principal features of the evening program were reports by Dr. S. A. Slater, Worthington, and Dr. D. J. Halpern, Brewster, who were delegates to the annual meeting of the Minnesota State Medical Association in Duluth in June.

WASHINGTON COUNTY SOCIETY

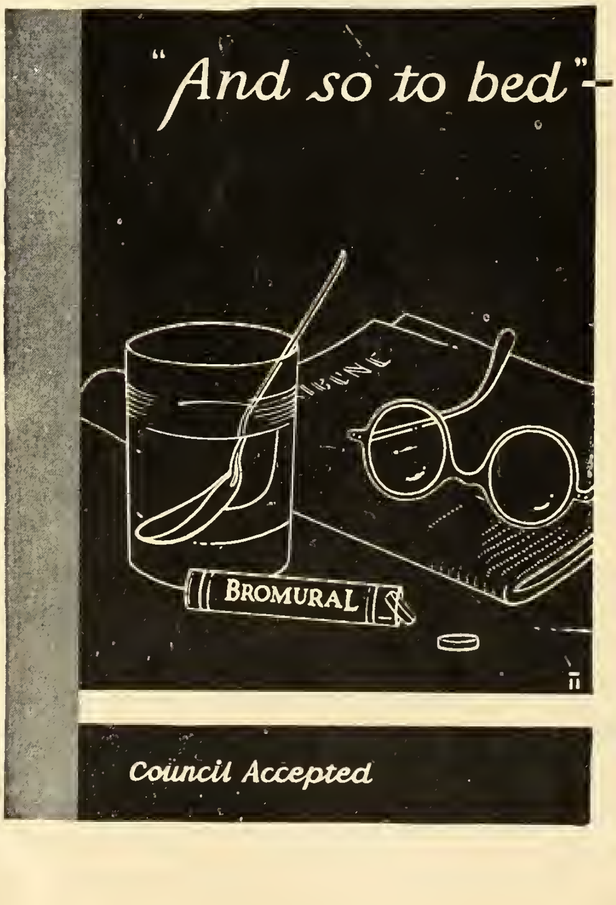
At the monthly meeting of the Washington County Medical Society, held in Stillwater on September 9, the guest speaker was Dr. Benjamin Sommers, Saint Paul, who spoke on "Treatment of Congestive Heart Patients."

Dr. Edgar C. Burseth, an associate of Dr. George M. Ruggles of Forest Lake, was elected a member of the society. A visiting guest at the meeting was Dr. Lucien Culver, Saint Paul, who formerly practiced in Stillwater.

MINNESOTA SOCIETY OF ANESTHESIOLOGISTS

All physicians interested in ansethesia and related subjects are invited to attend the second meeting of this Society Saturday evening, November 15, 1947, in Minneapolis.

For exact time, place and program, address Dr. J. W. Baird, Committee Chairman, University Hospitals, Minneapolis 14, Minnesota.



BROMURAL

WOMAN'S AUXILIARY

Upper Mississippi Auxiliary

The Woman's Auxiliary to the Upper Mississippi Medical Society were hostesses to the auxiliary members of the Northern Minnesota Medical Society at the convention on September 6, 1947. Approximately sixty members and friends registered and were guests of the Brainerd doctors at a luncheon in the main dining room of Breezy Point Lodge, where the convention was held.

In the afternoon the ladies participated in bridge and a social hour, and were served refreshments by the Brainerd doctors' wives. Mrs. J. A. Thabes, Sr., president of the state auxiliary, was an honored guest. There was a banquet in the evening for the doctors and their wives, at which Governor Youngdahl was the principal speaker.

Range Auxiliary

Members of the Range Medical Association Auxiliary held a joint session with members of the Medical Association at a dinner meeting in the Elks Club, at Eveleth in September. Auxiliary guest speaker was Margaret Moore, who gave a talk on her recent trip to Mexico, illustrated with motion pictures.

Mrs. Robert L. Bowen, president of the Auxiliary, represented her group at a tea which the women's organizations of Eveleth sponsored, following a public relations talk on various phases of socialized medicine given at the Little Theater of the Memorial Building on October 9. In the evening the Range Medical Association and Auxiliary members were hosts at a dinner for the St. Louis County Medical Society.

October 23 has been slated for the Auxiliary rummage sale to raise funds for the nursing scholarship at Hibbing General Hospital, which the organization is sponsoring. The Range Auxiliary embraces members from Hibbing, Chisholm, Buhl, Nashwauk and Keewatin.

SICKNESS STATEMENTS FOR RAIL WORKERS

Physicians throughout the nation are being asked to furnish medical evidence to substantiate the claims of railroad workers who may now draw cash sickness benefits under the Railroad Unemployment Insurance Act. The Railroad Retirement Board pointed out that unless an application is mailed not later than the seventh day after the first day of sickness claimed, it may not be received within the legal time limit for filing applications. As a result, the employe may lose one or more days' benefits. Physicians are asked either to return each completed Statement of Sickness to the patient, or mail it promptly to the office of the Board to which it is addressed.

Turmoil Time

Replacing Turmoil with Serenity

Replacing turmoil with serenity for women undergoing menopausal disturbances has become a matter of comparatively specific therapy.

Choice of an estrogenic product in this condition is likewise well charted. For optimum relief of symptoms, the competent physician selects a product whose manufacturing history he need never question.

This, perhaps, may account for the wide use of Solution of Estrogenic Substances, Dorsey. Made by Smith-Dorsey Company, whose plant facilities, personnel and procedure are above reproach, these products merit the continuing confidence of careful doctors.

In Memoriam

JOHN A. DUFFALO, JR.

Lieutenant Commander John A. Duffalo, Jr., died suddenly at Oakland, California, on July 6, 1947, at the age of thirty-one.

Born in Minneapolis, Dr. Duffalo graduated from the University of Minnesota Medical School in 1940 and joined the navy in 1942. He took part in battles at Okinawa, Iwo Jima, Leyte and Luzon as flight surgeon aboard the escort carrier, U.S.S. *Lunga Point.*

Dr. Duffalo is survived by his parents, his wife, Ellen, and a son, Bruce.

HAROLD F. DUNLAP

Dr. H. F. Dunlap, formerly of the Mayo Clinic, died July 22, 1947, at Indianapolis, Indiana.

Born in 1895 at Duncannon, Pennsylvania, Dr. Dunlap received his M.D. degree from Indiana University in 1920 and entered the Mayo Foundation as a fellow in medicine, January 1, 1922. In 1932, he left the Foundation and after a year of practice in New Jersey, went to Indianapolis, where he had practiced and served as associate in medicine at the Indiana University School of Medicine since 1934.

ROBERT K. GREEN

Dr. Robert K. Green, head of the Department of Bacteriology at the University of Minnesota medical school and well known nationally for his research work in virus diseases and cancer, died September 6, 1947, at the age of fifty-two.

Dr. Green was born at Wadena, Minnesota, January 11, 1895. He attended school at the University of Valparaiso (Indiana) and at International Falls before attending the University of Minnesota. There he received the degree of B.A. in 1919, M.A. in 1920, and M.D. in 1922. He was a member of Sigma Xi and an Honorary Fellow in the New York Zoological Society.

A decade ago, Dr. Green was credited with having saved the nation's fox industry by developing a vaccine to prevent fox encephalitis. A year ago, he introduced a revolutionary theory on the cause of cancer. At the time of his death, he was working on what he hoped would be a successful vaccine against poliomyelitis and an agent to immunize against cancer. He left his personal laboratory equipment to the University of Minnesota for the continuation of research.

Dr. Green's wife, the former Beryl Bertha Sparks, whom he married in 1917, died in 1941. A daughter, Gale, two brothers and five sisters survive him.

Dr. Green was a member of Hennepin County Medical Society, the Minnesota State and American Medical Associations, the Society of American Bacteriologists, the American Society of Mammalogists, the American Association of Immunologists and the Minnesota Academy of Medicine.

JULIUS F. GENDRON

Dr. Julius F. Gendron, a practitioner in Grand Rapids, Minnesota, since 1904, died September 11, 1947, at the age of seventy-nine.

Dr. Gendron was born at St. Francis de Montmagny in the province of Quebec on March 31, 1868. After studying law at Laval University, he came to Minnesota and decided to study medicine. He graduated from Hamline University medical school in 1896. He practiced medicine at Centerville, Minnesota, from 1896 to 1898; at Saint Paul, as an associate of Dr. Marquis from 1898 to 1899; at Crookston from 1899 to 1900; at Red Lake Falls from 1902 to 1904, when he located in Grand Rapids. He was health officer for Grand Rapids for a number of years before his death.

Dr. Gendron was well known in Canadian literary circles as a poet, doing his writing in French. He was once poet laureate of Canada. In 1928, he published a symbolic poem in French entitled "D'Oil." Several works in both verse and prose were never published. In 1930, he became a member of the Society of French Canadian Poets.

A member of the St. Louis County Medical Society, the Minnesota State and American Medical Associations, he served as a captain in the medical corps of the army in World War I. He is survived by his widow and a son, Bertrand Gendron, a druggist at Brainerd, Minnesota.

WILLIAM GINSBERG

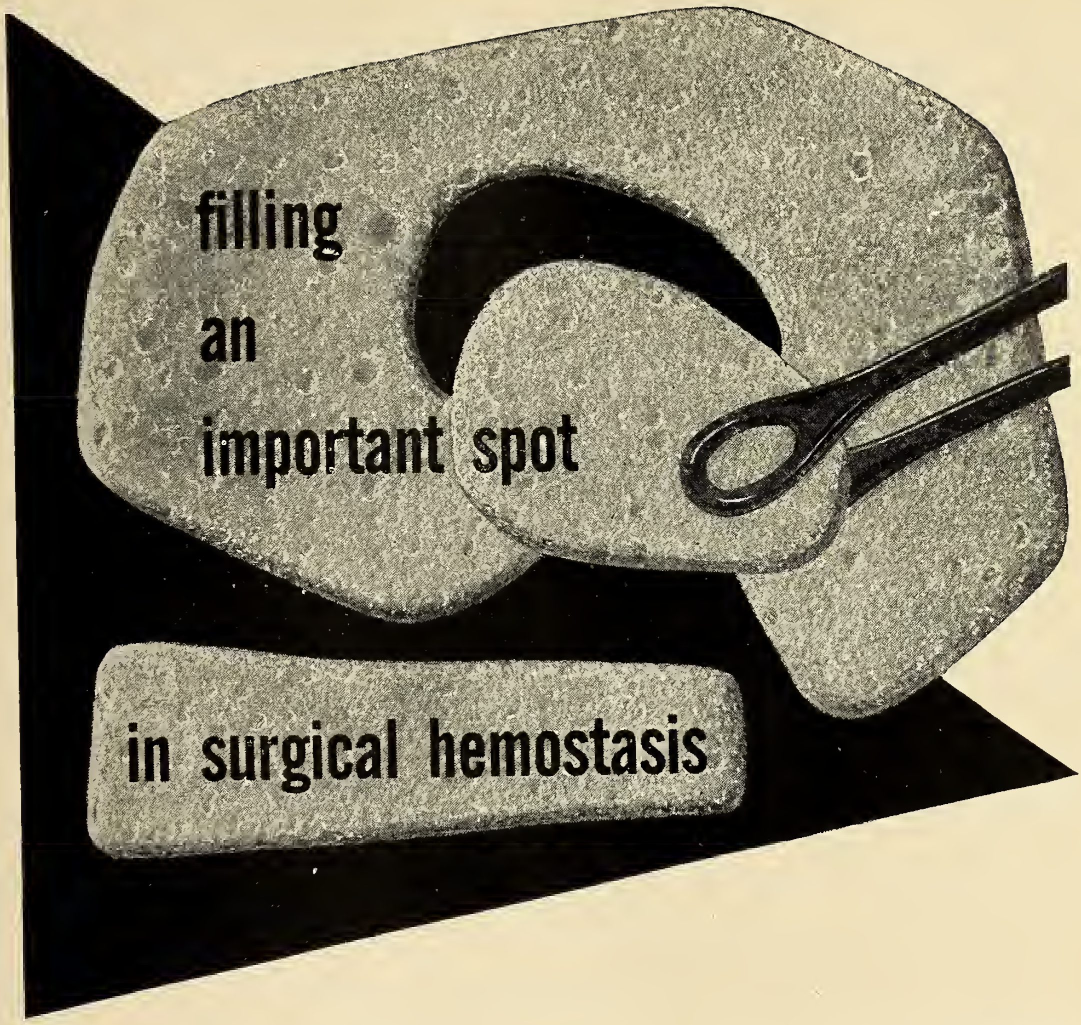
Dr. William Ginsberg, for thirty years a practitioner in Saint Paul, died at the age of fifty-seven on September 21, 1947, at his home. He had retired from active practice three years previously because of ill health.

Born in Saint Paul, December 11, 1889, he was the son of Jacob and Mollie Ginsberg. He attended the University of Minnesota where he received his B.S. degree in 1914 and his M.D. degree in 1915. During World War I he served overseas as a first lieutenant in the Medical Corps. He had maintained his reserve commission as a major since that time.

After his return to practice, Dr. Ginsberg was a staff member of St. Luke's, St. Joseph's and Miller Hospitals. Early in his career he manifested a broad untiring interest in medical, civic and philanthropic activities, and although he included the entire gamut of community life, he had the sincerity and patience to master the details of the many institutions and causes with which he was affiliated. Nothing which was socially progressive or helpful was alien to his sphere.

He was one of only two life members of the Jewish Educational Center, of which he was one of the principal founders and first president. For many years he was active in Boy Scout Circles, serving as a member of the Executive Committee of the Boy Scouts of America, Saint Paul Area Council, and as chairman of

(Continued on Page 1094)



GELFOAM* was developed by the Upjohn research laboratories to fill an important spot in surgical hemostasis. GELFOAM supplements the clamp, the clip, and the suture, affording biochemical arrest of bleeding with an absorbable organic agent which may be left in situ. This unique gelatin sponge simplifies the problem of clearing oozing surfaces, of staunching capillary bleeding, the trickling from small vessels, and the annoying hemorrhage from such tissues as liver, kidney, spleen, and tumors. In general practice, GELFOAM is an aid in the control of epistaxis, hemorrhage from lacerations, and postextraction bleeding.

the Leadership and Training Committee of the Saint Paul Area Council, Boy Scout Regional Executive Committee.

His memberships indicated the diversity and generosity of his interests. These included the Ramsey County Medical Society, Minnesota State Medical Association, American Medical Association, B'nar B'rith lodge of which he was a Past President, Masonic Lodge, American Legion, Jewish War Veterans, and Veterans of Foreign Wars. He was also a member of the St. Paul Refugee Service Committee, Refugee Affidavit Committe and the Conference of Christians and Jews. He was a member of the Board of Directors of the Jewish Home for the Aged, the Temple of Aaron Congregation, Central Hebrew School, St. Paul Zionist Organization, Jewish Welfare Board, United Jewish Fund and Council, Central Community House, Council of Jewish Social Agencies, the American Jewish Congress and chairman of the Local Theological Seminary.

On April 28, 1947, Dr. Ginsberg was chosen to represent the St. Paul Jewish physicians by signing a goodwill certificate which was sealed in the cornerstone of the new tuberculosis hospital, a unit of Hebrew University Hospital on Mount Scopus, Jerusalem.

He received an award from the Jewish War Veterans, naming him the outstanding Jewish citizen in 1942, recognition of a life of communal service and benefaction which won him the highest esteem, confidence and admiration of all.

He is survived by his sons, Dr. Robert L. Ginsberg and James P. Ginsberg of Saint Paul and Stanley Thomas Ginsberg of Oshkosh, Wisconsin, and three sisters, Annie and Lily Ginsberg and Mrs. Alex Mains, all of Saint Paul, and a brother, Dr. S. Theodore Ginsberg of Marion, Indiana.

BENJAMIN F. SMITH

Dr. B. J. Smith, formerly superintendent of the State Hospital at Rochester, Minnesota, died August 17, 1947, at Jackson, Louisiana, where he was superintendent of the Louisiana State Hospital.

Dr. Smith was born March 3, 1895. He received his B. A. degree from the University of Missouri in 1917 and his M. D. degree from Tulane University in 1919.

He came to Minnesota in 1922 as assistant physician at the St. Peter State Hospital and was superintendent of the Willmar State Hospital from 1927 to 1935 when he was appointed superintendent of the Rochester State Hospital. He left here in 1942 and later was superintendent at a hospital in Missouri before his appointment to the Louisiana State Hospital.

On June 15, 1920, at Neosho, Missouri, Dr. Smith married Stella G. Walters, who with three sons, Dr. B. F. Smith, Jr., of St. Louis, William, and George, survive.

Communication

To the Editor:

Dr. Kano Ikeda's criticism* of the edito ial "Laboratory Abuse" is gratefully acknowledged by the author.

The title of the editorial is unfortunate. It was not the author's choice. There was no allegation of abuse. Dr. Ikeda heartily agrees with the observation that the multiplicity of laboratory procedures may be a distinct danger to the clinical approach.

He does not agree with the idea of the partition of the economic load nor does he like the illustration of a cushion, i e., the State Board of Health Laboratories.

Besides the present multiplicity of laboratory procedures we add as an example the oncoming rush of requests for hormone levels in the blood or urine, the vitamin levels in body fluids, the various enzyme systems. Who is going to pay the technicians able to do these biochemical assays?

Again, every hospital the author has contact with, and every physician of his acquaintance uses the State Board of Health Laboratories for diagnostic purposes. The reason for this is obvious. Lack of facilities or economic pressure, or both, are the factors which have brought this about.

It was in that sense the author used the word "cushion."

Henry L. Ulrich
Associate Editor

*See page 1011, September, 1947, issue.

SHOULD BUSINESS AND PROFESSIONS JOINTLY OPPOSE WELFARE STATE?

Industrialists and manufacturers show little inclination to oppose Federalization of medicine. The banker may think it is no worry of his if medicine is socialized. The physician may conclude he has nothing to lose if the Federal Government sets up sickness insurance benefits by diverting railroad unemployment insurance funds into strange channels. But the banker, the physician, and the manufacturer would do well to inquire if they are not all being threatened by various manifestations of a single movement. Schemes for socialization do not operate in an economic vacuum. They are well planned; they strike on many fronts. No one can predict which part of the economy will be taken over first when the Welfare State is established.—*Insurance Economics Surveys,* September, 1947.

NURSING ***is a proud profession***

. . . and rightfully so. For next to the doctor in service rendered stands the present-day nurse. Into her hands is entrusted the care of the sick, and often the success of the doctor's work depends directly upon her skill.

GLENWOOD HILLS HOSPITAL—through its School of Nursing—is anxious to cooperate with you in your effort to increase the number of nurses in your community. A student from your locality will result in increased nursing assistance to you in the near future.

Your help is greatly needed in recruiting candidates for this profession. A one-year course in psychiatric nursing is currently being offered to eligible applicants. Tuition is free. Regular classes begin in January, June and September.

of radiology. Dr. Mixer, who is also an instructor in radiology at the University of Minnesota Hospitals, began his work with Dr. Kelby on August 15, 1947.

* * *

Dr. R. G. Tinkhman, who had been associated with Dr. John Eiler of Park Rapids in the practice of medicine and surgery since December, 1946, withdrew from the partnership in August but at the time was undecided as to where he subsequently planned to locate.

* * *

Dr. M. J. Schirber, who recently completed a two-year residency at St. Joseph's Hospital in Chicago, has become associated in the practice of medicine with Dr. M. J. McKenna, Dr. R. V. Jolin, and Dr. A. V. Grinley in Grand Rapids. Dr. Schirber is a graduate of Northwestern University.

* * *

On August 23, Dr. Roger G. Hassett, Mankato, suffered two fractured ribs when the automobile in which he was riding was struck by another car at a street intersection in Mankato. The only person injured in the accident, Dr. Hassett was believed to have been thrown forward against the dash board.

* * *

Two Thief River Falls physicians, Dr. Harold C. Johnson and Dr. C. A. Haberle, have announced their withdrawal from membership in a local clinic and have jointly engaged in general practice in a combined office in that city. They plan later to erect a clinic building in the business district of Thief River Falls.

* * *

In Sandstone on September 5, Dr. H. P. Dredge celebrated the forty-fourth anniversary of his arrival in the city. Forty-four years ago, Dr. Dredge stated, he arrived in Sandstone in a freight car, sleeping on a cot, surrounded by his household goods and a team of horses, but eager to open his medical practice.

* * *

At a meeting of the Cancer Institute, a division of the Iowa State Department of Health, held in Des Moines on September 23, Dr. D. O. Ferris of Rochester presented two papers, entitled "Carcinoma of the Kidney, Ureter and Bladder" and "Carcinoma of the Uterus." The meeting was sponsored by the Iowa State Medical Society.

* * *

Dr. Richard P. Griffin, who has been associated for the past year with Dr. I. L. Oliver at Graceville, recently opened a practice in the office of Dr. Oscar Daignault in Benson. A graduate of the University of Iowa in 1944, Dr. Griffin interned at Santa Rosa Hospital in San Antonio, Texas, before entering the navy for one year.

* * *

Recently discharged from the army, Dr. Gerald E. Bourget has become associated in practice with Dr. L. H. Rutledge and Dr. C. W. Moberg in Detroit Lakes. A graduate of the University of Minnesota in 1944, Dr. Bourget served his internship at Western Pennsylvania Hospital in Pittsburgh before entering the army.

* * *

Results of the chest x-ray survey in Blue Earth County and North Mankato were reported at the annual meeting of the Blue Earth County Public Health Association by Dr. Hilbert Mark, director of the Tuberculosis Division of the State Board of Health, who was the principal speaker at the September 24 meeting in Mankato.

* * *

Dr. Robert E. Rocknem, who recently completed an internship at Minneapolis General Hospital, was married in Minneapolis early in September to Miss Margery Lou Hill, formerly of Veblen, South Dakota. A graduate of the University of Minnesota, Dr. Rocknem expected to be called to active duty in the army in late September.

* * *

An emergency health board was organized in Hibbing at a meeting on August 27. The group will work within the framework of the Community Fund to supply funds for emergency health cases where needy patients are concerned. Among the members of the board are Dr. Carlyle Tingdale, Dr. T. A. Estrem, and Dr. C. N. Harris, all of Hibbing.

* * *

On October 1, Dr. W. W. Canfield returned to Houston after almost four years of absence, and opened offices for his medical practice. Dr. Canfield formerly practiced in Houston from 1929 until January, 1944, when he entered military service. After his discharge from the army, he practiced medicine for a short time at Forest Lake and at Winona.

* * *

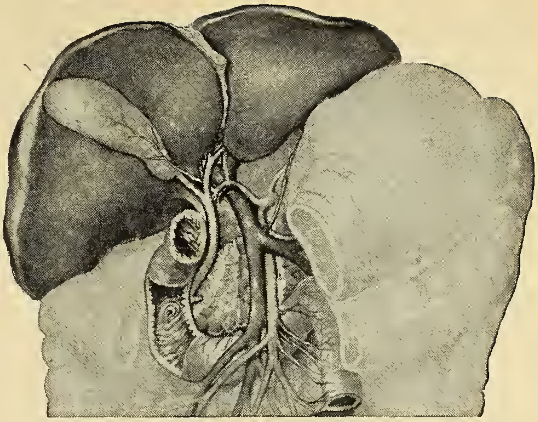
Dr. Percy T. Watson, Minneapolis, suffered bruises and an injury to his eye on the morning of September 8 when his automobile was struck on a highway near Rosemount by a car coming out of a blind crossing. Dr. Watson's car rolled over twice, bruising the physician and another occupant. The two occupants of the other car were not injured.

* * *

In White Bear, Dr. A. L. Wurdemann, formerly of East Orange, New Jersey, has opened offices for the general practice of medicine. Dr. Wurdemann, a graduate of the University of Iowa, served her internship at East Orange General Hospital in New Jersey and later became associated in an obstetrics and gynecology practice in East Orange.

* * *

Rochester physicians who presented papers at the annual session of the Michigan State Medical Society, at Grand Rapids, September 23 to 26, included Dr. S. W. Harrington, Dr. W. E. Herrell, and Dr. Paul A. O'Leary. Dr. Harrington spoke on "Surgical Treatment of Carcinoma of the Breast," Dr. Herrell on "The Present Status of Sulfonamide and Antibiotic Therapy," and Dr. O'Leary on "The Use of Penicillin in the Treatment of Syphilis in General Practice."



In Cholangitis . .

Decholin produces hydrocholeresis, flushing the bile ducts, removing accumulated mucus and inspissated bile.

In Cholecystitis . .

Decholin relieves stasis, discourages ascending infection, promotes drainage.

Word has been received that Dr. Donald T. Anderson, former Red Wing resident now on the staff of the Veterans Hospital in St. Cloud, has been promoted to the rank of captain in the U. S. Army Medical Corps.

* * *

An annual fall chest clinic was held in Faribault on September 22, at which time Dr. Karl H. Pfuetze, superintendent of Mineral Springs Sanatorium, interviewed former patients of the sanatorium and administered free Mantoux tests to all interested residents of the area as part of the campaign against tuberculosis.

* * *

Newly appointed to the staff of the University of Minnesota pediatrics department as an associate professor is Dr. Charles D. May, formerly of Boston. Graduated from Harvard University Medical School in 1935, Dr. May was director of the outpatient department at the Children's Hospital in Boston when he accepted the Minnesota appointment.

* * *

Dr. Charles D. Freeman, Jr., has opened offices at 1160 Lowry Medical Arts Building, Saint Paul, for the practice of dermatology and syphilology. After graduating from the University of Minnesota Medical School in 1942, Dr. Freeman spent three and a half years in the army medical corps in Puerto Rico, in Kentucky, and on the European front.

* * *

Dr. Erling G. Hestenes, resident physician at St. John's Hospital, Saint Paul, has accepted a call to establish a medical mission and public health service in Africa. Recently discharged from the army, Dr. Hestenes will assume his new duties early next year. It will be the first time that an American physician has been permitted to practice in British South Africa.

* * *

Dr. Charles W. Fogarty, Jr., has opened offices at 1019-1021 Lowry Medical Arts Building, Saint Paul, for the practice of internal medicine, with special emphasis on arthritis and allied rheumatic disorders and peripheral vascular diseases. Dr. Fogarty was a member of the class of 1938 of the University of Minnesota Medical School. He has since spent four years at the Mayo Clinic and four years in the army.

* * *

After practicing in Lakeville since January, Dr. Paul A. Wagner closed his office on September 15 and left for Portland, Oregon, to complete his war-interrupted postgraduate training in a hospital there. A graduate of the University of Minnesota, Dr. Wagner served for three years in the army, stationed in Burma for part of the time. Following his discharge, he opened practice in Lakeville.

* * *

The Dearholt Medal for distinguished service in combating tuberculosis has been awarded to Dr. S. A. Slater, superintendent of the Southwestern Minnesota Tuberculosis Sanatorium. The medal, named for the late Dr. Roy Dearholt of Milwaukee, pioneer tuberculosis fighter, was presented to Dr. Slater at a recent dinner meeting of the Mississippi Conference on Tuberculosis.

Under the leadership of Dr. J. W. Duncan, a committee in Moorhead is staging a county-wide drive to raise funds for the building of the Mayo Memorial medical center at the University of Minnesota. Plans are to establish a quota and work out a method for covering the entire county during the drive. In Moorhead the aid of local service organizations is being enlisted to cover the city.

* * *

Dr. John J. Bittner, University of Minnesota cancer research head and president of the American Association for Cancer Research, was a member of the nine-man United States delegation to the Fourth International Cancer Research Conference held in St. Louis, Missouri, September 2 to 7. About 200 scientists from more than thirty countries attended the conference, the first since the war ended.

* * *

The Southern Minnesota Spastic Club had Dr. John F. Pohl of Minneapolis as its guest speaker at a meeting held in Mankato on September 19. Dr. Pohl, who is attending orthopedic surgeon for the Michael Dowling School for Crippled Children, medical supervisor for the Elizabeth Kenny Institute, and a member of the medical advisory committee of the Minnesota Society for Crippled Children, discussed problems in the care and rehabilitation of cerebral palsied children.

* * *

Formerly of Minneapolis, Dr. Theodore Rasmussen has been appointed professor of neural surgery at the University of Chicago. A graduate of the University of Minnesota Medical School and a former fellow in the Mayo Foundation, Dr. Rasmussen has been doing neurosurgical work at the Montreal Neurological Institute for the past several years. During the war he was neural surgeon for the Fourteenth Evacuation Hospital in Burma.

* * *

On September 16, Dr. Donald W. Hastings, professor and head of the department of neuropsychiatry at the University of Minnesota, spoke at a meeting held in the Fort Snelling armory by the 110th General Hospital Organized Army Reserve.

A colonel in the Army medical reserve, Dr. Hastings discussed problems of military personnel in regard to neuropsychiatric fitness. Dr. Hastings is a member of a national ten-man commission studying that topic.

* * *

Dr. Curtis J. Lund, associate professor of obstetrics and gynecology at the University of Minnesota Medical School since 1943, has become head of the University of Louisiana's department of obstetrics and gynecology at New Orleans.

Dr. Lund, who received his medical degree at the University of Wisconsin in 1935, has been engaged in research work at the University of Minnesota and, previously, at the University of Wisconsin.

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL

Address:
Registrar, 427 S. Honore St., Chicago 12, Ill.

Brigham Hospital in Boston, died at his home on August 16, 1947. During World War II, Dr. Cutler was a brigadier general in the Medical Department of the Army, serving as chief consultant in surgery and later as chief of professional services in the Office of the Chief Surgeon, European Theater of Operations. He was an honorary consultant to the Army Medical Library.

* * *

Washington County will be one of the first areas in Minnesota, after the Twin Cities, to have a mass chest x-ray survey conducted, it was recently announced. No definite dates for the survey have yet been set, but it is expected that the program will get under way early in the fall of 1948. Funds to finance the survey will come partly from the sale of Christmas seals and partly from money raised by popular subscription in the county. Chairman of the survey is Roy Sakrison of Bayport.

* * *

Included in the new advisory board of the Diagnostic Clinic for Rheumatic Fever in the Wilder dispensary, Saint Paul, are Dr. Thomas E. Broadie, Dr. R. B. J. Schoch, Dr. George W. Snyder, Dr. Edward L. Strem, Dr. Robert Rosenthal, Dr. Harold Flanagan, Dr. James N. Dunn, and Dr. Paul F. Dwan.

Dr. Evelyn Harris is medical director of the clinic, which is sponsored by the Saint Paul section of the National Council of Jewish Women. Any Saint Paul child up to the age of eighteen years is eligible for the clinic's services.

* * *

Dr. Donald E. Hoaganson, a former Bemidji resident who has been practicing with Dr. H. R. Tregilgas in Saint Paul, recently moved back to Bemidji and became associated with Dr. Charles W. Vandersluis of that city.

A graduate of the University of Minnesota Medical School in 1944, Dr. Hoaganson served his internship at St. Joseph's Hospital in Saint Paul before entering the armed services. Following his discharge from the army in March, 1947, he joined Dr. Tregilgas in Saint Paul.

* * *

Formal recognition for his contributions to medicine and public health has been given to Dr. William A. O'Brien, director of postgraduate medical education at the University of Minnesota, by the House of Delegates of the Minnesota State Medical Association. A resolution recently passed by the House of Delegates commented on Dr. O'Brien's radio health broadcasts, and read in part: "Resolved that this House express its deep appreciation and thanks to Dr. O'Brien for the unique contribution he has made through his work to medicine and the public health in Minnesota."

* * *

Dr. Richard Virnig, who was released from naval service in June, has joined his brother, Dr. Mark P. Virnig, in medical practice in Wells.

The brothers are having the first floor of a building in Wells remodeled into a fourteen-room office suite.

The new offices will include waiting room, recovery and physiotherapy room, two private offices with adjoining treatment rooms, x-ray room, darkroom, laboratory, secretary's office, and a minor surgery room.

Dr. Richard Virnig is a graduate of the University of Minnesota. He interned at the Naval Hospital in Philadelphia and then served for five years in the navy. He was discharged on June 25.

* * *

A new member of the Marshall Medical Center is Dr. P. C. Hedenstrom, formerly at Bethesda Hospital in Saint Paul. The staff of the Marshall clinic is now comprised of Dr. W. W. Yaeger, Dr. J. E. Murphy and Dr. Hedenstrom.

* * *

Following a flood in Hibbing in the week of September 7, Dr. Carlyle Tingdale, local health officer, stated that citizens who had been exposed to insanitary sewer conditions should consult their local physicians in regard to typhoid innoculations. In his newspaper message, Dr. Tingdale said that there was no imminent danger but that the preventive health measure should be observed.

* * *

Dr. Clifford G. Grulee, Jr., an instructor in pediatrics at the University of Minnesota since 1946, has accepted a position as assistant professor of pediatrics at the University of Texas, Galveston. Dr. Theodore G. Panos, head resident physician in pediatrics at the University of Minnesota, will also move to Galveston to become an instructor in pediatrics at the University of Texas. He has been at Minnesota since 1945.

Both Dr. Grulee and Dr. Panos will be associated with Dr. Arild E. Hansen, head of the pediatrics department at the University of Texas, who was formerly an associate professor of pediatrics at the University of Minnesota.

* * *

After five years of medical practice at Erskine, Dr. J. H. Cameron has joined the staff of the Northwestern Clinic at Crookston, where he will be associated with Dr. C. L. Oppegaard in the Eye, Ear, Nose and Throat Department.

A graduate of the University of Saskatchewan and McGill University of Surgery at Montreal, Dr. Cameron took postgraduate work in surgery at California Hospital in Los Angeles and at New York Polyclinic Hospital. Before opening his practice at Erskine in 1942, he practiced in Bagley for four years. Dr. Cameron is a past president of the Red River Valley Medical Society.

* * *

Approved residencies in internal medicine and general surgery will soon be available at the Veterans Administration Center, Dayton, Ohio, it was recently announced. The residency training program is being conducted under the auspices of the University of Cincinnati College of Medicine and will follow the pattern of residencies in the Cincinnati General Hospital. There are 1,004 general medical and surgical beds at the VA institution and 2,500 domiciliary beds. Application for residency should be made to Dr. D. E.

For two weeks in September Dr. Ira O. Wallin, Saint Paul, conducted the practice of Dr. W. J. Lund in Staples while Dr. Lund was a patient in the Northern Pacific Hospital in Saint Paul.

* * *

On August 23, Dr. Linus F. Leitschuh, a former resident of Minneapolis, was married to Miss Helen Patricia Carroll in Portland, Oregon, where Dr. Leitschuh is on the staff of Providence Hospital. A graduate of the University of Minnesota in 1937, Dr. Leitschuh was at Minneapolis General Hospital for three years, after which he practiced at Red Lake Falls for one year. He then served in the army for five years. After January 1, 1948, he will be established in an obstetrics and gynecology residency at St. Mary's Hospital, Minneapolis.

* * *

Two talks on tuberculosis were given by Dr. Kathleen Jordan, Granite Falls, at meetings held in Virginia and Ely on September 23. In the afternoon, Dr. Jordan, whose husband is Dr. Lewis S. Jordan, superintendent of Riverside Sanatorium in Granite Falls, addressed a gathering of school superintendents, physicians and nurses in Virginia, leading a discussion on Mantoux testing in schools of the area. Dr. Mario Fischer, Duluth city health director, presided at the meeting. In Ely, at a dinner meeting that evening, Dr. Jordan spoke on "The Eradication of Tuberculosis."

Both meetings were part of the anti-tuberculosis program being conducted by the St. Louis County Tuberculosis and Health Association.

* * *

Announcement has been made that Dr. Milton D. Starekow, for the past six years associated with the Lynde Clinic in Thief River Falls, has purchased the clinic from Dr. O. G. Lynde, and that Dr. Frank Fraser, formerly on the staff of St. Vincent's Hospital in New York, has become associated with Dr. Starekow in the practice of medicine and surgery.

A graduate of the Medical College of New York University, Dr. Fraser served his internship and a surgery residency at St. Vincent's Hospital, New York. He then studied surgery for eighteen months under Dr. L. K. Ferguson in Philadelphia. During the war Dr. Fraser served in the navy for three and one-half years.

* * *

For his aid in planning medical evacuations during the Normandy invasion, Dr. Einar C. Andreassen, chief of medical service for the Veterans administration branch at Fort Snelling, has been awarded the Order of the British Empire by the king of England.

Dr. Andreassen, who was chief of medical operation for the U. S. Army in southern England during the war, will go to Washington to receive the award from the British ambassador.

Dr. Andreassen, a graduate of the University of Minnesota in 1917, was a Navy lieutenant during

World War I. After six years in China as a doctor with the Lutheran Board of Missions, he set up practice in Minneapolis. He was called to active military duty with the Minnesota National Guard in 1941.

* * *

Honorary fellowship in the American Medical Association has been granted Dr. C. P. Robbins, Winona, who is now in his fifty-fourth year of medical practice.

Dr. Robbins, a graduate of Jefferson Medical College in Philadelphia in 1894, first opened his medical practice in Winona in 1896 after a year in Los Angeles and a year of postgraduate surgical study in New York. During his years in Winona he twice traveled to Europe for a year of study in Vienna, Berlin and London. In his earlier years of practice he was a steady contributor to several medical journals.

Dr. Robbins has been the official Winona County physician for ten years. He is a life member of the Winona County Medical Society and an honorary life member of the Minnesota State Medical Association.

* * *

As a one-man commission for the Rockefeller Foundation, Dr. Irvine McQuarrie, head of the pediatrics department of the University of Minnesota Medical School, left for Japan on September 16 to conduct a three-month survey of medical education and practice.

Dr. McQuarrie will visit twenty-seven Japanese medical schools, inspecting laboratory facilities, clinics, libraries and hospitals. His report will aid the Rockefeller Foundation in determining its future support of Japanese medical training. Dr. McQuarrie also will be a special consultant to General MacArthur on medical education.

During his absence, Dr. John M. Adams, associate professor, will be acting head of the pediatrics department.

* * *

Ten orthopedic clinics are being conducted throughout the state this fall by the State Division of Social Welfare.

The clinics include examinations by orthopedic surgeons, diagnosis and recommendation for treatment, consultation with the patient's physician, and vocational advice for children more than sixteen years old. The service is made possible by state and federal funds and is part of the crippled children's service of the welfare division.

Each clinic conducted in the state serves several different counties in the area surrounding the site of the clinic. Cities at which clinics are being conducted are the following: Winona, Fergus Falls, Bemidji, Virginia, Cambridge, Little Falls, Mankato, Crookston, Willmar, and Marshall.

Organizations co-operating in the program are the Minnesota-Dakota Orthopedic Society, Northwestern Pediatric Society, Gillette State Hospital for Crippled

Children, Division of Vocational Rehabilitation, Minnesota Public Health Association, and the Minnesota State Medical Association.

* * *

Twice within the past year an International Falls eye, ear, nose and throat specialist has had the unusual task (for his geographic area) of removing a filaria parasite from the eye of a patient.

The patient, an ex-missionary, contracted filariasis between 1925 and 1932 while living in the Belgian Congo. Not until several years after her return to the United States did she become aware of the infection. At that time a California physician removed a filaria parasite from one eye. A year ago, while living in International Falls, she again noticed a "wriggling sensation" in her left eye. Her local physician removed an inch-long parasite from the superficial tissues of her eyeball. In August of this year, she again experienced the same symptom, and for the second time the International Falls physician hooked out a filaria parasite, this one 22 millimeters long and embedded in the lower lid of her left eye.

* * *

Fifty-nine years of medical practice lie behind Dr. Ward Z. Flowers, Gibbon, who has at last retired in the community he served for three decades.

After graduating from the University of Illinois School of Medicine in 1886, Dr. Flowers came to Minnesota for a brief visit with his sister in Sibley County. His love of hunting was so satisfied by the abundant wild life in that area that he decided to stay and practice medicine for one year. After twelve months in Gibbon, he gave up plans to study in Germany and decided to make Gibbon his home. The hunting was too good to leave.

Hunting has always been Dr. Flowers' favorite recreation. From 1896 until 1940 he never missed an open season for deer in the United States and Canada. Though less active now at the age of eighty-six, he still keeps his guns free from rust for each fall season.

Dr. Flowers practiced in Gibbon for thirty-three years, and then moved to Minneapolis for another twenty years of professional work. When his wife died in 1940, he returned to Gibbon, reopened his practice, and served the community until 1946. During the past summer, while Gibbon was without a resident physician, Dr. Flowers was still on call for emergency cases.

* * *

Attorney General J. A. A. Burnquist on September 5 ruled that a school board has power to abolish the position of school physician but it has no authority to contract with a hospital to furnish professional services of a physician.

The legal question came up when a school board in St. Louis County employed a school physician for the year 1946-47, then in August abolished the position and made a contract with a local hospital to furnish physicians to serve the school. The physician whose position was abolished claimed veterans preference right to employment and contended his contract was still in force.

"It was for the school board to decide whether it would have a school physician," stated Burnquist. "It decided to have one for the year 1946-47. The board had the power to continue or discontinue the employment. When the board abolished the position, it determined a policy."

In regard to the hospital contract, however, the attorney general emphasized that "a hospital is not a person and is not licensed to practice medicine." He went on, "I fail to understand how in the case under consideration a hospital can assume to furnish the services which the law contemplates will be performed by physicians. In other words, the hospital cannot practice medicine."

The attorney general then ruled: "So far as the board attempted to contract with a hospital to furnish the professional services of a physician, it is my opinion that the contract was without effect and, in fact, was not a contract."

* * *

DR. M. A. BURNS HONORED

Dr. M. A. Burns of Milan was the guest of honor at festivities held at the Kviteseid Lutheran Church at Milan, Minnesota, on September 14, 1947. Friends and townsfolk gathered in large numbers to celebrate approximately fifty years of faithful and conscientious service contributed by Dr. Burns to the community.

The idea of the appreciation day festival for the doctor originated among his friends and was carried out by action of the Milan Commercial Club.

The program started at 2:30 p.m. with Rev. Frank M. Salveson as master of ceremonies. Rev. R. R. Syrdal, Madison, former pastor at Milan, pronounced the invocation. This was followed by a song by the Gay Nineties Quartette of Montevideo. Dr. William A. O'Brien, Minneapolis, delivered an address, dwelling on some of the great advances made in the science of medicine during the past fifty years.

Dr. Leon G. Smith, Montevideo, told how he and Dr. Burns have been working pleasantly together in the practice of their profession. He also presented the guest of honor with a pin awarded by the Minnesota State Medical Association for fifty years of medical practice. Miss Solveig Anderson brought a greeting from the Milan school in appreciation of the many years Dr. Burns has served as a member of the local board of education.

The Rev. Mr. Salveson read a paper written by Dr. Arnold Anderson of St. Petersburg, Florida, but formerly of Milan, telling of many interesting incidents of the early days in Milan.

A gift in the form of a gold watch was then presented by the Rev. Mr. Salveson to the honored guest. It bore the inscription: "Dr. M. A. Burns, 50 Years of Faithful Service, 1898-1948, Milan Community."

After Dr. Burns had expressed his appreciation of the honors shown him, refreshments were served in the church parlor. In passing down the line to greet the guest of honor, each person deposited a gift of money in a large bowl which, with its contents, was later presented to Dr. Burns.

It was generally agreed that the celebration was a great success from beginning to end, and served its purpose of expressing the appreciation of the community to Dr. Burns.

* * *

AMERICAN CONGRESS OF PHYSICAL MEDICINE

Physical medicine stepped into the spotlight on September 2 when the American Congress of Physical Medicine opened its twenty-fifth annual meeting in the Radisson Hotel in Minneapolis. An estimated 500 specialists in physical medicine attended the five-day session which extended through September 6.

On the first day of the meeting a prediction was made by Dr. Max Newman, head of the physical medicine section at Wayne University, Detroit, that within the next ten years even small general hospitals in the United States will expand to include physical and occupational therapy departments. The new president of the organization, Dr. H. Worley Kendall of the University of Illinois, pointed out the great strides that physical medicine has been making in the rehabilitation of war veterans and in the return to productivity of persons injured in industry. "Physical medicine has become one of the vital agents in keeping American production in high gear," he stated.

Among the mechanical devices exhibited at the meeting was an electrical apparatus developed by Dr. Donald L. Rose, University of Kansas, and Dr. Sedgwick Mead, Massachusetts General Hospital, that measures the level of a patient's ability to withstand pain. It is hoped that the device will lead to research which will produce apparatus to stimulate muscles without pain or discomfort of any kind.

Dr. Allan Hemingway, University of Minnesota, demonstrated to the group the value of an oximeter in the treatment of poliomyelitis, while the essentials of atom smashing and the development of radioactive elements were displayed by Dr. Frederic T. Jung of the AMA Council on Physical Medicine.

Artificially induced fever was shown to be of some value in the treatment of chronic rheumatoid arthritis by three Mayo Clinic physicians, Dr. Frank H. Krusen, Dr. K. G. Wakim, and Dr. E. C. Elkins. Physical exercise, started while tuberculosis patients are still confined to bed, was advocated by Dr. Edwin R. Levine of Michael Reese Hospital, Chicago.

The importance of games and exercise in the treatment of mental disease was emphasized by Dr. J. E. Davis, Veterans Administration chief of corrective physical rehabilitation, who cited numerous examples to show that the proper use of games and exercise helps restore mental balance by developing confidence in the patient or respect for his fellow men.

At the annual dinner of the organization on the evening of September 4, the gold key award of the Congress was presented to Dr. A. C. Ivy, physiology professor and vice president, University of Illinois; to Major General Norman T. Kirk, former surgeon general of the army, and to Lord Thomas Horder, president of the British Association of Physical Medicine. Dr. Ivy was the only one of the three present to receive the citation.

Dr. O. Leonard Huddleston, Los Angeles, was named president-elect of the Congress, and Dr. Earl C. Elkins, Rochester, was elected first vice president.

HOSPITAL NEWS

The American College of Hospital Administrators named Ray Amberg, Rosetown, second vice president of the organization at a convention held September 22 in St. Louis. Mr. Amberg is superintendent of the University of Minnesota Hospitals.

* * *

While in Minneapolis in August, Dr. Paul R. Hawley, chief medical director of the Veterans Administration, stated that the proposed $6,000,000 addition to the Fort Snelling Veterans Hospital will make the institution one of the most modern medical centers in the nation. He said that the hospital already is "one of the outstanding plants of the world," including private hospitals, and that much of the credit for the rating must go to the University of Minnesota for placing its medical resources behind the hospital.

The new addition will be a centrally placed structure connected to the other buildings in a spoke-like arrangement. It will house surgery and clinical departments and will allow the addition of 300 beds, to give the hospital a total of 1,100 beds.

* * *

One of the speakers at the forty-ninth annual convention of the American Hospital Association, held in St. Louis, September 22 to 25, was Dr. Victor Johnson, director-elect of the Mayo Foundation for Medical Education and Research. Dr. Johnson spoke on "Medical Education in the Tax-supported Hospital."

* * *

Rising hospital expenses were explained to the Minneapolis public on September 4 by Dr. William A. O'Brien, chairman of the Minnesota Hospital Association's Council on Public Education, who pointed out that

BORCHERDT MALT SOUP EXTRACT

the hospitals are continually trying to find ways to cut costs while still maintaining high standards of service.

Dr. O'Brien described a ten-year cost study at an "average" hospital which showed that most expenses have more than doubled in the last decade.

"In 1938 the cost of operating this hospital was $6,400 a month," he said, "while today it is $13,730. Nursing service has increased from $1,750 a month in 1938 to $6,312 in 1947, dietary service from $1,087 to $2,768, laundry from $450 to $750, housekeeping from $390 to $824, administration from $904 to $1,598, and plant maintenance from $1,123 to $1,384 per month. Likewise, the hospital's payroll in 1938 amounted to $4,841 a month for sixty-five employes, but today totals $17,700 for 125 employes."

IT DOES HAPPEN HERE

Severe rickets still occurs — even in sunny climates

Vitamin D has become such an accepted practice in infant feeding that it is easy to think that rickets has been eradicated. However, even deforming rickets is still seen, as witness the above three contemporary cases from three different sections of the United States, two of them having well above the average annual sunshine hours for the country. In no case had any antirickets been given during the first two years of life. *It is apparent that sunlight did not prevent rickets.* In other cases of rickets, cod liver oil was given inadequately (drop dosage) and even this was continued only during the winter months.

To combat rickets simply, inexpensively, effectively —

OLEUM PERCOMORPHUM

This highly potent source of natural vitamins A and D, if administered regularly from the first weeks of life, will not only prevent such visible stigmata of rickets as pictured above, but also many other less apparent skeletal defects that might interfere with good health. What parent would not gladly pay for this protection! And yet the average prophylactic dose of Oleum Percomorphum costs less than one cent a day. Moreover, since the dosage of this product is measured in drops, it is easy to administer Oleum Percomorphum and babies take it willingly. Thus there is assurance that vitamin D will be administered *regularly.*

OLEUM PERCOMORPHUM WITH OTHER FISH-LIVER OILS AND VIOSTEROL

Potency, 60,000 vitamin A units and 8,500 vitamin D units per gram. Supplied in 10 cc. and 50 cc. bottles; and as capsules in bottles containing 50 and 250.

Your Ability to Earn is your Greatest Asset

Many disability policies contain the following clauses:

(1) Standard Provision No. 16 which reads: "The Company may cancel this policy at any time, etc." or—

(2) "This policy may be renewed WITH THE CONSENT OF THE COMPANY from term to term."

If a disability policy has one of the above clauses, you may not have coverage when you most need it.

Don't make your policy part of the hazard of disability.

Protect your earning capacity with long term, non-cancellable, incontestable disability insurance.

Facts regarding *fluidity* of PENICILLIN in oil and wax

When penicillin in oil and wax is to be used once daily, the most important consideration is the maintenance of therapeutic blood levels for 24 hours.

For easy administration and adequately sustained blood levels, the formula must be neither too viscous nor too fluid . . . the penicillin crystals of correct size, shape and density . . . the container appropriate to the use intended. The following should also be recognized:

1 For administration from multiple-dose vials, the mixture should be sufficiently fluid to permit easy withdrawal, accurate measurement and easy injection.

2 In all fluid preparations, however, the penicillin has a tendency to settle out. Unless the container has adequate air space and volume to permit resuspension of the settled penicillin by shaking, 24 hour blood levels may not be maintained. Either overdosage or underdosage may result.

3 When injected from individual-dose cartridges, the penicillin in oil and wax suspension should be of slightly thicker consistency. If it is not, and the penicillin settles out, it cannot be resuspended by shaking, because (a) the volume is too small, and (b) the cartridge has no air space.

4 The slightly heavier type of suspension can be easily injected in accurate dosage with a minimum of discomfort to the patient. It is essentially free-flowing at room temperature, and each cartridge contains a full 1 cc. (300,000 unit) dose, which eliminates the need of measuring.

In keeping with Squibb policy of making the form of the product appropriate to the use, two forms of Squibb Penicillin G in Oil and Wax are available. Each offers the advantages of proper formula and consistency.

For easy, individual injections in home, office and emergency:

SQUIBB PENICILLIN G IN OIL AND WAX

Essentially free-flowing at room temperature: in Double-cell Cartridges for use with B-D* disposable or permanent syringe.

*T. M. REG. BECTON, DICKINSON & CO.

For easy, mass injections in clinic, hospital, or office, the new 10 cc. vial of

SQUIBB LIQUID PENICILLIN G IN OIL AND WAX

Resuspension readily attained; easy to inject; no withdrawal difficulties.

ETHICS

VALIDOS UNIMUS

CAMP

INVALIDIS SERVIMUS

There can be no middle course between the ethics of the medical profession and the temptations of the market place in the field of anatomical supports. Here the standards of the businessman must be elevated to the standards of the doctor because the customer of the businessman is the patient of the doctor. Anything else is "merchandising quackery." We at Camp have for many decades controlled our distribution throughout the recognized retail institutions which like the doctor have earned the respect and confidence of their home communities. No appeal is used in our advertising approach to the consumer which fails to meet the precepts of the profession. We serve the physician and surgeon by living up to our chosen function of supplying scientific supports of the finest quality in full variety at prices based on intrinsic value. We try to insure the precise filling of prescriptions through the regular education and training of fitters. In cooperation with medical and educational public health authorities we play the role our resources permit in promoting better posture and body mechanics. That is our idea of the practical ethical standards which permit the businessman to solicit the recommendation of the doctor.

Camp Anatomical Supports have met the exacting test of the profession for four decades. Prescribed and recommended in many types for prenatal, postnatal, postoperative, pendulous abdomen, visceroptosis, nephroptosis, hernia, orthopedic and other conditions. If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent upon request.

A POSITIVE STEP
toward an
Active Middle Age

Outstanding clinical endocrinologists, both here and abroad, have commented on the brighter mental outlook displayed by women receiving "Premarin." Not only does "Premarin" impart a feeling of "well-being" but it offers many other advantages as well.

It is orally active.
It is well tolerated.
It is promptly effective in controlling the menopausal syndrome.

"Premarin" is supplied in three potencies—tablets of 2.5 mg., 1.25 mg. and 0.625 mg. It is also available in liquid form containing 0.625 mg. in each 4 cc. (1 teaspoonful).

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens . . . estradiol, equilin, equilenin, hippulin . . . are also present in varying small amounts, probably as water-soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract.

Exacting head linesman .... dietary dub!

He sees that first-downs are measured accurately, but he lets his diet be measured by the whims of his appetite. Sooner or later he faces the penalty of subclinical vitamin deficiency—along with a host of other self-made victims: *food-faddists,* excessive smokers, alcoholics, those on self-imposed and ill-advised reducing diets, patients "too busy" to eat properly, to name only a few. When such patients come to you, dietary reform is your first thought. Your second may well be a suitable vitamin supplement. For these cases, consider the advantages of specifying Abbott Vitamin Products: known quality . . . assured potency . . . wide variety to fit every vitamin need—in supplemental or therapeutic levels of dosage, in oral or parenteral forms, in single or multiple vitamin preparations. Abbott Vitamin Products are readily available at all prescription pharmacies.

ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS

VAGINAL JELLY
Ramses
PRESCRIPTION PACKET
NO. 501

1. Extensive clinical experience has established that the combined use of an occlusive diaphragm and a spermatocidal jelly affords the optimum in protection to the patient.

2. A comprehensive report shows an overwhelming preference for the diaphragm-jelly technique of conception control. In a survey comprising 36,955 cases, clinicians prescribed this method for 34,314 or 93 per cent.[1]

3. Warner,[2] in a study of 500 cases in private practice, concludes that the combined technique is the most efficient method; there was no case of unexplained failure.

4. For the optimum of protection and simplicity in use we suggest the "RAMSES" Prescription Packet NO. 501 . . . a complete unit, containing a "RAMSES" Patented Flexible Cushioned Diaphragm of prescribed size, a "RAMSES" Diaphragm Introducer of corresponding size, and a large tube of "RAMSES" Vaginal Jelly.† Available through all prescription pharmacies. Complete literature to physicians on request.

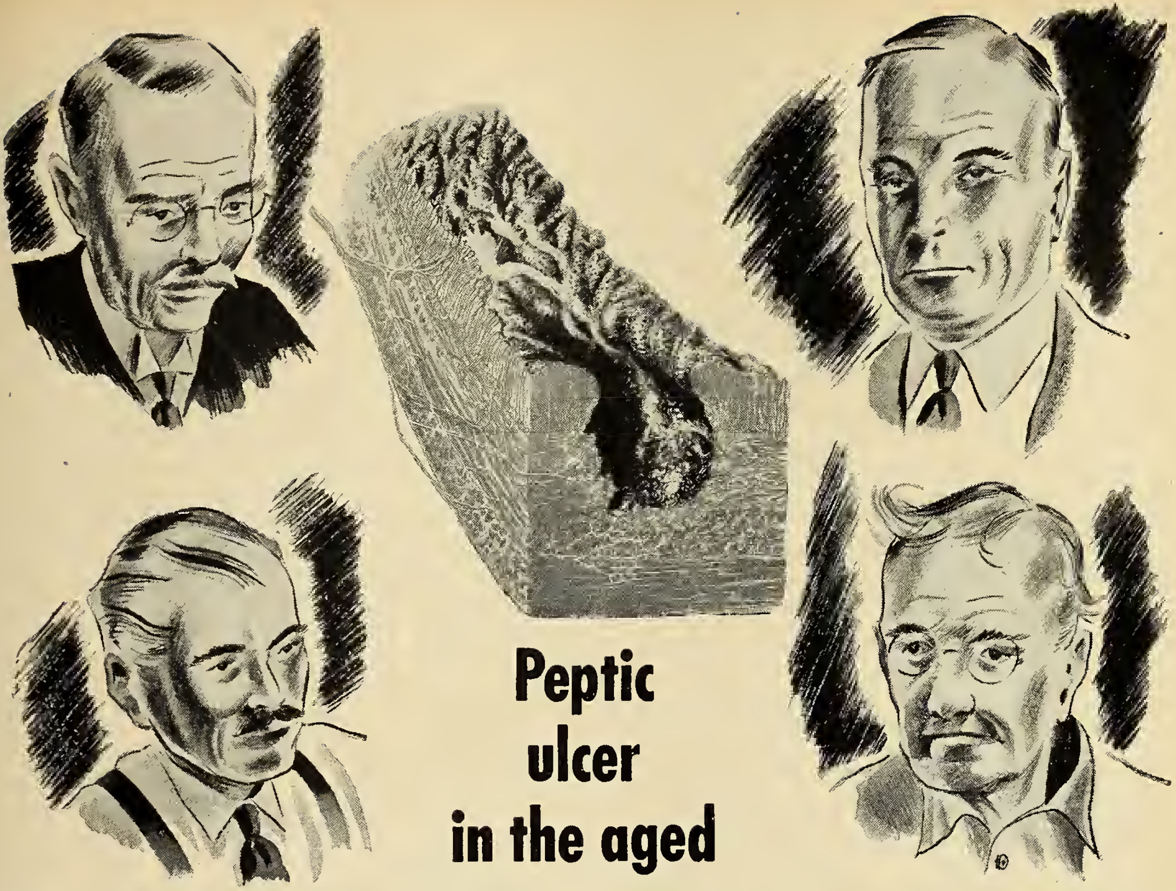
A MARK OF Ramses DEPENDABILITY



Peptic ulcer in the aged

Recent statistics indicate that more than 10 per cent of all peptic ulcers occur in persons past the age of 60. Except for a greater tendency to bleed, ulcers in the aged are no different from those in younger persons and require essentially the same therapeutic program of rest, diet and acid neutralization.

Creamalin, the *first* aluminum hydroxide gel, readily and safely produces sustained reduction in gastric acidity. With Creamalin there is no compensatory reaction by the gastric mucosa, no acid "rebound," and no risk of alkalosis. Through the formation of a protective coating and a mild astringent effect, nonabsorbable Creamalin soothes the irritated gastric mucosa. Thus it rapidly relieves gastric pain and heartburn, and helps in the healing of peptic ulcers as well as in the prevention of a recurrence.

Creamalin®

***First* Brand of Aluminum Hydroxide Gel**

Supplied in 8 fl. oz., 12 fl. oz. and 16 fl. oz. bottles

MEAT

And Protein Deficiency

While protein deficiencies per se are difficult to recognize in their incipiency, conditions which lead to negative nitrogen balance are well known. The presence of any of the following states which characteristically exert an adverse influence on nitrogen balance, calls for immediate measures to prevent serious protein depletion:

1. Diseases of the digestive organs, which impair proper digestion and absorption.
2. Wasting diseases, infections and thyrotoxicosis, which increase protein breakdown and need far above normal levels.
3. Hemorrhage, burns, and chronic exudative processes, causing excessive loss of protein.

A high protein diet, whenever possible, is considered to be the most effective method of protein administration in the prevention and correction of protein deficiencies.

Meat, which readily is eaten two or more times daily, is an excellent component of the high protein diet. Meat is an outstanding source of protein for the following reasons. The protein of meat is biologically complete, capable of satisfying the body's protein needs. The percentage of protein contained in meat makes it one of man's most important protein foods. And, all meat is highly digestible—96 to 98 per cent—an important consideration especially in the presence of disease.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

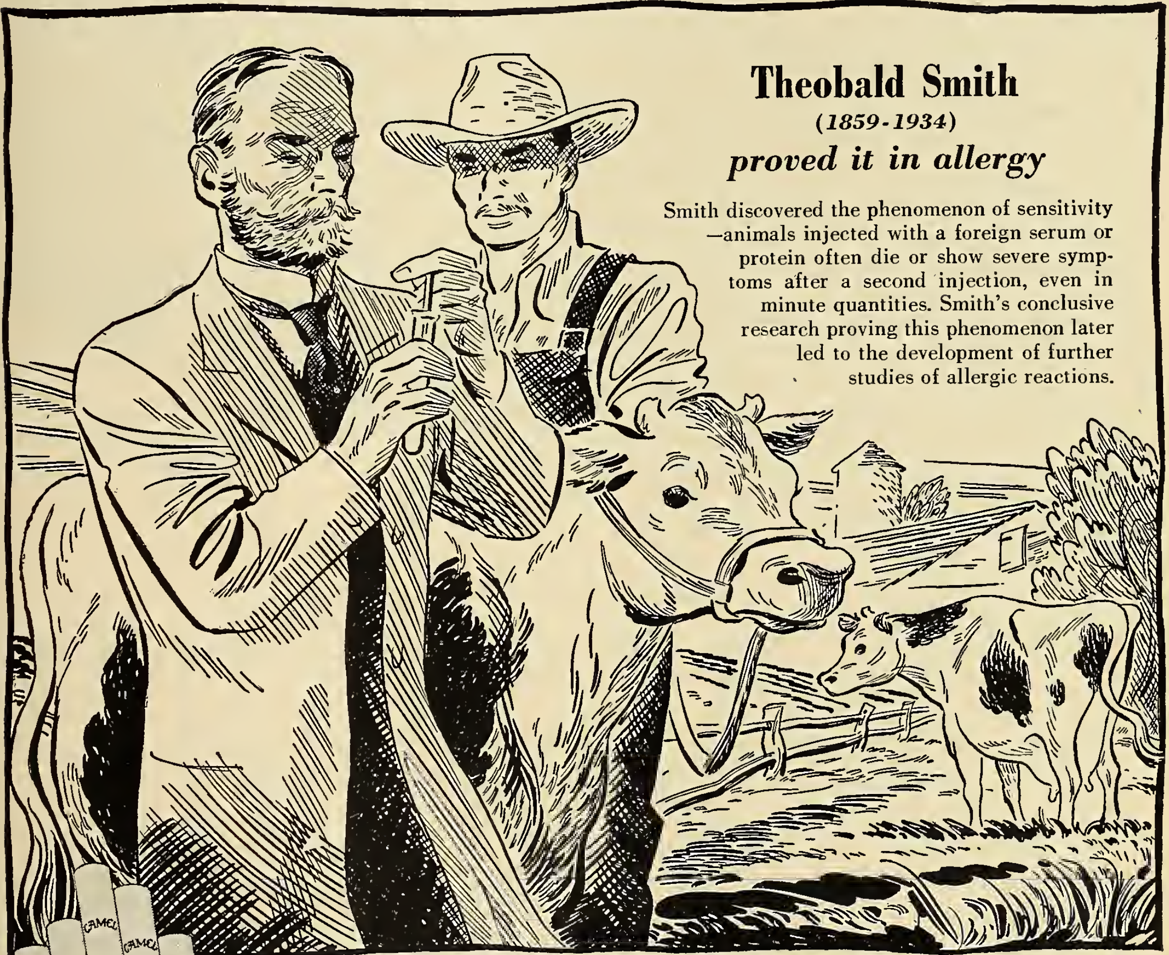
Experience is the Best Teacher



Theobald Smith
(1859-1934)
proved it in allergy

Smith discovered the phenomenon of sensitivity —animals injected with a foreign serum or protein often die or show severe symptoms after a second injection, even in minute quantities. Smith's conclusive research proving this phenomenon later led to the development of further studies of allergic reactions.

CAMEL
CHOICE QUALITY
TURKISH & DOMESTIC BLEND CIGARETTES

Yes, and experience is the best teacher in smoking too!

EXPERIENCE during the wartime cigarette shortage taught smokers the differences in cigarette quality. In those days, people smoked —and compared—many different brands. That's the experience from which so many smokers learned that Camels suit them best. **As a result, more people are smoking Camels than ever before.**

Try Camels! Let *your* taste and throat tell you why, with millions who have tried and compared, Camels are the *choice of experience!*

Turmoil Time

Replacing Turmoil with Serenity

Replacing turmoil with serenity for women undergoing menopausal disturbances has become a matter of comparatively specific therapy

Choice of an estrogenic product in this condition is likewise well charted. For optimum relief of symptoms, the competent physician selects a product whose manufacturing history he need never question.

This, perhaps, may account for the wide use of Solution of Estrogenic Substances, Dorsey. Made by Smith-Dorsey Company, whose plant facilities, personnel and procedure are above reproach, these products merit the continuing confidence of careful doctors.

"Beginner's luck" isn't always good

The good luck so often attributed to beginners can't be counted on in infancy. Here the "beginners" often meet insurmountable obstacles which have raised the proportion of infant deaths within the first 30 days to 62.1% of the total infant mortality.* During this hazardous first month proper selection of the first formula is therefore of vital importance.

'Dexin' has proved an excellent "first carbohydrate" because of its high dextrin content. It (1) resists fermentation by the usual intestinal organisms; (2) tends to hold gas formation, distention and diarrhea to a minimum, and (3) promotes the formation of soft, flocculent, easily digested curds. 'Dexin' *does* make a difference.

*Vital Statistics—Special Reports: Vol. 25, No. 12, National Office of Vital Statistics, Washington, D. C. (Oct. 15) 1946, p. 206.

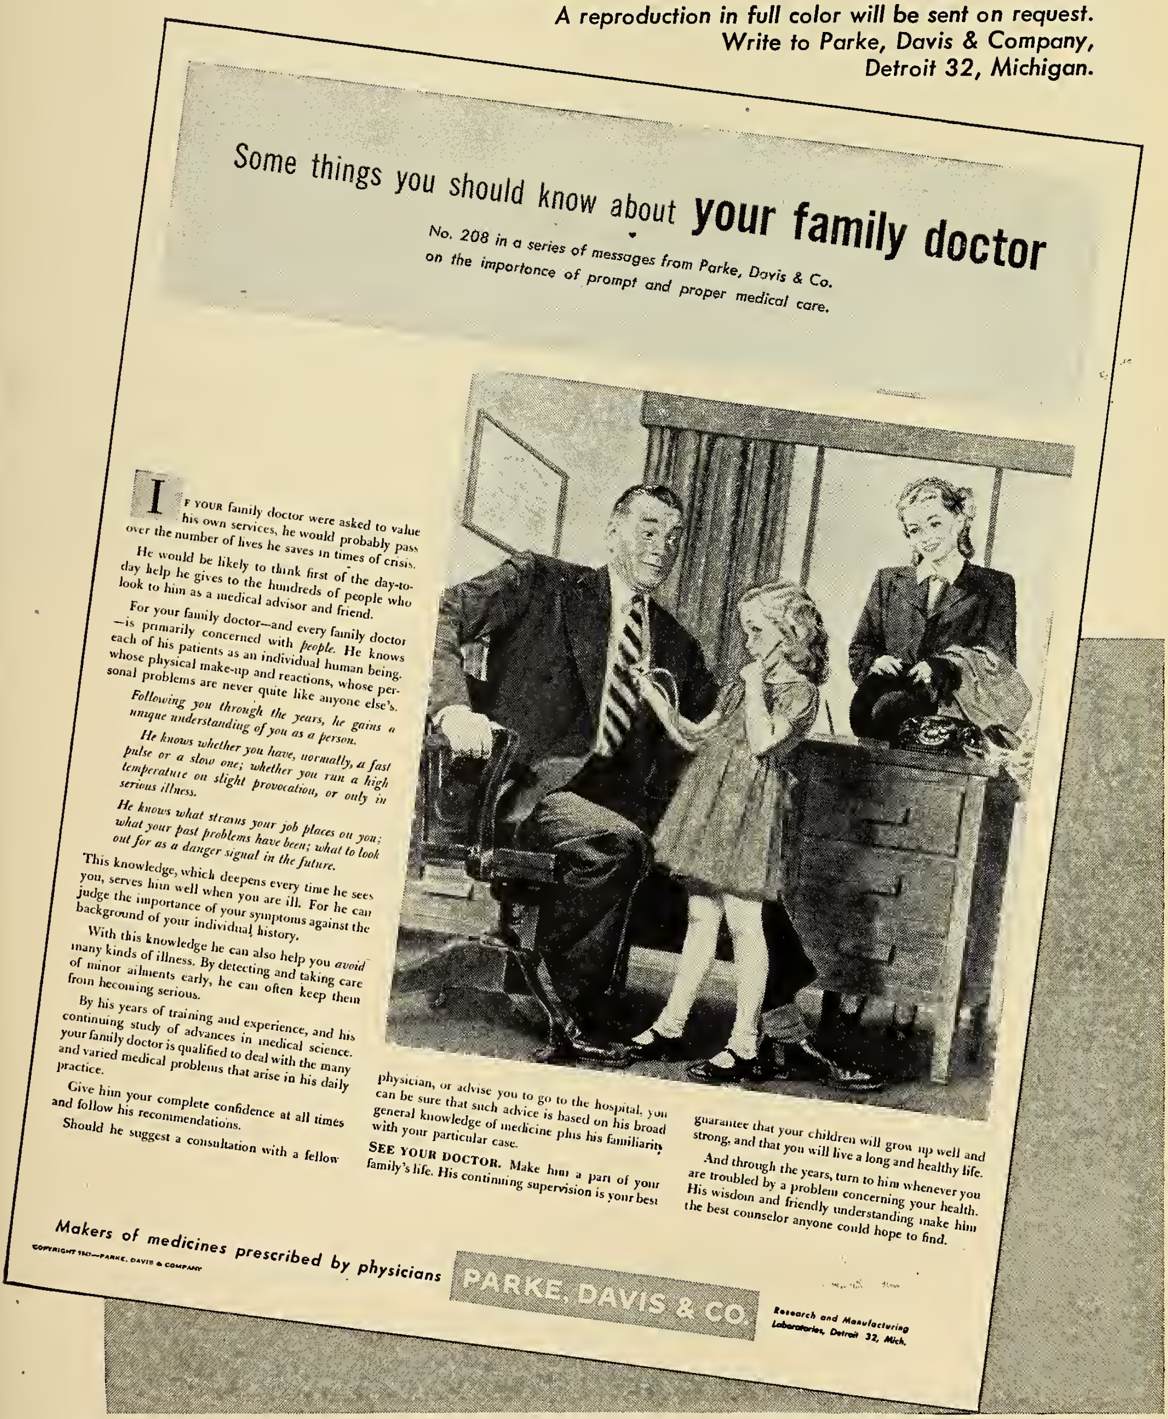
No. 208 in the "See Your Doctor" series

. . . published in behalf of the medical profession

To an audience of over 23 million people, in LIFE and other national magazines, Parke-Davis presents the message shown below.

A reproduction in full color will be sent on request.
Write to Parke, Davis & Company,
Detroit 32, Michigan.



Some things you should know about **your family doctor**

No. 208 in a series of messages from Parke, Davis & Co. on the importance of prompt and proper medical care.

If your family doctor were asked to value his own services, he would probably pass over the number of lives he saves in times of crisis.

He would be likely to think first of the day-to-day help he gives to the hundreds of people who look to him as a medical advisor and friend.

For your family doctor—and every family doctor—is primarily concerned with *people.* He knows each of his patients as an individual human being, whose physical make-up and reactions, whose personal problems are never quite like anyone else's.

Following you through the years, he gains a unique understanding of you as a person.

He knows whether you have, normally, a fast pulse or a slow one; whether you run a high temperature on slight provocation, or only in serious illness.

He knows what strains your job places on you; what your past problems have been; what to look out for as a danger signal in the future.

This knowledge, which deepens every time he sees you, serves him well when you are ill. For he can judge the importance of your symptoms against the background of your individual history.

With this knowledge he can also help you *avoid* many kinds of illness. By detecting and taking care of minor ailments early, he can often keep them from becoming serious.

By his years of training and experience, and his continuing study of advances in medical science, your family doctor is qualified to deal with the many and varied medical problems that arise in his daily practice.

Give him your complete confidence at all times and follow his recommendations.

Should he suggest a consultation with a fellow physician, or advise you to go to the hospital, you can be sure that such advice is based on his broad general knowledge of medicine plus his familiarity with your particular case.

SEE YOUR DOCTOR. Make him a part of your family's life. His continuing supervision is your best guarantee that your children will grow up well and strong, and that you will live a long and healthy life.

And through the years, turn to him whenever you are troubled by a problem concerning your health. His wisdom and friendly understanding make him the best counselor anyone could hope to find.

The First Modern Anatomy . . .

Medicine and Dentistry thank Belgium's Vesalius (1514-1564) for the first accurate knowledge of human anatomy. Galen's knowledge of monkeys, dogs and pigs had been gospel for 1,350 years. But what of the *human* body? Vesalius, who at 23 held Padua's first chair of anatomy, robbed scaffolds of charred criminals until he could name every human bone, even when blindfolded.

His great book (printed, like the Copernican theory, in 1543—11 years after Jordan's book on teeth and a year before Ryff's on the correct number of tooth roots) showed no vena cava arising from the liver, no imputrescible heart bone, no opening between the 2 ventricles, etc. He had brought honest *observation* to anatomy.

A doctor's responsibility was greater, too, after 1200 A.D. Under Europe's "modern" Roman Law, he was liable not only for intentional injury, but for use of less than "*standard*" knowledge or skill.

Doctors Today avoid loss of reputation, time and money by securing the Medical Protective policy's *complete* protection, *preventive* counsel and *confidential* service.

EPIDEMIOLOGY AND RECENT DEVELOPMENTS IN POLIOMYELITIS

JOSEPH G. MOLNER, M.D.
Deputy Commissioner and Medical Director, Detroit Department of Health
Detroit, Michigan

POLIOMYELITIS as a disease has attracted the attention of lay individuals, laboratory workers and members of the medical profession for well over a century and a half. The recognition of the existence of the disease is noted by many as dating back to 1600 B.C. Actually, the first good clinical description of the disease is made by Underwood in a paper entitled "Debility of the Lower Extremities" published by J. Matthews in London, England, in 1789.

In recent years a great deal of interest has been manifest in this disease. This interest has centered around the mode of transmission of the disease, prevention and treatment. A great deal of progress has been made in these particular fields, but the sum total of our knowledge of the disease is still rather limited—limited at least from the point of view of practical application.

Etiology.—Although there are proponents of the bacterial etiology of the disease, it is generally recognized that the causative agent is a virus. There is also general agreement that the poliomyelitis virus is a neurotropic virus which probably is disseminated through the body by passage along the nerve fibers. More specifically, Toomey[16,17] believes that the virus travels best along nonmedullated or gray nerve fibers.

In 1909 Flexner and Lewis[7] described a virus as the etiological agent in this disease and described in detail their experimental work with the M. Rhesus monkey. By cerebral inoculation of macerated spinal cord tissue, experimental animals developed a disease closely simulating infantile paralysis. The isolation of this virus and experimental work herein described have been repeated many times since.

The Portal of Entry.—Although it is generally agreed that the virus of poliomyelitis is a neurotropic virus which enters the central nervous system by traveling along nerve tracts, there has been no agreement as to ways and means by which this virus reaches the nerve tracts. There are two concepts which may be mentioned as to the portal of entry of the virus, namely, the nasopharynx and the intestinal tract.

Toomey[16,17] is the principal proponent of the gastrointestinal route of entry. By experimental inoculation of the virus into the gastrointestinal tract, Toomey was able to produce a disease in monkeys which simulated poliomyelitis. However, he was obliged to create severe stagnation of the gastrointestinal tract before he could promote the development of this condition in his experimental animals. Other investigators are of the opinion that such unusual stagnation is probably nonexistent normally, and therefore the gastrointestinal work of Toomey and his associates should be looked upon as additional good scientific information without a great deal of practical application value.

Sabin and his associates[15] are proponents of the olfactory route of entry. This theory probably has more supporters than any other theory. Proponents of the theory point out that the virus has

---

Read in Symposium on Management of Poliomyelitis at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

been isolated from the nasopharynx of patients and apparently healthy carriers; further, that the epidemiological characteristics of the disease suggests a droplet type of infection. Supporters of this theory also point out the ease with which entrance into the olfactory system might be brought about through the nasopharynx. Certainly the virus has been isolated in acute cases from the nasopharynx. All of these facts taken together are strongly suggestive of the nasopharyngeal route of entry of the virus.

Escape.—The escape and liberation of the virus from the human body have been repeatedly studied and innumerable publications are available for study.[11] The virus of poliomyelitis has been isolated from the stools and nasopharynx of apparently healthy carriers as well as persons acutely ill with the disease. The virus in the nasopharynx is usually present only for relatively short periods of time. The virus, however, may be present in the gastrointestinal tract weeks before the onset of clinical symptoms[5] and for months after the acute symptoms have subsided. There is, of course, a question which arises in the minds of investigators as to whether or not the primary localization of the virus is in the upper respiratory tract and that the gastrointestinal localization is secondary and is brought about by the swallowing of sputum contaminated with the virus.

Reservoirs.—Although extensive research work has been directed at the recognition of reservoirs of this virus, there is but one definite reservoir known, namely, that of the human being. The reported recovery of the virus of poliomyelitis from a mouse found dead in a home where there had been a case of poliomyelitis only adds greater confusion to an already confused situation. To the best of the speaker's knowledge, this finding has not been repeated. Fowl, birds, rodents and various other animals have been examined but without a satisfactory recognition of the poliomyelitis virus.

The virus has been isolated from sewage[12] and it has been shown that it will resist[10] the effect of chlorine in concentrations of 0.5 per 1,000,000 parts for over a half hour. There have been variously reported outbreaks which, according to the epidemiological evidence, would tend to incriminate food and milk, but all of these factors are affected by missing links of information and certainly it has been repeatedly pointed out that the pattern of behavior of poliomyelitis is such that it does not correspond with the characteristic behavior of food- or water-borne infections.

The recognition of the virus in the nasopharyngeal secretions of persons affected with the disease and the recognition of the virus in sewage[12,13,14] and its presence in the stools of apparently healthy persons[11] lend emphasis to the significance of the human reservoir. The repeated recognition of the virus in apparently healthy human carriers and the rapid development of the carrier state is reported by Brown, Francis and Pearson. Certainly the report of the recognition of the virus of poliomyelitis in the stool of an apparently healthy individual, nineteen days before the development of clinical symptoms,[5] is a notable contribution to the knowledge of poliomyelitis.

Mode of Transmission.—There is no definite agreement as to the mode of transmission of this disease. The virus of poliomyelitis has been isolated from the nasopharyngeal washings of apparently healthy individuals as well as those suffering from the disease. It has been isolated from sewage, from food and from the gastrointestinal tract of flies. This wealth of confusing facts only lends further confusion to the possible ways and means by which this disease is transmitted. It has also been proposed, only because of some epidemiological evidence, that possibly the disease is transmitted by insect vectors.

Certainly the epidemiological characteristics of the disease are such that they do not coincide with water- or food-borne diseases. Water- and food-borne epidemics are usually explosive in nature and affect large numbers of people simultaneously. Usually epidemics of poliomyelitis are progressive, develop gradually, show evidences of radial spread and reach their peaks within several weeks from the date of onset. The distribution of cases within the area affected is scattered with occasional aggregation, while in water-borne epidemics the distribution is somewhat more uniform. The attack rate of poliomyelitis in urban epidemics seldom exceeds one per thousand, and in rural epidemics the attack rates seldom exceed three per thousand. In food- and water-borne outbreaks the attack rate among exposed persons is usually much higher.

One cannot too emphatically discount the food and water bases as the modes of transmission because, as has been noted many times, the rate of infection with poliomyelitis virus probably far exceeds the incidence of reported cases. Proponents of the food- and water-borne mode of transmission therefore have this very important argument in their favor.

Probably the oldest and the best theory of the mode of transmission of poliomyelitis is that of person-to-person contact and droplet infection. Certainly the number of persons succumbing to the disease who have had contact with other cases is statistically significant. In investigation which has been carried on, evidence of contact with cases has been reported as high as 60 to 80 per cent. There are contradictory points to this method of transmission. The low secondary attack rate, intra, and extra-familially, is certainly suggestive of some important extrinsic or intrinsic factors limiting the occurrence of secondary cases. There is also the important fact that additional cases in families and households may develop in subsequent years in persons who escaped the first exposure.

Age, Sex, and Race Distribution.—The disease affects primarily persons between the ages of five and fourteen years of age, with a reasonably high incidence under four and with greatest concentration of cases between five and nine years. The disease, however, does affect persons of all ages, and the writer has had the experience of seeing a patient seventy years of age and has seen poliomyelitis in a newborn infant.

By sex, the distribution of the disease shows a somewhat greater incidence among males than among females, the ratio being approximately 1.4 males to one female. A great deal has been said and written about the racial distribution of poliomyelitis, depending almost entirely upon the section of the community or section of the country which is affected. The writer and his associates have not been able to show any difference in the race distribution of poliomyelitis. In individual epidemics difference of significant amount has not been noted, and over a period of many years the attack rate among Negroes and whites is approximately the same. The differences which have been noted in attack rate by race were due to geographic or area location of the epidemic.

The rural as against the urban incidence of the disease is noteworthy. In the most severe urban outbreaks the incidence of the disease seldom exceeds one per 1,000 population while in rural areas when epidemics occur the attack rates are two or three times as great as in urban areas. As a matter of fact, the actual incidence of the disease is much greater in rural areas than in urban. The rural incidence of poliomyelitis is so much greater that it is frequently referred to as primarily a rural disease. The Henderson County outbreak of 1945 in Tennessee is a good illustration of this observation.

There is a definite seasonal variation of the disease. It has been repeatedly noted that poliomyelitis has an apparent selective occurrence both as to season and individuals. Epidemics seem to occur in summer and early fall, and, as previously noted, clinical poliomyelitis affects but a very few persons who live in the epidemic area.

Seasonal Variation.—The seasonal variation is of significant epidemiological importance because coupled with this seasonal variation is the fact that the incidence of paralytic disease in areas where seasonal changes are not so radical is considerably lower than in the more temperate climates where the seasons change and change radically. This has brought about the prognostication that possibily there is something in the physiology of the human being which in part at least is related to the possibility of successful and clinical invasion of the virus. In other words, the prognostication is that a certain percentage of the people in these areas fail to make adequate physiological adjustments with the varying climate and season, with the end result that the infection with poliomeylitis virus results in clinical disease. On the other hand, the person whose physiology follows a more favorable pattern of adjustment is infected but escapes clinical disease.

Predisposing Factors.—There is a great deal of evidence to suggest that there is a hereditary predisposition to poliomyelitis and that the clinical disease is prone to recur in families. This fact is proposed along with drawing attention to the fact that the incidence of secondary cases in households during the same epidemic is rather infrequent. In a survey of the incidence of poliomyelitis in families, Aycock pointed out that 51 per cent of the patients gave a history of disease among relatives while only 5 per cent of his controls gave a similar history.[2,3]

Further investigations by other workers, notably Adair and his associates,[1] confirm this familial predisposition to poliomyelitis. There have been attempts by Aycock and Draper to associate the disease with endocrine imbalance and to point out that certain institutional types[4] are more apt to acquire clinical poliomyelitis than are others. Aycock further suggests that susceptibility may reside in a subclinical endocrine difference, and, more particularly, a subclinical difference between periods of growth and development. These theories, needless to say, cannot be completely ignored but evidence to the contrary is proposed by other investigators.

Aycock also points out that there appears to be a predisposition to attacks of poliomyelitis among pregnant women. He noted that poliomyelitis is associated with pregnancy about four times as frequently as it would be expected in nonpregnant individuals. The closer examination of this relationship shows that the greatest risk occurs in the second and third trimester of pregnancy.[18]

Here again Aycock draws attention to the fact that this may be associated with some endocrine disturbance. Experiments have been attempted by Jungblut to associate the incidence of the disease with Vitamin C deficiency. Helm[9] has proposed that Vitamin B deficiency is the major factor accounting for increased susceptibility to the virus and Weaver in turn[19] in his experimentation with cotton rats was unable to show any relationship between Vitamin B deficiency and the poliomyelitis virus.

It is conceivable therefore that the endocrines and vitamins, or the lack of endocrines or vitamins, are associated with susceptibility to clinical poliomyelitis. If there is an intimate association, the method of its operation is not clearly understood.

Certainly from the overwhelming amount of information which is available, it is obvious that the incidence of infection with poliomyelitis virus far exceeds the reported incidence of clinical disease.

It has also been noted by some investigators that trauma, overexertion and exhaustion are predisposing to clinical poliomyelitis. One must question this proposition because although trauma may be very definite, the degree of shock may be variable, or at least the interpretation placed upon the severity of such trauma by the investigator is variable. Also, exhaustion and overexertion are relative terms. In the Detroit studies virtually no correlation existed between these factors and the incidence of the disease. The increased incidence of severe poliomyelitis following recent tonsillectomy is quite significant. For example, there is evidence to indicate that children who have recently undergone tonsillectomy develop bulbar poliomyelitis much more frequently than those who have not.[6] There are, of course, persons who do not agree with this. But the evidence is overwhelmingly in favor of the proponents of the predisposing effect of tonsillectomy to the development of bulbar poliomyelitis.[8]

Carriers.—As has been previously noted, the incidence of infection with poliomyelitis virus far exceeds the incidence of clinical cases.[5,11] The writer and his associates were able to show that in one outbreak, involving an institution caring for children between infancy and ten years of age, several individuals without any clinical symptoms were found to be carriers of the virus of poliomyelitis. A nurse and a physician, in addition to several of the children, who had intimate contact with cases, were found to be positive. It seems quite possible that those with abortive and subclinical disease may carry the virus for varying periods of time. Brown and his associates, for example, were able to show that a person who developed clinical poliomyelitis had actually harbored the virus of poliomyelitis in his stools nineteen days before the onset of the first clinical symptoms.

Prevention.—The principles of prevention of poliomyelitis have varied many times even within the past decade. Vaccines have been developed which have been most unsuccessful. Prophylactic spraying of the nasopharynx with various and sundry chemicals has proved to be a total failure. As a matter of fact, there are observers who believe that both the vaccine and the nasal spraying had actually the opposite effect of that which was expected.

The closing of schools, the avoidance of crowds and the isolation of the patient and contacts appear to have the effect of only a placebo. Certainly the wide and general distribution of the virus in nature and among humans particularly

THE SICK CHILD IN POLIOMYELITIS

ERLING S. PLATOU, M.D.
Minneapolis, Minnesota

THE 1946 outbreak of poliomyelitis furnished a serious challenge to the physicians of Minnesota. The physician became the initiator and co-ordinator of medical care, nursing care, physical therapy, psychotherapy, and orthopedic care in 2,877 cases between May and December. Although 222 (7.7 per cent) of these patients died, the untiring efforts of the medical and nursing profession saved many lives and ameliorated great suffering.

It is the purpose of this presentation to discuss some of the more important responsibilities of the physician in the care of the sick child with poliomyelitis. The opinions of contemporary workers in this field have been drawn on freely.

As Stimson[9] has pointed out, "In the average spinal case with involvement of a leg or an arm, co-ordination of the patient's care becomes a matter of relative routine. A schedule of rest and relaxation, of proper nursing care, and of measures to combat increased muscle tension should be quickly and adequately instituted" in the hands of well-trained personnel. The management of special manifestations in this disease requires experience, judgment and the skill of many workers. The symptoms of greatest importance are those seen in the patient with bulbar or intercostal paresis or paralysis.

In 1946 between May and December, 107 cases were admitted to the University Hospital and 265 cases were admitted to the Minneapolis General Hospital, a total of 372 patients, in whom a greater or lesser degree of bulbar involvement was exhibited. In addition to symptoms such as fever, prostration, and toxemia, these patients had dysphagia, nasal regurgitation, voice change, palatine weakness with lost gag reflex, pooling of mucus in the oropharynx and the airways, pulse changes, hypertension, and pallor associated with varying degrees of cyanosis.

Grulee,[2] reviewing the cases at the University Hospital, emphasized the fact that heretofore attention had been primarily focused on morbidity instead of mortality in poliomyelitis when practically all of the deaths occur in the bulbar group. He correctly stressed the proper management of the bulbar patient since almost 100 per cent of the polio deaths occurred in the bulbar group, which comprised only 23 per cent of the total patients. In contrast, almost all of those with bulbar involvement who survived recovered completely.

In the care of bulbar cases, the factors deserving special consideration may be listed as follows:

1. Psychological reassurance.
2. Fluid and electrolyte balance.
3. Optimum nutrition.
4. Prevention of aspiration.
    - (a) Posture
    - (b) Suction
    - (c) Tracheotomy
    - (d) Avoidance of respirator except in the high spinal type.
5. Oxygenation.
6. Adjuvants.
    - (a) Avoidance of bladder and bowel retention.
    - (b) Reduction of intracranial pressure.
    - (c) Prophylaxis against infection.
        - (1) Superimposed contagion (measles, pertussis, streptococcal, et cetera).
        - (2) Pneumonia, genito-urinary, et cetera.
    - (d) Supportive measures, i.e., caffeine, et cetera.

Anoxic patients were especially in need of reassurance and the inspiring influence of a doctor.

Dr. Albert Schroeder,[15] fellow in pediatrics at the University and Minneapolis General Hospital, one of the many who worked day and night during the outbreak, has summarized the psychological needs and care in a recent report. "To aid in providing good psychological environment, patients having a like involvement were grouped in wards, and a serious effort was made to become familiar with each patient. These children were not allowed to dwell on their weakness, stiffness, or paralysis, but their interest was transferred to other thoughts of environment and ward activity. By explanation and demonstration it was found possible to teach all but a few of the patients to use a bulb syringe or water suction to aspirate secretions pooled in the pharynx. With more instruction some patients learned to pass their own gavage tubes. These achievements and others, such

as initial accomplishment of swallowing, maintenance of recumbancy during packing, and co-operation in exercises, were generously praised by the nurses and physicians before the patient's ward mates."

Disturbances of fluid equilibrium in the sick child with poliomyelitis are especially important during the acute stage. This is true because of the relatively greater susceptibility of children to the effects of changes in volume and character of body water.

Optimum nutrition, meaning an optimum of calories, food elements, minerals, and vitamins have recently been stressed in disease. Cannon[1] and others have shown that by omitting essential amino acids, antigenic response is inhibited and even abolished. Spies,[7] Smith,[6] and Stare[8] have demonstrated that body stores cannot meet the nutritional demands of starvation. In bulbar poliomyelitis, relative starvation is inevitable and more or less a part of the disease.

At the onset of the epidemic, the dysphagic patients were provided with fluids and part of their nutritional requirements parenterally. However, the inadequacy of this treatment became more and more apparent and its use induced apprehension on the part of the children and made them less co-operative to the physical therapy.

The problem of nutrition in patients who were unable to swallow for long periods of time was of major importance. The use of a gavage tube, using No. 12 to No. 16 French tubes, proved to be an easy solution, since the patient with dysphagia and a depressed gag reflex experienced no particular discomfort from the passage of the tube. The procedure was explained to the children before the initial insertion, and they were assured that it was only for temporary expediency. Gavage feedings were instituted on patients who had marked dysphagia or complete inability to swallow. Most of the patients co-operated in the procedure, and many were proud of their ability to pass the tube themselves. The dangers often referred to in the use of the gavage tube, such as aspiration pneumonia and aspiration asphyxia were not encountered in this series.

Special formulas, high in calories and adequate in protein, minerals, and vitamins were administered by tube in four daily feedings. The high carbohydrate and protein content in the feeding which might be expected to produce an alimentary disturbance seemed to improve elimination which is prone to be sluggish in this disease. With the slow partial return of the function of swallowing, oral supplements of liquids and then pureed and soft foods were added to the gavage feeding.

In those children where difficulty was encountered in gavaging by an easily aroused gag reflex, and in all who were deeply lethargic or comatose, infusions of plasma and amino acid-glucose (fortified Hartmans, et cetera) solutions were used in preference to the tubing.

The initial swallowing of liquids was best accomplished by keeping the child in a supine position. After fluid from a rubber-tipped dropper had been injected into his mouth, the child was instructed to close his lips tightly, breathe through his nose, hold his nose, and then swallow. He was encouraged and praised by the staff for this accomplishment, and then was allowed to try pureed foods in the same manner after a period of time. The upright position worked best for this latter achievement.

Loss of body fluids due to the profuse sweating caused by the hot packs, also resulted in the need of sodium chloride. Replacement was best accomplished by proctoclysis, using 5 per cent glucose in normal saline. Since this disease is accompanied by intestinal atonia, this was readily accomplished, and 400 to 800 c.c. daily were retained.

Manifestations of respiratory disturbance, characterized by the restriction of respiration and oxygenation, are briefly outlined as follows:

1. Damage to the respiratory center.
2. Pharyngeal or laryngeal paralysis with its resultant accumulation of mucus in the airways.
3. Muscular "tightness" in the thoracic area which interferes with normal expansion and contraction.
4. Impaired peripheral respiratory innervation with anoxia as found in respiratory muscle paralysis (diaphragm and intercostals) seen in the high cervical involvement.

Since these factors may occur singly or in combinations, it is important for the physician to evaluate the needs of the patient. It is at this point that the judicious use of the respirator is of prime importance. The bulbar patient who can neither cough nor swallow will not benefit but will be placed in jeopardy by the use of the respirator. On the other hand, the high spinal patient with an extensive loss of innervation of the muscles of breathing often owes his life to the use of artificial respiration.

Posture and careful aspiration of mucus, administration of oxygen, tracheotomy, and occasional use of the respirator were methods which were used. Early recognition of anoxia by clinical means and more accurately later by oximeter were the most valuable weapons in directing therapy. Sabin[4] has stated that encephalitis is practically nonexistent in poliomyelitis and actually is a symptom-complex due to anoxia of the brain. Adequate oxygenation through a tracheotomy tube or cleared normal airways frequently brought about rapid and marked changes in the sensoriums.

Tracheotomy was one of the life-saving measures in combating anoxia and the trend during the course of the epidemic was to do this more often in well-selected cases. Criteria cited by Priest[3] and Goltz were:

1. Respiratory distress as evidenced by recurrent cyanosis, coarse rales in the chest and laryngeal stridor.
2. Excitement and unmanageability causing the patient to resist pharyngeal aspiration strenuously.
3. Stupor of degree sufficient to make the patient oblivious to accumulation of secretion in his airway.
4. Inability to cough effectively.
5. Pharyngeal pooling of mucus, vocal cord paralysis, or intralaryngeal hypesthesia demonstrable by laryngoscopy.

Forty-two tracheotomies were done on patients at the University and Minneapolis General Hospital, of whom twenty-five died. Most of those with fulminating course are included in this fatal group. Of 372 dysphagic patients, 284 lived.

The dramatic saving of life by means of suction, tracheotomy, and oxygenation was impressive in this series of almost 400 seriously ill patients. The newer ideas in physical therapy continued to be meritorious. Round-the-clock vigilance of the physician, the expert service furnished by the nurse and physiotherapist in conserving the physiological functions necessary to life, though not acclaimed in the public press, should be permanently documented as a tribute to the younger men of medicine who participated in this formidable task. Their teamwork resulted in the best care known for the sick child with poliomyelitis. Completely equipped centers with well-considered plans, staffed by personnel who have experience and a co-operative spirit, are the places of choice for the management of the critical case that it has been my privilege to discuss.

ASKS AID IN NURSING CRISIS

Katharine J. Densford, president of the American Nurses' Association, has urged the governors of all forty-eight states to call state-wide conferences "at the earliest possible date" to consider concrete measures to resolve the nursing crisis created by increased demands for nursing service now facing the American public.

Pointing out that the nursing profession is united on a program of action, Miss Densford, in telegrams to each governor, called for effective action in every state of the union. Her message follows:

"I made a nation-wide telephone roll call from Minneapolis on October 20 to get the support and co-operation of the forty-eight presidents of the state nurses' associations. The ANA, representing 155,000 professional registered nurses, received whole-hearted support from the state association presidents on three major points of the ANA's program: (1) Make nursing care equally available to all by intensifying efforts of the ANA's counseling and placement service for the best possible use of available nursing service, and provide a continuing supply of nurses by promoting recruitment; (2) improve nurses' working conditions, rates of pay, personnel practices, and see that nurses share in the administration of nursing services; (3) protect the public by adequate legal control of nursing practice, both professional and practical.

"We in ANA are doing everything in our power to rouse the public to a clearer understanding of the nursing crisis, because nurses cannot singlehandedly solve the problem. Effective action is needed at once in every state of the Union. As president of the American Nurses' Association I am respectfully requesting the governors of each state to co-operate with us.

"Specifically, I ask you to call on the president of your state nurses' association and the head of every group interested in public health and public service, to meet at a state-wide conference under your auspices at the earliest possible date to consider concrete measures resolving the nursing crisis now facing the American public. I shall deeply appreciate a prompt reply from you indicating what co-operation you can give this public situation."

THE TREATMENT OF THE MUSCULAR AFTER-EFFECTS OF POLIOMYELITIS

MILAND E. KNAPP, M.D.
Minneapolis, Minnesota

ACUTE anterior poliomyelitis is a disease which runs a rather short febrile course, usually lasting only a week or two; but during that febrile course enough damage may be inflicted upon the central nervous system so that there may result serious muscular after-effects requiring treatment for months or years, and permanent disability may ensue. These after-effects cannot be removed by medication, and at present we know of no effective methods for preventing them. Therefore, their treatment resolves itself into the solution of various mechanical problems. Each individual case is a problem unto itself and must be solved mechanically for that individual. *There is no routine treatment which is uniformly successful.* The basic mechanical factors which must be considered in solving these problems are three in number: namely, muscle shortening, muscle weakness or paralysis, and loss of muscular efficiency, often called incoordination.

Muscle Shortening

Muscle shortening is not an accurately descriptive term. Sometimes the muscle is actually shortened so that flexion contractures are present, but more commonly the condition could be described as a loss of normal extensibility of the muscle. In the past it has often been ascribed to muscle imbalance. Contrary to the situation implied by the ordinary concept of muscle imbalance, muscle shortening in my experience seems to have no relationship to muscle strength or weakness. It often begins very early in the course of the disease, even as early as the first day, and it may continue forever if not treated. On the other hand, muscle shortening sometimes appears slowly over a long period of time—as much as a week or more in some instances. It may be present in a relatively strong muscle, in a relatively weak muscle, or in the opponent of either a strong or a weak muscle. Muscle shortening in the neck, back, and hamstrings seems to have no relationship to the number of cells in the spinal fluid. In the early stages of the disease, this shortening seems to be of neurogenic origin since it can be relaxed temporarily by spinal anesthesia and other anesthetics which induce muscular relaxation. After some months have passed, however, the shortening apparently changes from a neurogenic type to a peripheral type, so that it is probable that fibrotic changes have occurred in which, at this time, anesthesia does not produce relaxation. We have learned by experience that in order to obtain the best results, this muscle shortening must be combated at the earliest possible date, long before fibrosis has occurred. We begin the treatment immediately after the diagnosis has been made, even while the temperature is still elevated, and we have learned that the more vigorously we treat this symptom, the more likely we are to succeed in overcoming it.

The essential element in the treatment of muscle shortening is motion. If the patient has sufficient muscle strength to allow him to perform voluntary motion against gravity, activity alone will often cause relaxation of the muscle shortening. However, in those patients who are too weak to carry out motion actively, the motion must be performed for them passively. At first, attempts should be made to cause relaxation by motion within the limits of pain. However, if relaxation is not accomplished by such mild degrees of motion, it becomes necessary to use forced motion or stretching. This may be done even in the stage of isolation. It is important, however, that the physical therapist should have enough experience to be able to differentiate between forced motion, which is improving the range of motion, and forced motion which is decreasing the range of motion, because it is not infrequent that the pain associated with forced motion will cause an increase of shortening and therefore be harmful rather than helpful.

If pain is a potent factor and especially during the early stages of the disease, hot packs are a useful adjunct in the treatment of muscle shortening. They should be as hot as possible, but

---

Dr. Knapp is Clinical Associate Professor of Physical Medicine at the University of Minnesota.

Read in Symposium on Management of Poliomyelitis at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 2, 1947.

also dry enough so that there are no droplets of water to cause burns. Experimentally, we have found that the packs can be applied at a temperature of 130-140° F. on the wards. They cool off rapidly, so that within five minutes after application the temperature of the pack is down to about 102°, after which it shades off gradually so that within fifteen minutes the temperature is approximately that of the body. These packs should be repeated as often as necessary for the individual patient. In fairly mild cases, in the early stages, the packs are usually changed once an hour; in the less severe cases, once every two hours; in the very severe cases, the packs may be changed as often as every two or three minutes.

One thing that should be stressed is that the packs should be extremely hot, hot enough so that the patient squirms, in order to be effective. It seems quite obvious to me that this is not a heat application in the true sense of the word; it is really a reflex stimulus, and it should be possible to obtain this reflex stimulus by simpler means. Research is being carried out to try to find these simpler means. There is some evidence to indicate that in some stages stretching alone may be as effective as hot packs plus stretching.

It should be emphasized that hot packs alone will not cause relaxation of the muscle shortening. In fact, hot packs may sometimes increase muscle tightness, rather than relax it. There are certain individuals in whom this has been shown very definitely to be true. The percentage of these individuals is rather small, but it is important that this possibility be recognized in a patient who is continually tightening in spite of apparently efficient treatment. If hot packs seem to increase the tightness, other types of heat may be used, such as hot baths, paraffin, fever therapy, or occasionally infra-red radiation or diathermy.

Several drugs have also been used for the purpose of relaxing muscle tightness. Prostigmine has been found to be useful in certain cases that do not respond to other types of therapy. It must be remembered, however, that prostigmine is not the complete answer to the relaxation of muscle tightness in poliomyelitis; its usefulness is definitely limited, and it is impossible to predict whether improvement will be obtained in any individual case. I do not recommend the routine use of prostigmine.

Curare has also been used and advocated for the relaxation of muscles in poliomyelitis. Curare is a drug which acts upon the myal side of the myoneural junction to prevent acetylcholine from causing contraction of the muscle. Therefore, it produces relaxation of muscle. For this reason it has been used extensively in surgery in order to get maximal muscle relaxation with a minimal amount of anesthetic. Its use in poliomyelitis has been advocated by Ransohoff and others in the last few years. Its usefulness has been predicated upon the fact that it relaxes normal muscle. In the case of poliomyelitis, however, there are apparently other processes entering into the causation of muscle tightness which are not always affected by curare. Therefore, we have found that curare often relaxes all the muscles except the ones which we want relaxed. However, it may be a useful adjunct in preventing the normal muscle fibers from resisting forced motion so that stretching may be more effective in the curarized muscle.

Some other drugs also have a similar effect. Among these are quinine, quinidine, and atropine. However, the side effects of these drugs are so pronounced that their usefulness is extremely limited, and they have not been investigated thoroughly as regards their effect in poliomyelitis.

If the attempts at relaxation of muscle tightness are unsuccessful, even though continued adequately for many months, it may become necessary to resort to more forceful procedures. Among these are the use of neurotripsy, with an air-hammer-like instrument, to break up the fibrosis in the muscle under anesthesia, or the use of stretching manipulation under anesthesia, or the use of tendon lengthening and other surgical procedures. It is my opinion, however, that these procedures should be used only as a last resort.

It may seem illogical that so much stress should be placed upon the restoration of adequate muscle length, especially in view of the fact that a majority of untrained normal individuals are unable to pass the required flexibility tests. It is essential that adequate muscle length be obtained in order to have maximal function of those muscles which are weak. If the antagonist of a weak muscle is short, it acts as a brake upon the weak muscle and may not allow the weak muscle to move the part through a full range of motion. It may thus make useful function impossible. As an example, may I quote the situation as regards the knee joint. It is commonly found that the hamstrings are shortened and the quadriceps is weak. This makes a situation which is incompatible with locomotion unless braces are used. A person with normal strength in the quadriceps may walk with his knee bent, but a person with a weak quadriceps cannot walk unless his knee is completely straight, in fact, unless it is slightly beyond a straight line so that there is a small amount of what may be termed normal recurvatum present in the knee. Thus it is imperative that the tightness of the hamstrings be completely released in order that such a patient may walk without a brace. This situation is not taken into account by the brace-makers at the present time. Nearly all such braces are made with the knee flexed slightly, only a few degrees, it is true, but that few degrees is enough so that if the patient wears a brace for a long enough time to allow tightening of the posterior capsule to occur, that patient can never walk without the brace, sometimes in spite of fair strength in the quadriceps.

Muscle Weakness

Muscle weakness may be due to destruction of anterior horn cells, to temporary loss of function of the motor nerve cells due to the presence of inflammation or other types of damage, or to factors of conduction higher in the central nervous system which interfere with normal function. If the anterior horn cell is destroyed, it never regenerates. If the anterior horn cell is damaged, it usually recovers function spontaneously. There is no known treatment which will increase the number or the activity of the lower motor neurons. Therefore, treatment of the anterior horn cell is of no avail.

There is no successful method of increasing the number of muscle fibers present in the body. We are born with the maximum number of muscle fibers that we will ever have. We may die with fewer muscle fibers, but not with more. Therefore, there is no way to increase muscle strength by increasing the number of muscle fibers.

The only method left by which muscle strength can be increased is to produce hypertrophy in those muscles which still have innervation. In order to accomplish this, it is necessary that the muscle contract actively, and the best method is by the normal nerve pathway. Electrical stimulation has never been found to be as effective as natural stimulation. The most effective method of causing hypertrophy of muscle fiber has been found to be the use of heavy resistance exercises, making the patient contract the muscle against a nearly maximal load. It is better to carry out such a motion only once or twice a day than to carry out an unresisted motion many times a day, for this purpose. Of course we must realize that in poliomyelitis there is an unusual situation where frequently the muscle itself is unable to lift even the weight of the extremity, let alone any load placed upon it. Therefore, maximal heavy resistance exercise may be performed merely by moving the extremity itself. Thus, walking with the extremely weak muscles is frequently the best type of heavy resistance exercise. It must be remembered, however, that the natural tendency of poliomyelitis is toward improvement; therefore, we must be very conservative in ascribing improvement in strength to any particular treatment.

Mention may be made here of a possible method of increasing muscle strength by nerve-crushing or neurotripsy as introduced by Billig and Van Harreveld. This is an attempt to use the well-known phenomenon of branching-out growth of nerve fibers following injury to produce re-innervation of previously denervated muscle fibers. It is not yet fully evaluated but some results have been promising.

Muscular Efficiency

The factor of muscular efficiency is difficult to define and difficult to explain, but in my opinion is extremely important, even more important than the development of muscle strength. Co-ordinated, rhythmic, muscular movements are produced by the interaction of many muscles, some stabilizing the part, some carrying out the motion, others relaxing gradually to pay out slack. This is all controlled by the central nervous system, and though a great deal of the control is exercised by the cerebellum, there is probably also a considerable amount exerted through the spinal cord. And of course the connections between the cerebellum and the anterior horn cells are mediated by other cells in the spinal cord. There is never less than a three-neuron arc between the cerebrum and the muscle, which means that there must be at least one internuncial cell involved in every motion. The so-called motor pattern is produced by this interaction of correlated neurons so that rhythmic movements are possible. This motor pattern is produced by the carrying out of motion, either passively or actively. At first great mental effort is required to carry out any skilled motion. As the motion is repeated over and over, it eventually becomes automatic, and then co-ordination has been secured to a maximum degree.

In poliomyelitis we have a knockout of certain cells controlling muscular action. We may also have some of the internuncial cells which are connected with co-ordination destroyed. The entire neuromuscular setup has been disturbed; therefore, the entire neuromuscular setup needs retraining. There has been a great deal of controversy concerning the function of various individual muscles, and many books have been written to detail the function of these muscles. However, from a practical point of view, in the retraining of the patient, it is necessary only to carry out the motions as desired. Muscles do not work independently, but in combination with each other in varying degrees. Therefore, if the part is used in the manner which is desired, the various correlating muscles and neurons will learn to interact with each other in such a manner as to produce the action which has been practiced. This constitutes rhythmic co-ordinated motion.

On the other hand, if the patient is allowed to substitute any muscle or muscle group in an abnormal manner, he will develop power in the stronger muscles and use these stronger muscles to excess. For instance, he may walk with his foot everted, and never develop power in the inverters because he is not using them. The best example of this situation is in flexion at the hip. The iliopsoas is ordinarily considered to be the prime flexor of the hip. However, the hip can be flexed with the sartorius, rectus femoris, and the adductors as well. Under normal circumstances, the psoas performs most of the function. However, with increased resistance, all of the other muscles are brought into play so that, if the flexor of the hip is strongly resisted, every muscle will be working to its maximum. In poliomyelitis, we frequently have the iliopsoas very weak. Then in order to move the weight of the extremity, the sartorius, rectus femoris, and adductors may come into play much more prominently than normal. It is true that these muscles can flex the hip and many people rely upon increasing their power in order to use the hip flexion to its maximum. However, it is also true that if the psoas is not exercised, it will not increase its strength. Therefore, it is my opinion that the training should be done to decrease emphasis on the muscles other than the psoas and to try to increase the emphasis on the weak psoas, thus promoting increase in strength of the weak psoas which would not occur if effort were not made to move it.

I feel that the carrying out of motion in the nearest possible approach to the normal manner is the most important part of the treatment, and I am perfectly willing to sacrifice the development of maximal strength in order to have smooth, rhythmic function in as normal a manner as possible. Artificial support and braces are to be avoided in so far as possible. Occasionally it may be necessary to use some form of support in order to prevent an excessive back-knee or in order to prevent rotation of the foot in such a manner that walking is impossible. However, the number of braces to be used will be very, very small, if proper attention is paid to the foregoing factors.

NATIONAL HEARING WEEK, NOVEMBER 9-15

Three million children in the United States have a hearing loss, and millions of adults are already hard of hearing, according to Dr. C. Stewart Nash, president of the American Hearing Society, Washington, D. C. The national organization was joined by its 120 local chapters throughout the country in the observance of National Hearing Week, November 9-15.

"Authorities estimate that one out of every ten persons in America has a hearing loss, ranging from a slight loss to almost total deafness. The social and mental effects of this hearing loss can do much to warp the personality of a growing child, and in addition may prove an effective bar to the child's making a success of later life," says Dr. Nash. He points out the necessity for parents and teachers to watch children carefully for any signs of hearing loss, especially after illness involving the nasal passages, ears or throat.

"Prompt attention by a competent otologist is necessary where such a hearing loss is suspected," Dr. Nash declares. "Inattention, falling grades in school, a tendency to shun the company of other persons are often indications of a beginning hearing loss. The majority of people with serious hearing defects need never have reached that stage if the trouble had been checked in its incipient state."

Dr. Nash recommended a vigorous hearing conservation program to be put in effect in the schools. This program includes periodic hearing tests, medical examinations followed by prompt medical attention if any impairment is discovered, and adequate education and rehabilitation for those with handicapping hearing loss.

RECENT ADVANCES IN THE MANAGEMENT OF EAR, NOSE AND THROAT PROBLEMS

OLAV E. HALLBERG, M.D.
Rochester, Minnesota

WE ARE all familiar with the benefit otology has obtained through the use of sulfonamides and antibiotics. Let us first look into the problem of the more commonly called "sulfa" drugs. They made their entry about ten years ago, and are now used for all kinds of infectious diseases, including infections of the ear. However, they should not be used indiscriminately.

Infections of the Middle Ear

Hadjopoulos and Bell[4] stated that there are two types of infections of the middle ear. One of them is caused by an obligate aerobe, and produces an infection limited by the amount of oxygen present in the spaces of the middle ear when inflammatory swelling closes the eustachian tube. Such an infection often is characterized by a violent onset of pain in the affected ear. Spontaneous rupture or myringotomy results in almost immediate subsidence of symptoms, and the secretions dry up within a few days without any treatment.

Probably, however, in the majority of cases, the infection is of the second type; that is, it arises by invasion of a facultative anaerobe which might reach the middle ear and mastoid process either directly through the tube or along the submucosal lymphatic vessels of the eustachian tube. This type of organism is able to multiply in the presence of a very low oxygen tension, and it produces a more dangerous infection of the middle ear and mastoid process than might otherwise occur. At the onset, there might be marked tenderness over the mastoid. If it looks as if mastoiditis might develop, both sulfonamide compounds and penicillin should be administered immediately. The medication should be continued for several days after the discharge has stopped.

During the past several years there has been no severe mastoid disease, and the tendency is to give the sulfonamide drugs and penicillin all the credit for this situation. We know, however, that streptococci and pneumococci may vary in virulence from year to year. Results of studies carried out by Kopetzky and Hadjopoulos[7] would tend to support this view. They found that in acute mastoiditis caused by hemolytic streptococci variations in the severity of the infection and also in the mortality rate occurred from year to year. For a period of several years the variations were characterized by regular periodicity, and the authors suggested that a major cycle consists of a period of five to six years.

For example, at the Mayo Clinic we have lately seen several patients with surgical mastoiditis arising from influenza and measles contracted during a local epidemic. The mastoiditis in these cases became so severe as to require surgical treatment in spite of adequate sulfonamide and penicillin therapy that had been instituted at the very onset of the infection. So far as biologic resistance is concerned, it is now an established fact that immunity to infection does not develop when the infection is terminated by chemotherapy or antibiotic agents. I am sure we all have experienced this sad fact. It is especially annoying when it occurs among babies with infections of the upper part of the respiratory tract. As soon as one infection has been terminated by these means, another one starts right away.

I should like to make a plea that physicians do not consider patients all but cured after having started to administer chemotherapy and antibiotics. At the Mayo Clinic, we feel that we have encountered more patients with serious mastoiditis and complications than previously. Many of these patients had been receiving adequate sulfonamide therapy and then began to receive penicillin. The "masking" effect of these drugs is an important thing to recognize. "Masking" is a poor term; perhaps we should say "change of symptoms," a change which must be recognized by the surgeon. Other workers, such as Kopetzky[6] have observed that since sulfonamide drugs have been available, many more patients come to hospitals suffering from epidural abscesses than was previously the case.

Otitic meningitis is caused by either acute or chronic infections in the middle ear or mastoid process. Before the advent of chemotherapy this

From the Section on Otolaryngology and Rhinology, Mayo Clinic, Rochester, Minnesota.

disease had a very poor prognosis. Now the chance of cure is almost 100 per cent if the treatment is not started too late. Septicemia caused by infection of the ear or its complication, thrombophlebitis of the sigmoid sinuses, now can be attacked successfully by combined chemotherapy and surgery. Abscess of the brain secondary to disease of the ear also has a better prognosis than formerly.

Ménière's Disease

Ménière's disease has received much attention lately. At the Mayo Clinic, Dr. H. L. Williams prefers to designate this disease as "endolymphatic hydrops" because in some reported cases gross dilatation of the endolymphatic system and degenerative changes of the organ of Corti were the main findings at necropsy. I shall not burden you with etiology except to say that Ménière's disease probably has an allergic background. The reaction is not of the antigen-antibody type; the condition might belong in a group of the so-called physical allergies which is intimately connected with disturbed permeability of cell membranes and disturbed electrolytic metabolism.

Histamine is still used in the treatment of Ménière's disease. Horton treated 270 patients with histamine (1 grain or 0.065 gm. of histamine base in 250 to 500 c.c. of isotonic solution of sodium chloride). Seventy per cent obtained complete remission, with improvement of hearing in 40 per cent. Many of these patients suffered remissions when treatment was discontinued in a month to a year. Lately, at the clinic, we have used a combination of nicotinic acid and potassium nitrate, with good effects. All treatments aim at control of fluid metabolism, correction of balance in the tissue fluids and production of vigorous vasodilation.

When medical management does not control the dizziness, surgical treatment can be attempted. For a long time, only section of the eighth cranial nerve was done. In this type of surgery there is always a certain risk, since the surgeon must proceed intracranially in order to reach the nerve. Lately, transmastoid labyrinthotomy has come into favor. This operation was suggested by Lake[9] in 1906. Since then, sporadic reports of it appeared until Day[2] and Cawthorne[1] reported a series in which labyrinthotomy had been done for Ménière's disease. At the Mayo Clinic nineteen patients who had Ménière's disease have undergone labyrinthotomy as outlined by Day.

In the selection of patients for surgery only those whose hearing in the diseased ear is not useful should be chosen, since in our cases the hearing disappeared entirely in the operated ear. Patients who have almost normal or fairly normal hearing should have the benefits of long and fair trial of conservative measures. The operation itself is fairly simple. We use a postauricular incision. As much of the mastoid process is exenterated as is possible, so as to provide enough operative room. The horizontal semicircular canal is exposed to view all the way anteriorly to the junction with the anterior vertical canal. With an electrically driven burr, a small hole is made in the horizontal canal about 2 mm. posterior to the ampulla. A thin, curved electrode is inserted into the vestibule and light cautery is used. Transitory facial palsy often develops among these patients. It disappears within two weeks to a month. Penicillin is used during convalescence to prevent infection.

Ménière's disease can occur in all age groups, but it is more common in the later decades of life. We had one patient recently whose condition was very interesting. Gooch and I[3] have reported the case. The patient, a deaf-mute, had had episodes of dizziness all his life, and had tried all kinds of treatment, without result. Bilateral destructive labyrinthotomy was done, since we did not know which ear was responsible for the dizziness. The operation was performed about a year ago and so far the patient has been doing remarkably well. He is carrying on his work satisfactorily as a printer.

Otosclerosis

The greatest advance in the treatment of a certain type of deafness is the fenestration operation for otosclerosis. This operation is indicated only in certain selected cases of otosclerosis in which bone conduction is good and in which there is little if any damage to the acoustic nerve. The diagnosis of otosclerosis has to be made by exclusion. The onset of loss of hearing usually is very insidious; most often hearing begins to diminish when the patient is between ten and twenty years old. These patients often hear better in noisy places. A familial history of deafness can be obtained in about 40 per cent of cases. Otosclerosis is a disease in which pathologic changes occur in the auditory capsule. Osteoclasts destroy the bone of the auditory capsule and the destroyed region is rebuilt in a disorderly manner by osteoblasts. When this process causes ankylosis of the stapediovestibular joint, deafness will result. Otosclerosis is primarily a disease of bone, and stapedial ankylosis is an incidental complication that occurs occasionally. In a study of the temporal bone, it was found that stapedial ankylosis occurred in only ten of eighty-one ears examined in which otosclerosis was present. Otosclerosis is only a histologic diagnosis, and if the diagnosis is to be made for the living patient, the term must be modified to "clinical otosclerosis." The diagnosis of clinical otosclerosis can be arrived at with reasonable accuracy by exclusion, on the basis of the history and results of examination, of all other conditions likely to produce a conduction type of deafness.

The fenestration operation is applicable only to patients who have clinical otosclerosis and in whom the hearing reserve is so great that release of it will rehabilitate the patient socially. Lempert, who perfected the fenestration operation, reported that up to the time of his report 33 per cent of patients who had been operated on six years or more previously had been rehabilitated socially and economically through restoration of hearing to normal conversational levels. Because of recent improvement in technique, he considered that in approximately 70 to 75 per cent of cases restoration of hearing to normal conversational levels could be secured in the ear on which operation is performed. The fenestra rarely closes if it has remained open for a year. In 347 fenestration operations performed at the Mayo Clinic, we have been able to secure good early results in about 90 per cent of the cases. It would seem that about 70 per cent of the patients will have permanent good results, although it is still a little too early to be certain, because we started to employ this type of surgery only about two and a half years ago. In approximately 3 per cent of the cases the ability to hear may be decreased by the operation, and in about 1 per cent complete deafness may develop in the operated ear. The latter result, we feel, is caused mostly by hemorrhage into the labyrinth or by an infection.

It might be asked, how does the fenestration operation improve hearing? It has been known for many years that in conduction deafness the draining off of a portion of the perilymph, so that mobility of both perilymph and endolymph is increased, would produce immediate improvement in the ability to hear; this improvement is again lost when the perilymph refills the perilymphatic space. The hypothesis has been presented that the fenestration operation makes the tympanic membrane more responsive to vibrations by means of removal of the head of the malleus and leaves the tympanic membrane attached to a thin flap of membrane which is used to cover and maintain patent a new opening into the perilymph, so that a permanent condition is produced in which the endolymph is more mobile and is stimulated by the more vigorous vibrations of a more mobilized tympanic membrane. Therefore, in order to secure good results, the tympanic membrane must be intact and capable of increased response to sound waves. This theory is not entirely satisfactory, however, since I have seen several patients with badly torn eardrums and flaps in whom marked improvement in hearing nevertheless develops. It is possible that the eardrum does not have much to do with the good result obtained from the fenestration operation.

I feel that the sound waves might enter the round window, and that the excess acoustic trauma then normally escapes through the oval window, the whole chain of ossicles then being a protector for the cochlea, so that very loud noises might be screened out. After fenestration operations, the sound waves might escape through the new window. It seems that in such an instance the normal protector mechanism with the ossicular chain is gone, and therefore deterioration of hearing might be expected if the patient so treated has a prolonged exposure to loud noises. In practice, this conclusion does not seem to hold true; at least, I know of one patient who was exposed to continuous gunfire during the war, but he did not experience any deterioration of hearing. As a general rule, patients, after successful fenestration surgery, should not expose themselves to continuous acoustic trauma.

It might also be asked if this operation can be performed in all cases in which a presumptive diagnosis of clinic otosclerosis can be made. There appears to be an increased number of cases of clinical otosclerosis in which atrophy of the fibers of the cochlear nerve or cells of the organ of Corti occurs. It is not known whether this atrophy is one of disuse secondary to immobilization of the stapes or secondary nerve degeneration. When secondary nerve degeneration occurs, the probability of obtaining a good result from surgery is diminished. If the nerve degeneration affects only the higher tones above the range of speech, it is perfectly advisable to proceed with surgery, but if it is suspected that the nerve degeneration affects the range of speech, the chance of success of the operation in restoration of hearing is inversely proportional to the degree of degeneration present.

It has been found that the 30 decibel line is the critical level for conversational speech. At 5 decibels above this line, a person will have little difficulty in understanding speech, whereas at 5 decibels below this line, the person is severely handicapped. The two most important frequencies for the understanding of speech are 1,024 and 2,048 double vibrations per second.

Lempert has stated that the average improvement in hearing, measured in decibels, which is produced by a successful fenestration operation is about 20. The object of fenestration surgery is to bring the hearing above the 30 decibel line. Therefore, a patient who has a loss of hearing of 50 decibels or more must expect much less than the average probability of a good result from surgery.

What are the usual causes for failure? I shall only enumerate them: (1) faulty diagnosis, (2) osteoma (I have seen two patients with such lesions), (3) closure of window with regeneration of bone, in which event the surgeon must be very careful so that all bone chips are removed from the window, (4) infection with development of labyrinthitis, (5) late infection with fibrosis of the endolymphatic duct, (6) hemorrhage into the labyrinth after surgery, and (7) poor surgery.

If the patient who seeks aid is found to have clinical otosclerosis of an operable type, he is first informed as to the possibility of obtaining a good result for his particular condition. We tell him that surgery is optional and that it is accompanied by a risk which, however, is small. The patient must weigh this risk against the results obtained by use of a hearing aid, which instruments nowadays are efficient and give promise of even further improvement.

Conditions of the Nose and Throat

About fifteen or twenty years ago surgical treatment for a variety of nasal conditions was radical; almost everything that protruded was excised from the nose and the end result for the patient would be a so-called lead-pipe nose. Modern surgical treatment generally has been directed toward retention of the normal physiology of the nose. Penicillin did much to better the therapy of diseases of the nose and throat. The sulfonamide drugs, however, did not prove to be so effective as was hoped in the treatment of infections of the paranasal sinuses.

Williams and Popp[12] reported in 1940 on roentgen therapy for acute sinusitis. I feel it is worth while to mention their views again herein. Roentgen therapy reduces pain promptly, probably by rendering secretions more liquid. Occasionally, roentgen therapy shrinks the mucous membrane sufficiently so that when the next infection occurs there is either no pain at all or it is very slight.

In the treatment of chronic sinusitis much can be done with conservative surgical treatment with penicillin as an adjunct. Penicillin alone will not cure chronic disease of the sinuses. If penicillin is administered the condition of the nose often will improve, but as soon as the use of penicillin is stopped, the infection will recur.

In the treatment of chronic pansinusitis without bronchiectasis, surgery and penicillin are the agents of choice. The treatment of chronic pansinusitis with bronchiectasis is somewhat different: often by the clearing up or amelioration of the condition in the lungs first, remarkable improvement is seen in the nose, and occasionally no further treatment need be directed to the nose. Sometimes the infection extends into the bone, in which instance osteomyelitis arises. The so-called spreading type of osteomyelitis has been dreaded by otolaryngologists. This type of infection occasionally starts after an intranasal operation. I reported two such cases, in which the infection was situated in the maxilla.[5] Both patients recovered after a combined treatment with radical surgery and penicillin. These infections usually are caused by an anaerobic streptococcus, and in spite of everything that could be done—that is, before the advent of penicillin—the mortality rate was almost 100 per cent. Lillie[10] also has reported several such cases.

Nasal allergy still is one of the unsolved problems of rhinology. Nasal allergy includes seasonal hay fever and so-called vasomotor rhinitis, which is characterized by sneezing and watery discharge in the morning. Of the newer treatments, I should mention that involving histamine. The physiologic effects of histamine are known to be: (1) contraction of smooth muscle, (2) constriction of arterioles, (3) dilatation and increased permeability of the capillaries, with localized edema, and (4) increased secretion by the secretory glands. Because there is a similarity between the action of allergy and that of histamine, small doses of histamine are administered in an attempt to desensitize the patient. Histamine and nicotinic acid can be tried, but in my experience, especially in respect to nicotinic acid, the results have been rather disappointing.

Benadryl (beta-dimethylaminoethyl benzhydryl ether hydrochloride), which is an antihistaminic substance, has been tried much lately. In vasomotor rhinitis it helps only in about 20 per cent of the cases. Moreover, the side effects—drowsiness and nervousness—are most annoying.

A newer drug, pyribenzamine hydrochloride (N′-pyridyl-N′ benzyl-N-dimethyl-ethylene diamine hydrochloride), seems to affect vasomotor rhinitis more satisfactorily; 50 to 60 per cent of patients derive benefit from this drug. The side reactions are not so noticeable as are the side effects of benadryl. At least, this was the opinion of McBean,[11] who recently studied the subject.

Of the newer treatments, I might also mention that involving the use of streptomycin—the newest of the antibiotic agents. Since Klebsiella ozaenae, a bacterium which is sensitive to streptomycin, often is found in ozena, treatment of this disease with streptomycin has been tried. These experiments were started only recently by Dr. K. M. Simonton, and it is still too early to be able to say whether the patients have derived lasting benefit from it.

Finally, I shall mention the use and misuse of nasal vasoconstrictors. These points recently were stressed by Lake.[8] For a long time it has been known that overuse of vascoconstrictors eventually leads to difficulty in nasal function. Scarcely a day goes by during which some of us in the Section on Otolaryngology and Rhinology do not see one or two patients who are the victims of misuse of nose drops. We often call this condition "rhinitis medicamentosa." The usual story is as follows: "My doctor gave me nose drops for 'sinus trouble.' After a few weeks they did not give me relief any more and I got hold of some stronger ones. Now they don't help me much, either."

Every attempt should be made to alleviate the original condition which led to the use of vasoconstrictors. An explanation of the normal physiology of the nose frequently is helpful in relieving the patient's mind concerning certain misconceptions that he has entertained regarding his nose.

There are certain indications for the use of nose drops. First, strong vasoconstricting agents are necessary in preoperative preparation and anesthetization of the nose. Second, nose drops can be used for not more than two days, during the first stages of an acute cold, when certain patients experience complete blockage of the nares. Third, nose drops can be administered to the nursing infant who has a cold, so that he may be enabled to breathe well enough to take his feeding. Otherwise, the habit of the use of nose drops should be strongly discouraged.

AMEBIC ABSCESS OF THE LIVER WITH BRONCHOHEPATIC FISTULA

Report of a Case and Discussion of Emetine Cardiotoxicity

B. I. HELLER, M.D., and W. E. JACOBSON, M.D.
Minneapolis, Minnesota

AMEBIASIS with all its protean manifestations presents a problem of great importance. This disease has never been considered a strictly tropical problem for it has been discovered wherever careful surveys have been conducted. The over-all infection rate for the United States has been estimated to be about 10 per cent.[1] The incidence in tropical and subtropical regions and in areas of poor hygienic standards is much higher. Klatskin[10] has estimated the incidence of amebiasis among American troops stationed in India during the recent war to be between 20 and 40 per cent. This is comparable to the incidence of 23 per cent infection among troops in Calcutta and 18.3 per cent infection among troops in Myitkyina, Burma, as quoted by Karl and Sloan.[9] The return of troops from those and other endemic areas increases the significance of this disease to the physician and the public. Several authors[1,9,10] have recently stressed the danger of producing a definite public health problem incident to the return to this country of a large number of undiagnosed and unsuspected cases of amebiasis. The chronicity of the disease, especially in asymptomatic "cyst passers," can be expected to manifest itself in exacerbations and complications in the patient and by the spread of the disease to previously uninfected persons. These problems can be expected to arise in the Upper Midwest as frequently as might be expected in other portions of the country. A constant awareness of the possibility of this disease is the most important factor which will lead to a proper diagnosis and successful treatment. It is imperative that the physician be acquainted not only with the intestinal signs of amebiasis but also with the numerous other clinical manifestations and complications of the disease. We are presenting a case of amebic abscess of the liver with pleuropulmonary complications.

Case Report

R.B., a twenty-year-old World War II veteran, was admitted to the Minneapolis Veterans Administration Hospital on February 11, 1947. He dated the onset of his present illness to December, 1946, when he noted the onset of fever, cough, shortness of breath, soreness in the right shoulder, and pain in the right lower chest. He attributed his symptoms to a recurrence of malaria and took quinine sulfate for several days. The symptoms persisted and he was admitted to a local hospital on December 30, 1946, with an admitting diagnosis of recurrent malaria and right lower lobe pneumonia. He was treated with quinine sulfate, sulfadiazine, penicillin, and streptomycin; however, his symptoms persisted. On February 2, 1947, while still in the hospital, he suddenly coughed up a large amount of a "chocolate pudding-like" material and subsequently coughed up bitter, bile-stained material. The diagnosis of amebiasis with hepatic abscess and bronchohepatic fistula was made at that time, and he was started on emetine therapy. He received seven intramuscular injections of emetine prior to transfer to the Veterans Administration Hospital. During the course of this illness he lost about 30 pounds in weight.

The past history was significant in that he had first developed bloody diarrhea about a year prior to admission while stationed on Luzon in the Philippine Islands. At that time he received nonspecific therapy and the diarrhea subsided in about four days. Two months later while en route to the United States he

Published with permission of the Medical Director, Veterans Administration, who assumes no responsibility for the opinions expressed or conclusions drawn by the authors.

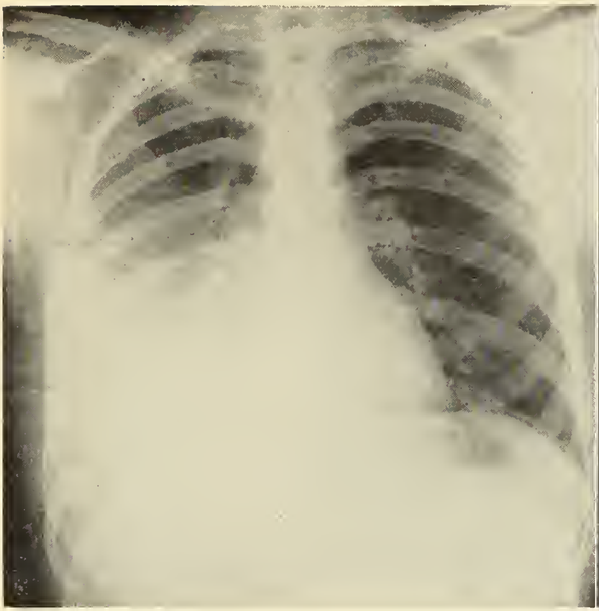

Fig. 2. Roentgenogram of chest, posteroanterior view, March 10, 1947. Marked increase in the parenchymal lesion on the right.

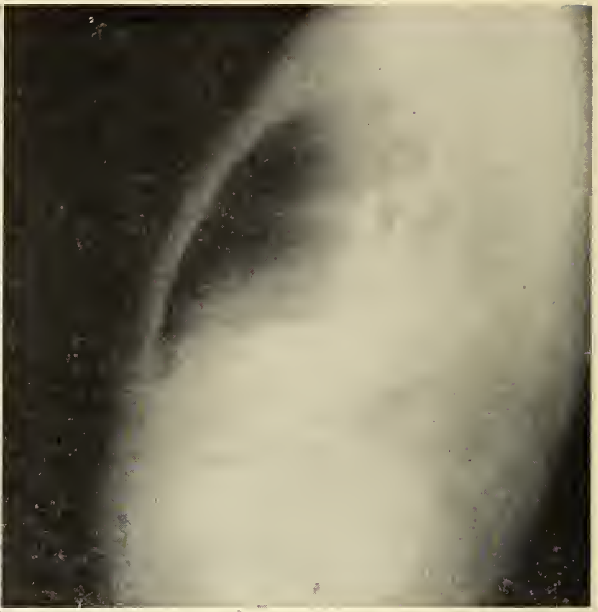

Fig. 3. Roentgenogram of chest, lateral view, March 10, 1947. Doming of the anterior portion of the right hemi-diaphragm.

developed a second episode of bloody diarrhea. He also had chills and fever, and examination of the blood smear revealed the presence of malaria parasites. He was treated only with quinine and all his symptoms subsided. Following this he had recurrent episodes of bloody diarrhea every four to eight weeks. At no time during this entire year was his stool ever examined for ova or parasites; however, on numerous occasions he received nonspecific therapy for the diarrhea.

Physical examination on admission revealed a well-developed, poorly nourished young white man who appeared chronically ill. His temperature was 99° F., his pulse 120 per minute, and his respirations 20 per minute. There was no icterus of the skin or sclerae. Examination of the chest revealed limited expansion on the right and there was dulness to percussion over the lower third of the right lung field posteriorly and laterally. The right diaphragm was immobile. The breath sounds were diminished over the area of dulness. Many coarse râles were present in the lower right lung field. The heart was not enlarged and the heart tones were normal. The blood pressure was 120 mm. mercury systolic and 68 mm. mercury diastolic. There was marked tenderness to pressure in the right upper abdominal quadrant, and the liver mass was thought to extend just below the costal margin. There was compression tenderness elicited over the liver area. The remainder of the physical examination was otherwise essentially negative.

Laboratory Data.—Blood study on admission revealed a hemoglobin of 14.2 grams per cent, a red blood count of 4,870,000, and a leukocyte count of 13,700, with a differential of 56 per cent neutrophils, 30 per cent lymphocytes, 3 per cent monocytes, and 11 per cent eosinophils. The erythrocyte sedimentation rate was 45 mm. per hour. The serological test for syphilis was negative. Blood chemistry studies revealed a blood sugar of 84 mg. per cent, a blood urea nitrogen of 14 mg. per cent, total plasma proteins of 8.3 grams per cent, with 5.5 grams per cent albumin and 2.8 grams per cent globulin. The total serum bilirubin was 0.4 mg. per cent.

Urinalysis on admission revealed a slightly acid reaction, a specific gravity of 1.025, negative tests for albumin and sugar, and 2 to 3 white blood cells per high power field. Examination of the blood smear failed to reveal malaria parasites. Numerous examinations of the sputa were all negative for bile, and no endameba histolytica were found. No ova or parasites were found in the feces on repeated studies. The bromsulfalein test revealed 10 per cent retention at the end of forty-five minutes. The cephalin cholesterol flocculation test was negative after twenty-four and forty-eight hours. Liver function studies repeated on April 2, 1947, the fiftieth hospital day, revealed no retention of bromsulfalein at the end of forty-five minutes, a negative cephalin cholesterol flocculation test, a total serum bilirubin of 0.3 mg. per cent, and an alkaline phosphatase activity of the serum of 8 King-Armstrong units.

Roentgenologic examination of the chest shortly after admission (Fig. 1) showed an elevation of the right diaphragm and evidence of pleural effusion on the right. On fluoroscopic examination the right diaphragm was noted to be almost immobile, although slight paradoxical movement could be seen on deep inspiration.

Hospital Course.—On the fourth hospital day the patient was started on intramuscular injections of emetine in doses of 1 grain daily. He was also started on diodoquin, 10 grains three times a day. The patient

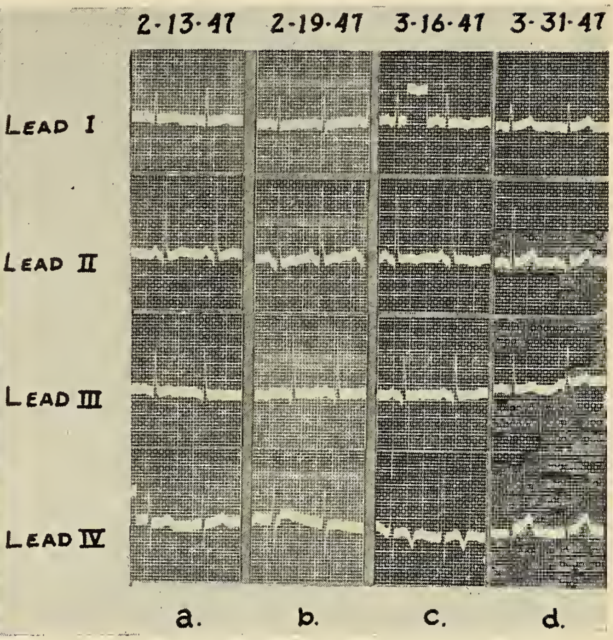

Fig. 5. (a) Pretreatment electrocardiogram interpreted as within normal limits.

(b) T wave changes noted after 5 grains emetine hydrochloride intramuscularly over five-day period.

(c) Marked T wave changes after third course of only 3½ grains emetine hydrochloride. Course preceded by short rest period, and thus the electrocardiogram shows cumulative effect of emetine.

(d) After 15-day rest period the electrocardiogram shows complete return to normal.

was kept on strict bed rest, the blood pressure was checked frequently, and electrocardiagrams were taken every other day. On the third day of emetine therapy a marked decrease in the amplitude of the T waves was noted in all leads and on the fifth day there was a flat T_1 and diphasic T_2, T_3, and Tcf_4 (Fig. 5b): In view of the progressive electrocardiographic changes from the normal pretreatment tracing (Fig. 5a) emetine was discontinued after a total of 6 grains had been given. The diodoquin was continued for a total of twelve days. On this regime he improved subjectively and by the thirteenth hospital day the erythrocyte sedimentation rate was down to 5 mm. per hour. However, the leukocyte count remained elevated between 13,000 and 14,000. On the eleventh and fifteenth hospital days, thoracenteses were attempted but no fluid was obtained at either time. In order to prevent secondary infection following attempted thoracentesis, penicillin was given prophylactically from the twelfth through the seventeenth hospital days. Except for occasional elevations to 99° F. the patient's temperature remained essentially normal during the early phase of treatment.

On the twentieth hospital day the patient again became rather acutely ill; his temperature rose to 100° F., and the leukocyte count rose to 16,759, with 71 per cent neutrophils. The emetine treatment was renewed in doses of one grain daily given intramuscularly and continued for five days. His temperature remained between 99° and 100° F., for seven days, the leukocyte count rose to 19,600, and the erythrocyte sedimentation rose to 86 mm. per hour. Penicillin was again started prophylactically on the twenty-first hospital day. Posteroanterior and lateral chest x-rays, taken on March 10, 1947 (Figs. 2 and 3), the twenty-seventh hospital day, revealed a doming of the anterior portion of the right diaphragm, which was interpreted to be the formation of a new liver abscess or reaccumulation of fluid in the previous abscess cavity. In spite of the fact that the patient had not had a sufficient rest period, a third course of emetine was started preparatory to attempted aspiration of the abscess. The emetine was given in doses of ½ grain intramuscularly every eight hours for four doses preoperatively. Following this the patient was taken to the operating room and aspiration was attempted from three approaches: lateral, anterolateral, and anterior. All attempts failed to yield pus and the procedure was discontinued. Emetine was continued postoperatively in doses of ½ grain intramuscularly daily. The electrocardiogram showed progressive changes with tendency to inversion of all T waves (Fig. 5c), and thus emetine was discontinued after a total preoperative and postoperative dose of 3½ grains had been given. In spite of the failure to aspirate pus from the liver, the patient improved rather remarkably. His temperature returned to normal, the leukocyte count and the erythrocyte sedimentation rate gradually returned to within normal range, and subsequent roentgenologic studies showed disappearance of the doming and clearance of the pulmonary lesion. On the forty-ninth hospital day the leukocyte count was 9,600 with 56 per cent neutrophils, and the erythrocyte sedimentation rate was 2 mm. per hour. The electrocardiogram at that time was within normal limits with normal positive amplitude of all T waves (Fig. 5d). In view of the severity of the original infection, it was deemed advisable to give the patient another small course of emetine. There had been a rest period of sixteen days since the last emetine had been administered. The final course consisted of ½ grain daily for eight days. At no time during this course did the electrocardiogram become abnormal; however, on the seventh day of therapy there was a very slight decrease in the upright amplitude of the T waves.

Subsequent roentgenologic (Fig. 4) and fluoroscopic studies showed a remarkable clearing of the pulmonary lesion and almost normal movement of the right diaphragm. The liver was still palpable 3 cm. below the costal margin in the mid-clavicular line but it was no longer tender. On the sixty-fifth hospital day the patient was up and about the ward. His weight was 148 pounds as compared with an admission weight of 131 pounds. He was discharged on the seventy-second hospital day.

Discussion

Amebic hepatitis and amebic abscess of the liver are the most important extra-intestinal manifestations of this disease. In Klatskin's series[11] of 748 cases of amebiasis there were sixty-nine cases (9.2 per cent) with liver involvement, and in the 360 cases reported by Karl and Sloan[9] there were thirty cases (8.3 per cent) with liver involvement.

The symptoms and signs of hepatic amebiasis have been stressed in a number of recent articles.[1,9,10,11,13,14,15,18,19] Pain over the liver area is the most common symptom and is almost universally present. The pain is usually anterior and subcostal in location but may also be present over the lower chest posteriorly. Not infrequently the pain may occur over the entire lower right chest and may be aggravated by coughing. This may direct one's attention to the chest and suggest the erroneous diagnosis of pleurisy or early pneumonia. Fever is probably the next most common symptom and is an almost constant feature of abscess, but may be absent in presuppurative lesions of the liver. In the event of abscess formation chills are not infrequent. Nausea and vomiting are said to occur in about one-third of the cases.[10] Anorexia, cough, and jaundice are other less common symptoms. Sodeman and Lewis[18] report the presence of jaundice in five cases (15.1 per cent) of a series of thirty-three patients with amebic hepatitis. Diarrhea may or may not be present during the development of hepatic involvement. In the thirty-three cases reported by Sodeman and Lewis[18] only nine patients had diarrhea at the onset of the hepatitis, although another seven gave a history of previous episodes of diarrhea.

The most constant and significant physical findings include liver tenderness and hepatomegaly. Klatskin[10,11] places considerable emphasis on the importance of compression tenderness over the liver area. Corroborative laboratory evidence will usually include a moderate leukocytosis and an elevated erythrocyte sedimentation rate. The finding of cysts or trophozoites of endameba histolytica in the feces is not essential to the diagnosis of hepatic amebiasis. In the sixty-nine cases of amebic hepatitis reported by Klatskin,[10] endameba histolytica was found in the feces in 80 per cent of the cases. In the series reported by Sodeman and Lewis[18] the organisms were found in the feces in only 54.5 per cent of thirty-three cases. Roentgen-ray studies may give further aid to the diagnosis by the demonstration of a mass bulging under the diaphragm. Elevation of the right diaphragm and immobilization are other frequent findings.

The absolute diagnosis of hepatic amebiasis depends upon the aspiration of "anchovy-sauce" pus and the demonstration of endameba histolytica in the material. However, to wait for this evidence in all cases would be unjustified. With the aforementioned signs, symptoms, and laboratory findings, one can make a presumptive diagnosis of hepatic amebiasis, and a trial of emetine therapy is indicated. A satisfactory response to this treatment adds further weight to the correctness of the diagnosis.

Pleuropulmonary involvement constitutes one of the most important complications of amebic abscess of the liver. This manifestation of the disease has been considered in some detail by Ochsner and DeBakey.[13,14,15] A few of the more pertinent facts mentioned by these authors will be discussed here. Occasionally pulmonary amebic abscess may occur without evidence of liver disease, or may occur independent of the liver infection. However, pleuropulmonary involvement is most commonly the result of direct extension of the disease from the liver through the diaphragm.

Of the 2,490 cases of the amebic hepatic abscess collected by Ochsner and DeBakey,[13] 198 (7.5 per cent) had pleural complications and 209 (8.3 per cent) had pulmonary complications. Thus pleuropulmonary complications occurred in

15.8 per cent of the cases. In their own series of 181 cases of amebic hepatitis and hepatic abscess there were twenty-six cases (14.4 per cent) of pleuropulmonary involvement.[14,15] In the series of fifty-eight cases of hepatic amebic abscess reported by Sodeman and Lewis[19] there were twelve cases (20 per cent) in which the presenting signs and symptoms were those of pleural pain, pleural effusion, or pneumonitis. Of the twenty-six cases of pleuropulmonary involvement reported by Ochsner and DeBakey[14,15] there were nine cases (34.6 per cent) of empyema, nine cases (34.6 per cent) of pulmonary abscess, and eight cases (30.4 per cent) of bronchohepatic fistula.

The symptoms and signs of pleuropulmonary complications depend to a large extent upon the type of involvement. Chest pain and cough are almost constant symptoms. The former may frequently be referred to the shoulder area as a result of diaphragmatic irritation. The expectoration of "anchovy-sauce" pus is considered to be pathognomonic of the disease. The demonstration of endameba histolytica in the sputum of course establishes the diagnosis. Roentgenologic examination of the chest may frequently reveal in the lower lung field a triangular shadow with the base directed toward the liver and the apex directed toward the hilum of the lung. However, roentgen-rays may only demonstrate evidence of a pleural effusion or empyema.

The prognosis depends upon the type of complications and the type of therapy used. In the collected series of Ochsner and DeBakey[13] there was a mortality of 56.1 per cent among cases of pleuropulmonary involvement not receiving emetine. In cases receiving emetine the mortality was 8.2 per cent. Open drainage increased the mortality even when combined with emetine. The total mortality in the collected series was 41.1 per cent. In the twenty-six personal cases reported by Ochsner and DeBakey[14,15] the total mortality was 30.8 per cent. The development of an empyema has the worst prognosis while the formation of a bronchohepatic fistula offers the best prognosis. Of the twenty-six cases of Ochsner and DeBakey[14,15] there were six deaths (66.6 per cent) among the nine cases of empyema, two deaths (22.2 per cent) among the nine cases of pulmonary abscess, and no deaths among the eight cases of bronchohepatic fistula.

Emetine Cardiotoxicity

The therapeutic problem which arose when the patient manifested electrocardiographic evidence of emetine cardiotoxicity was of extreme concern to us. Though the cardiotoxic effects of emetine have been known[12] since 1916, considerable difference of opinion still exists as to its clinical significance. The experimental basis for emetine cardiotoxicity has been universally accepted.[2,4,12,16] In 1916 Levy and Rowntree[12] demonstrated that the intravenous injection into dogs of 4 to 18 mg. of emetine per kilogram of weight produced death by ventricular fibrillation. The authors stated that the principal pathological lesion was a hemorrhagic gastroenteritis, but no discussion is given of the myocardial pathology. In 1922 Chopra and Ghosh[4] reported cloudy swelling, atrophy, and myocardial necrosis in rabbits that had been poisoned by doses of emetine. Rinehart and Anderson[16] reported that in rabbits and cats a single dose by mouth of 15 to 20 mg. per kilogram produced death in more than 50 per cent of the animals in two to eight days. Lethal or sublethal doses of the drug caused severe injury to the heart muscle. Those animals that died in less than forty-eight hours showed interstitial edema of the myocardium. In animals surviving for more than three days there was found a necrosis of some fibers and a degenerative swelling of the remainder. Focal proliferation of plasma cells, polymorphonuclear cells, and eosinophils was present. A more chronic intoxication with divided lethal doses caused small cellular scars in the myocardium, the scars being centered about necrotic fibers.[16] As will be suggested later this is of considerable clinical significance in evaluating the cumulative effect of emetine upon the myocardium. More recently striking electrocardiographic changes have been noted in dogs and cats following the intravenous administration of emetine in a dose of 37 mg. per kilogram.[2] The earliest alteration consisted of widening of the initial QRS complex. This was noted to occur as early as 20 to 30 seconds after the injection and was not accompanied by prolongation of the PR interval, T wave changes, or unusual change in the heart rate. A second injection caused further intraventricular block and auricular extrasystoles. A third injection usually caused the heart to stop in diastole. Paroxysmal auricular tachycardia was frequently noted. Ventricular tachycardia was less common and often changed to ventricular fibrillation. None of the dogs showed an abnormal increase in the PR interval; however, two cats were noted to have complete heart block. The electrocardiographic alterations usually disappeared within forty-five minutes if the dose did not exceed 37 mg. per kilogram. The striking effect of the cumulative action of emetine is noted by the response to a second or third injection of the drug. Thus it has been shown that emetine is capable of producing marked cardiotoxicity in experimental animals, although it is recognized that the doses employed are far in excess of those used therapeutically. It remained for clinical investigation to establish that emetine cardiotoxicity may also occur with the usual therapeutic doses. The difference of opinion which challenges this concept is felt to be due to a different clinical approach to the problem.

In 1935 Brown,[3] in summarizing his experience with 544 cases of amebiasis treated at the Mayo Clinic with emetine, reported no evidence of cardiovascular disease. It is noted, however, that no electrocardiograms were reported. In the same year Sayid[17] reported two cases of auricular fibrillation following the subcutaneous administration of emetine. One might challenge the arrhythmia in his first case since it occurred in a patient with mitral heart disease. The second case is thought to be significant since the patient had no evidence of heart disease prior to emetine therapy. In 1943 Heilig and Viveswar[8] reported a series of forty-five unselected cases of amebiasis in whom emetine was given by both the intramuscular and intravenous routes. It was noted that these authors were dealing with chronically ill, malnourished patients, a large majority of whom had abnormal electrocardiograms prior to institution of therapy. In one of fourteen cases treated intramuscularly, electrocardiographic changes consisted of lowered QRS voltage and flattening of the T_2 after therapy. In six of sixteen cases treated intravenously, prolongation of the PR interval, diminished QRS voltage, and flattening of the T waves were noted. Fifteen cases treated with intravenous emetine were subjected to an exercise tolerance test, and lowered voltage of the R waves was noted in six instances and lowered T waves in nine instances. In all of the above-mentioned series, the dose consisted of 1 grain daily for twelve days. The authors' conclusion that a moderate cardiac lesion is no contraindication to emetine would seem, in view of the above-noted electrocardiographic changes, to be open to some criticism.

In 1944 Hardgrove and Smith,[7] in a series of seventy-two cases treated with ½ grain of emetine twice a day for ten days, noted depression of T waves varying from lowering to frank inversion in thirty-three cases (45.8 per cent). In nine cases it was noted that the PR interval increased although still remaining within normal limits. In four cases there were noted auricular or ventricular extrasystoles. In 1945 Cottrell and Hayward[5] reported a series of thirty-two cases treated with 1 grain of emetine intramuscularly for ten to twelve days. Lowering of the QRS was noted in seven cases and diminution of the T waves in one or more leads in twenty-five cases. In twelve cases the PR interval increased from .02 to .04 seconds but still remained within normal limits. The blood pressure was observed in twenty-one cases; no change occurring in thirteen, a transient fall from 15 to 20 mm. mercury occurring in six, and a persistent fall in two cases. Recently Dack and Moloshok[6] reported nine cases of amebic dysentery in whom toxic cardiac manifestations developed after treatment with emetine. Dyspnea, tachycardia, or palpitation were observed in seven cases. Electrocardiographic abnormalities consisting of T wave changes were reported in all nine cases. The authors stress the fact that electrocardiographic abnormalities may first appear one or two weeks after cessation of treatment.

From the bulk of evidence it would seem safe to conclude that emetine is capable of producing clinically significant toxic effects on the heart. The electrocardiographic changes noted in our case were interpreted as evidence of early emetine cardiotoxicity and indications for at least temporary cessation of emetine therapy. The length of the rest periods between courses of emetine was shorter than we would have liked to observe; however, our desires in this regard were modified by the severity of the infection and the dire need for specific therapy.

Summary

1. A case of amebic abscess of the liver with bronchohepatic fistula is reported. The diagnostic criteria have been discussed.

2. Amebiasis and its complications present a

(Continued on Page 1177)

CLINICAL USE OF FOLIC ACID

MARCUS A. KEIL, M.D.
Minneapolis, Minnesota

MUCH has been written on the clinical use of folic acid (pteroyl glutamic acid). The results of the various investigations have been quite similar, and consequently there is fair agreement as to indications and contraindications for its use. The purpose of this paper is to review briefly some of the literature and to add the results of the use of folic acid by the Department of Medicine at the University of Minnesota Hospitals during the past year.

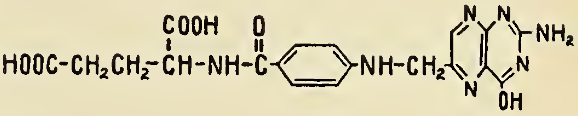
Studies on Nutrition of the Monkey

Berry and Spies[5] and Spies[43] have published the most complete reviews of the literature. Time permits only a brief review here. Probably it is most logical to first review the studies done on the nutrition of the Macacus Rhesus monkey. Wills and Bilimoria[50] in 1932 showed that monkeys fed a diet similar to that eaten by pregnant women in Bombay, India, developed anemia, leukopenia, and had a megaloblastic bone marrow. Yeast extract corrected the condition. In 1935 Day, Langston, and Shukers[15] performed a similar experiment, noted that the animals developed in addition gingivitis, diarrhea, and expired in twenty-six to ninety-three days. They also noted[16] that 10 grams of brewer's yeast or 2 grams of a liver stomach preparation daily promoted a normal state of nutrition. This unknown substance was designated vitamin "M,"[17] the "M" for monkey. Known vitamins were noted to be ineffective in the condition and liver extract was shown to be effective.[29] In subsequent experiments[19,38,39,46,51] beneficial effects in the deficiency syndrome were obtained with yeast residue, crude liver extract, a norit eluate fraction of liver, and a highly purified L. caseii factor. Finally, crystalline folic acid was shown to correct the condition.[18]

Work on L. Caseii Factor—"Folic Acid"

In 1941 Stokstad[44] isolated a factor from solubilized liver which was necessary for the growth of Lactobacillus caseii. At about the same time, Mitchell, Snell, and Peterson[31] reported isolation of a growth factor for Streptococcus lactis R (Streptococcus faecalis) from spinach. This they termed folic acid because of the source. A number of investigations have followed. Very briefly these have demonstrated that these factors were probably related and that hydrolysis of crude compounds produced substances equal in activity for both organisms. One of the biggest problems in studying folic acid is that the only method of quantitation is by bio-assay with either L. caseii or Streptococcus faecalis. At best it is not a very satisfactory method.

The various investigations have revealed there are at least four different compounds from various sources which have "folic acid" activity. The Lactobacillus caseii factor from liver has been synthesized[1] and its formula is:[2]



The folic acid factor from yeast has the same ring structure but differs in the number of molecules of glutamic acid, and is pteroylhexaglutamylglutamic acid.[35] The fermentation L. caseii factor has been described by Hutchings et al as pteroyldiglutamylglutamic acid.[26]

Studies in Chick Nutrition.—Hogan and Parott[25] in 1939 following studies on the nutrition of the chick, reported that a water soluble extract of liver was necessary to maintain growth and a satisfactory level of hemoglobin. He designated this substance as vitamin Bc, the "c" for chick, and showed that none of the known vitamins would replace it. In 1943 Pfiffner et al[36] reported they had isolated a crystalline substance from liver which was active for the chick and very active for L. caseii. This they felt was the same as the previously described "Eluate factor" and "folic acid." In subsequent reports[8,9,37] this same group of investigators showed that by enzymatic digestion of the yeast extract the substance was equally active for L. caseii and Streptococcus faecalis and also was as equally active as the liver factor. Much confusion has arisen

in connection with the studies of chick nutrition also but it appears that Briggs and Lillie[10] answered most of the problems by feeding chicks what appeared to be a diet deficient in folic acid and adding the synthetic substance. This promoted normal growth in all respects whereas the chicks not fed the synthetic product began to develop signs of the deficiency syndrome.

Folic Acid Deficiency in the Rat.—There are two reviews[5,12] of this work which do not interest us greatly here except that these studies were responsible for the original use of folic acid at the University of Minnesota. Two papers[27,45] appeared which reported that rats fed on a purified diet plus sulfaguanidine or sulfasuxidine developed agranulocytopenia and aplasia of the bone marrow. This was corrected in three to ten days by liver fractions known to contain folic acid, even when the control conditions were continued. A similar response[13] was obtained with crystalline L. caseii factor. In a subsequent report[28] L. caseii factor was repeatedly able to correct the granulocytopenia of rats on the deficient diet.

Possible Folic Acid Deficiency in other Animals.—A number of studies on deficiency states in other animals have been reported. Most of these have been reviewed by Spies.[5] It appears at this time that they do not add anything to our knowledge of folic acid and its relationship to human nutrition.

Studies on Folic Acid in Man

It is impossible to know where such a review should begin; perhaps with the use of liver extract in pernicious anemia, perhaps with the use of yeast in macrocytic anemia of pregnancy. In any event, both liver and yeast have been used successfully and extensively in the treatment of various anemias and sprue. Whether their beneficial effects have been due to their folic acid content is not definitely apparent at this time. Again, the subject is reviewed by Spies.[51]

One of the first clinical studies was reported in 1944 when a Bc concentrate was given to ten patients with anemia which would not respond to the usual therapy. A dose of 1500 gamma per day failed to give a response.[40]

In 1945 Watson et al[49] reported giving folic acid concentrate orally to eight patients with refractory anemia. No response was noted. In six cases with leukopenia resulting from intensive roentgen ray therapy for carcinoma of the cervix, definite elevations of the leukocyte count were noted. One patient with polycythemia vera, receiving total body radiation, exhibited a rise in the leukocyte count. No effect was noted in one patient with Hodgkins disease who was receiving radiation therapy. Also in 1945 Berry, Spies, and Doan[6] obtained transitory rises in the leukocyte counts in patients with leukopenia associated with a general vitamin B complex deficiency. A more recent report[34] stated that agranulocytosis appeared in a patient receiving propylthiouracil while 30 mg. of folic acid was being given daily.

Vilter, Spies, and Koch[47] reported a study on fourteen cases of macrocytic anemia treated with synthetic folic acid. Five of these were Addisonian pernicious anemia, six were classified as nutritional anemias, and three were of indeterminate type. Thirteen of the patients responded with a satisfactory reticulocytosis, rise in hemoglobin, and erythrocyte count. The response was considered to be equal to that expected from liver extract and was independent of the route of administration.

Moore, Bierbaum, Welch, and Wright[32] reported a small group of cases treated with synthetic folic acid. Included were two patients with Addisonian pernicious anemia, one patient with nontropical sprue, and one patient with pernicious anemia of pregnancy. All obtained excellent hematological remissions.

Spies[41] more recently summarized treatment of forty-five patients with various anemias. He obtained hematological responses in five cases of nutritional macrocytic anemia, five cases of Addisonian pernicious anemia, eight cases of sprue, three indeterminate macrocytic anemias, three pernicious anemias of pregnancy, one macrocytic anemia and alcoholism, one macrocytic anemia and carcinoma of the stomach. Ten patients did not respond at all. These included three with aplastic anemia, three with leukemia, three with hypochromic anemia, and one with an indeterminate macrocytic anemia.

Arnall and Wright[3] noted that pernicious anemia responded to folic acid.

Other articles of interest have appeared. Zuilzer and Ogden[53] noted that nine of twelve infants with macrocytic anemia responded to folic acid.

Berman et al[4] reported a series of eleven cases in which response was obtained in each instance where the bone marrow was megaloblastic. Doan[20] found folic acid failed in macrocytic anemia of cirrhosis. He also states that minor neurological signs and symptoms in patients with pernicious anemia in relapse have responded as promptly and completely following L. caseii factor supplement as with potent liver extract. Goldsmith[21] reported that familial hemolytic anemia did not respond to folic acid therapy. Moore et al[33] found that 100 mg. of folic acid given rectally to a patient with Addisonian pernicious anemia gave a submaximal response. There are four writers who disagree with Doan's view so far as the effect of folic acid on subacute combined degeneration is concerned. Spies[48] reported follow-up studies on a series of twenty-six patients. After five to eight months of treatment, four patients developed paresthesias and unsteady gait. Fifty to 500 mg. of folic acid orally per day for ten to fourteen days did not benefit the patients but five cubic centimeters of liver extract parenterally gave improvement in ten days. Hall[22] in a study of fourteen cases of pernicious anemia noted that the spinal cord lesions progressed. Meyer[30] noted progression of neurological lesions in three of eleven patients treated. Heinle and Welch[24] considered the possibility that folic acid caused a more rapid development of cord lesions in one patient.

Folic acid has also been used in the treatment of sprue, perhaps witth more success than in any other disease. Darby and Jones[14] treated successfully two patients suffering from tropical sprue with synthetic folic acid. More complete studies followed, but Spies et al[42] reported treatment of nine tropical sprue patients with excellent hematological responses, decrease in the volume and the number of stools, and improvement in the patient's sense of well-being.

*Results of Our Studies with the Use of Folic Acid.**—Our studies with folic acid (pteroylglutamic acid) have included administration to patients with a variety of conditions. Our results, in general, agree fairly well with what has been previously reported.

We have treated seven patients with pernicious anemia in relapse, six at this hospital and one at Ancker Hospital.

Case Reports

Case 1.—E. M., a woman aged sixty-three, was given folic acid 200 mg. intravenously over a period of sixteen days. The hemoglobin was 10 grams and the erythrocyte count was 2.4 million at the beginning of treatment. On the twenty-seventh day the hemoglobin was 15.7 grams and the erythrocyte count was 4.9 million.

Case 2.—J. B., a man aged sixty-six, was given 140 mg. of folic acid in ten days (60 mg. intravenously, 60 mg. intramuscularly, and 20 mg. orally), and on the tenth day, the hemoglobin had risen from 6.4 grams to 8.1 grams. Maximum reticulocyte response was 15.5 per cent on the sixth day. Liver extract parenterally failed to give a secondary reticulocytosis. Bone marrow study on the seventh day revealed an almost completely normoblastic marrow whereas before therapy it had been megaloblastic.

Case 3.—M. B., a woman aged forty-one, was given 15 mg. folic acid orally for twenty-four days and 15 mg. intramuscularly for the first three days. The hemoglobin rose from 3.9 grams to 10.6 grams, and the erythrocyte count from 850,000 to 3 million. Maximum reticulocytosis appeared on the sixth day when the count reached 35 per cent. Folic acid therapy was continued in this case from September 10, 1946, to November 15, 1946, the dosage being 15 mg. orally daily and 30 mg. intramuscularly every week. It is, however, not certain just how much of the medication the patient received. On November 15, 1946, the hemoglobin was 15.6 grams and the erythrocyte count was 4.8 million. The cell indices were normal, whereas before therapy there had been a marked macrocytosis.

Case 4.—E. J., a woman aged sixty-seven, was given folic acid 15 mg. intramuscularly and 15 mg. orally daily for eighteen days. The hemoglobin rose from 5.4 to 8.1 grams, and the erythrocyte count rose from 1.9 to 3.4 million. The maximum reticulocyte count appeared on the tenth day, when it was 10 per cent.

Case 5.—C. D., a man aged fifty-one, received folic acid 15 mg. intramuscularly daily for ten days, and 10 mg. orally daily for eighteen more days. The hemoglobin rose from 9.6 to 15.2 grams and the erythrocyte count rose from 2.5 million to 4.6 million in this interval. The reticulocyte count was maximal at the seventh day, when 11.3 per cent was recorded.

Case 6.—M. J., a woman aged seventy-three, was given 20 mg. of folic acid intravenously for ten days and 20 mg. orally for ten more days. The hemoglobin rose from 7.3 to 10.5 grams and the erythrocyte count from 1.4 million to 2.5 million. The maximum reticulocyte count was 16.2 per cent on the seventh day of therapy.

Case 7.—This patient, a woman aged eighty-five, was given 15 mg. of folic acid intramuscularly for ten days and 5 mg. orally thereafter. On the eighth day, the reticulocyte count was 25 per cent. The hemoglobin rose from 3.8 grams to 7.8 grams at the end of 20 days of therapy.

---

*Synthetic folic acid, Lederele's "Folvite" was used in this study and was supplied by Dr. Stanton M. Hardy of Lederle Laboratories, Pearl River, New York.

The hematological responses in these patients compares quite favorably with the responses following liver therapy. In Case 3, where the intake of extrinsic factor was very poor, folic acid apparently was capable of maintaining normal blood levels for the period of time the patient was treated.

In June, 1946, we felt it would be very desirable to place a group of patients with treated pernicious anemia on folic acid in order to determine, if possible, whether the neurologic lesions of subacute combined degeneration would appear while folic acid was being given. We also wished to study the effect of folic acid on the cord lesions present at the time therapy was begun. We selected twenty-two patients, nineteen of whom we were able to follow for the period of study. Eleven of these patients had no neurological signs at the beginning of treatment, and their hemoglobin levels were well maintained by parenteral liver extract. Two of these eleven patients received 30 mg. of folic acid intramuscularly every two weeks. Two more received 30 mg. intramuscularly every two weeks for two months and were then given 5 and 10 mg. orally daily, respectively, for another four months. The remaining seven patients of this group of eleven were given 5 mg. folic acid orally for five to six months. Hemoglobin values and erythrocyte counts on these patients remained at relatively normal levels and the neurological pictures were unchanged.

There were nine patients of the group of twenty-two who had variable neurological symptoms and signs at the beginning of the study. Seven in this latter group were old cases which were stable on liver. Three of these had moderate neurological changes which did not progress during five months of treatment with folic acid. A fourth patient left the clinic before the study could be completed. A fifth patient had moderate neurological findings which did not progress. Two patients had severe cord changes when the study was begun. In one of these there was no apparent progression of the lesions during five months of study. The other demonstrated no changes at the end of five months and was again given a moderately refined liver extract. One month later, however, she had definite evidence of progression of the neurological lesions. She has shown no improvement after six weekly injections of crude liver extract. The other two patients in this series are difficult to evaluate, but in neither were any significant changes demonstrated neurologically. The amount of folic acid given to these nine patients varied from 5 mg. orally daily to 30 mg. intramuscularly every two weeks. In all of the nineteen patients the hemoglobin and erythrocyte values were maintained at satisfactory levels but there was no definite increase over the values obtained while the patients received liver extract.

Cases 3 and 6, above, deserve further consideration in regard to neurological lesions. Case 3 had evidence of extensive cord involvement at the time she was first seen. Reflexes were hyperactive. Babinski reflexes were present bilaterally. Position sense was poor and vibration sense was absent bilaterally on the lower extremities. Ataxia and scissor gait were present and she walked only with support. After the initial hospitalization of twenty-four days she was given folic acid 15 mg. orally per day and 30 mg. intramuscularly weekly by her local doctor. On October 8, 1946, one month after discharge, she returned to the out-patient clinic and several examiners felt that her gait was more unsteady. She also complained of inability to control her urine. After unsuccessful attempts to place her in a rest home, she was hospitalized on November 15, 1946. At that time she was psychotic, exhibited marked malnutrition, had a flaccid paralysis of the lower extremities, was incontinent, and had no vibration or position sense in the legs. She also had several large decubiti and there were a number of erythematous areas over the feet and legs which were felt to be due to pellagra. As was pointed out above, her blood values were normal. She was treated intensively with a high caloric diet, crude liver extract, and vitamins. The skin lesions subsided rather promptly and two months later she was mentally clear, was no longer incontinent, and there was some evidence of improvement in the neurological lesions.

Case 6 was maintained on folic acid 10 mg. per day after she developed sensitivity to liver extract. She had definite evidence of neurologic involvement at the time treatment was begun and was poorly nourished. After about seven months she complained bitterly of paresthesias and manifested evidence of progression of the neurological lesions with hyperactive reflexes, a Babinski reflex on the right, and loss of vibratory sense in her legs. She has not improved significantly after two months of intensive therapy with liver extract and vitamins.

Other Conditions Treated

Folic acid has also been tried in a variety of other conditions. One patient with idiopathic hypochromic anemia failed to respond after a month of treatment with 30 mg. of folic acid daily orally. Four patients with hyporegenerative (aplastic) anemias failed to respond. One patient eighty-five years old with a macrocytic anemia due to undetermined cause failed to respond. Another sixty-one-year-old man with a macrocytic anemia and a macronormoblastic marrow failed to respond. A fifty-nine-year-old man who had had a gastrectomy in 1941 developed a macrocytic anemia which did not respond to folic acid orally. The bone marrow before therapy was macronormoblastic.

Results of treatment in one case are very interesting. This patient had a macrocytic anemia with free hydrochloric acid on gastric aspiration. Intermittent diarrhea was present. Liver therapy had been carried out for a prolonged period in adequate amounts, and liver injections were continued while folic acid was given. However, after twenty-three days on 10 mg. of folic acid orally daily, the hemoglobin had risen from 8.5 to 10.6 grams. A reticulocyte response was obtained and reached 14.6 per cent on the sixth day. It is probable that this patient had sprue, but laboratory proof was not available.

Six patients with neutropenia or agranulocytosis have been treated. Three of these were associated with hyperthyroidism in patients receiving various medications including thiouracil or propylthiouracil. In one patient, a marked response occurred simultaneously with the administration of 10 mg. of folic acid intravenously daily. The patient also received pyridoxine and penicillin. The same situation prevailed in the other two cases where there was a less marked rise in the leukocyte count, and again the responses may have been due to other medications. One five-year-old girl with a severe neutropenia of undertermined cause failed to respond and another patient, also with an agranulocytosis of undetermined etiology, demonstrated no apparent response to folic acid. In one patient with a sulfonamide leukopenia the leukocyte count rose from 3,650 to 9,400 cells after three days of treatment. The percentage of polymorphonuclear cells rose from 20 to 68 per cent. This result may well have been due to discontinuing the sulfonamide.

Two patients with nonspecific ulcerative colitis were given folic acid 40 mg. daily for eleven and 100 days, respectively, without a definite improvement in the number or character of their stools. Another patient with nonspecific ulcerative colitis who had had repeated resections of portions of her small bowel in addition to the colon because of extension of the disease failed to respond after fourteen days of therapy. One patient with steatorrhea may have had a response to folic acid but the clinical picture was complicated by hemorrhage from an esophageal diverticulum, and no conclusions can be drawn. One patient with pernicious anemia and an unexplained diarrhea was treated. No improvement in the diarrhea was noted. A temporary improvement was noted in one patient with steatorrhea thought to be due to sprue.

Amounts and Administration

We have used folic acid intravenously, intramuscularly, and orally. When diluted with 10 c.c. of saline, as much as 40 mg. of folic acid has been given intravenously without reaction. Intramuscular injections produce temporary discomfort. No reactions have been noted to oral administration. Doan[20] reports that 125 to 150 mg. given intravenously produce unpleasant histaminelike reactions.

Discussion

The role of folic acid in human nutrition is not at all clear, nor is it established that it is an essential substance as it is in the nutrition of the monkey. Our knowledge at this point permits us to say that given parenterally, orally, or rectally to patients with pernicious anemia and other megaloblastic anemias it produces an apparently complete remission of the blood picture. It apparently fails to exert any beneficial effect on the associated cord lesions of pernicious anemia. The folic acid content of liver has been studied.[11]

by bio-assay methods and the amount of free folic acid present is less than 10 micrograms per cubic centimeter. Oral liver preparations also give a low assay value. Many studies have been reported in which the amount of folic acid in liver and yeast (as determined by bio-assay methods) could be increased by acid or base hydrolysis, or enzymatic digestion, but the amount obtained is not significantly increased.

The above findings have led Spies[5] to postulate that folic acid in food occurs as a conjugate, and patients with megaloblastic anemias are unable to liberate the active substance because of lack of enzymes. He further postulates that liver extract may provide an enzyme capable of liberating folic acid from the conjugated form. The work of Bethell[7] and Heinle[23] tend to support this theory.

Case 3, above, presents another feature which I believe is significant. The question might well be asked if folic acid deficiency plays any part in producing the clinical picture of pellagra. This patient developed what was felt to be pellagra while she was being given folic acid, and responded rather promptly when nicotinamide was given.

Doan[20] has described folic acid as "an essential panhematopoietic stimulus," and Wright and Welch[52] regard folic acid as part of the vitamin B complex. I should like to point out that in several of our patients an unexplained feeling of well-being followed folic acid therapy. In one instance this effect was later secured by giving placebos. In others it may have been due to a dislike for intramuscular injections of liver extract. The improvement in one patient's epigastric distress and bowel habits may have been related to change in bacterial flora of the bowel since folic acid is an essential growth factor for the lactobacilli group and also streptococcus faecalis. It is, however, to be noted also that several patients felt better after liver extract therapy was resumed.

In the present state of our knowledge it does not appear possible to state clearly the indications for the clinical use of folic acid. Certainly it appears that folic acid should be given to every patient who appears to have sprue. There appears to be sufficient evidence to warrant its continued use and evaluation in neutropenias and agranulocytosis, particularly those due to sulfonamides. In some of the megaloblastic anemias where spinal cord lesions are not present it may be made more desirable than liver extract, particularly where there is sensitivity to the latter. It also seems quite possible that it may be an essential vitamin.

Conclusions

From our studies it seems fair to draw the following conclusions:

1. Folic acid (pteroylglutamic acid) parenterally is capable of inducing a complete remission in Addisonian pernicious anemia and, given orally or parenterally, is capable of maintaining normal blood values for a period of at least five months.

2. It appears to exert no beneficial effect on the spinal cord lesions of subacute combined degeneration.

3. Macrocytic anemias in which a megaloblastic marrow could not be demonstrated did not respond to folic acid.

4. It does not appear to be of any benefit in the other conditions in which it was tried, with the possible exception of the sulfonamide leukopenias.

PRACTICE BY APPOINTMENT

Criticism of the individual members of the medical profession is encountered in every survey and test being made to find answers to problems of public relations. Laymen complain that "they are being pushed around by the doctors." Just today we were told of a patient trying to find a doctor in one of our larger towns. The patient had an earache too severe for ordinary remedies, but could see the otologist only by appointment, and the first available date was two weeks ahead. Too often the doctor's appointments are made up as far as six weeks in advance.

Industrialists complain that if a worker has to go to a doctor during working hours it takes at least three hours, and causes too many lost man-hours. And the patients that do get in to see the doctor complain that the appointment is crowded into so little time that they feel as though they are on an assembly line.

Tens of thousands of our doctors have returned from military service where they became used to fixed hours, and shorter hours for their work. Labor and the government have impressed upon all of us the ideal of a forty-hour week. Doctors, especially the younger ones, are adjusting their practices to short hours filled with appointments, and these are made far in advance. Such a regime makes for the complaint that doctors are hard to find; that there are too few of them.

During the war many of our busy doctors found that they were not rendering the best possible service by the appointment system, and opened their offices to all comers; first come, first served. The office doors would be closed at a designated hour, and the doctor would care for all who remained before leaving. People complained of having to wait sometimes a long while, but they did get medical care. This plan should appeal to some doctors in each community.

If doctors continue to practice by appointment, and since the public is really entitled to medical attention, we would suggest that every day of appointments include one hour or a specified time for patients without appointments.—Editorial, *Journal Michigan State Medical Society*, October, 1947.

CLINICAL-PATHOLOGICAL CONFERENCE

DIAGNOSTIC CASE REPORT

KARL W. EMANUEL, M.D., MALCOLM GILLESPIE, M.D., and ARTHUR H. WELLS, M.D.
Duluth, Minnesota

DR. K. W. EMANUEL: Mrs. E. P., aged thirty-nine years, consulted me on June 4, 1947, complaining of diarrhea, occasional vomiting, and some cramp-like abdominal pain associated with her diarrhea beginning May 7. The diarrhea had stopped at the time I saw her, and her chief complaint was itching of the skin associated with some areas of papular dermatitis. The physical examination was essentially negative throughout, with normal blood counts and routine urine analysis. On June 6, she again came to my office, stating that her skin had become very yellow during the preceding two days. She had also noticed some weakness and itching. Her icterus index was 70 units. The red blood cell sedimentation rate was 75 mm. in one hour (Westergren) and there was a 2 plus bile in the urine. The white blood cell count was 12,250. Her pulse and temperature were normal. The examination was otherwise essentially negative. There were no clay-colored stools. Hospitalization was advised, but refused. She was, therefore, placed on proklats and ketochal. On June 11, her icterus index had dropped to 69 units. The red blood cell sedimentation rate was 65 mm. and the urine had 1 plus bile. Besides jaundice and associated itching, she was beginning to feel definitely weaker. Her appetite was fair, and there was no nausea or vomiting. The stools were normal in color and in frequency. Hospitalization was again urged, but refused. On June 16, her icterus index had dropped to 60 units. The sedimentation rate was 55 mm. and the urine showed a trace of bile. The jaundice had receded slightly but there was still considerable itching. Her weakness was more profound than on previous visits. The hemoglobin was 94 per cent and the red blood cell count was 4,480,000. Her stools were lighter in color but not clay-colored.

Because of her profound weakness, she consented to enter the hospital on June 22. While at home she had noticed some chills and a slight fever for a couple of days. There had also been a loss of from 5 to 10 pounds in weight since the onset of the present illness which she felt to be due to loss of appetite.

She was a well-developed and well-nourished white woman with a grade III jaundice. There were marked deformities of the hands and feet due to rheumatoid arthritis. The blood pressure was 130/80. Temperature, pulse, and respiration were normal. The abdomen had no tenderness whatever. The gall bladder and other masses could not be seen or felt. The cardiac, lung, pelvic and rectal examinations were essentially negative.

The family history was not contributory. She had five children, living and well. All her pregnancies had been normal. She had had no operation. She had had pneumonia once and had suffered from rheumatoid arthritis for many years.

Laboratory findings: A four-day stool was negative for urobilinogen. A twenty-four hour urine specimen contained bile, but no urobilinogen. The blood cholesterol was 267.0 and cholesterol esters 51.5 mg. per cent. A cephalin flocculation test on June 24 was negative, and on June 27 it was 1 plus. The alkaline phosphatase was 40.6 units (K.A.). The direct Van den Bergh was 16.4 mgm. per cent and the indirect Van den Bergh was 1.85 mgm. per cent. The benzoic acid excretion test revealed 3.33 gm. excreted in three hours. There were 6,400 white blood cells with a normal differential count. The red blood cells totaled 3,970,000 and the hemoglobin was 14 gm. The red blood cell sedimentation rate was 97 mm. in one hour (Westergren). A red blood cell fragility test was normal. X-ray studies showed a nonvisualization of the gall bladder and no changes in the stomach or duodenum.

DR. A. H. WELLS: The case is now open for diagnosis.

PHYSICIANS: Choledocholithiasis, acute hepatitis, carcinoma of the liver.

DR. E. L. TUOHY: The absence of urobilinogen in the stool and urine plus normal results with liver function tests even after a month of jaundice make this an almost certain case of carcinoma blocking the common duct.

DR. F. J. HIRSCHBOECK: More specifically, this is a case of carcinoma of the papilla of Vater. This type of cancer is much more likely to result in a fluctuating jaundice than carcinoma of the pancreas.

DR. M. G. GILLESPIE: Through a mid-right rectus incision, exploration revealed a distended gall bladder and common duct without stones. Dake's smallest dilator passed through the ampulla without much difficulty. However, we opened the duodenum vertically to expose a tiny nonpalpable mass on the papilla. A Whipple operation was performed, with resection of the head of the pancreas, the first and second portions of the duodenum, the pyloric end of the stomach and the terminal end of the common duct (Fig. 1). The remainder of the head of the pancreas was sutured into the end of the first part of the jejunum and the common duct joined

---

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

end to side with the same loop a few centimeters distally. The patient had a completely uncomplicated convalescence. A T-tube left in the common duct came out about two weeks after the operation, and its sinus tract closed immediately.

Dr. A. H. Wells: The lesion involved the very margins of the orifices of the common duct and duct of Wirsung, and extended distally on the duodenal mucosa for 5 mm. (Figs. 2 and 3). There was a severe dilatation of the two ducts with thickening of their walls. Microscopically (Fig. 4) the adenocarcinoma appears to have had its origin from the epithelium of the two ducts at their transitions to the duodenal mucosa. No extension into the head of the pancreas or through the duodenal musculature could be found. I predict a complete cure.

Frequency

In a group of 464 cases of carcinoma of the gall bladder extrahepatic ducts, and the major duodenal papilla, there were 291 cases originating in the bladder, 119 in the ducts, and 54 in the papilla. Carcinoma of the latter represented 1.13 per cent of the cases of carcinoma found in 26,306 necropsies.[15] Cancer of the papilla is reported in a ratio of from 2:1 to 6:1 predominance in males. Although this malignancy may occur at any period of adult life, the mean age is approximately 56 years.[16]

Etiology

The most convincing theory[6,7,16] as to the etiology of carcinoma of the papilla concerns the little known, yet remarkably frequent tendency for the normally prominant valvelike folds of the epithelium inside the orifice of the papilla to form adenomatoid hyperplastic polyps. It is generally accepted that this pathologic manifestation is a common precursor of cancer in the rest of the gastrointestinal tract. Recurrent inflammation may be the instigator of the polyps.[7] Gallstones occur in 50 per cent of the cases of carcinoma of the gall bladder, in 31 per cent of the cases of cancer of the extrahepatic ducts and in only 17 per cent of the malignancies of the papilla.[8]

Pathology

Carcinomas of the papilla may have their origin from seven possible epithelial structures: (1) common duct, (2) pancreatic duct, (3) the confluence of ducts (ampulla), (4) Lieberkuehn's glands of the duodenum, (5) Brunner's glands, (6) aberrent pancreatic glands and (7) Dradinski's mucous glands of the papilla. In most instances, tumors of these different sources cannot be differentiated and for practical purposes are grouped as adenocarcinomas of the major duodenal papilla, caruncula major, or papilla of Vater. Since an ampulla does not exist in 43 per cent of the papillas[16] and the tumors can be demonstrated in some instances to arise from most of the above normal sources, the frequently used term of carcinoma of the ampulla of Vater should be discarded as inadequate.

Very rarely other malignant tumors including melanoma, lymphosarcoma, and spindle cell sarcoma have been described.[9,14] Rarely, benign neoplasms have been found causing clinical manifestations.[1] They include papilloma, adenoma, lipoma, fibroma, neuroma, granuloma, melanoma, and carcinoid. Benign duodenal ulcers rarely occur on the papilla.[1]

The epithelial malignancies are nearly all adenocarcinomas. They have a decided tendency to become papillary and are frequently described as infiltrating and ulcerating. Rarely they form much mucus. They tend to be of low histologic grade. They range up to 3 cm. in diameter, and are frequently too small for the surgeon to palpate through the duodenal walls. The fact that less than half of the cases have metastasized even at the time of death makes this malignancy unique among the cancers of the gastrointestinal[16,17,18] tract. Metastases do occur late in the adjacent lymph nodes, pancreas, and liver in some cases.

Cited as the reasons for the rapid exitus which averages seven and a third months from the onset of symptoms in untreated cases are: cholemia, cholangitis, liver abscess, empyema of the gall bladder, acute peritonitis, suppurative pylephlebitis, exsanguination from intraduodenal hemorrhage, duodenal obstruction, cachexia, and pneumonia. Other anatomical complications result from blocking the common duct and Wirsung's duct, include a dilatation of the gall bladder (possibly 90 per cent), dilatation of intrahepatic bile ducts, hydrops of the gall bladder and extrahepatic ducts, cholecystitis, dilatation of the major pancreatic duct (majority), pancreatic fibrosis and atrophy.

Clinical Manifestations

Dr. K. W. Emanuel: The early occurrence of signs and symptoms of malignancies of the papilla of Vater depend primarily upon their strategic location and almost universal obstruction of the flow of bile and to a less extent on the frequent obstruction of the pancreatic duct. The consequent jaundice is nearly always present and is the chief complaint in the majority of cases. In the majority of patients the jaundice is constantly present with some fluctuation and slow progression.[21] A few cases with intermittent icterus are explained upon the basis of ulceration and necrosis of the obstructing malignancy. Occasionally the jaundice is continuous and progressive without fluctuation and rarely there is no jaundice.

Contrary to the general belief, these patients do not have a painless jaundice, but over 50 per cent have a colicky or continuous pain in the epigastrium right upper quadrant or elsewhere in the abdomen.[17] The pain is generally not severe and may decrease in severity.

Pruritis, rapid loss of weight, anorexia and progressive weakness are outstanding and frequent complaints. Chills and fever occur in over 50 per cent and simulate these symptoms in common duct calculus. Light colored or acholic, tarry and steatorrheal stools have been described. Nausea, vomiting, diarrhea, severe constipation, bloating sensations and eructations are occasionally noted. In some hands distended gall bladders are palpable in over one half of these patients.[21] Courvoisier's law is proved correct in 83 per cent of the cases at the time of laparotomy.[18]

A barium meal and roentgren study may reveal some deformity in the second part of the duodenum and prove helpful in ruling out other gastrointestinal diseases. An abdominoscopic examination has been considered of use.[22]

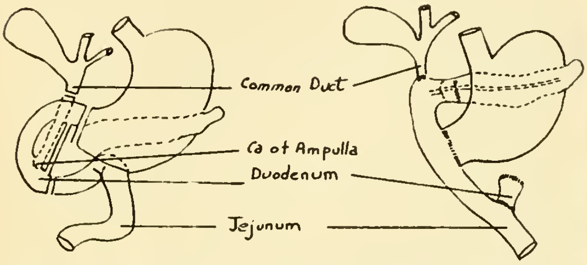

Fig. 1. Diagrams of one-stage pancreatoduodenectomy.

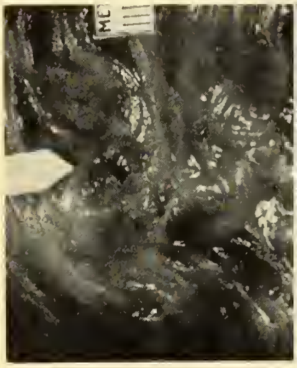

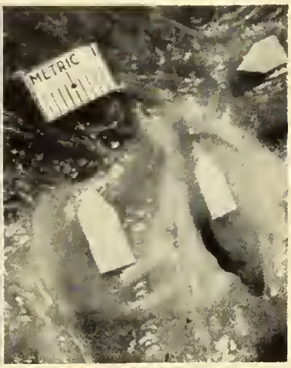

Fig. 2. *(left)* Arrow points to the duodenal mucosal surface of the carcinoma on top of the papilla of Vater.

Fig. 3. *(right)* Arrows point to the early carcinoma about the margins of the dilated (in order) common duct and duct of Wirsung, also an extension down on the duodenal mucosa.

The literature on carcinoma of the papilla of Vater is dominated by surgical interests which may explain the great paucity of data concerning exact measurements of physiologic processes. When the figures are known, we predict that the laboratory can be of considerable help; first in differentiating obstructive (surgical) from intrahepatic (medical) jaundice and second, in aiding in the determination of the exact location of the lesion. The patient we have presented is an illustration of how the various liver function tests (cephalin flocculation, galactose tolerance, benzoic acid excretion, blood cholesterol and cholesterol esters) are negative for diffuse disease of the liver and how the complete absence of urobilinogen of the stool and urine leads to the clinical diagnosis of carcinoma obstructing the common duct. Other aids are found in the fact that occult blood occurs in the stools in a majority of patients with cancer of the papilla. Also blood amylase and lipase may be increased due to the pancreatic duct obstruction. Duodenal aspiration of blood with little or no bile is considered helpful.[21]

One must clinically differentiate carcinoma of the major duodenal papilla from: cancer of the pancreas, common duct calculus, stricture of the common duct, cholecystitis, cirrhosis of the liver, hepatitis, empyema of the gall bladder, duodenal ulcer, carcinoma of the liver and others. The most important of these, carcinoma of the head of the pancreas, is less likely to have occult blood in the stools and is more likely to have a rapidly developing to complete and continuous obstruction of the common duct, a longer prodromal phase of abdominal pain, weight loss, anemia and cachexia before the appearance of jaundice,[3] a palpable mass, and x-ray evidence of an enlarged head of the pancreas.

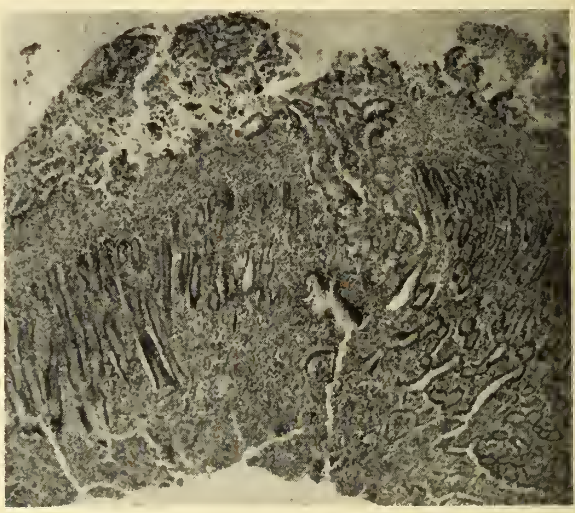

Fig. 4. Photomicrograph showing an adenocarcinoma at the margin of the common duct with beginning infiltration of the normal duodenal mucssa covering the outside of the papilla of Vater.

The diagnosis is rarely made before and never established until a surgical exploration is performed. No patient should be permitted to go more than a few weeks with an obstructive jaundice without a laparotomy.

Treatment

Dr. M. G. Gillespie: Barring a surgical death, the excellent prognosis following radical resection of carcinoma of the papilla of Vater has led to a wide variety of techniques in an effort to circumvent the many disasters evidenced throughout the literature on this subject. In a review[17] of 124 collected cases there was a 30.6 per cent surgical mortality. In one review[12] of thirty-eight deaths, twelve died of hemorrhage, five of peritonitis, three of duodenal fistula, two of shock, two of pneumonia, and fourteen were not stated. Five factors of poor success have been listed[14] as (1) the insidious onset of the disease, (2) the poor condition of the patients, (3) the relative inaccessibility of the lesions, (4) the proximity of important structures which cannot be sacrificed, and (5) technical difficulties. In spite of these, radical resection has sustained life for a longer period than conservative treatment and it offers the only prospect there is of a cure. With the advent of vitamin K, a more liberal use of blood transfusions, chemotherapy and improvements in surgical techniques, surgical mortalities have decreased considerably.

No single operative procedure is suited for all varieties of tumors of the papilla.[5] The mistake of performing a radical resection for a benign papilloma followed by surgical death[11] is indeed unwarranted. In such benign lesions and possibly selected tiny malignant neoplasms, local resections with reimplantation of the common bile and pancreatic ducts may be indicated.[13] Most surgeons prefer a one- or two-stage radical resection.[9,18,23,24] If the pancreatic duct is tied off, disturbances in carbohydrate and fat metabolism may develope.[10,19,23] The feeding of lecithin, choline and pancreatic extract or lipocaic have been advised for both preoperative and postoperative care.[20]

Because of the fibrous adhesions resulting from the first procedure, we favor a one-stage radical resection in those cases where there are no demonstrable metastases and in which the patient has been suitably prepared and is a good operative risk.

Summary

The case of a thirty-nine-year-old woman with a carcinoma of the papilla of Vater is presented as a diagnostic study. Over a five-week period she suffered with diarrhea, vomiting, colicky abdominal pain, a slowly progressive, apparently fluctuating jaundice and pruritus followed by loss of from 5 to 10 pounds of weight, profound weakness, chills and fever. The laboratory studies revealed no urobilinogen in the stools or urine, and normal results in a series of liver function tests. A radical (Whipple) resection of the malignancy has almost certainly resulted in a cure.

A very brief review of the literature concerning the frequency, etiology, pathology, clinical manifestations and treatment of carcinoma of the papilla of Vater is presented.

AMEBIC ABSCESS OF THE LIVER

(Continued from Page 1166)

problem of great importance. The key to an early diagnosis is constant awareness of the disease.

3. Emetine cardiotoxicity and a brief review of the experimental and clinical literature is cited. The fact that emetine cardiotoxicity may occur with the usual therapeutic doses is stressed.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from October issue)

Jay Le Roy Sackett, the only son and one of the three children of Dr. and Mrs. Reuben N. Sackett, was born at St. Charles, Winona County, in the late fifties. His father and mother were of the finest type of pioneer settlers of southern Minnesota, in Olmsted, Fillmore and Winona Counties.

Reuben Nathaniel Sackett was born on December 8, 1825, in Chautauqua County, New York, obtained his general education and medical training in his native state and was admitted to practice in Syracuse. On August 11, 1854, he was married to Julia A. Palmer and in May of 1855 the young couple moved to southern Minnesota, to settle first in Olmsted County, in Quincy Township; in this period he was known as Dr. Nathaniel R. Sackett. Subsequently Dr. and Mrs. Sackett lived in St. Charles, Winona County, where the doctor had a medical and surgical practice, and later they were in Janesville, Waseca County, and in Windom, Cottonwood County. At one period, presumably before moving into western Minnesota, Dr. Sackett practiced for a time in Chatfield, Fillmore County. Of the two daughters of the family, Zilpha Estell died in infancy; Nettie was married to A. G. Chapman, a lawyer, of Lanesboro. Dr. Sackett was active in the Masonic order and as a charter member helped to organize lodges at St. Charles, Janesville and Windom. He and his wife for more than seventy years were members of the Methodist Church. Mrs. Sackett died at the home of her daughter, in Lanesboro, on November 21, 1914; Dr. Sackett died on December 20, 1920, in a hospital at Rochester; both were buried at Lanesboro, where they often had visited Mr. and Mrs. A. G. Chapman and where they were well known.

Jay Le Roy Sackett received his preliminary education in the schools of St. Charles. Later he was a student at Hamline University, in Saint Paul, and took his medical training at the Hahnemann Medical College of Chicago, from which he was graduated in the late winter of 1887; soon afterward he was licensed to practice in Minnesota, receiving certificate No. 1328 (H), dated March 16, 1887.

Just at that time Dr. James M. Wheat, since 1856 a highly respected physician and surgeon in Lenora, Canton Township, Fillmore County, was moving permanently to California, and Dr. Sackett, young, "a fine looking man of the brunet type, intelligent and quick," succeeded to his practice. The village of Lenora, in a prosperous community fourteen miles from Lanesboro, its nearest railway point, and five and a half miles from Canton, once was expected to become a railway town but, like many another village in the county, had been left on one side by the Southern Minnesota Railroad in 1870, so that its fortunes had dwindled; even in 1887, however, it had 125 residents, a school, a hotel, two churches and several stores, daily mail and tri-weekly stages to Canton and Rushford.

His promising career so well begun in Lenora was cut short after only two years when Dr. Sackett contracted tuberculosis; in the hope of benefiting from change of climate he removed to San Antonio, Texas, but he did not improve and died in San Antonio soon after his arrival there. His wife, who had been Minnie Spencer, of St. Paul, survived him; there were no children. After her husband's death Mrs. Sackett returned to Saint Paul, where she remained until, some time in 1898, she removed to Colorado.

A **Dr. Schoolcraft,** of Fillmore County, started for Devils Lake, North Dakota, on Monday, stated the *National Republican* of Preston on April 8 (Thursday), 1886; in subsequent issues Mrs. Schoolcraft was mentioned several times as "canvassing for a number of useful works." Other mention of this physician, if he was a medical practitioner, has not been noted.

Louis Dwight Shipman, the only child of Mr. and Mrs. Dwight Edson Shipman, was born on April 11, 1875, at Morrisville, New York, where his father, a native of Easton, New York, owned a clothing manufactory; his mother, Augusta Ann Wales, was born at Morrisville.

In 1890 Louis Shipman came with his parents to their new home in Minneapolis and there continued the education which he had begun in the schools of Morrisville. After completing his high school instruction at the Lyndale School and taking collegiate courses at the Minneapolis Academy, he entered the University of Minnesota College of Homeopathic Medicine and Surgery, from which he was graduated on June 26, 1896, with the degree of doctor of medicine.

The scene of Dr. Shipman's earliest medical practice was Fillmore County, first in the village of Preston, from 1896 to 1898, and next in Canton, which offered better financial opportunity. Young Dr. Robert L. Conkey, new in his profession, had died in Canton in that year, and Dr. Robert A. Sturgeon, in his seventies and for many years past an invalid, was not in active practice, so that Dr. Henry H. Haskins, in his middle fifties and perhaps already planning his retirement (1902) from practice, was the only resident physician. Here for the next four years Dr. Shipman served the community as a private physician and surgeon and for a time as county physician. On April 10, 1901, he was married to Bertha McKinney, at Canton. Dr. and Mrs. Shipman had two children, Cleon Dwight and Gladys.

Successful though he was as a general practitioner, Dr. Shipman early determined to become a specialist and in 1902 he left Canton to take postgraduate work at the Chicago Eye, Ear, Nose and Throat College and Hospital. On completion of this course, early in 1903, he went to London, England, to study and there he first was a clinical assistant at the London Central Throat, Nose and Ear Hospital and later at the Royal Ophthalmic Hospital. At the end of 1903 he became acting house surgeon of the London Throat Hospital; it has been said that had he been the holder of a degree from an English medical school, as was required by the hospital for members of its professional staff, he would have been appointed house surgeon; as it was, his position was the highest which up to that time had been held in the institution by an American.

In the spring of 1904 Dr. Shipman returned to Minneapolis, to open offices in the Medical Block, 608 Nicollet Avenue, as a specialist in treatment for diseases of the ear, nose and throat. His announcement card of April 1 included the lines, "Finsen's London Hospital Light, Ultra-Violet Rays and Eclectical Treatment of Lupus, Tuberculosis, Growths and Diseases of the Nose, Throat, Ear and Face."* Well qualified professionally and personally, and possessing in addition the ability to write with clarity and interest on subjects medical and nonmedical, Dr. Shipman entered on a career in which he soon received recognition, for in 1907 he was appointed a member of the faculty of the Medical School of the University of Minnesota. He was never to realize his new position; in the week that the appointment was confirmed, Dr. Shipman contracted diphtheria from a patient whom he was treating for the disease and died within a few days, on February 5.

Distinguished in appearance, tall and slender, with blue eyes and wavy dark brown hair, Dr. Shipman was genial, friendly and considerate in all his relationships. The interest in community life which he had shown in Canton he broadened in Minneapolis, transferring his membership in the Masonic order to Lodge No. 19 in the city and becoming an active member of the Linden Hills Congregational Church, instrumental in the organization and functioning of its men's club. Happiest when in his home, he was the kindest of husbands and fathers and was a gracious and delightful host to many guests.

After Dr. Shipman's death Mrs. Shipman with the two children, both of whom were born in Minneapolis, remained in the city and in 1943 she continued to reside there as did her daughter Gladys (Mrs. R. B.) Nelson, and her son, Cleon Dwight Shipman, associated with the Graybar Electric Company.

Reuben Farmer Spencer, who was born in December, 1834, at West Burke, Vermont, received his early education and medical training in the East. In 1856, when he was twenty-two years old, he traveled west to Wisconsin, where he taught school and practiced dentistry until, sometime in 1861, he first entered Minnesota. In the next fifteen years, judging from different comments, he changed locations various times; in 1865 he returned to Wisconsin and then to Vermont, and in 1868 he came again into Minnesota, to remain three years before traveling on into Dakota Territory, where he practiced medicine for several years. Finally, in 1877, he settled permanently in Minnesota, in the village of Etna, on the Root River, in the southeastern corner of Bloomfield Township, Fillmore County, eight miles from Spring Valley and twenty miles from Preston.

In those years Etna (laid out in the early fifties as "Tiffton," sometimes seen "Tefton," a name rejected by common consent) had a population of fifty, daily mail and stage connections with Spring Valley and also with Lime Springs, Iowa. The Root River furnished power for grist mills. Hopefully, as late as 1883, a business gazetteer announced that a good store was needed in the village. In the early seventies Dr. J. J. Morey, recently of Spring Valley, was practicing medicine in Etna; perhaps he still was there when Dr. Spencer came.

For seventeen years, until his death in 1894 at the age of sixty years, Dr.

---

*Neils Ryberg Finsen, Danish physician (1860-1904).

Spencer carried on from Etna a general medical and surgical practice in a large territory which extended as far north as Spring Valley; he was well known and highly respected. In 1882 he served as justice of the peace in Etna. On October 25, 1883, under the "Diploma Law" of that year he received state certificate No. 185-3, which he filed in Fillmore County on November 26, 1883.

Reuben F. Spencer was married in 1874 to Carrie M. Howey, of Wisconsin. Of the two children of the marriage, one was living in 1943, Mrs. Edwin Finch, of Vulcan, Province of Alberta, Canada, and in this year also Mrs. Spencer, at the venerable age of eighty-eight years, had long been making her home in Spring Valley.

Aaron Marshall Stephens was born in June, 1842, at Frankfort Springs, Beaver County, Pennsylvania, the son of J. Stephens and Elizabeth Marshall Stephens, and a descendant of an English family who were colonists in Virginia in 1607. Little record exists of his early years except that he was left an orphan when he was a child, that he taught school when he was a youth, that he was interested in science and microscopy, and that he early became a Methodist minister. In 1866 he first came to Minnesota to occupy the position of professor of mathematics and natural science at Hamline University (then in Red Wing, Goodhue County). In 1879 he received the degree of master of arts from One Study University, in Ohio, and soon afterward, accompanied by his wife, he came to Chatfield, Fillmore County, to fill the pulpit of the local Methodist Church.

After some years in Chatfield The Reverend Mr. Stephens, A.M. (he always used these letters) left the church and temporarily left the village to prepare for entering the profession of medicine. It is recalled in Chatfield to the credit of this clergyman and his wife that, before Mr. Stephens was able to enter medical school, they joined in surmounting the financial difficulties of the undertaking by assuming additional employment, he in extra-clerical work in the railroad roundhouses that were a feature of Chatfield in those years, and she as a saleswoman in a local store.

Dr. Stephens was forty-one years old when, early in 1883, he was graduated from the Hahnemann Medical College and Hospital of Chicago and returned to Chatfield in his capacity as physician and surgeon. The *Chatfield Democrat*, on March 8, 1883, carried the following item: "Degree of Doctor of Medicine and Surgery conferred on Rev. A. M. Stephens, A.M., on February 21, 1883, at the Grand Opera House, Chicago, by Hahnemann Medical College and Hospital. We expect the doctor home in a few weeks." And this note was followed on April 21 by a second: "Dr. A. M. Stephens, A.M., returned last week from Hahnemann Medical College and Hospital of Chicago, where he has been attending lectures the past year. Dr. Stephens has spent several years in the careful and earnest pursuit of medical studies, besides attending the full course of lectures and is already well qualified for his profession. He will remain for the present with his family in Chatfield and engage at once in the practice of medicine." On April 19, 1884, Dr. Stephens received his license, No. 875 (H), to practice medicine in the state, and on April 25 filed it in Fillmore County. His office was in his residence, "near the foundry."

This physician is remembered in Chatfield as a quiet, kind and fatherly man, large and rather portly, who had dark brown hair and a long full brown beard, unflecked by gray. Respected as a clergyman in the community, on his graduation from medical school he was well received as a physician by the residents. Children delighted in going to his office, both because they were fond of him and because he kept there in a cage some fascinating white rats —the psychologic effect of which no doubt aided therapeutics as represented by Dr. Stephens.

During his years as a general medical practitioner in Chatfield, Dr. Stephens served for a time as the local health officer and as an examining surgeon on the board of pensions of the district. He also maintained an active interest in the Methodist Church, occasionally preaching in Chatfield and in other villages, and worked for betterment of the schools; in 1889 he filled a vacancy on the board of education, and in 1890 was elected for three years, a term which ended with his resignation on June 28, 1892.

After eight years as a physician in Chatfield, Dr. Stephens moved, in the summer of 1892, to the suburbs of the Twin Cities, making his home in Hamline and engaging in the practice of medicine with Dr. Sheridan G. Cobb of Merriam Park. In 1895 he returned to his first Minnesota home, Red Wing, and there for the next thirteen years he followed his profession.

Aaron Marshall Stephens was married in 1864, at Waterloo, Iowa, to Mary Bishop, a schoolteacher, of English descent; Mary Bishop, like her husband, had early been left an orphan and little is known about her family. Dr. and Mrs. Stephens had two children, Ray Bishop Stephens, who died in Chatfield in 1890 at the age of eighteen years, and Alice M. Stephens, who became a trained nurse.

Dr. Stephens died in Red Wing on September 21, 1913, after a year and a half of illness which followed a stroke of apoplexy. He was survived by his wife and his daughter. Some time after her husband's death, Mrs. Stephens moved from Red Wing to Chicago, where her daughter had been since 1910, and there she lived out her long life, dying at the Old People's Home on May 28, 1943, within two weeks of her ninetieth birthday. Miss Stephens, retired from the profession of nursing, in 1943 was still residing in Chicago.

Robert Anderson Sturgeon was born at Belfast, Ireland, on June 7, 1824, the son of John Sturgeon and Elizabeth Anderson Sturgeon, both of whom were natives of Ireland. The five other children of the family were William, John, George, Samuel and Elizabeth.

Robert Sturgeon received his education in Belfast: his academic schooling at Dr. Bryce's Academy, his training in pharmacy, medicine and surgery at Queen's College, and, after his graduation as a physician, in 1848, two years' work at the Belfast Hospital, a postgraduate service of inestimable value. From Belfast he went to England, purposing to sail for America in search of an older brother who had emigrated some years previously, and from Liverpool he embarked as medical officer on the *Silas Greenman,* bound for New York. After much search and inquiry he traced his brother to Montreal, Canada, only to learn that he had died in that city, leaving a wife and several children.

Liking the city, Dr. Sturgeon established himself in Montreal and practiced medicine there for three years. After the death of his wife, Harriet Scriver, a Canadian to whom he was married in Montreal, he left Canada for the Middle West of the United States, where he settled first in Burr Oak, Winnesheik County, Iowa, about three miles south of the state line between

Iowa and Minnesota. After two years in that community he was attracted by the thriving village of Elliota, just inside Minnesota, in Canton Township, Fillmore County, and removed to that place in 1855, as nearly as can be determined.

Elliota, sixteen miles equidistant from Preston, Minnesota, and Decorah, Iowa, although for many years now a phantom village, was one of the most interesting of the early settlements. It was laid out in 1854, as stated earlier, by Captain Julius W. Elliott, a native of Vermont, who came to Minnesota Territory from Moline, Illinois, in 1853, bringing with him a company of pioneers. The first buildings of the village were burned but soon were replaced and by 1858 the settlement was an important mail station at the intersection of several stage lines, one of which was M. O. Walker's route from Dubuque to St. Paul. In its palmiest days Elliota had three hotels, the Elliott, the Lewis and the Crags, two stores, a stone school house, built at a cost of $900, a drugshop (probably Dr. Sturgeon's), a mechanic shop, and at that time, it was stated, there was need of a grist mill and a sawmill. The only early physician in Elliota other than Dr. Sturgeon of whom note has been found was Dr. Thomas Little.

Dr. Sturgeon's residence in Elliota was interrupted by his military service during the Civil War; record has not been available, except that he was with the Union Army in Missouri. In the year after the close of the War, on July 18, 1866, Robert Anderson Sturgeon was married to Jane Young, who was the daughter of a farmer near Elliota and was a native of Dumfermline, Fife County, Scotland. The six children of the marriage were Helen, Georgina, Robert, Harriet, Florence and William. The family were members of the Presbyterian Church.

In Elliota Dr. Sturgeon remained for many years, contributing largely to the interest and welfare of the community and sharing its fortunes, which inevitably declined after the railroad passed the village by; in 1882 the greater part of the business of the place was transferred three miles northeast to Boomer (later named "Canton"), also in Canton Township; Boomer was founded in 1879 but was not incorporated as the railway village of Canton until 1887. The postmasters of Elliota, after Captain Elliott, were Mr. Dickson, Mr. Wilcox, Mr. Morrell and, finally, Dr. Sturgeon, who closed the office and surrendered the key of the mail pouch in April, 1882. In that final year Elliota had only fifty residents; there were still functioning one hotel, three flour and grist mills of four run of stone each, two churches and the school, and there was to be for a time stage connection with Rushford, Minnesota, and with Decorah and Cresco, Iowa.

In his drug store in Elliota Dr. Sturgeon maintained his offices and compounded his own medicines. The story is told of one of his prescriptions, which was given to a patient who had contracted a severe cold after breathing in dust while handling rubbish: The advice was to inhale the steam from a mixture of iodine, oil of tar and water; the patient followed instructions and the congestion cleared up promptly. In 1881, preparatory to removal to Boomer, Dr. Sturgeon was having his store and office building taken down and reconstructed in the new village.

In 1882 Dr. Sturgeon settled with his family in Boomer, or Canton, where for nineteen years he continued to win and hold the love and confidence of the community for his gentleness and professional skill and his capability and dependability as a citizen. Under the medical practice act of 1883 in Minnesota he received certificate No. 1172, given on March 24, 1886, and filed in Fillmore County on the following May 6.

The last twenty years of his life Dr. Sturgeon was a semi-invalid, as the result of a stroke; one arm was paralyzed and he walked with a cane, but he nevertheless consulted with patients, managed his drug store and, from 1893 to 1897, served as postmaster for the village. In the latter year, when his health was failing greatly, and subsequently, his daughter Georgina and his sons Robert and William in turn took his place as postmaster. His position in the esteem, respect and gratitude of the community was such that no one even considered making application for the office of postmaster as long as a member of the Sturgeon family was willing to fill it.

Dr. Sturgeon's professional contemporaries in Canton were few. Dr. Henry H. Haskins was the chief and eldest, practicing in the village from 1878 to 1902. Dr. C. Wilbur Ray was in practice there in 1894 and 1895. Dr. Robert L. Conkey, a native of Preston, in his brief medical career, was in Canton only a year, in 1897 and 1898, before his untimely death. Dr. Louis D. Shipman, beginning in 1898, spent four years in Canton, as noted, before leaving to prepare for specialization in ear, nose and throat work.

That Dr. Sturgeon was a cultured gentleman of warm and vivid personality and a physician of exceptional native ability and professional training is certain. Although not consciously humorous, he possessed a lively fancy and a felicitous turn of phrase that distinguished him among the less articulate. One of his friends and truest admirers, the late Dr. George Kessel, of Cresco, Iowa, who was a boy when Dr. Sturgeon was in his prime, gave the writer a verbal picture of a tall, well-built man who had black hair and wore a black mustache and whose eyes, once seen, were never forgotten, of more than medium size, so darkly blue as to look black under heavy overhanging black eyebrows, and holding always a little twinkle that indicated that they were friendly and kindly eyes. Dr. Sturgeon was a man of arresting personality, dignity and almost military bearing; of polished diction and extensive knowledge of the world's great literature in Latin and in English; Latin he used freely, but he quoted most often from the Bible and from Shakespeare. "He seemed so different from our neighbors roundabout us on the farm."

In his earliest years in the county, in the immediate community of Elliota, Dr. Sturgeon commonly rode on horseback to make his calls, carrying his drugs and instruments in saddlebags. In those times Indians were objects of fear to the settlers, and wild animals were a menace to the denizens of barnyards and poultry runs, so that almost every family in rural neighborhoods kept at least one competently savage dog to protect them and their possessions from marauders, two-legged or four-legged. The dog could not or did not always discriminate and therefore Dr. Sturgeon, being a prudent man, when arriving at a homestead would not dismount until the guard had been called off and pacified. After he had given up horseback riding, Dr. Sturgeon always employed a driver in going about his business in horse-drawn vehicles. Dr. Kessel described the doctor on drives in winter, sitting erect in his cutter, his head up, his highly colored long scarf wrapped around his shoulders and crossed over his chest in a bright "X," an accessory "that was attractive and again made him look different from other people." And further, "He was a wonderful man, one of the pioneer characters, and a real character he was . . . enough . . . to make a book in himself."

Robert Anderson Sturgeon died in Canton on January 8, 1901, from paralysis. Of his family group there was living in 1943 Georgina Sturgeon, of Amboy, Minnesota, and William Sturgeon, of Santa Ana, California.

Jerome B. Tamblin, who was in Lanesboro, Fillmore County, in the early eighties, came to Minnesota indirectly from New York. Arriving in Winona in 1867, he established his residence at 159 Third Street and opened an office in Ford's New Brick Block on Second Street, announcing himself as doctor of medicine, physician and surgeon, recently from New York, of twelve years' experience as a practitioner, especially interested in the diseases of women and children, and willing to answer calls in city and country. After two years in Winona Dr. Tamblin moved to St. Charles where he operated a drug store with Dr. H. H. Guthrie and carried on a medical practice that extended throughout the countryside to Elba, Utica, and other villages.

Described as at all times an active participant in local politics, Dr. Tamblin was also an energetic member of his profession, progressive and evidently in good standing. In 1869, then in St. Charles, he became a charter member of Winona County Medical Society, and in 1871 he was elected to membership in the Minnesota State Medical Society. At the annual meeting of the state group that year he debated vigorously, opposing the resolution that a committee of three be appointed to obtain from the legislature an appropriation to aid in publishing the transactions of the society (this resolution was passed), and by proposing that the fee for examination for life insurance by members of the society be fixed at not less than three dollars (this resolution was placed on the table). At different times he served as a member of the Committee for Essays on Medical Subjects, the Committee on Medical Societies, and the Committee on Epidemics, Climatology and Hygiene.

In 1882 Dr. Tamblin moved from St. Charles to Lanesboro; by 1885 he was living in Lincoln, Nebraska.

Isaac Whittington Timmons (1883-1912), a member of the homeopathic school of medicine and, after 1887, the possessor of an exemption certificate under the Affidavit Law of the state, was for many years a practicing physician in southern Minnesota. Coming to Minnesota in 1870, he began his medical practice in Money Creek, Houston County, leaving after a few years to settle in Winona, Winona County. By 1877 he had returned to Houston County and was practicing medicine in the village of Houston. In 1881 he went for a time to North La Crosse, Wisconsin, and not long afterward, learning that there was an opening for a physician in Chatfield, Fillmore County, he established himself in that place for a year and a half. A note in the *Chatfield Democrat* of November 3, 1883, stated that he was using the office formerly occupied by Dr. R. W. Twitchell. By the early spring of 1884 he had returned to Winona and there he followed his profession and joined actively in the civic life of the community until his death in 1912. In notes on medical history in Houston County the writer included a detailed sketch of the life of Dr. Timmons.

President's Letter

NATIONAL PHYSICIANS' COMMITTEE CALLS CONFERENCE OF THE PROFESSIONS

Recently; it was my privilege to attend the National Conference of the Professions held in Chicago and sponsored by the National Physicians' Committee for the Extension of Medical Service. This meeting was attended by 184 physicians and dentists, and every state in the Union was represented. It was the consensus of all who were fortunate enough to be among those present that this was an epoch-making meeting. Any doubt of the need for the National Physicians' Committee was dispelled during those two memorable days, September 29 and 30, 1947.

During the course of the Conference, vitally important facts were revealed with the utmost clarity. I was profoundly impressed with the vastness of achievement which is possible through co-ordinated effort. Several startling revelations were disclosed. For example, it was demonstrated beyond peradventure that the source of the relentless drive for compulsory sickness insurance—socialized medicine—is the "Moscow-dominated Communist Party of the United States." Also, incontrovertible evidence was provided that statistics compiled by Federal bureaus have been misused or misinterpreted by government employes to create the impression that there is a great lack of adequate health care in this country. And furthermore, it was shown that an inquiry into government records indicated that millions of dollars of public funds have been spent illegally in an effort to create a demand on the part of the people for socialized medicine. I was deeply impressed by the step-by-step method by which the monument of evidence was built. Indisputable facts demonstrated that forces behind the relentless drive for socialized medicine are pressing toward the achievement of their chosen objectives by the use of coercive and deceitful devices.

The Honorable Forest A. Harness* spoke at the evening session. He said: "The amazing ramifications of the Federal propaganda in behalf of socialized medicine have astonished me." He stated too that all the Federally financed activity for socialized medicine originates in the Bureau of Research and Statistics of the Social Security Board. "Our committee investigators," he said, "have found in that Bureau a veritable nerve center of socialized medicine propaganda for the entire world. On the basis of evidence at hand American Communism holds this program as a cardinal point in its objectives . . . and . . . in some instances, known Communists and fellow travelers within the Federal agencies are at work diligently with Federal funds in furtherance of the Moscow party line in this regard."

All during the meeting, the authoritative guest speakers, selected by the National Physicians' Committee, produced facts which indicate that the propaganda of the protagonists of socialized medicine has its source in the Communist party and in a small group of officials of certain Federal agencies charged by Congress with the administration of social and welfare laws. These speakers stated that the Communist party finances its efforts by collecting dues equal to 6 per cent of the wages and salaries of its members and in addition has levied an assessment on all members, equal to one week's earnings. In some instances the assessment was as much as $2,500. Also, it was brought out that bureaucrats in our national government have been dispatched to Tokyo and Manila for the purpose of establishing programs of compulsory sickness insurance in the Philippine Islands and Japan.

I came away from the meeting with a feeling of admiration and esteem for the National Physicians' Committee. This organization has grown in strength and effectiveness until now it is undoubtedly the most important single agency which has for its objective the preservation of our system of private medical practice. Probably, it is the greatest single force in the nation directed toward preserving the entire freedom of enterprise system.

The following quotation which I have taken from an editorial which appeared in the October, 1947, issue of the *North Carolina Medical Journal,* pays fitting tribute:

"It may be recalled that the National Physicians' Committee has been the principal target of abuse for the proponents of socialized medicine, and that over a nationwide radio broadcast this organization was accused of having spent one million dollars for the publication and distribution of one pamphlet. Doctor Edward Carey, appearing before the Murray Committee, refuted this accusation by showing that in six years the National Physicians' Committee had spent only $905,359.23 on all its activities. It is a tribute to the National Physicians' Committee's management that with this sum—paltry by comparison with the $75 million spent by Federal Government agencies in one year—a handful of men have been able to withstand the onslaught of 45,000 employes engaged full or part time in propaganda activities."

---

*Chairman of the subcommittee on Publicity and Propaganda of the House Committee on Expenditures of Executive Departments.

If one should seek official approval of the National Physicians' Committee, it can be found in the records of the American Medical Association and other medical organizations. In June, 1947, the House of Delegates of the American Medical Association approved the report of its Committee on Executive Session, a portion of which read: "Among those who were familiar with the organization (N.P.C.), the general impression was that it was just about the only thing that had stood between the medical profession and political control. We recommend that the House of Delegates of the American Medical Association continue its commendation of the accomplishments of the N.P.C. and resolve a vote of confidence in the managing board of that organization."

During the past twenty-five years there have been approximately 100 attempts to enact compulsory sickness insurance laws in Congress and in the state legislatures. An effort was made to enact the most vicious kind of compulsory health insurance legislation during the 1947 session of the Territorial Legislature of the Hawaiian Islands. That this move toward socialized medicine in Hawaii had great national significance becomes clear when one realizes that the territory stands upon the very threshold of statehood. The delegate from Hawaii to the House of Delegates of the American Medical Association made this report at the Centennial meeting: "The pattern-trend in Hawaii has been and continues to be of such nationwide importance that the N.P.C., at the request of the Territorial Association, made its full facilities available to us. All the services which the N.P.C. gave us so generously—literature, analyses of legislation, comparative data, statistics, personal services—were of such tremendous importance in solving our problems that every professional and businessman in Hawaii now fully realizes that this all-physician organization can truly be called the 'shock troops' and the 'winning battalion' in the cause of both professional freedom and the whole freedom of enterprise system when the big push is on. The N.P.C. has earned and truly deserves the financial and moral support of every ethical physician for its long and effective services to the professions."

It has not been my purpose merely to pay tribute to a group of physicians who unselfishly have rendered such yeoman service to the citizens of their country, but in addition I wish to use this story of accomplishment as a stimulus toward even greater achievement. Whenever there has been a grave crisis, these courageous men of the National Physicians' Committee have quickly and effectively moved against the evil forces which would wreck the finest system of health care which the world has ever known. And now, after nearly a decade of service, they face their most important tasks. They must clarify in the public mind the true meaning of the bold and purposeful, the adroit and sinister moves that would result in political control of the distribution of medical care. This can be accomplished only by the highest unity of purpose and co-ordinated effort on the part of the professions. We must recognize the sterling character and performance of our colleagues of the National Physicians' Committee. Only through maximal co-operation and generous support of this great organization by all physicians can the integrity of the medical and dental professions be preserved.

Louis A. Buie

President, Minnesota State Medical Association

SOCIALISM OR FREE ENTERPRISE?

WE are intrigued by the American Heritage Program and the Freedom Train, said to have been conceived by Attorney General Clark. Making such historic documents as the Declaration of Independence, the Constitution of the United States, and the Bill of Rights available to the gaze of millions of citizens throughout the forty-eight states cannot fail to have an important educational value. And after all, an informed public opinion determines the kind of laws our representatives pass, and will determine whether we adhere to the form of government which has made our country what it is in freedom and opportunity or whether we shall go all out for Communism or Socialism.

We have had recent examples of how Communism and Socialism work. The Communists advocate the elimination of private property and the employment of all citizens by the state, with equal compensation for all types of work. The members of the Communist party are, of course, to hold the important offices. Human nature being what it is, we see how differently Communism has worked out in Russia. How any patriotic American can consider Communism for a moment is beyond comprehension.

Socialism advocates the wide nationalization of industry by the government, and correspondingly less private industry. England has gone far on the socialistic path under its present labor government. The effect on England's economy does not recommend Socialism for its efficiency according to American standards.

How far we as a nation want to go in the direction of Socialism is for the people to decide—not the government nor elements in the government. If the public realizes that with Socialism comes regimentation, government regulation of wages and prices, and loss of personal freedom, it will make the people pause. If the public learns that socialization of industry in other countries has begun with the socialization of medical care, they will pause before they adopt such legislation as the Wagner-Murray-Dingell bill. Of course, there is the necessity for the government to undertake certain activities for the good of the public. A certain amount of socialization of medical care has been deemed necessary, as evidenced by the governmental care given the insane, the tuberculous, the veterans, et cetera.

To anyone not entirely blind to present-day trends, it must be evident that there is a strong element in Federal government circles working with enthusiasm of zealots for a socialistic form of government in our country.

The Wagner-Murray-Dingell bill, providing for complete socialization of medical care, repeatedly submitted to Congress in a little different form each time, was backed by President Truman on its last submission. And now comes the suggestion that this bill be incorporated as a plank in the Democratic platform. We can conceive of no worse outcome than that such a radical change in government should be subjected to the heat of a political campaign rather than to cool, considered deliberation of Congress.

No more should the Taft-Hartley hospital bill be considered a Republican measure just because a Republican congress passed it!

We have referred editorially to the Health Workshops conceived and promulgated entirely by government employes in the U. S. Public Health Association and other Federal departments. This is a good example of the enthusiasm in certain parts of the Federal government for the complete socialization of medicine.

The government's Health Mission to Tokyo is another example of the fanaticism for Socialism which exists in certain quarters in Washington. The scheme of a Health Mission to Tokyo originated in the Division of Research and Statistics in the Social Security Board in Washington. Federal employes were deliberately sent from Washington to Tokyo for the purpose of engineering a request for a health mission. Is it not significant that the personnel of the mission sent was composed entirely of men long identified as advocates of socialized medicine not only in the United States but throughout the world?

According to Representative Harness, chairman of a Congressional subcommittee investigating publicity and propaganda of the U. S. Government, the real purpose of the Health Mission to Tokyo was to lay the foundation for a system of socialized medicine in Japan. If this is not evidence of a fanaticism for world Socialism, what is it? As Harness said, "I deem it inappropriate for Federal employes, at the expense of the American taxpayer, to travel throughout the world preparing or assisting in the preparation of legislation to be adopted by foreign countries when similar legislation, long pending, has not been approved by the Congress of the United States."

It seems very evident that America stands today at a crossroads. Public opinion must decide whether we are going to continue our socialistic trend, which includes unwarranted competition on the part of the government with private industry, and Federal subsidy of states for activities which each state should sponsor itself, or whether we are going to retrench in our socialistic activities. The recent declaration of Indiana that henceforth she will refuse Federal subsidy and support her own projects without Federal assistance is encouraging and merits emulation by other states.

We are in favor of any activities, such as the American Heritage Program and the Freedom Train, whose purpose is to give the public a clear understanding of the price we have paid for our liberty and the price we shall all have to pay in personal freedom if we substitute Communism or even Socialism for our present economic system. There should be no question of what choice informed and freedom-loving Americans will make.

TYPHOID IN MINNESOTA

In the old days, typhoid fever proved a very substantial source of revenue for the general practitioner—enough patients with typhoid, and Junior's college expenses were assured. Today, many recent medical graduates have never seen a patient with typhoid fever.

In 1910, there were 3,892 cases of typhoid in Minnesota, with 688 deaths. Starvation and ice packs, or tubbing in ice water, formed the standard treatment. Such figures show the disgraceful status of public sanitation in the state at that period. With improvement in water and food supply, by 1920 there were only 684 cases with seventy-one deaths, and by 1930 only 217 cases and twenty-five deaths. For the past ten years the number of yearly cases has been less than 100 with fewer than ten deaths, and with a low of twenty cases in 1945 and no deaths in 1944.

This brilliant reduction in morbidity and mortality from typhoid fever is due to improvement in water supply by the sanitary engineers, the use of pasteurized milk, and the diligent follow-up of sources of infection by the Section of Preventable Diseases of the Minnesota Department of Health as soon as a case is reported. Since 1913 the Health Department has identified a total of 469 typhoid carriers and, what seems quite remarkable, it has at present 206 on the active carrier list.

It is not generally realized that carriers afford the most common source of infection. Individuals who have obtained their infections out of the state are next in frequency, and since 1940 a number of cases have been traced to Mexico.

Five infections with paratyphoid A and thirty with paratyphoid B have occurred among the total of 521 cases reported in the past ten years. The remainder have been straight typhoid infections. Three of the individuals with paratyphoid A and one of those with paratyphoid B contracted the disease in Mexico.

This summer three members of a party of eighteen tourists from Saint Paul contracted typhoid fever in Mexico. Two were classified as typhoid and one as paratyphoid A. One of the typhoid patients had been vaccinated in 1946. The other two patients had never been vaccinated. Nineteen cases of typhoid have been reported so far in 1947, eight persons having contracted the disease from carriers, three in Mexico, and one from elsewhere outside the state.

As far as Minnesota is concerned there have been thirteen cases of typhoid contracted in Mexico since 1940. If other states have had similar experiences, and there is no reason to suppose that most of them have not, attention should be called not only to the desirability of a recent vaccination with triple typhoid vaccine for those planning to visit Mexico but also to the fact that great care should be taken to avoid contaminated food and drink when visiting Mexico.

NOTE: The statistics cited were kindly furnished by the Minnesota State Board of Health.

TOPICAL SULFA N. G.

THAT we were at first carried away by our enthusiasm for sulfa drugs has now become apparent. Sulfa drugs were poured into laparotomy and other wounds to prevent infection in clean ones and to clean up infected ones, were applied in salves to skin lesions or incorporated in lozenges for sore throats, and were used in various and sundry other ways.

One of the contributions made to civilian practice by war experience was the discovery that sulfa drugs actually delay healing of wounds and were actually ineffective for wound sterilization. As a result, the Council on Pharmacy and Chemistry of the AMA has made the following statement on the topical use of sulfa drugs in the 1947 edition of *New and Non-Official Remedies:*

> "Experience gained in World War II seems to indicate that the use of crystalline sulfonamides as topical agents was not very successful in the management of wound infection or in the treatment of infections of the skin and mucous membranes. The routine use of sulfonamides as topical applications in wounds, burns and in superficial infections is, therefore, to be discouraged."

The sulfonamides intended for topical therapy will, therefore, be discontinued in this volume. It may be noted that sulfonamides in hair tonics and shaving creams are useless. They not only render a false security but may cause the development of a cutaneous sensitivity which will in the future prevent the use of sulfonamides in serious conditions for which these drugs are known to be effective.

AMA DIRECTORY INFORMATION CARD

Preparations are being made to publish the new, eighteenth edition of the American Medical Directory! The last edition of the Directory was issued late in 1942.

About November 15, a directory card will be mailed to every physician in the United States, its dependencies, and Canada, requesting information to be used in compiling the new Directory. Physicians receiving an information card should fill it out and return it promptly whether or not any change has occurred in any of the points on which information is requested. It is urged that physicians also fill out the right half of the card, which information will be used exclusively for statistical purposes. Even if a physician has sent in similar information recently he should mail the card promptly to insure the accurate listing of his name and address.

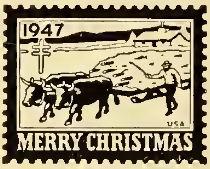
The Directory is one of the most important contributions of the American Medical Association to the work of the medical profession in the United States. In it, as in no other published directory, one may find dependable data concerning physicians, hospitals, medical organizations and activities. It provides full information on medical schools, specialization in the fields of medical practice, memberships in special medical societies, tabulation of medical journals and libraries.

Therefore, should any physician fail to receive one of these Directory Information cards by December 1, he should write at once to the Directory Department, American Medical Association, requesting that a duplicate card be mailed.

TUBERCULOSIS AND CHRISTMAS SEALS

Pioneer days when tuberculosis was "captain of the men of death" and when people suffering with it came "west" to Minnesota seeking health are recalled by the 1947 Christmas Seal. It pictures a team of oxen pulling a sleigh of greens over the snow.

Christmas Seals



. . . Your Protection Against Tuberculosis

An outstanding figure in the pioneer days of Minnesota's fight against tuberculosis was Dr. H. Longstreet Taylor, of Saint Paul, who died in 1932 after a life devoted to the work. Dr. Taylor received his medical degree from the Medical College of Ohio in 1882, the same year that Dr. Robert Koch discovered the tubercle bacillus. His imagination fired by this accomplishment, he said: "It is now possible to drive tuberculosis out of the world." To this task he set himself.

After studying two years with Koch in Germany and two years more in Prague, he practiced medicine in Cincinnati, Ohio, and Asheville, N. C. In 1893 he came to Saint Paul and began his crusade.

Dr. Taylor founded the Minnesota Association for Prevention and Relief of Tuberculosis, the state Christmas Seal organization, now called the Minnesota Public Health Association. Known throughout the United States as the "father of the sanatorium movement" and as an outstanding authority on tuberculosis, in 1927 Dr. Taylor was elected president of the National Tuberculosis Association.

A good picture of the tuberculosis situation at the turn of the century is given in the following abstract from an article written by him in 1893:

> "This is an age when a great deal is being done on all sides to help the unfortunate members of society. . . . Too much praise cannot be given to those who, having wealth, have turned it in part or as an entirety into channels that would bring happiness to other hearthstones, even if, in all this flood of liberality and generous help, one large class of sufferers has been almost entirely overlooked. While many are the recipients of so much charity and attention for ills which they have brought on themselves by their own follies and vices, these unfortunates are suffering from a condition transferred to them from others by the neglect of the state in not putting an end to it, and are themselves spreading it unwittingly right and left, among rich and poor, the high and the low, at such a rate that one individual in seven falls a victim.

"This acquired condition is one, too, which would yield to scientific care and treatment if applied early, but which, once past this borderland of safety, destroys nearly every victim it fastens upon. It is indeed difficult to explain, with all the boasted advantages of the nineteenth century, why such preventable misery should be allowed to grow and flourish. This is all the more surprising in a commercial age, an age that counts the cost and reckons the interest, and finding a profitable balance plunges into the most enormous undertakings and carries them through successfully.

"Such an estimate shows that the state is an annual loser of many millions over and above what it would cost to eradicate this form of suffering and effectually put an end to its future ravages. This plague, which knows no geographical limits and respects no race or condition of man, is tuberculosis, and the unfortunates on whose behalf this plea is issued are the consumptive poor, than whom none appeal to us more strongly for sympathy and help, and although the world has, with a few exceptions, remained deaf to their supplications, yet every motive of charity and selfishness urges us on to do our utmost for them. . . . No steps are being taken by national, state, or municipal governments to prevent the propagation, and very little to rescue the victims of this disease, although science has been proclaiming with increasing emphasis each year of the past decade that the possibility of prevention is beyond question, and that many can be rescued whom the fell destroyer has marked as his prey. In short, if the state did its duty, consumption would be one of the rarest diseases instead of the commonest. Such statements must be sustained by facts, and facts can be produced to prove every one of them."

Progress made since the period pictured by Doctor Taylor is indicated by the fact that the tuberculosis death rate has been cut approximately 80 per cent. Minnesota now has more than 2,000 beds for the care of the tuberculous. Early and unsuspected cases are being searched out in tuberculin testing and mass x-ray surveys. That there is still much to do in the fight against tuberculosis is shown by the facts being stressed in the educational campaign accompanying the Christmas Seal sale. They include the following:

Tuberculosis is still the first cause of death from disease between the ages of fifteen and thirty-five.

It kills 53,000 people in the United States annually—one every 10 minutes. Last year, 596 Minnesotans were victims.

Tuberculosis germs are passed from sick persons to well persons by contact. Early discovery and isolation of spreaders is essential for tuberculosis control.

Sixty-seven per cent of the patients entering Minnesota sanatoria are in the advanced stages of the disease.

Five hundred thousand American have the disease at the present time and only one-half of them know it.

Tuberculosis is curable. Mass chest x-ray surveys find unsuspected cases.

Tuberculosis can be eradicated if we put to full use present-day knowledge and facilities.

The Christmas Seal sale is conducted by some 10,000 volunteer leaders under the direction of the Minnesota Public Health Association, state unit of the National Tuberculosis Association. Ninety-five per cent of the funds raised remain in Minnesota for local and statewide programs, while 5 per cent goes to the National Tuberculosis Association for its medical research and general program of organization and education throughout the nation.

EPIDEMIOLOGY AND RECENT DEVELOPMENTS IN POLIOMYELITIS

(Continued from Page 1148)

precludes the possibility of any effective means of avoiding possible infection. Based upon these facts, the rules and regulations for the control of communicable diseases have brought about a change in attitude towards the isolation of poliomyelitis cases and contacts. Presently but few states isolate patients and contacts.

The only significant statement which a person can make as far as prophylaxis of poliomyelitis is concerned is that up to this time nothing has been found to be effective, and the only encouraging statement which can be made is that clinical and research efforts are ever expanding in the hope of finding some effective ways and means through which preventive measures may be exercised.

Minnesota State Medical Association
George Earl, M.D., Chairman

NORTH CENTRAL CONFERENCE MEETS IN SAINT PAUL, NOVEMBER 23

On Sunday, November 23, doctors from Minnesota, Iowa, Nebraska, North and South Dakota and Wisconsin will convene in Saint Paul for their annual North Central Medical Conference.

A panel of speakers will present half-hour discussions on several medical economic problems common to the North Central states. Ample opportunity will be provided for delegates to comment from the floor. Program topics include the physician's role in the total medical care picture, the co-ops, veterans' medical care, rural health, public relations and medical society administration.

Sessions begin at 10 a.m. with the presidential address by Dr. William J. Duncan of Webster, South Dakota, Conference president. Other speakers on the morning program are Drs. Floyd L. Rogers, Lincoln, Nebraska, and Fred Sternagel, West Des Moines, Iowa, and Mr. Thomas A. Hendricks, Secretary of the Council on Medical Service of the American Medical Association.

Educator to Speak at Dinner

A fresh viewpoint on the old problem of ways and means of improving rural health will be presented at the 12:30 p.m. dinner by Dr. John O. Christianson who directs the school of Agriculture of the University of Minnesota Farm Campus. In the afternoon Mr. L. S. Kleinschmidt of the American Medical Association, who has devoted considerable study to the problem of health co-operatives, will speak on whether the co-ops have a place in the voluntary prepayment medical care program. Following this, Dr. W. A. Wright, Williston, North Dakota, will describe that state's plan for veterans' medical care, and Dr. W. D. Stovall, Madison, president of the State Medical Society of Wisconsin, will outline a plan for speeding up administrative processes of state medical organizations. At 3:30 p.m. there will be an open forum at which time conference delegates can bring up specific questions for discussion. Moderator will be Dr. Louis A. Buie, Rochester, president of the Minnesota State Medical Association.

The Conference will close with a brief address by the 1948 president of the Conference, Dr. A. W. Adson, Rochester.

STATE DIVISION REHABILITATES 590 HANDICAPPED PERSONS

An increase during the past year in the number of handicapped civilians who have been rehabilitated has been noted by the Division of Vocational Rehabilitation of the State Board for Vocational Education. In its annual report just published, the division claims 590 cases closed as rehabilitated, an increase of fifty-two over the previous year.

The economic returns of the program are far outweighed by the human benefits derived from these services to the handicapped, the report says. Whereas these 590 rehabilitated persons who have now been able to earn a total of $958,932 and will pay Federal and state taxes in the amount of $97,327.91, the transformation of men and women from dependency into self-sufficiency is a return which cannot be measured in dollars and cents, the report points out.

In addition to those cases actually closed there were 267 other handicapped persons in gainful employment who are now being followed up to determine the suitability of their jobs before closing their cases. This brings the total to 875 disabled persons placed in employment this year.

Earn Good Wages

Based on earning reports secured from these rehabilitated persons, their average weekly wage is $33.18, showing that these disabled persons are not earning a bare subsistence wage. Many have found it possible to increase their earnings; and, looking at the total picture, they are now collectively earning 80 per cent more than they were when they first began working.

The Division of Vocational Rehabilitation can take credit for saving thousands of dollars of public assistance funds which need not be spent when these disabled are rehabilitated to the status of self-supporting wage earners. Its records show that for thirty-five persons a total of $405 a week was being doled out to them when they were first referred to the division for help. Now these same thirty-five are actually earning $959 a week by their own efforts.

It is estimated that of the 195 persons who had no income at all at the time when their cases were first investigated, all are now earning their own way so as to have earned in six weeks what they cost the division.

Over 6,000 Received Services

During the year the total number of disabled cases on the rolls of the division was 6,362, an increase over last year. In preparing disabled persons for their jobs, here are some of the items the division purchased last year: twelve artificial limbs, twelve hearing aids, one pair of glasses, 309 medical examinations, two repairs for appliances and 229 items of training supplies.

During the year the division's medical consultant reviewed 1,153 medical reports to determine eligibility and completeness of information so that adequate programs could be outlined by the counselors. Medical examinations were purchased for 298 new clients; and in addition, 855 medical reports were secured from family physicians, clinics, and hospitals which had records available.

More and more the disabled youth in this state are looking to the division to prepare them for employment. Results are being obtained by co-operation on the part of the division with school people over the state initiating programs to emphasize the abilities of the handicapped youth and minimize their disabilities.

Disabled Need Understanding

The great need for understanding of the disabled on the part of the general public was cited in the division's report. The disabled person must be reached early in the period of disablement, the report said, so that restoration services can be started before he is unduly subjected to the disintegrating effects of idleness. The longer the period between disablement and the start of restoration, the more difficult and costly the latter becomes. Therefore the report urges that all organizations, public and private, should know about these services in order to make prompt referrals.

Services for the seriously disabled or the "homebound" continued to expand during the last year. Their total earnings also increased greatly over the last year. The area served was increased by opening an office in Virginia, serving seven towns on the Iron Range. This expansion was made possible by a grant from the Minnesota Society for Crippled Children and Adults.

Tuberculosis rehabilitation continued to receive considerable attention. In addition many deaf and hard of hearing received assistance under the program.

CONFERENCE STUDIES NATIONAL SCHOOL HEALTH PROGRAM

"Civilization marches forward on the feet of healthy, well-instructed children!" That statement was made in a speech by a Missouri superintendent of schools before a recent national gathering of physicians, educators and public health officials and it summarizes perfectly the present goal of our nation's schools.

The physician's responsibility in the attainment of such a goal was the subject of the conference, which was called by the American Medical Association in an effort to stimulate action, in a spirit of friendly co-operation, among all groups concerned with the health of our school children.

Held at Highland Park, Illinois, October 16 through 18, the gathering was entitled "The Conference on the Co-operation of the Physician in the School Health and Physical Education Program," and the purpose was, in the main, twofold: The three-day meeting was devoted to a thorough examination of what is being done at present to provide for the health and well-being of children in school and to suggesting ways of implementing the rather broad, ideal, national policy within the various states.

Co-operation Is Key

The inspiring talk by the gentleman from the Ozarks, Mr. John Bracken, superintendent of schools in Clayton, Missouri, echoed the sentiments of all of the conference delegates when it placed most emphasis on the need for co-operation on the part of everyone concerned in the school health problem—teachers, administrators, government officials, doctors, nurses and parents.

As the health adviser, the physician, Mr. Bracken declared, is "part of the team that takes care of children." It was the beginning of a new, brighter era in child health, he said, when the physician entered the picture.

Other conference speakers expressed ideas along the same line. In his address of welcome, at the opening of the conference, Dr. George Lull, secretary and general manager of the AMA, emphasized the vital need for the medical profession to work with all groups toward the attainment of better health for all people. It was agreed that the foundations of health are laid in childhood and that the level of the health of people generally cannot be raised effectively without first improving the health of youngsters in school.

Dr. Edward L. Bortz, AMA president, viewed the meeting as one of the most significant arranged by the AMA in a long time. He expressed the hope that it would be the first of a series of such conferences.

"The AMA welcomes constructive criticism," Dr. Bortz declared. "The medical profession is blazing trails in the fight for better health; and through the medium of such conferences as this, with the help of educators and all other groups involved, we can do an even more effective job."

Health Is Important Topic

Health is the number one topic for study in schools, it was pointed out at the conference. For youngsters in their formative years, it was recommended that they be given: (1) full and scientific health information, (2) thorough, periodic health examinations, (3) instruction in the basic facts of healthful living, and (4) a balanced program of mental and physical education.

The need for modernizing the health and physical education program in the nation's schools was cited as particularly important. A new concept of education has developed which recognizes a child as a total personality, and it is important to have a health and physical education program in step with this idea.

Since the conference was called by physicians, discussions centered around what physicians themselves can do in the program. However, it was emphasized that doctors are *not proposing a medical profession's program* for health in the schools, they are merely offering their services in a constructive and co-operative way.

It was not the intent of the meeting to publish as a result of its deliberations a volume of new information on policies and programs to improve school health. It was rather the hope of the delegates to decide upon plans for putting into practice the existing policies and to take these plans back to the various states.

Groundwork Already Laid

Discussions were based on the results of previous discussions and the preliminary groundwork laid by the National Conference for Co-operation in Health Education and its National Committee on School Health Policies. This group formulated in 1945 a set of suggested school health policies, which was admittedly very idealistic. It also compiled an analysis of the functions of the school administrator, the physician and the nurse in the total school health program.

In putting these health policies into effect, the delegates noted that it would be necessary to have an exchange of information between the various states, descriptions of programs in operation for purposes of comparison and evaluation.

The problem of how to evaluate the various programs was also discussed. It was suggested that the United States Office of Education or the AMA Bureau of Health Education might be asked to collect information of this kind for distribution to communities requesting information on how to proceed.

Children themselves should have a share in evaluating these programs, it was pointed out. Children should be encouraged to take a very live interest in the school health program so as to secure their understanding and co-operation.

Conference in Four Sections

For purposes of more detailed study of the problems involved, the Conference was divided into four work sections. The sections were entitled (1) School Health Services, (2) School Health Programs and Studies, (3) The Physician and Physical Education and (4) Pre-Service and In-Service Education.

Experts in the field from the various organizations participating, that is, state departments of education and health, state education associations and state medical associations, led the discussions in each section. The conference was brought to a close with a general meeting at which a report or summary of the discussions carried on by each of the four was read.

A wide range of topics was covered—for example, the problem of too many "excuses" from physical education classes. It was found that this problem has many contributing causes, all of which must be remedied. First of all, there are the parents and children who do not understand the importance of physical education to the total school program, nor do they have any understanding of the role of exercise in body development. Many children dislike physical education because it is not properly taught—the program in their school is not an attractive one.

As regards the doctors who write excuses for these youngsters, they have never been informed about the aims of the school system and consequently they cannot understand its problems.

Role of the Medical Society

Throughout the discussions it was agreed that the state medical associations and the component medical societies can do much to foster co-operation between doctors and educators. It was suggested that joint meetings, perhaps one a year, between the school board and the local medical society might be of real benefit.

At the state level, the medical profession can work for the co-operation of the groups involved. It was suggested that sections at the medical association's annual meeting could be devoted to a study of the problem with nurses, educators and government officials invited to participate. The medical association can also appoint committees or utilize existing committees for the study of school health.

All were in agreement that what is needed is the participation of all groups concerned. If a school health council is formed, for example, it should include representatives from the medical, dental, nursing and allied health professions, as well as teachers, school administrators, parents and students themselves. Since the school health program takes in everything that affects the well-being of children in school, every person who is connected with the school must be enlisted before the program can be a success.

Minneapolis Woman Sentenced to Four-year Term for Criminal Abortion

Re State of Minnesota vs. Alida Toivonen

On October 7, 1947, Alida Toivonen, forty-nine years of age, 416 21st Avenue No., Minneapolis, was sentenced to a term of not to exceed four years at hard labor in the Women's Reformatory at Shakopee by the Hon. E. A. Montgomery, Judge of the District Court of Hennepin County. Mrs. Toivonen entered a plea of guilty on that date to an information charging her with the crime of abortion and also to a second information charging her with having a prior conviction of a felony. Following a statement of the facts to the Court by legal counsel for the Minnesota State Board of Medical Examiners, Judge Montgomery stayed the execution of sentence and placed the defendant on probation for a period of four years.

Mrs. Toivonen was arrested on September 17, 1947, by Minneapolis police officers following the admission of an eighteen-year-old married Minneapolis woman to Minneapolis General Hospital. The patient was suffering from an infection following an abortion. She named the defendant as the person who performed the abortion which took place in a room at a Minneapolis hotel. The defendant at first denied the charge, but subsequently admitted that she performed the abortion and was paid $75.00 for her services. Mrs. Toivonen was convicted for a similar offense on February 13, 1945, in the District Court of Hennepin County, and at that time was sentenced to a term of one year in the Minneapolis Workhouse. She served six months of the sentence and was on probation for eighteen months. In the present case the investigation disclosed that Mrs. Toivonen refused to perform the abortion when first requested, but was prevailed upon to do so by the employer of the man responsible for the patient's pregnancy. There was no evidence of any other offense and under those circumstances the Court stayed the execution of sentence.

During the investigation Mrs. Toivonen stated that she was born and raised in Yellow Medicine County, Minnesota, and had worked at a small hospital in Wisconsin as a practical nurse. She also claimed to have taken a correspondence course in nursing. The defendant has resided in Minneapolis for twenty-five years. She holds no license to practice any form of healing in the State of Minnesota.

Two Saint Paul Women Sentenced for Criminal Abortion

Re State of Minnesota vs. Asunda Willner, also known as Sue Willner

Re State of Minnesota vs. Helen A. Heck

On October 9, 1947, Asunda Willner, also known as Sue Willner, thirty-five years of age, 343 W. Central Avenue, Saint Paul, and Helen A. Heck, forty years of age, 799 Iglehart Avenue, Saint Paul, were sentenced by the Hon. Clayton Parks, Judge of the District Court of Ramsey County, Minnesota, to terms of not to exceed four years each in the Women's Reformatory at Shakopee. Both sentences were stayed and the defendants ordered to serve sixty days in the Ramsey County Jail. Each defendant is to be on probation for the balance of the four-year term. Both defendants had entered pleas of guilty on August 21, 1947, to an information charging each with the crime of abortion. At that time, Judge Parks referred the matter to the Probation Officer of Ramsey County, for a pre-sentence investigation.

The defendants, together with one John L. Capra, were arrested by Saint Paul police officers on a complaint filed in the Municipal Court of Saint Paul on August 13, 1947. The complaint charged the defendants with having performed a criminal abortion on a twenty-two-year-old unmarried Saint Paul girl. The abortion was alleged to have been performed on or about July 5, 1947, at the home of the defendant Heck. The patient stated that she paid $350.00 to the defendant Willner and was taken to the Heck home where she was blindfolded and the abortion performed by some person unknown to her. The defendants denied performing the abortion and claimed that it was done by "a Minneapolis doctor." Each of the defendants denied knowing the identity of the doctor. The defendant Heck stated that the person performing the abortion had been to her home previously, but that she knew him only as "Doc." The persons investigating the case place no belief in this part of the defendant Heck's story. The case against the defendant Capra was dismissed on motion of the County Attorney for the reason that the evidence disclosed that his only connection with the case was that he drove the patient from the Heck home where he lived, to the patient's own home.

The defendant Willner has a previous criminal record having entered a plea of guilty on August 8, 1942, in the District Court of Ramsey County to an information charging her with the crime of practicing healing without a basic science certificate. That charge, likewise, grew out of an alleged criminal abortion. For that offense the defendant Willner was given a suspended sentence of one year in the Ramsey County Jail. Neither of the defendants holds any license to practice any form of healing in the State of Minnesota.

THE MAN ON THE STREET

Does industry pay a dollar in dividends for every dollar of wages? A poll on the West Coast showed that The Man on the Street believes that capital gets more than half of what is left after all other costs are paid, and labor less than half. In fact, 72 per cent of the Men on the Street believe this.

Believing it, how do they feel? They feel sore at the American system. They think that it is unfair. And, if true, it would be unfair. If I believed it, I would be a Socialist or a Communist, too. I would say, "To h—— with them. Take it out of their lousy profits."

Men vote as they think. "As a man thinketh in his heart, so is he." If he thinks wrong, he will strike wrong and vote wrong.

How the Man on the Street thinks is more important to business than any other thing whatsoever. The Man on the Street holds every business, from the corner grocery to the giant factory, in the hollow of his hand. The Man on the Street elects Governors, Congressmen, Presidents. As he believes, so he elects.

Well, what is the fact about this matter? Not the "bull," but the truth.

After all other expenses are paid, we have, say, $100 for both labor and capital, wages and dividends. The belief is that capital gets $50 or more, and labor gets $50 or less. Most people think less. That makes them bitter.

Now for the truth. I have gone to two sources, one private, the other the United States Department of Commerce. The private statistical organization is the National Industrial Conference Board. For the year 1939 it reports that of this $100 employes got $84.70 and capital got $15.30. This is nearly $6 to employes and $1 to capital. But bear in mind that nearly 60 per cent of all business companies did not make any profits whatever for capital that year.

That was the figure for 1939. So I took the question up with the Department of Commerce. In their Survey of Current Business for January, 1946, they give the division for all corporations for the year of 1944. It shows that after taking out the taxes paid to government "the ratio was almost seven to one." That is $7 to employes and $1 to capital.

This is a far cry from fifty-fifty, or more than 50 per cent to capital and less than 50 per cent to employes. The truth is about $87.50 to employes and $12.50 to capital. Of course, the ratio varies in one industry from another, but this is the U. S. Government average for all corporate business.

Now is 6 to 1, or 7 to 1 a fair division? Here is Mr. Investor. He puts in, on the average, $6,000 in tools, buildings, et cetera, for every man employed. If the business fails he loses his dough. He takes that risk. If it succeeds he gets $1, while the man who uses his machinery gets $6 or $7.

For reasons I haven't room for here, I believe Mr. Worker would shake hands with Mr. Investor on the division and say, "Fair enough, let's go to work."

But Mr. Worker has to know the truth about the split, the whole truth, nothing under the table, and believe it. If he doesn't know it and doesn't believe it, he is ready for the hammer and sickle instead of the Stars and Stripes.

Whose business is it to get the truth to him? It is the business of honest labor leaders themselves—rather than to whip up envy and hate with fake figures.

But it is primarily the business of businessmen. In this, most of them have fallen down on the job. They wait until there is a strike and then when feeling runs warm they try at the eleventh hour, in big full-page ads, to tell a little of the story.

The only thing that makes me an optimist about the American system—and its chance to survive—is that it is, in truth and fact, an incomparably better and fairer system than the picture of it which a lot of dumb businessmen allow to persist in the minds of the public. But, by their indifference and inaction, they are taking an awful chance for their stockholders, workers and the country's heritage of free institutions.—S. B. PETTENGILL, National Radio Commentator and Newspaper Columnist.

Minnesota Academy of Medicine

Meeting of April 9, 1947

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, April 9, 1947. Dinner was served at 7 o'clock and the meeting was called to order by the president, Dr. E. M. Hammes, at 8:10 p.m.

There were sixty-three members and four guests present.

The secretary read a letter from Dr. Giffin expressing his appreciation of his election to Honorary Membership.

The secretary also read a letter from Dr. Diehl suggesting that Dr. J. C. McKinley's name be transferred from the University to the Honorary Membership list. This was voted unanimously, the Executive Committee having approved the transfer.

Upon ballot the following were elected as candidates for membership in the Minneapolis group: Drs. E. D. Anderson and Erling Platou. There were no vacancies in the Saint Paul membership list.

The scientific program followed. Dr. Charles W. Mayo, Rochester, read his Inaugural Thesis which was illustrated with lantern slides.

THE SURGICAL TREATMENT OF CARCINOMA OF THE RIGHT PART OF THE COLON

CHARLES W. MAYO, M.D.
Rochester, Minnesota

It is possible that the public gradually is becoming alert to the various manifestations of malignant disease, and therefore, in the presence of symptoms, is seeking the aid of the physician earlier than in previous years, but such is not known definitely to be true. It is heartening, nonetheless, to observe that between 1907 and 1938, inclusive, the resectability rate of malignant lesions of the colon in one large series which I studied was 67 per cent; whereas in another series between 1940 and 1946, inclusive, which I studied, the resectability rate was increased to 77 per cent.

A number of factors are responsible for the general improvement thus implied. The physician, for one thing, is becoming more and more impressed with the necessity for suspicion and investigation of the colon when a patient complains of fatigability and weakness and when anemia is found to be present. For another thing, the physician is now quick to realize that any digestive disturbance which is persistent and is associated with an alteration in intestinal habit calls for roentgenologic study of the colon.

It is still true, however, that earlier diagnosis is of paramount importance in the successful surgical treatment of malignant processes of the right portion of the colon. Improvement in the end results of such treatment is based on the fact that surgical intervention must be carried out before the malignant process has developed to such an extent as to limit the value of resection.

In the present paper I wish to present what I believe are significant data, gained from a recent review of cases, concerning malignant lesions of the right part of the colon. In addition, I shall describe a method of resection and of end-to-end ileotransverse colostomy, carried out in one stage, which has proved to be of considerable value.

Definitions of Structure Concerned

The term, "right portion of the colon," probably is ambiguous from the anatomic standpoint. Some writers have said that the abdominal portion of the colon is composed of two main parts, the right and the left, which would imply that the line of demarcation is in the middle of the transverse colon. When statistical material pertaining to the colon is under consideration, it is important to know exactly what a speaker or writer means when he concerns himself with this structure. In the present paper, as in past considerations of the right portion of the colon, I shall include the cecum, ascending colon and hepatic flexure only.

Diagnostic Aids and Differential Points

Despite the advances in diagnostic procedures of recent years, it is still uncommon, in the presence of early lesions, to discover definite signs or symptoms to direct the physician's attention to the right part of the colon. It is still true, unfortunately, that when the diagnosis is made early, it generally is done so accidentally. A majority of patients (about 67 per cent) will have experienced symptoms for six months to more than a year before a correct diagnosis is made.

Many malignant lesions in this portion of the colon ulcerate as they progress. Some have a large surface area, a fact which explains the oozing of blood and the development of secondary anemia so often encountered and too frequently mistakenly treated as primary anemia.

Another diagnosis sometimes made for patients who really have a malignant lesion of this part of the colon is "acute" or "subacute appendicitis." In one study it became apparent that 15 per cent of the patients concerned had undergone appendectomy within the period in which symptoms caused by the malignant lesion had been present. This actually is an important consideration. When it is linked to the fact that only about 2 per cent of carcinomas of the right part of the colon develop among persons less than thirty years old, then it becomes clear that any incision for appendectomy should be adequate to permit surgical exploration of the right part of the colon.

Clear-cut symptoms of obstruction are not prominent. A marked degree of obstruction is rare because of the

---

From the Division of Surgery, Mayo Clinic, Rochester, Minnesota.
Inaugural thesis.

fluid nature of the intestinal contents on the right side and because constricting or napkin-ring lesions are unusual in this portion of the colon. Even so, a mass can be palpated in about 75 per cent of the cases.

If the lesion is to be detected before surgical operation, roentgenologic examination is essential. It should be done by one who understands roentgenoscopy. Double contrast roentgenography should be employed; in such a procedure the second roentgenogram is made with the colon inflated with air, after the barium has been expelled. Once it has been demonstrated that a malignant lesion is present, the situation becomes an emergency. Hence, no time should be lost in preparing the patient for surgical intervention unless operation is otherwise contraindicated. Time is of prime importance in the treatment of all malignant processes.

In view of present-day knowledge, the problem of diagnosis might be summarized by the statement that if digestive disturbances have been present, or a change in intestinal habit has persisted, in a patient who is more than thirty years old, and if the stomach, duodenum and gall bladder have been ruled out as seats of the disturbance, then investigation of the right part of the colon certainly is indicated.

Preparation of the Patient

The preparation of most patients for operations on the colon requires about four days. Secondary anemia, if it is present, may have to be corrected. The group to which the patient's blood belongs and the Rh factor should be determined, because blood should be transfused in all cases, during or immediately after operation, when resection is performed.

As a rule, one of the sulfonamide drugs is employed in the preparation of the colon for operation. I consider sulfathalidine to be the drug of choice at present for the preparation of patients for resection of the right portion of the colon. This drug is administered by mouth in a dose of 1.5 gm. every four hours, until the patient has received 36 gm. Paregoric should be administered in doses of 8 c.c. at 2, 6 and 10 o'clock of the afternoon and evening before operation, in order to put the bowel at rest.

Surgical Procedures in General

It is a commonplace observation, but one which is still true, that the anesthetic agent of choice is the one with which the anesthetist is most familiar.

Surgical techniques.—Resection of the right portion of the colon can be carried out by a number of methods; any one of the methods encompasses still more differences of detail in performance. Again, every surgeon entertains certain preferences or antipathies toward various types of technique, suture material and suturing procedures, and surgical instruments. Hence, I believe it will be useful for me to consider the surgical trends, and to present only one surgical procedure which has been of value to me, namely, primary resection and end-to-end ileotransverse colostomy.

A number of years ago a colleague and I reviewed all the cases in which resection of the right portion of the colon for malignant lesions had been performed at the Mayo Clinic from 1907 to 1938, inclusive.[1] The series comprised 885 cases. I have just completed, with the assistance of the Division of Biometry and Medical Statistics, another review of cases in which resection was performed at the clinic from 1940 through 1946. Results of the latter study indicate that the following changes have evolved.

First, as I mentioned earlier herein, the resectability rate has increased from 67 to 77 per cent, so far as the Mayo Clinic series are concerned.

Second, primary resection and ileotransverse colostomy carried out in one stage have superseded two-stage and multiple-stage operations. In the past six years, 73 per cent of operations for the condition in question have been one-stage procedures.

Third, in 38 per cent of the one-stage operations, the particular procedures used have been primary resection and end-to-end ileotransverse colostomy.

Fourth, in 1946, resection of the right portion of the colon was carried out for malignant lesions in ninety cases, with no deaths in the hospital. In only three of these ninety cases was the operation done in two stages, and extraperitoneal resection was not performed.

Fifth, although a comparison of mortality rates between the period from 1907 to 1938 and the period from 1940 to 1946 is not a fair one, it is interpolated herein merely to emphasize the progress that has been made. From 1907 to 1938 the mortality rate associated with one-stage procedures was 22 per cent; for two-stage procedures it was 29 per cent. From 1940 to 1946 one-stage procedures were performed with a mortality rate of 3 per cent, and two-stage procedures were carried out with a mortality rate of 6 per cent.

Primary Resection and End-to-End Ileotransverse Colostomy

To the time of this report, on my surgical service, one-stage resection and end-to-end ileotransverse colostomy have been accomplished fifty-four times, with one death. The two procedures at present constitute my operation of choice for malignant lesions of the right part of the colon.

I make a longitudinal incision at the outer border of the right rectus abdominis muscle through the rectus sheath. The rectus abdominis muscle is retracted medially and the posterior fascia and the peritoneum are incised.

After exploration for metastasis or other complicating factors has been completed, the right portion of the colon, beginning with the cecum, is mobilized. A wide segment of the mesentery of the colon is resected and the vessels are ligated deep.

The points for transection of the transverse colon and the ileum are selected with special consideration of the blood supply and the distance of these points from the lesion. I transect the ileum at an angle in order to insure a good blood supply to the cut edge and an adequate lumen to fit the colon. I have not yet encountered a case in which the ileum, cut in this manner, could not be made to fit the transected end of the transverse colon. I cut the colon and the ileum with the cold scalpel. I do not use cautery because I believe that the heat involved devitalizes the tissue.

I do not, moreover, employ crushing clamps at the site of anastomosis. I establish an open type of anastomosis in which rubber-covered clamps are utilized to minimize soiling. Whatever questionable loss may be caused by some degree of soiling is more than compensated for by the accuracy with which sutures can be placed when the open method of anastomosis is used.

An outer row of running cotton suture is placed half way around the serosa. The mucosa is closed with a running catgut suture. The remaining half of the serosal coat is closed with interrupted cotton sutures. Only two rows of suture material are used because it is felt that more would interfere unnecessarily with healing.

The mesentery of the ileum and the mesentery of the transverse colon are brought together and closed in order to keep the small bowel from slipping through this opening. The raw surface on the right from which the colon has been removed is peritonized after retroperitoneal drainage has been established by the placing of two Penrose drains in position and bringing them out through a small incision in the right flank. Next, the region of the anastomosis is thoroughly swabbed with an antiseptic agent (phemerol); before the incision is closed 5 gm. of sulfonamide powder is sprinkled on the area intraperitoneally.

It is advisable, after the abdominal incision has been closed and before the patient has recovered consciousness, to dilate the anus manually enough to paralyze the sphincters temporarily, so that gas cannot be retained. This procedure, I feel, is a very important part of the operation.

Except in one or two instances, it has not been necessary to employ a Miller-Abbott tube preoperatively. Thus far I have not found it necessary to use this tube postoperatively for any of the patients on my service.

Patients are permitted to walk early. Most of them are dismissed from the hospital in less than two weeks.

Outlook for the Patient

What the outcome will be for the patient operated on for malignant lesions of the right portion of the colon is an interesting problem in itself. The surgeon's objective is, of course, to maintain a good result over the years after operation, so that the patient will be assured of a happy and productive existence.

A number of factors determine the outcome after the operation in question. The pathologic grade of the lesion, the mural penetration of the malignant cells, the extent of metastasis to adjacent and distant points, and, of course, the age of the individual patient, all are important factors.

Some definite data are at hand, however. That is, if the patients in the present series are divided into two groups—those who did not have nodal involvement and those who did have nodal involvement, regardless of other factors—the certain five-year survival rates appear to be valid. Sixty-four per cent of those patients who did not have involvement of lymph nodes lived five years or longer; 47 per cent of those who did have such involvement lived five years or longer. A recent study of malignant lesions of the rectum for which one-stage combined abdominoperineal resection was performed revealed that, when involvement of lymph nodes was not present, 74 per cent of the patients lived five years or longer, but that when involvement of lymph nodes was present, 38 per cent of the patients lived five years or longer.

Conclusions

One-stage resection of the right portion of the colon can be performed with a lower mortality rate and lower morbidity rate than can multiple-stage procedures.

With certain rare exceptions, one-stage resection can be carried out in any case in which it is possible to do a multiple-stage procedure.

One-stage resection of the right portion of the colon, with end-to-end ileotransverse colostomy, constitutes an operation that has given very valuable results.

1. Mayo, C. W., and Lovelace, W. R., II: Malignant lesions of the cecum and ascending colon. Tr. West. S. A., (1939) 49:378-425, 1940; (Abstr.) Surg., Gynec. & Obst., 72:698-706, (April) 1941.

Discussion

Dr. O. H. Wangensteen, University of Minnesota: Dr. Mayo's discussion of the management of lesions of the right colon was most interesting and instructive. The results of the period prior to 1938 from his own clinic, and those achieved since that time, are representative of the improvement in surgery that is occurring everywhere. The surgery of the gastrointestinal canal has been static for a generation; it is reassuring, indeed, to note that through the agency of some improvement here and some there with the problem of intestinal anastomosis how much better the mortality score is. The primary anastomosis, which Dr. Mayo employs with such satisfactory results in the management of lesions of the right colon, antedated the exteriorization operation for dealing with colic cancers. As a matter of fact, now that surgery is ready for the primary anastomosis, I feel it is time to exteriorize the exteriorization operation throughout the colon. For several years now, my associates and I at the University Hospitals routinely have performed primary anastomoses for all colic lesions, in the absence of acute obstruction, without the aid of complemental external decompressive vents, save the indwelling duodenal tube.

It is difficult to assay all the items that have contributed to betterment of the surgeon's mortality record in dealing with cancer of the colon. Certainly elimination of the element of speed has been important, and the principal occurrence that has made it possible to operate without speed is improved anesthesia. It is no longer necessary to rush through an operation to get the patient off the table alive. Much surgery of the past generation had to be done that way. If there are any surgical adherents to that "get in quick and out quicker" policy still around, no matter how pleased they may be with their own achievement, they will be startled, indeed, to learn how their own accomplishment may be improved upon by elimination of the element of hurry.

Better preoperative preparation and improved postoperative care, too, have played important roles in the reduction of surgical mortality. Moreover, today, operations, because of these improvements, can be extended to borderline surgical risks as well as older patients, with risks that are not far out of line from the standard surgical risk.

Dr. Mayo employs the open anastomosis. I will not quarrel with anyone whose total hospital mortality is only slightly more than 3 per cent for a large series of cases. The main thing is to get as satisfactory immediate and as good late results as can be achieved. We can all agree on this. My associates and I use the closed anastomosis exclusively from the stomach to the rectum. Moreover, the best results we have achieved with resection of the colon occurred in the two-year interval from 1941 to 1943. During this pre-antibiotic era, as far as intestinal antisepsis is concerned, we did sixty-one consecutive colic resections from the cecum to and including the rectosigmoid with one hospital death—a mortality of 1.6 per cent. We have not duplicated that performance since. In the series of colic resections done in the next two-year interval, we had three unavoidable deaths—a streak of bad luck that would mar any operative record. But any surgeon who is operating upon patients for malignancy in the upper age bracket must be prepared to lose patients now and then through the agency of coronary or cerebral thrombosis. In other words, having no unavoidable deaths in that first series of sixty-one cases, we did use up a lot of "surgical luck."

My feeling is that the most important item in the procedure is a nice, closed anastomosis made without spillage. Moreover, my associates and I are now making such anastomoses with a single row of sutures, thus assuring ourselves of large, patulous, functional stomas. I think it goes without saying, if one is committed to open anastomoses, he is dependent upon antibiotics to suppress growth of intestinal bacteria to lessen the hazard of peritoneal contamination. Drs. Ravdin and Zintel of Philadelphia recently have reported a comparative study of the efficacy of succinylsulphathiazole and streptomycin in controlling B. coli in the feces. They gave each drug for a period of eight days prior to operation. Streptomycin was given in 0.25 gram doses every four hours. B. coli counts in the range of 400,000 per gram of feces was usual after succinylsulphathiazole; after streptomycin had been administered by mouth for eight days, B. coli counts fell to about 400 organisms per gram of feces. It would appear, therefore, that streptomycin is about 1,000 times as effective as succinylsulphathiazole in reducing the B. coli count in the feces.

There is another phase of Dr. Mayo's presentation that was very interesting—the diagnosis of cancer of the colon. As you will remember, Dr. Mayo dwelt at length upon the circumstance that the stage of development of the cancer had much to do with the ultimate fate of the patient after recovery from operation. If we were to look at the problem of diagnosis of internal cancer from a realistic point of view, it must be conceded that early recognition of gastric or colic cancer is unusual. Even rectal cancer in reach of the examiner's finger is not diagnosed early! In other words, internal cancer is a *silent disease*. If is my feeling that, if we are to make a greater impact upon this problem, we should be setting up cancer detection clinics where patients may report periodically for examination even in the absence of symptoms. Cancer is a frequent disease. One out of every five women past forty and one out of every six men past fifty will die of cancer. It is just a question of who will have it, in what organ and when. The public would like to have from us a *cancer preventive or a cancer cure*. These are not available nor does there appear to be any likelihood that they soon will be. What we need most now to help us with the detection of cancer is a biologic test. That also is not available. The best substitute until a more universally applicable and helpful diagnostic agent is found, would appear to be to urge the erection and strategic placement of cancer detection clinics. The worth of such clinics in the earlier detection of cancer, I believe, can readily be assayed in a few pilot plants. Surgery has made great strides in the management of cancer. Our lament, however, is that, so many patients come so late. Employing only the knowledge we now have concerning the diagnosis of cancer, recognizing at the same time that cancer is essentially a *silent disease,* just as great strides in the management of cancer can be made in the next decade through diagnosis, if we will only implement that knowledge to the best of our ability. The public looks to us for helpful guidance. Here is an opportunity to lend real impetus to the management of the cancer problem in our own generation. The surgery of today makes it possible for patients having cancer to undergo serious and difficult operations at low risks. If such patients are to be offered better chances of permanent cure, earlier diagnosis is our only hope.

Dr. James Johnson, Minneapolis: I certainly want to commend Dr. Mayo for the careful and exhaustive way in which he has handled this particular subject. It is interesting to see the mortality rate improvement over a period of years. This, as has been pointed out, is no doubt due not so much to the improvement in surgical technique as to other measures such as the developments in anesthesia, decompression of the obstructed intestine, and the control of infections.

Only on two occasions, and they were before the introduction of intestinal decompression, have I employed the two-stage operation. It is very unsatisfactory in this locality because of the great loss of fluid. Its purpose was chiefly to relieve the obstruction. Since this can now be eliminated by intestinal decompression, and the general condition of the patient controlled by transfusions and like measures, I see no occasion to do anything but a one-stage operation. I do not believe it matters much whether an end-to-end, an end-to-side, or side-to-side anastomosis is done. Personally, I have for many years used an end-to-end or end-to-side anastomosis by means of a Murphy button. I suppose my early training has led me to employ this method.

I would like to ask Dr. Mayo one question. During the years I have operated upon two inflammatory lesions of the cecum that I mistook for cancer. They in all respects resembled cancer so I had to play safe and resect them. I know of no certain way to differentiate them from cancer. I would like to know what Dr. Mayo's experience has been with these lesions.

Dr. A. W. Ide, Saint Paul: I have enjoyed hearing Dr. Mayo's paper and the discussion. The subject of surgery of the colon has interested me for a long time. The results described by Dr. Mayo are certainly gratifying.

I am particularly impressed with the great improvement that has been made in recent years in anesthetics. This, no doubt, is in a considerable measure responsible for improved results. I am reminded of a remark made by our old friend, the late Arnold Schwyzer, shortly before his death. He said that if he could have had modern anesthetics during his active surgical life he would have been a much younger man.

Dr. Robert Earl, Saint Paul: I have nothing special to add. I want to thank Dr. Mayo for his thesis. I have done a number of these cases with side-to-side anastomosis. I started with that method, have found it very satisfactory, so have been following that technique since.

Dr. Mayo (in closing): I have appreciated the discussions. I can only say that I came back from service in the army and found that the mortality rate in colon surgery was lower by quite a bit than it was when I went away. I don't know where to give the credit, whether it was because I had been away, the surgery was being done better, or it was due to antibiotics. I still don't know.

Every surgeon has his pet method and his pet way of doing things. I do not want to appear to be discrediting any other method; it is simply that I have adopted this particular procedure and have had good results, and I thought they were worth bringing to your attention. One point that I wish to mention here is that there are many factors, aside from the surgical procedure, which are helpful in bringing about a good result, and among them are the expertness with which the anesthetic is given and the administration of transfusions. Regarding the latter, if one thinks that a patient does not need a transfusion, I believe that it is well to give one anyway; if one thinks that one is indicated, I think it is well to give two or three. The use of oxygen postoperatively also has been a contributing factor in a smooth convalescence.

As far as granulomas are concerned, I appreciate that situation. I have a patient on whom I operated in 1938. He returned to the clinic in 1946 and I found he had multiple abscesses. I drained the abscesses and later resected about three feet of bowel. These cases certainly present a problem. It seems to me that one seldom is able to find out what the etiology is. I would much rather resect a right colon for malignancy than for granuloma.

There is one group of cases in which I believe there is a chance of error from the standpoint of the nature of primary lesions. That is in cases in which palliative ileocolostomy is performed for lesions of the right portion of the colon. We have found that in a percentage of these cases the patients have lived three or five years, or longer, after the surgical procedure which, it was thought, had been performed for a malignant lesion. This is a group in which I am interested at present.

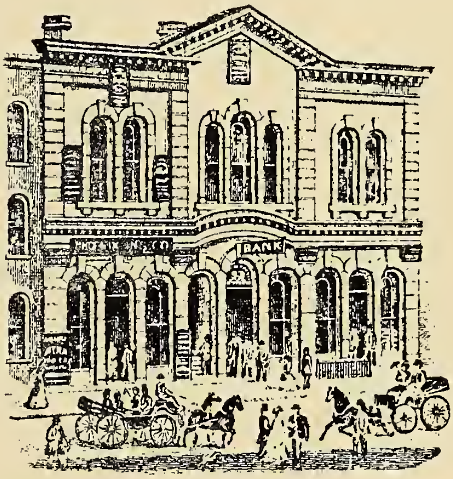
The meeting adjourned.

A. E. Cardle, M.D., *Secretary*

HEALTH DEPARTMENT SEVENTY-FIVE YEARS OLD

This year the Minnesota Department of Health celebrates its seventy-fifth anniversary. The Minnesota State Board of Health was created March 4, 1872, with Dr. Charles N. Hewitt of Red Wing as its executive secretary.

Although Minnesota is comparatively young in statehood, it has one of the oldest health departments in the nation. Only Massachusetts, California, the District of Columbia, and Virginia were ahead of Minnesota in establishing boards of health. The District of Columbia is of course not a state, and Virginia's health department was set up less than a month before Minnesota's, so it may be said that Minnesota ties for third place in the creation of a state department of health.



First home of the Minnesota Department of Health
Keystone Building, Red Wing

The state has another remarkable record in the fact that during its seventy-five years of existence, it has had only four health officers, Dr. Hewitt, Dr. Henry M. Bracken, Dr. Charles E. Smith, and Dr. A. J. Chesley, the present executive officer. Dr. Chesley has been state health officer since 1921, a period of more than a quarter of a century, and has spent his entire professional life in the health department.

To celebrate the 75th anniversary of the State Department of Health and to honor many of its old board and staff members, the Minnesota Public Health Conference held a banquet at the Radisson Hotel in Minneapolis at 6:30 on the evening of Friday, November 14.

MINNESOTA STATE MEDICAL ASSOCIATION

House of Delegates

Summary of Proceedings

Duluth Session — June 29-30, 1947

In accordance with action by the Council of the Minnesota State Medical Association taken in 1944, publication of the proceedings of the House of Delegates is limited to summary.

First Meeting, Sunday, June 29, 1947

Ballroom, Hotel Duluth
Duluth, Minnesota

The Ninety-fourth Annual Session of the House of Delegates of the Minnesota State Medical Association convened in the Ballroom of the Hotel Duluth, Duluth, Minnesota, at 2 p. m., Dr. W. A. Coventry, Duluth, Speaker of the House of Delegates, presiding.

Dr. Coventry called the meeting to order and asked for a report from the Credentials Committee. Dr. A. G. Liedloff, Mankato, reported that a quorum was present. After approval of the minutes of the previous session of the House, Dr. Coventry noted the presence of a distinguished visitor, Dr. George F. Lull, Secretary and General Manager of the American Medical Association.

Dr. Lull addressed the assembly briefly, saying that he was on his way back from a meeting of the Canadian Medical Association, where he had noted that the problems facing organized medicine in Canada are much the same as those facing doctors in the United States. He also reported on the expanding activities of the American Medical Association and mentioned plans for developing regional meetings of the Council on Medical Service and the Council on Industrial Health.

Dr. Coventry then called upon Dr. F. J. Elias, Duluth, for the report of the Chairman of the Council.

Report of the Council

Dr. Elias: The first meeting of the Council in connection with the Annual Session was held at 2 p.m., Saturday, June 28, 1947, for the transaction of routine business. The Council approved the minutes of the previous meetings. Financial reports were submitted and accepted.

The following applications for affiliate membership accepted and approved: A. E. Booth, Minneapolis; J. H. Haines, Stillwater; H. L. Zlatovski, Duluth; A. H. Brown, Pipestone; J. S. Kilbride, Worthington; Allen Sather, Fosston; and C. M. Gambill, Rochester. Affiliate membership also approved for fifteen medical officers, former members of Hennepin County Medical Society and now taking postgraduate professional training. Life membership was granted to the following: C. P. Aling, W. H. Aurand, J. F. Hendrickson, M. J. Jensen, J. C. Litzenberg, A. E. MacDonald, H. W. Noth, O. A. Olson, J. R. Peterson, G. H. Thomas, and J. A. Prim, Minneapolis; G. A. Dahl, Mankato; C. L. Scofield, Benson; Charles Bolsta, Ortonville; and W. F. C. Heise and C. P. Robbins, Winona. Associate membership was granted to K. G. Wakim, Rochester.

Resignation of Richard M. Hewitt as Chairman of the Editorial Committee was accepted with regret and C. M. Gambill of Rochester was suggested to replace him.

The Council went on record as approving the Sickness Benefit Plan under the Railroad Unemployment Insurance Act. It was recommended that the Chairman later give a report to the House of Delegates on the plan which goes into effect July 1, 1947.

Mr. A. R. Hustad, Twin City Manager of the Northwestern National Life Insurance Company, presented a proposal for group life insurance for active members of the Minnesota State Medical Association. It was decided that representatives of the company should appear before the House of Delegates to explain the plan.

A merger of the Watonwan County Medical Society with the Redwood-Brown County Medical Society was approved. Thomas E. Broadie, Saint Paul, was appointed to the advisory board for registration of hospital superintendents.

The second meeting of the Council took place at 6:30 p. m. Saturday, June 28, with the first order of business the consideration of a panel of ten psychiatrists, from which five might be selected to serve as an advisory committee to the Minnesota Mental Health Unit in the Division of Social Welfare. The following names were recommended: F. J. Braceland and M. C. Petersen, Rochester; S. A. Challman, A. G. Dumas and D. W. Hastings, Minneapolis; W. P. Gardner and E. M. Hammes, St. Paul; G. H. Freeman, St. Peter; W. L. Patterson, Fergus Falls; and L. R. Gowan, Duluth. A request from the Director of Social Welfare for approval of the organization of outpatient clinics in the seven state mental hospitals was granted.

The name of Albert Fritsche, New Ulm, was presented in answer to a request from the Practical Nurses' Association that the Council recommend a physician to serve on its advisory board.

P. F. Eckman, Duluth, and B. C. Ford, Marshall, were recommended as candidates for appointment as a physician representative on the State Board of Examiners of Nurses, provided for under the act for the licensure of practical nurses. One will be chosen from these two.

Acting on a letter from the American Medical Association, the Council suggested that Dr. Louis A. Buie, President of the Minnesota State Medical Association and member of the National Committee on Physical Fitness, represent the Association at a conference on the co-operation of physicians in the school health and physical education program to be held October 16-18 in Chicago and that a member of the State Office staff also attend.

After considering a request from a sub-committee of the Committee on Tuberculosis that the Council approve a proposed bill for the commitment of persons suspected of being in the infectious stage of tuberculosis, it was generally agreed that the law as stated needed strengthening and that the matter should be placed on the Fall Council agenda, at which time a member of the Committee should be invited to explain the law in detail.

The Council approved decisions of the Committee on Ophthalmology with regard to the establishment of a fee schedule so as to be eligible for federal funds under the program of the Division of Social Welfare services for the blind.

Action taken by the Board of Directors of the Hennepin County Medical Society with regard to the establishment of a Cancer Detection Center at the University of Minnesota was reviewed. It was decided that Dr. Wells and the Cancer Committee be invited to appear before the Council on Tuesday morning to explain the program further.

The third session of the Council was held at 8 a. m. Sunday, June 29, at Hotel Duluth, called for the purpose of discussing the rural health program. Dr. Paul C. Leck, Austin, Chairman of the Committee on Rural Medical Service, presented a proposal originating from the Second Annual Conference on Rural Health, sponsored by the American Medical Association, for the organization of local health councils throughout the state on a county, trade area or councilor district basis.

Permission was granted to Dr. Leck and his Committee to hold two experimental meetings with allied health professions to determine what methods should be used to interest the lay public in an educational program. One meeting was suggested for the southern part of the state and another for the northern part of the state. Dr. Leck was asked to report back to the Council at a future meeting. The councilors expressed willingness to meet with members of the Committee on Rural Health and assist in the planning of these experimental meetings. After the results of the two meetings have been determined, the organization of local health councils throughout the state could be considered, with an invitation to participate extended to all interested lay groups.

* * *

Dr. Elias next summarized the program for sickness benefits for railroad employees under terms of the Railroad Unemployment Insurance Act, as it was presented to the Council by members of the Railroad Retirement Board. (An explanation of the program will be found in the August, 1947, issue of MINNESOTA MEDICINE, page 883.)

Speaker Coventry next called upon Dr. R. L. J. Kennedy, Rochester, for the report of the Finance Committee.

Report of Finance Committee

DR. KENNEDY: Due entirely to the extremely wise judgment exercised by the preceding Finance Committee, the financial status of the Minnesota State Medical Association has weathered the increase in costs of materials and services and the marked deterioration in the investment market with a slight net increase in its worth. This is extremely gratifying, and more so when you recall that the Association undertook additional financial obligations to carry its members through the war period as well as other projects that necessitated financial support. Too much cannot be said for the wisdom and good judgment exercised by the administrative officers in maintaining the sound economic position of the Association. The investment portfolio of the Association has continued to receive close scrutiny by auditors and advisors in finance and the latest evaluation by them on the position of the Association is favorable. The system of checks and balances exercised by the House of Delegates and the Council has continued to prove effective.

With the return to active practice of many of our colleagues, continued steady progress in the affairs of the Association can be expected.

Two major undertakings financed by the Association were, first, the organization of the prepayment medical service plan, and of the Veterans Medical Service Division. The functions of the organization committees have been completed, as have the details pertaining to personnel and administrative offices. The work of the Veterans Medical Service Division has been inaugurated and the method of repayment of funds borrowed from the Association has been worked out.

Experience of the past year has emphasized the need for retaining strong reserve positions in order that the successive projects undertaken by the Association which demand financial support will not be jeopardized and, on the other hand, the assumption of responsibilities in connection with the furtherance of such projects will not weaken the financial structure of the Association.

While this may be considered a favorable report in that it indicates that the Association has been able to maintain its own even keel, it would be evidence of extreme shortsightedness were it presented without reference to present financial trends. Continuation of the present high market for help and materials will undoubtedly have an adverse effect upon the finances of the Association. If, in addition to this, a marked or even a moderate recession develops, the financial condition may well be crippled. The Finance Committee has been cognizant of the trends of affairs and has been working with its advisers in an effort to fortify itself against unfavorable developments. Every member should be cognizant of these facts and should hold himself ready to support the Finance Committee and other duly elected officers and to protect them from conditions beyond their control.

* * *

In connection with a matter referred to in the Chairman of the Council's report, the Delegates next heard a report from Mr. Arthur Hustad of the Northwestern National Life Insurance Company in which he outlined the plan for providing life insurance to active members of the Minnesota State Medical Association on a group basis.

Following Mr. Hustad's report, it was moved and seconded that Speaker Coventry appoint a committee of three physicians to work out details of the Life Insurance Program with the Council and the Executive Secretary and that the Council be empowered to enact the program. Motion carried.

It was requested that the Chairman of the Council re-read the portion of his report dealing with the resolution passed by the Hennepin County Medical Society on the University Cancer Detection Center, and while waiting for the resolution to be brought in, the Delegates heard a brief report on the Centennial Session of the American Medical Association, held in Atlantic City, by Dr. F. J. Savage, St. Paul, a delegate to the Session, supplemented by Dr. Coventry, also a delegate.

Dr. Elias then read the letter from the Executive Secretary of the Hennepin County Medical Society to Dr. A. E. Cardle, Councilor of the Sixth District, outlining action taken by the Society with regard to the Cancer Detection Center. A general discussion of the Cancer Detection Center took place. A resolution concerning the approval of activities affecting the practice of medicine, as applied to the Cancer Detection Center, was made and referred to the Resolutions Committee.

It was then moved that the report of the Chairman of the Council be approved. Seconded and carried.

Reports of Reference Committee

The next order of business was the reports of the various reference committees. The Speaker called first upon Dr. H. M. Carryer, Rochester, Chairman of the Reference Committee on Medical Education Reports.

Medical Education Reports

Dr. Carryer: On Sunday, June 29, 1947, there was a meeting of the Reference Committee of the House of Delegates on Medical Education Reports. At this time a number of committee reports were considered and the contents recommended for approval. These reports have been sent to each of you for study prior to this meeting. Those considered were:

Committee on Cancer—A. H. Wells, M.D., Duluth, Chairman
Committee on Conservation of Hearing—L. R. Boies, M.D., Minneapolis, Chairman
Committee on First Aid and Red Cross—J. S. Lundy, M.D., Rochester, Chairman
Heart Committee—F. J. Hirschboeck, M.D., Duluth, Chairman
Committee on Hospitals and Medical Education—H. S. Diehl, M.D., Minneapolis, Chairman
Committee on Public Health Nursing—M. McC. Fischer, Duluth, Chairman
Committee on Syphilis and Social Diseases—P. A. O'Leary, M.D., Rochester, Chairman
Committee on Tuberculosis—J. A. Myers, M.D., Minneapolis, Chairman
Committee on Vaccination and Immunization—E. J. Huenekens, M.D., Minneapolis, Chairman

Since the report of the Heart Committee was summarized and sent to you there has been an additional note concerning the report. A Committee consisting of Drs. C. N. Hensel, Saint Paul, M. J. Shapiro, Minneapolis, and F. J. Hirschboeck, Duluth, met with an executive committee of the American Public Health Association on June 25, 1947. A motion by that executive committee was passed indicating approval of a Minnesota Heart Association.

The report of Dr. Diehl covering the activities of the University of Minnesota Medical School is particularly called to the attention of every delegate for careful study in an effort to clear up much of the misunderstanding.

* * *

The Delegates approved the report of the Reference Committee on Medical Education Reports, after which Dr. C. G. Sheppard, Hutchinson, Vice Speaker, took over the Speaker's chair and called for the report of Dr. J. F. Briggs, Chairman of the Reference Committee on Miscellaneous Scientific Reports.

Miscellaneous Scientific Reports

Dr. Briggs: The Reference Committee on Miscellaneous Scientific Reports met Sunday, June 29, 1947, and considered the following reports:

Committee on Anesthesiology—R. C. Adams, M.D., Rochester, Chairman
Committee on Child Health—G. B. Logan, M.D., Rochester, Chairman
Committee on Diabetes—J. R. Meade, M.D., St. Paul, Chairman
Committee on Fractures—V. P. Hauser, M.D., St. Paul, Chairman
Committee on General Practice—R. H. Creighton, M.D., Minneapolis, Chairman
Historical Committee—M. C. Piper, M.D., Rochester, Chairman
Committee on Industrial Health—A. E. Wilcox, M.D., Minneapolis, Chairman
Committee on Interprofessional Relations—W. P. Gardner, M.D., St. Paul, Chairman
Committee on Maternal Health—J. J. Swendson, M.D., St. Paul, Chairman
Committee on Medical Testimony—E. M. Hammes, M.D., St. Paul, Chairman
Committee on Military Affairs—R. B. Hullsiek, M.D., Minneapolis, Chairman
Committee on Nervous and Mental Diseases—W. P. Gardner, M.D., St. Paul, Chairman
Committee on Ophthalmology—T. R. Fritsche, M.D., New Ulm, Chairman
Committee on Public Health Education—S. H. Baxter, M.D., Minneapolis, Chairman
Radio Committee—R. M. Burns, M.D., St. Paul, Chairman

Your Reference Committee wishes to commend the Committee on Medical Testimony for the excellent work it is doing. Your Committee also noted the activities that have been carried on by the Committee on Public Health Education and wishes to make reference to the Subject-of-the-Month Packets which it feels is an outstanding activity carried on through the State Association offices. The Committee also feels that the radio programs of the State Association, with Dr. William A. O'Brien as spokesman, are an excellent medium for dissemination of medical and health education to the public.

The Report of the Reference Committee on Miscellaneous Scientific Reports was accepted by the Delegates.

Dr. Sheppard called upon Dr. Monte C. Piper, Chairman of the Reference Committee on Officers and Council Reports.

Officers' and Councilors' Reports

Dr. Piper: Your Committee considered the reports of the Officers and Councilors very carefully and found them to be very complete. I will take up each report separately and make a few comments.

As regards the report of the Secretary and Executive Secretary, your Committee was very much impressed with the work that has been done in the State Office during the past year and we noted the comprehensiveness of the report submitted. We recognize that the State Office has been most efficient in attending to the countless details incident to the development of the Association as a service organization. You will notice in their report they say they have held 68 meetings of committees during the year. That does not include the nine Council sessions nor the special meeting of the House of Delegates in December.

We wish to call special attention to the second paragraph of the Secretary's and Executive Secretary's report which enumerates briefly the major activities carried on by the State Office during the year. Particularly impressive is the part played by our Association in the investigation of the Faribault institution since we feel that such matters are properly the responsibility of the medical profession. We should like to see such investigations extended to other state institutions. We, therefore, heartily recommend the acceptance of this report.

Next to be considered is the report of the Treasurer, Dr. W. H. Condit. In recommending the adoption of this report, we believe the House of Delegates should extend to Dr. Condit our thanks and appreciation for his long service as Treasurer and for his efficient management of this office.

The report submitted by the Chairman of the Council was most comprehensive and thorough and we recommend that it be read carefully by every member of the House of Delegates, since it will acquaint them with the multitude of activities in which our Association figures. . . . We recommend that the report be adopted by the Delegates.

The reports of the Councilors were each carefully considered also. We are of the opinion that many of the problems cited are local in nature and should be handled by the individual districts. We would ask special attention be given to Paragraph Three of Dr. R. L. J. Kennedy's report for the First District, regarding the availability of graduate students to supply the need for general practitioners.

In Dr. L. Sogge's report, attention is called to the Cancer Institutes and the fine work done in this field. We note also that there is no report from the Third District by reason of the vacancy created by the death of Dr. C. M. Johnson of Dawson. We believe that we express the wish of the House of Delegates in voicing our deep regret over the loss of Dr. Johnson as a valued friend and faithful servant of the Association.

Dr. A. E. Sohmer's report from the Fourth District is very comprehensive and indicates a great amount of activity has been going on in that locality. We note particularly the fact that in the Fourth District several of the societies within the district have held meetings jointly during the year, with apparent mutual benefit.

The report of the Fifth District by Dr. E. M. Hammes is brief and to the point, indicating strongly the good will and spirit of co-operation in that district. As for the Sixth District, Dr. Cardle mentions particularly the mobile x-ray project and the blood bank, which have been so successful.

Dr. W. W. Will's report of the Seventh District and Dr. Burnap's report of the Eighth District are also indicative of the increasing participation by members in Association affairs. We take cognizance with regret of the fact that Dr. W. L. Burnap is requesting that he be retired at the conclusion of his term in 1948. An interesting fact worthy of mention from Dr. F. J. Elias' report of the Ninth District is that this district has incurred no loss of membership either through casualty or transfer during the year.

* * *

The Delegates voted their approval of Dr. Piper's report.

Dr J. R. Manley, Duluth, was called upon next for his report as Chairman of the Reference Committee on Medical Economics Reports.

Medical Economics Reports

Dr. Manley: The Reference Committee reviewed the report of the Committee on Medical Economics. Dr. George Earl, Chairman, submitted a comprehensive report covering his work in Minnesota Medicine and the work of his sub-committee which will be taken up in detail later. His remarks regarding the co-operative health movement in this state are pertinent and should be studied carefully. The Committee approved his report.

The Committee next reviewed the report of the Editing and Publishing Committee of which Dr. E. M. Hammes is Chairman. This is an excellent report and the Reference Committee calls your attention to the financial showing in this report since it indicates that Minnesota Medicine is maintaining a very high standard.

The Medical Advisory Committee, with Dr. W. H. Hengstler, Chairman, submitted a short report, stating there had been two malpractice cases in which they had given advice. The Committee on Medical Ethics, Dr. R. H. Mussey, Chairman, reported no breeches of medical ethics during the past year.

Next came the report of the Committee on Medical Service, headed by Dr. A. W. Adson. This is the committee which originated the prepayment plan that we have been working on now for more than a year. This report, however, does not take that up in detail since it is covered in a report to come up for discussion later. The report mentions the National Health Bill and the Hill-Burton Hospital Construction Act, both of great importance to us. The latter should be kept in mind in the development of medical service, particularly in the rural areas. This Committee is to be congratulated for its maintenance of close contact with national medical affairs.

Your Reference Committee reviewed the report of the Committee on Public Policy, of which Dr. L. Sogge is Chairman. This is one of the most important committees of the Association, and its report merits the special attention of the Delegates.

To our Committee came the report of Dr. T. H. Sweetser, Chairman of the Committee on State Health Relations. This report deals with state institutions and particularly with the hospitals for the insane. You have read, no doubt, in another report that there has been a bill passed in the legislature to appropriate more money to pay doctors who are in charge of these hospitals reasonable salaries so that the standard of care for the mentally ill can be raised.

Our Committee reviewed the report of the Committee on University Relations, of which Dr. E. J. Simons is Chairman. This is a complete report dealing with the question of whether there has been overemphasis on specialization in our University Medical School. The contention that the University is trying to develop only specialists is well refuted. I move the adoption of these reports as submitted.

* * *

The motion was seconded and carried.

Dr. Sheppard asked for the report of Dr. M. J. Anderson, Rochester, Chairman of the Reference Committee on Miscellaneous Medical Economics Reports. The following reports were accepted without comment:

Faribault Investigating Committee—T. H. Sweetser, M.D., Minneapolis, Chairman
Commitee on Licensure of Practical Nurses—W. H. Valentine, M.D., Tracy, Chairman
Committee on Rural Medical Service—P. C. Leck, M.D., Austin, Chairman
Minnesota Advisory Committee on Nursing—W. L. Burnap, M.D., Fergus Falls, Chairman
Speakers' Bureau—F. J. Heck, M.D., Rochester, Chairman
Insurance Liaison Committee—A. W. Adson, M.D., Rochester, and B. J. Branton, M.D., Willmar, Co-Chairmen

In connection with the Report of the Operating Committee for Veterans Medical Service, considered by the Reference Committee on Miscellaneous Medical Economics Reports, Dr. Sheppard called up Dr. Ralph H. Creighton, Minneapolis, for a supplementary verbal report. Following Dr. Creighton's remarks, Mr. Ray Davison, Director of the Veterans Medical Service Division, was called upon to report on some of the administrative details of the program.

Delegates heard next reports on the Minnesota Plan for Prepayment Medical Care, Dr. Olof I. Sohlberg, Saint Paul, President of Minnesota Medical Service, reporting on the progress made by that corporation, and Dr. A. W. Adson, Rochester, Chairman of the Insurance Liaison Committee, reporting on the work of the physician-insurance underwriter committees towards setting up a program utilizing the services of reliable insurance concerns in the state. After full discussion by the Delegates, the report of the Reference Committee on Miscellaneous Medical Economics Reports was accepted.

Dr. Coventry, having resumed the Speaker's chair, called for new business. Dr. T. W. Weum, Minneapolis, presented a resolution concerning the need for a state committee to investigate the various types of health and accident policies issued to members of the Minnesota State Medical Association. Following a reading of the resolution, it was referred to the Council.

A resolution, offered by the Hennepin County delegates and relating to Rh typing by the State Department of Health laboratories, was read and referred to the Resolutions Committee.

A resolution calling for the appointment by the Council or the President of a committee to study traffic problems in the state was read and referred to the Council.

The House of Delegates was then recessed until 8 p.m.

Second Meeting, Sunday, June 29, 1947

Ballroom, Hotel Duluth
Duluth, Minnesota

The second session of the House of Delegates was convened at 8 p.m. with the first item of business a report on activities of the Division of Social Welfare by its director, Mr. Jarle Leirfallom. Mr. Leirfallom was introduced by Dr. Edwin J. Simons, Chief of the Medical Unit of the Division.

Mr. Leirfallom reported that crippled children's services had been greatly expanded during the year. Orthopedic clinics had been held in various areas of the state and two counties, Anoka and Washington, had been added to the rheumatic fever project. Through family physicians, the Division had given follow-up care to children stricken with poliomyelitis and two special physiologists had been employed.

All of these developments, Mr. Leirfallom said, had the approval of the local medical societies and of the Council of the Minnesota State Medical Association.

With regard to medical care of indigents, Mr. Leirfallom noted the increase in cost of welfare programs. Factors which he included as contributing to the increase were the upward revision of the topical code and price schedule; the raising of the old age assistance maximum from $40.00 to $50.00; the no-maximum program; and the higher costs of hospitalization, drugs, etc.

Consideration had been given, Mr. Leirfallom said, to the practice of requiring prior authorization of elective surgery.

Mr. Leirfallom also discussed briefly state tuberculosis services and the mental health program. In concluding his report, he expressed his appreciation of the fine co-operation received from the members of the medical profession, both individually and collectively.

Dr. W. L. Burnap, Fergus Falls, Chairman of a special committee appointed by the Governor, the Minnesota Medical Advisory Committee on Nursing, then gave a report on the shortage of nurses which is being experienced generally over the state. Dr. Burnap pointed out that this Committee can be of great service as a liaison between the Nursing Board and the hospitals wishing to establish schools for practical nurses, or school training registered nurses. A general discussion followed Dr. Burnap's report, at the conclusion of which Dr. Julian F. Dubois, Sauk Centre, presented his report as Secretary of the Minnesota State Board of Medical Examiners.

Speaker Coventry then called upon Dr. Viktor O. Wilson, Chief of the Section on Special Services of the State Department of Health, for a report on the Minnesota Hospital Survey, the Minnesota Child Health Survey and a recent project proposed for the Health Department, that of studying the situation with regard to nitrate poisoning of certain infants receiving formulae prepared with water from contaminated wells.

Dr. Richard B. Hullsiek, Chief Medical Officer of the Veterans Administration Regional Office, addressed the Delegates briefly on the need for medical society cooperation to insure the successful operation of the Veterans Medical Care Program, supplementing previous reports by Dr. Creighton and Mr. Davison.

Dr. Monte C. Piper, Rochester, presented the annual Necrology Report. The list of names of members and former members who had passed on during the year numbered 63, with 11 members having reached the age of 80 years or more and 26 having reached at least 70. Following the reading of the names the Delegates rose and observed a moment of silence.

The meeting was recessed until 1:15 p.m. Monday.

Third Meeting, Monday, June 30, 1947

Ballroom, Hotel Duluth
Duluth, Minnesota

The final session of the House of Delegates was convened at 1:15 p.m., Monday, June 30, with Dr. Coventry presiding. The Credentials Committee reported that a quorum was present and the Delegates proceeded to the report of the Resolutions Committee, presented by Dr. E. E. Scott, Saint Paul, Chairman.

The first resolution presented and approved was one extending the thanks of the House of Delegates to the officers and members of the St. Louis County Medical Society; the St. Louis County Woman's Auxiliary and its Committee on Local Arrangements; the management of Hotel Duluth and other Duluth hotels; radio stations WEBC and KDAL; the *Duluth Herald and News-Tribune* and the *Minneapolis Morning Tribune.*

A second resolution was adopted citing the nineteenth anniversary of Dr. William A. O'Brien as radio spokesman for the Minnesota State Medical Association and thanking Dr. O'Brien and radio stations WCCO, KUOM, KROC and KFAM.

A third resolution was passed dealing with the inclusion by the State Board of Health of Rh typing among its laboratory services.

The House of Delegates resolved to extend the thanks of the Minnesota State Medical Association to all members of the Committee on Organization for Minnesota Medical Service for their loyal and self-sacrificing service in laying the foundations for Minnesota Medical Service, Incorporated.

The next order of business was the report of the Chairman of the Council, Dr. Elias. In accordance with the Licensing Laws and Standards for Hospitals and Related Institutions, Dr. Elias reported that Drs. B. O. Mork, Jr., Worthington, and T. J. Catlin, Buffalo, had been recommended for appointment to the Hospital Licensing Board.

The Council also had recommended that Drs. E. W. Hansen, Minneapolis, and F. J. Savage, Saint Paul, succeed themselves as delegates to the American Medical Association, and that Drs. George Earl, Saint Paul, and W. W. Will, Bertha, succeed themselves as alternates.

With regard to the request received from the Hennepin County Medical Society for action on a proposed cancer detection center at the University of Minnesota, the Council voted that this be held in abeyance until the Council had opportunity to meet with the Cancer Committee.

Dr. Elias read the following resolution, earlier referred to:

WHEREAS the increasing death toll resulting from automobile accidents is a matter of grave concern to all citizens, particularly the medical profession, and

WHEREAS this serious situation has been officially recognized by the President of the United States, governors, mayors, law enforcement officials, safety organizations and other groups, and

WHEREAS the medical profession in Minnesota feels that it is incumbent on its members to assume leadership in the responsibility for promoting action designed to reduce this unnecessary loss of life and injury to our citizens, and

WHEREAS only by concerted action of all groups can any appreciable progress be expected in meeting this urgent problem, now.

(Here Dr. Elias inserted the revision suggested by the Council.)

THEREFORE be it resolved that the House of Delegates of the Minnesota State Medical Association authorize the Council to appoint three representatives of the Association to sit with the Minnesota Safety Council, present the profession's views and suggestions and to co-operate with the Safety Council's efforts to reduce traffic accidents.

The adoption of the resolution as revised by the Council was moved, seconded and carried.

It was moved and seconded that a Liaison Committee from the Council be appointed to confer with the Governor concerning appointments to the State Board of Health. Motion carried.

Dr. Elias then read a resolution submitted to the Council at its morning session:

WHEREAS the widespread publicity given to the use of BCG in controlling tuberculosis in humans is leading to a feeling of security in the public mind, and

WHEREAS no well controlled study has been made over an adequate period of time to prove that infection with BCG produces dependable immunity against tuberculosis, and

WHEREAS there is need for further study of special groups under carefully controlled conditions with sufficient time to make the experiment worth while before its use is publicly advocated, and

WHEREAS in the State of Minnesota highly satisfactory results are being obtained by proved methods, as shown by the marked reduction in mortality, morbidity and infection attack rates, every effort possible should be exerted to protect these results, and

WHEREAS to be infected with BCG sensitizes the tissues and thus nullifies the value of the tuberculin test which has been used so effectively therefore be it

RESOLVED, that the Minnesota State Medical Association now meeting in its Ninety-fourth Session go on record as opposing the use of BCG in the State of Minnesota except on special groups under carefully supervised and controlled study, and only after having proper consideration by the State Medical Association.

Dr. Elias said that at the Council meeting approval of that body had been given to this resolution; and after some discussion, the Delegates also voted approval.

After being introduced to the Delegates by Dr. Louis A. Buie, Rochester, Mr. Charles H. Crownhart, Madison, Wisconsin, Secretary of the State Medical Society of Wisconsin, addressed the House briefly.

Following Mr. Crownhart's talk, Dr. Sheppard, Vice Speaker, took over for the annual election of officers. The following officers were unanimously elected by the Delegates:

President-elect: Archibald E. Cardle, Minneapolis

First Vice President: J. R. Manley, Duluth

Second Vice President: G. Irving Badeaux, Brainerd

Secretary: Benjamin B. Souster, Saint Paul (re-elected)

Treasurer: W. H. Condit, Minneapolis (re-elected)

Speaker of the House: C. G. Sheppard, Hutchinson

Vice Speaker: H. M. Carryer, Rochester

Councilor, First District: R. L. J. Kennedy, Rochester (re-elected)

Councilor, Second District: L. L. Sogge, Windom (re-elected)

Councilor, Third District (to replace C. M. Johnson, Dawson, deceased): L. G. Smith, Montevideo

Councilor, Sixth District (to fill the unexpired term of Dr. Cardle): O. J. Campbell, Minneapolis

Councilor, Ninth District: Frank J. Elias, Duluth (re-elected)

Delegates to the American Medical Association: E. W. Hansen, Minneapolis (re-elected), and F. J. Savage, Saint Paul (re-elected)

Alternates: W. W. Will, Bertha (re-elected) and George Earl, Saint Paul (re-elected)

It was then moved, seconded and carried that the invitation of the Hennepin County Medical Society to hold the 1948 Convention in Minneapolis be accepted.

At 2:45 p.m. the Ninety-fourth Annual Meeting of the House of Delegates was adjourned.

SPECIAL FEATURES

At the annual banquet of the Minnesota State Medical Association, held in the Ballroom of Hotel Duluth, Tuesday evening, July 1, special recognition was given to several Minnesota physicians.

Admitted to the Fifty Club, in recognition of their fifty years of loyal and devoted service in the medical profession, were the following twenty-two doctors: J. F. Corbett, George B. Hamlin, A. J. H. Hammond and G. D. Head, Minneapolis; Robert Earl, L. A. Nelson and W. R. Ramsey, Saint Paul; A. H. Brown, Pipestone; M. A. Burns, Milan; J. E. Crewe, Rochester; S. A. Drake, Lanesboro; H. P. Dredge, Sandstone; J. F. Gendron, Grand Rapids; Roland Gilmore, Bemidji; J. H. Haines, Stillwater; G. H. Mesker, Cambridge; W. L. Palmer, Albert Lea; George F. Reinecke, New Ulm; George J. Schottler, Dexter; J. A. Thabes, Sr., Brainerd; Morrill E. Withrow, International Falls; and W. E. Wray, Campbell.

The Southern Minnesota Medical Association Medal, awarded each year to the individual physician presenting the most outstanding scientific exhibit at the annual meeting, was awarded this year to Dr. A. H. Wells, St. Luke's Hospital, Duluth, for his exhibit on pathologic anatomy. Honorable mention was accorded to another Duluth physician, W. V. Knoll, St. Mary's Hospital, for his "watch-glass" display of specimens and Kodachrome transparencies. Judges were A. E. Cardle, Minneapolis; R. P. Buckley, Duluth; and R. N. Barr, Saint Paul.

Presentation of Distinguished Service Medal to Dr. A. W. Adson

In appreciation of his many years of service to the profession and to the Association, Dr. Alfred W. Adson, former president of the Minnesota State Medical Association and present delegate to the American Medical Association, was awarded the *1947 Distinguished Service Medal and Citation.* Presentation was made by Dr. Frank J. Elias, Chairman of the Council.

DR. ELIAS: I deem it a great privilege, as Chairman of the Council of the Minnesota State Medical Association, to honor one of our most active and distinguished members this evening. I say distinguished because he has served our Association long and well—as a former president, as committee chairman and as a delegate to the American Medical Association.

A prominent neurosurgeon, he is a professor in the Mayo Foundation graduate school of the University of Minnesota and chief of the section on neurosurgery of the Mayo Clinic. He is a fellow in the American College of Surgeons, as well as a member of several other societies related to his profession. These include the American Neurological Association, the American Surgical Association, the Association of Military Surgeons, the Association on Research in Nervous and Mental Diseases, the Central Neuropsychiatric Association, the International Neurological Association, the Western Surgical Association and the Society of Neurological Surgeons, of which he is a past president.

His contributions to the advancement of scientific medicine have been noteworthy, and he has an equally fine record with regard to his efforts in behalf of organized medicine. His active participation on councils of the American Medical Association, particularly his tireless efforts in promoting the extension of medical services, not only in Minnesota but in the nation, are deserving of commendation and encouragement.

And so, at this time, for his devoted and illustrious service to medicine, the Council of the Minnesota State Medical Association awards its 1947 distinguished service medal to Dr. Alfred W. Adson of Rochester. It is an honor and a great pleasure to confer upon him at this time this citation and this medal of which he is so richly deserving.

WOMAN'S AUXILIARY

Renville County

The regular dinner meeting of the Renville County Medical Society and Auxiliary was held at Olivia on October 21, after which each group held separate meetings. Mrs. A. A. Passer, regional advisor for the 4th Councillor District, was present and suggested that membership, sale of *Hygeia* and the *Bulletin* be particularly stressed this year and that each member "talk county nurse." As an added appeal to students to participate in the Christmas Seal Essay Contest, the Auxiliary voted to give prizes of $5, $3, and $2 to the three best essays in the county.

Stearns-Benton

Nine communities were represented when the Stearns-Benton Auxiliary met on October 23 at the home of Mrs. H. B. Clark, St. Cloud, with Mrs. J. Buscher assisting. The Auxiliary went on record as favoring appointment of a public health nurse for both counties. Members will assist with the mobile x-ray tuberculosis unit. Chairmen were named for *Hygeia* and Postwar Planning Committees. At each meeting articles are received for the layette which the Auxiliary is again sponsoring for needy mothers. Cancer dressings will be one of the major projects of the Auxiliary this coming year, and women of the communities are invited to come and help with this urgent and worth-while activity.

Mrs. Buscher gave a report of the Atlantic City meeting. New members were added, making the membership this year thirty-seven. An interesting talk on "hosteling in Europe" was given by Miss Patricia Butler, recently returned from the Continent.

West Central

West Central Auxiliary mourns the passing of Mrs. Charles Bolsta of Ortonville who has a long record of activity in the Auxiliary.

Reports and Announcements

INTERNATIONAL COLLEGE OF SURGEONS

At the twelfth assembly and convocation of the United States Chapter, International College of Surgeons, held in Chicago on October 3, the following Minnesota physicians were among the 810 surgeons inducted into the College:

Fellows: Dr. Reinhold Milton Ericson, and Dr. Gerald M. Koepcke, Minneapolis.

Associates: Dr. Philemon C. Roy, Saint Paul; Dr. Kenneth H. Abbott, Rochester; Dr. Philip E. Gordon, Dr. John Korchik, and Dr. Daniel B. Mark, all of Minneapolis.

Affiliates: Dr. Gilbert P. Wenzel, Dr. Merchislaw M. Sarnecki, and Dr. Emil J. Fogelberg, Saint Paul; Dr. Lawrence J. Happe, Minneapolis, and Dr. James K. Keeley, Rochester.

Matriculates: Dr. Samuel Leonard, Minneapolis and Dr. Selmer Milo Loken, Saint Paul.

GEORGE CHASE CHRISTIAN LECTURE

One of the nation's outstanding leaders in the war on cancer, Dr. C. P. Rhoads, New York City, delivered the University of Minnesota's annual George Chase Christian cancer lecture in the Museum of Natural History auditorium on the evening of October 20.

The subject of Dr. Rhoads' address was "Clinical Investigation of Neoplastic Disease."

In addition to his duties as director of the Memorial Hospital Center for Cancer and Allied Diseases and the Sloan-Kettering Institute for Cancer Research, in New York, Dr. Rhoads is also chairman of the Committee on Growth of the National Research Council and is responsible for the distribution of a large share of the research funds raised by the American Cancer Society.

At a medical school seminar held earlier in the day on October 20, Dr. Rhoads spoke on "Butter Yellow Carcinogenesis and Cancer Biology."

MINNESOTA SOCIETY OF CLINICAL PATHOLOGISTS

A two-day meeting was held in Rochester on September 27 and 28 by the Minnesota Society of Clinical Pathologists.

After a morning of visiting the pathological laboratories of the Mayo Clinic and St. Mary's and Colonial Hospitals, the society members spent the afternoon of the first day at a seminar in hematology held in the Mayo Foundation House. On the morning of the second day a program was conducted in St. Mary's Hospital by staff members of the Mayo Clinic. In charge of the program were Dr. P. G. Sayre and Dr. G. G. Stilwell of Rochester. President of the society is Dr. A. H. Baggenstoss, Rochester.

ST. LOUIS COUNTY SOCIETY

A joint banquet meeting was held October 9 in Hibbing by the members of the St. Louis County Medical Society and its auxiliary.

Principal speaker at the meeting was Dr. O. I. Sohlberg, Saint Paul, president of the Minnesota Medical Service, who spoke on prepaid medical care versus socialized medicine.

Under the direction of Dr. E. L. Tuohy, society members from Duluth conducted a clinical-pathological conference for the scientific program, participated in by Dr. F. G. Chermak, International Falls, and Dr. Randall Derifield and Dr. Carl N. Harris, Hibbing.

At the meeting tribute was paid to the late Dr. C. W. More of Eveleth.

Dr. Robert Murray, Hibbing, secretary of the society, was in charge of arrangements for the meeting.

WABASHA COUNTY SOCIETY

The seventy-ninth annual meeting of the Wabasha County Medical Society was held in Wabasha on October 9.

At a business session in the afternoon, the society members drafted an appeal to the State Public Health Service to send into the locality as soon as possible one of the mobile x-ray units for a chest x-ray survey. The members also adopted a resolution of appreciation of the efforts of the *Lake City Graphic* in pointing out editorially in recent years some of the dangers of socialized medicine.

New officers elected at the meeting were Dr. R. N. Bowers, Lake City, president; Dr. T. G. Wellman, Lake City, vice president, and Dr. W. F. Wilson, Lake City, secretary-treasurer. It was decided to hold the next annual meeting at Lake City.

Guest speakers at a dinner preceding the evening scientific session were Dr. A. J. Chesley, secretary and executive officer of the State Board of Health, and Dr. P. T. Watson, director of the Division of Local Health Services.

The program for the evening scientific session included the following:

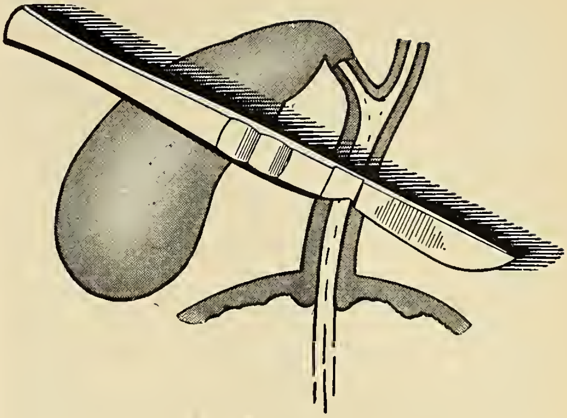
President's Address—"Some Experiences with Vitamin K"—Dr. B. A. Flesche, Lake City.

"Minnesota Medical Service Incorporated"—Dr. E. C. Bayley, Lake City.

"Ether by the Semi-Open Drop Method"—Dr. Albert Faulconer, Rochester.

"Report on a Meeting of the Anesthesiology Committee of the State Medical Association"—Dr. W. P. Gjerde, Lake City.

Preventive medicine requires the co-operation of the patient, and this in turn predicates the existence of a personal and confidential relationship between the physician, who serves as health advisor, and the family.—Medicine in the Changing Order, Rep. N. Y. Acad. Med. Comm., The Commonwealth Fund, 1947.



Surgical Principle Accomplished Medically

Drainage in the presence of infection or congestion is a sound surgical principle.

In chronic inflammatory conditions of the bile passages without stones, drainage is accomplished by increasing the production and flow of free-flowing, low viscosity bile, employing Decholin for its hydrocholeretic action.

Decholin (dehydrocholic acid) stimulates the production of thin bile by the liver cells, with a resultant cleansing action on the entire biliary tract.

Decholin
REG. U.S. PAT. OFF.

Decholin is supplied in boxes of 25, 100, 500 and 1000 3¾ gr. tablets.

* * *

On October 1, Dr. William C. Dodds left Park Rapids, where he had been associated with Dr. D. M. Houston for several months, to accept a partnership with Dr. A. R. Ellingson of Detroit Lakes.

* * *

One of the speakers at the eighth regional Minnesota Welfare Conference held October 15 at the state training school in Red Wing, was Dr. Maurice M. Walch, assistant professor of neuropsychiatry in the Mayo Foundation.

* * *

In Lisbon, Portugal, early in October, Dr. Charles W. Mayo, Rochester, participated in the program of the Second International Course on Emergencies by presenting several papers and giving several motion picture demonstrations.

* * *

At the meeting of the International College of Surgeons held in Chicago early in October, Dr. W. C. MacCarty, Rochester, presented a paper entitled "Early Diagnosis of Abdominal Neoplasms" and took part in a panel discussion on "Cancer of the Breast."

* * *

"Aerosol Therapy in Bronchiectasis" was the title of a paper presented by Dr. A. M. Olsen, Rochester, at a meeting of the Potomac Chapter of the American College of Chest Physicians in Washington, D. C., October 5.

* * *

When residents of Blue Mounds township met at District 95 on September 30 to discuss a proposed addition to the Minnewaska Hospital, Dr. A. F. Giesen of Starbuck was present as the principal speaker to explain and clarify problems in regard to the matter.

* * *

Dr. R. O. Johnston, formerly of Nashwauk, has been engaged by the Board of School District 27 as physician for the district. Before returning to live near his former Nashwauk home, Dr. Johnston practiced for fifteen years in New Jersey and spent four years in the Army.

* * *

Honorary fellowship in the International College of Surgeons was awarded to Dr. Henry W. Meyerding, Rochester, at the annual meeting of the organization in Chicago, October 3. Dr. Meyerding is a member of the orthopedic surgery staff of the Mayo Clinic and professor of surgery in the Mayo Foundation.

* * *

The prepaid medical care plan sponsored by Minnesota Medical Service, Inc., was explained by Dr. W. A. Coventry, Duluth, in a talk given at a meeting held September 30 in the Duluth Central YMCA. The dinner meeting was arranged by the Council of Social Agencies' Health and Hospital Committee, of which Dr. Mario Fischer is chairman.

"Chronic Cardiac Disease rarely develops in the presence of good body mechanics"*

Goldthwait, et al,* found that even when the disease had developed, the correction of faulty mechanics helped greatly "in reducing the peripheral load, in lessening cardiac strain, and in increasing the patient's usefulness."

We invite the physician's investigation of Spencer Individual Designing as adjunct to corrective treatment of body mechanics. A Spencer automatically induces better posture, thereby favorably influencing neuromusculoskeletal performance.

Each Spencer is specifically designed, cut, and made for each individual patient—based on a description of the patient's body and posture and detailed measurements. That is why Spencer Individual Designing is therapeutically more effective.

For information about Spencer Supports, telephone your local "Spencer corsetiere" or "Spencer Support Shop", or send coupon below.

*Goldthwait, J. E., Brown, L. Y., Swaim, L. T., and Kuhns, J. G., *Body Mechanics in Health and Disease,* 103-105, J. B. Lippincott Co., Philadelphia, 1937.

Two papers were presented by Dr. E. E. Gambill, Rochester, at a meeting of the Panhandle District Medical Society in Lubbock, Texas, October 14. The subjects of his papers were "The Investigation and Treatment of Patients with Jaundice" and "The Recognition and Treatment of Patients with Peptic Ulcer."

* * *

Among the physicians attending the thirty-third meeting of the Rock Island Lines' Surgical Association in Des Moines, Iowa, October 2 and 3, were Dr. J. A. Sanford, Farmington, and Dr. D. E. Morehead, Owatonna, both members of the railroad's medical-surgical staff.

* * *

Announcement has been made that Dr. Adelaide McFayden Johnson has been appointed clinical associate professor in psychiatry and neurology at the University of Minnesota. Dr. Johnson is the wife of Dr. Victor Johnson, new director of the Mayo Foundation for Medical Education and Research.

* * *

On the staff of the Mayo Foundation since 1929, Dr. Oren L. Kirklin has moved from Rochester to Indianapolis, Indiana, to enter private medical practice. A graduate of Indiana University in 1928, Dr. Kirklin entered the Mayo Foundation as a fellow in 1929 and was appointed an associate in medicine in 1934.

* * *

Hospital and medical librarians from five states heard Dr. William A. O'Brien, director of postgraduate medical education at the University of Minnesota, discuss "Guideposts for Hospital and Medical Librarians" when they met with the Regional Library Conference in Minneapolis on October 6.

* * *

At a meeting in Eveleth on September 23, the members of the Range Medical Association heard Dr. John McKelvey, chief of the Department of Obstetrics and Gynecology at the University of Minnesota, speak on modern principles of treatment for preventing obstetric deaths.

* * *

A new addition to the Bratrud Clinic in Thief River Falls is Dr. Edward A. Johnson, a graduate of the University of Minnesota Medical School in 1944, who recently completed a period of service in the Navy. Dr. Johnson will be associated with Dr. R. M. Watson of the clinic staff, specializing in obstetrics and gynecology.

* * *

After jumping his way to victory in September, Dr. L. A. Steffens of Red Wing was named state "mail" checkers champion in the annual tournament conducted by the Minnesota State Checker Association. Champion at the University of Minnesota in 1919, Dr. Steffens entered the tournament this year for the first time and won in a field of twenty entrants.

* * *

Dr. H. M. St. Cyr, a graduate of the University of Minnesota who recently completed an internship at St. Luke's Hospital, Duluth, was married on September 23 to Miss Margaret Christenson, formerly of Aitkin, in Trinity Lutheran Church in Duluth. Dr. St. Cyr has been called to active duty in the Army medical corps and will be stationed in Germany, where his wife plans to join him.

* * *

At the thirtieth annual meeting of the American Dietetic Association in Philadelphia on October 16, Dr. Ancel Keys, director of the University of Minnesota's laboratory of physiological hygiene, spoke on "Nutrition in Relation to the Genesis and Course of Degenerative Diseases." The day before the meeting Dr. Keys conferred with military officials in Washington on medical research projects.

* * *

Gibbon will again have its own resident physician after July 1, 1948, when Dr. John Glaeser, Chaska, completes his tour of duty in the army and moves to Gibbon to open his medical practice. Dr. Glaeser, a graduate of the University of Minnesota, recently purchased the residence and practice of Dr. P. C. Benton, formerly of Gibbon. At present, arrangements are being made to secure a temporary resident physician until Dr. Glaeser is released from the army.

* * *

On September 25, Dr. I. F. Seeley began his fortieth year of service as a physician in Northfield.

After graduating in 1903 from the University of Iowa, Dr. Seeley practiced in several other communities for short periods of time, then spent two years as physician to a construction company when the company was building the Milwaukee Railroad from Saint Paul to Montana. In 1908 he moved to Northfield, where he has practiced medicine for the last thirty-nine years.

* * *

The September meeting of the medical staff of St. Luke's Hospital, Duluth, featured Dr. Walter G. Maddock, professor of surgery, Northwestern University, who spoke on "Parenteral Fluids for the Seriously Ill Medical or Surgical Patient." Guest speaker at the October meeting of the staff was Dr. Miland Knapp, head of the Department of Physical Medicine, University of Minnesota, who discussed "Rationale of Treatment of the Muscular After Effects of Poliomyelitis."

* * *

Formerly of Minneapolis, Dr. Norton Rogin has joined Dr. J. A. Sanford in Farmington in the practice of medicine. Dr. Rogin has also taken over the Lakeville office of Dr. Paul Wagner, who recently moved to Oregon. A graduate of the University of Minnesota Medical School, Dr. Rogin interned at Queens General Hospital in New York, then served for twenty-five months in the Army. Before going to Farmington, he was a resident physician at Abbott Hospital in Minneapolis.

* * *

Approximately 100 members of the Ramsey County Medical Society attended a meeting held September 23 in Saint Paul to celebrate the fiftieth anniversary of the founding of the society library. Guest speaker for the event was Dr. John F. Fulton, Sterling professor of physiology at Yale University, who spoke on "Early

Years of Andreas Vesalius." Other speakers included Miss Perrie Jones, librarian of the Saint Paul Library, and Dr. Wallace H. Cole, chairman of the Library Committee.

* * *

After twelve years as chairman of the Blue Earth County Public Health Association, Dr. A. G. Liedloff, Mankato, has retired from office. In his honor a dinner was given on October 9 by association members, attended by representatives of the association executive board, county commissioners and public health nurses.

To replace Dr. Liedloff, Dr. A. F. Kemp, Mankato city health officer, has been appointed chairman of the association. Dr. Liedloff still retains his position as district health officer.

* * *

In Atlantic City on October 6, Dr. J. Arthur Myers, University of Minnesota Medical School, stated at the seventh annual meeting of the American Public Health Association that early detection and not vaccination is the answer to the problem of tuberculosis. He said that BCG and other proposed vaccines would "serve only as a smoke screen for the tubercle bacillus in Minnesota." He also told the group that in sizable areas in Minnesota tuberculosis had been eradicated at the school-age level but that total eradication would be "several decades away."

* * *

Brownsville, Texas, was the destination of Dr. H. A. Miller when he left Fairmont on September 29 after closing his medical practice there. Dr. Miller had purchased a building in Brownsville and planned to open a clinic with the assistance of his two sons, Dr. Harry E. Miller and Dr. John B. Miller. Dr. Harry E. Miller has been taking postgraduate work in surgery in Detroit for the past six years, while Dr. John B. Miller, an obstetrician, is at present in military service stationed in Hawaii. The two sons will join Dr. H. A. Miller in Brownsville, Texas, early in 1948.

* * *

Of the 26,826 persons x-rayed in Blue Earth County and North Mankato in a recent survey, 144 showed definite signs of tuberculosis, it has been announced by Dr. Hilbert Mark, director of the Tuberculosis Division of the State Board of Health. Seventy-nine other persons are suspected of having tuberculosis, while diagnosis has been deferred in more than 60 other individuals. About half of the cases of tuberculosis discovered during the survey required medical or sanatorium care. The x-ray campaign also revealed 360 persons with enlarged hearts.

* * *

In Chicago on September 30, Dr. Stanley F. Maxeiner, clinical associate professor of surgery at the University of Minnesota, told the International Congress of Surgeons that soft but tough gum-rubber tubing, wrapped tightly around a severely injured leg, will practically amputate the extremity without shock, pain or danger.

"If the rubber tubing is allowed to remain for a week or ten days, it will completely sever the extremity down to the bone almost painlessly and without any shock or deleterious general effect," Dr. Maxeiner said. "At a later date, when the patient's condition will permit, the bone may be severed and a hazardous operation converted into a practically harmless one."

* * *

Chinese medical practice was described by Dr. L. H. Klefstadt, of the More Hospital, Eveleth, in a talk given at the October 1 meeting of the Rotary Club in Virginia.

"In general, there has been little change in the practice of medicine in China in the last twenty centuries, al-

Officially retiring on October 1 as director of the Mayo Foundation for Medical Education and Research, Dr. Donald C. Balfour ended ten years of service in that position. He now is director emeritus and professor of surgery emeritus of the Foundation. He continues to be senior consultant in surgery at the Mayo Clinic.

First entering the Mayo Clinic as an assistant in pathology, Dr. Balfour became a clinical assistant in 1908, junior surgeon in 1909, and head of a section in the division of surgery in 1912. He became associate director of the Mayo Foundation in 1935 and succeeded Dr. Louis B. Wilson as director in 1937.

Succeeding Dr. Balfour is Dr. Victor Johnson, former secretary of the Council on Medical Education and Hospitals for the AMA, who joined the Foundation April 1 as associate director.

* * *

Some figures on the number of medical school graduates seeking advanced training were quoted by Dr. Victor Johnson, Rochester, in a statement made as he assumed directorship of the Mayo Foundation on October 1.

"Before the war about 5,200 men were in graduate medical training schools," he said. "Today there are about 12,000 men studying at that level of medical training."

In regard to Mayo Foundation facilities, Dr. Johnson stated: "We have many more applicants here than we can handle at present. This is true partly because of our commitments to fellows whose training was interrupted by the war, and who were told they could come back here and complete their work when they were discharged from the service. Right now we have 552 fellows enrolled here for study. Before the war the maximum was 360, in 1941."

* * *

"Multiple Births of Man" was the topic discussed by Dr. George W. Corner, director of the Carnegie Laboratory of Embryology, Baltimore, Maryland, when he spoke at the University of Minnesota's Museum of Natural History on October 16. The lecture was sponsored by the Minnesota Human Genetics League and the Dight Institute for the Promotion of Human Genetics.

Author of many books, Dr. Corner has been on the faculty of the University of California, Johns Hopkins Medical School, and the University of Rochester, as well as a special lecturer at the Royal College of Surgeons, London, and at Princeton and Yale Universities.

On October 17 Dr. Corner spoke on "The Nature and Causes of Prenatal Mortality and Congenital Defects" at a meeting principally for medical students.

More than 200 alumni of the Mayo Foundation met in Rochester October 8, 9 and 10 for the twenty-fourth annual meeting of the Mayo Foundation Alumni Association. The meeting was the first since 1941 when seventy-five alumni gathered to hear scientific lectures by their colleagues and to renew friendships of fellowship days.

Speakers at the scientific sessions of the three-day meeting included Doctors R. B. Wilson, W. F. Kvale, E. J. Kepler, R. G. Sprague, E. H. Rynearson, F. R. Keating, L. E. Prickman, P. A. O'Leary, D. R. Nichols, C. H. Slocumb, F. J. Heck and E. D. Bayrd, all members of the present Mayo Clinic staff.

"Our Medical Heritage and Its Promise" was the title of the second Judd-Plummer memorial lecture delivered on the evening of October 8 by Dr. Raymond B. Allen, former fellow of the Mayo Foundation, now president of the University of Washington.

President of the association, Dr. W. H. Long, now of Fargo, North Dakota, delivered his presidential address at the opening of the fourth scientific session on October 9.

During the three-day meeting the Foundation alumni attended surgical clinics, medical rounds in the hospitals, and demonstrations of current medical research.

* * *

At the meeting of the Minnesota Society of Internal Medicine held October 20 in Saint Paul, Dr. Daniel W. Wheeler, Duluth, was elected president, succeeding Dr. Charles Watson, Rochester, as head of the organization. Also elected at the society's annual meeting was Dr. John A. Lepak, Saint Paul, as vice president, while Dr. Alexander E. Brown, Rochester, was re-elected secretary-treasurer. The next meeting of the group will be held in Duluth in the spring of 1948.

* * *

Following his discharge from the army in June, Dr. Robert J. Brotchner has opened an office at 244 Lowry Medical Arts Building, Saint Paul, for the practice of internal medicine. Dr. Brotchner was graduated from the University of Minnesota Medical School in 1935, spent two years at Minneapolis General Hospital as an intern and medical resident, two years at Midway Hospital, Saint Paul, and a year with Dr. E. T. Bell in pathology at the University of Minnesota. He then practiced for a short time at Minot, North Dakota, before enlisting in the army in 1940.

* * *

Dr. Richard J. Plunkett has been appointed associate editor of the *Journal of the AMA*. Dr. Plunkett, who formerly was vice president and director of the Division of Health and Sanitation of the Institute of Inter-American Affairs in Washington, D. C., received his medical degree from Tufts Medical College in 1933 and his master's degree in public health from Harvard in 1939.

* * *

Physicians throughout the nation are being asked to furnish medical evidence to substantiate the claims of railroad workers who may now draw cash sickness benefits under the Railroad Unemployment Insurance Act. The Railroad Retirement Board has pointed out that unless an application is mailed not later than the seventh day after the first day of sickness claimed, it may not be received within the legal time limit for filing applications. As a result, the employe may lose one or more days' benefits. Doctors are asked either to return each completed statement of sickness to the patient, or mail it promptly to the office of the Board to which it is addressed.

* * *

A four-day laymen's course in tuberculosis control opened October 28 at the University of Minnesota Center for Continuation Study under auspices of the University and the Minnesota Public Health Association. Approximately seventy registrants took the course, which was planned for members of the Minnesota

Honoring the memory of the late Dr. Robert G. Green, former head of the Department of Bacteriology in the University of Minnesota Medical School, the Minnesota Cancer Society has presented the University with a $5,000 grant to support a cancer research fellowship.

The grant was accepted by the Board of Regents of the University at a meeting on the campus, November 1, and was assigned to the Minnesota Cancer Society research fund to support a fellowship in the division of cancer biology. This research fellowship is held by Dr. Robert A. Huseby, assistant professor of cancer biology.

A check for $5,000 covering the memorial grant has been presented to the University by Dr. William A. O'Brien, president of the Minnesota Cancer Society, and Mrs. S. E. Linsley, executive secretary.

Long an outstanding figure in cancer research work at the University, Dr. Green died September 6, 1947.

HOSPITAL NEWS

Newly elected president of the medical staff of Northwestern Hospital, Minneapolis, is Dr. J. C. Miller, who succeeds Dr. L. Haines Fowler. Dr. Malcolm Hanson has been elected vice president and Dr. R. S. Ylvisaker re-elected secretary-treasurer. Named to the Executive Committee are Dr. R. E. Hultkrans, Dr. William Sadler, Dr. Harold S. Trueman and Dr. William R. Jones, all of Minneapolis.

* * *

In October, Dr. Viktor O. Wilson, chief of the Special Services Section in the State Department of Health, announced that an administrative organization would be set up by November 1 to direct a $24,000,000 hospital construction program in Minnesota during the next five years. It was expected that applications for construction funds would begin after January 1.

The Federal government, through the State Department of Health, will grant approximately $8,000,000 for hospital construction in the state, while owners of the individual hospitals will supply two-thirds of the construction costs.

* * *

A new 140,000-volt x-ray therapy machine has been installed at Wesley Hospital in Wadena to increase the therapeutic service of the hospital. The apparatus will be used under the supervision of Dr. S. Freifeld, radiologist at Wesley Hospital and at five other hospitals in the area.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

Headache. Louis G. Moench, M.D. Assistant Clinical Professor of Medicine, University of Utah School of Medicine; internist, Salt Lake Clinic, Salt Lake City. 207 pages. Illus. Price, cloth, $3.50. Chicago: Year Book Publishers, 1947.

Pharmacology, Therapeutics and Prescription Writing. For students and practitioners. Fifth Edition. Walter Arthur Bastedo, Ph.D., Ph.M. (Hon.), M.D., Sc.D (Hon.) F.A.C.P. Consulting physician, St. Luke's Hospital, New York; St. Vincent's Hospital, Staten Island, and the Staten Island Hospital; president U.S.P. Convention 1930-40, member Revision Committee, U.S.P., etc., 840 pages. Illus. Price, cloth, $8.50. Philadelphia: W. B. Saunders Company, 1947.

Textbook of Clinical Neurology. With an Introduction to the History of Neurology. Sixth Edition. Israel S. Wechsler, M.D. Clinical Professor of Neurology, Columbia University, New York; neurologist, Mt. Sinai Hospital; consulting neurologist, Montefiore Hospital and Rockland State Hospital, New York. 829 pages. Illus. Price, cloth, $8.50. Philadelphia: W. B. Saunders Company, 1947.

Gifford's Textbook of Ophthalmology. Fourth Edition. Francis H. Adler, M.D. Professor of Ophthalmology, University of Pennsylvania Medical School. 512 pages. Illus. Price, cloth, $6.00. Philadelphia: W. B. Saunders Company, 1947.

The Oculorotary Muscles. Richard G. Scobee, B.A., M.D. Instructor in Ophthalmology, Washington University School of Medicine, St. Louis, Missouri. 359 pages. Illus. Price, $8.00, cloth. St. Louis: C. V. Mosby Co., 1947.

The Years After Fifty. Wingate M. Johnson, M.D. Professor of Clinical Medicine and Chief of Private Diagnostic Clinic, Bowman Gray School of Medicine of Wake Forest College. Foreword by Morris Fishbein, M.D., editor of Journal of the American Medical Association. 153 pages. Price, $2.00, cloth. New York: Whittlesey House, McGraw-Hill Book Co., 1947.

OBSTETRICAL PRACTICE. Alfred C. Beck, M.D., Professor of Obstetrics and Gynecology, Long Island College of Medicine, Brooklyn, N. Y. 4th ed. 966 pages. Illus. Price $7.00. Balitmore: Williams & Wilkins Co., 1947.

Dr. Beck in this the fourth edition of his textbook of Obstetrical Practice, has enhanced the value of an already excellent treatise by adding a chapter on analgesia amnesia and anesthesia. It has been brought thoroughly up to date, particularly in respect to chemo-antibiotic therapy.

The drawings are clear and easily understood. In the handling of controversial questions, he has adopted a conservative attitude. His chapters on management of pregnancy and toxicosis of pregnancy are noteworthy and written in such a way as to create a lasting impression.

A really up-to-date book that will justify its selection for a library.

James N. Dunn, M.D.

SYNOPSIS OF OBSTETRICS. Jennings C. Litzenberg, M.D.,F.A.C.S., Professor Emeritus of Obstetrics and Gynecology, University of Minnesota Medical School, Minneapolis. 3rd ed. 416 pages. Illus. St. Louis: C. V. Mosby Company, 1947. Price $5.50.

The *Synopsis of Obstetrics* is a concise, orderly résumé of an ordinarily detailed and comprehensive branch of medicine. The ability to be brief and yet complete in his subject springs from Dr. Litzenberg's long and successful teaching career. This review of obstetrics should prove of considerable help to the student of the subject and to the older practitioner, as well, who for one reason or another has need for a quick, comprehensive coverage of the field.

The obstetrical specialty is covered with marked brevity. This should not be construed as a criticism of the book, however, for, as the title suggests, it is meant to be no more than a synopsis. For more complete coverage of the various subjects, one should consult the standard works on obstetrics or the current literature. A useful addition to the book would have been a bibliography at the end of each chapter to help those students desiring to expand their knowledge of the items skimmed over hurriedly in the text.

Several portions of the book have been rewritten or additions have been made. The various laboratory methods used in diagnosis of pregnancy are discussed. The following subjects have been expanded: the relief of pain in labor, diabetes in pregnancy, and puerperal infections, their treatment with the sulfonamides and antibiotics. A rather complete review of the relationship of the Rh factor to obstetrics is included in this, the latest edition of the *Synopsis of Obstetrics.*

A. F. H.

DISEASES OF CHILDREN'S EYES. James Hamilton Doggart, M.A., M.D. (Cantab), F.R.C.S. (Eng.), London, England. 282 pages. Illus. Price, $10.00. St. Louis: C. V. Mosby Company, 1947.

The author of this book has covered quite completely the subject from the embryology and anatomy to the many conditions encountered in adults' as well as in children's eyes. The individual style in this text is direct, concise, and very understandable. There are 282 pages of text and 210 illustrations, thirty-two of which are colored plates. These illustrations have been freely borrowed from the best British ophthalmic works and enhance the value of the book. The chapters are well arranged and, following most chapters, is a short bibliography of British references.

The text, as the author states, is his personal view of the subject matter. In these times when texts are padded volumes of every author's views, it is refreshing to find one with the temerity to write his own ideas in his own fashion and let the reader accept it as the frank expression of the author's opinion. While exceptions will be taken by many, as for example the chapters on treatment, no two would agree anyway.

As the reader will have to admit, the author has crammed more ophthalmological information into 282 pages in concise readable form than has been done any other modern treatise on the subject.

John C. Brown, M.D.

NURSING *is a proud profession*

. . . and rightfully so. For next to the doctor in service rendered stands the present-day nurse. Into her hands is entrusted the care of the sick, and often the success of the doctor's work depends directly upon her skill.

GLENWOOD HILLS HOSPITAL—through its School of Nursing—is anxious to cooperate with you in your effort to increase the number of nurses in your community. A student from your locality will result in increased nursing assistance to you in the near future.

Your help is greatly needed in recruiting candidates for this profession. A one-year course in psychiatric nursing is currently being offered to eligible applicants. Tuition is free. Regular classes begin in January, June and September.

SHOULD VITAMIN D BE GIVEN ONLY TO INFANTS?

VITAMIN D has been so successful in preventing rickets during infancy that there has been little emphasis on continuing its use after the second year.

But now a careful histologic study has been made which reveals a startlingly high incidence of rickets in children 2 to 14 years old. Follis, Jackson, Eliot, and Park* report that postmortem examination of 230 children of this age group showed the total prevalence of rickets to be 46.5%.

Rachitic changes were present as late as the fourteenth year, and the incidence was higher among children dying from acute disease than in those dying of chronic disease.

The authors conclude, "We doubt if slight degrees of rickets, such as we found in many of our children, interfere with health and development, but our studies as a whole afford reason to prolong administration of vitamin D to the age limit of our study, the fourteenth year, and especially indicate the necessity to suspect and to take the necessary measures to guard against rickets in sick children."

*R. H. Follis, D. Jackson, M. M. Eliot, and E. A. Park: Prevalence of rickets in children between two and fourteen years of age, Am. J. Dis. Child. 66:1-11, July 1943.

MEAD'S Oleum Percomorphum With Other Fish-Liver Oils and Viosterol is a potent source of vitamins A and D, which is well taken by older children because it can be given in small dosage or capsule form. This ease of administration favors continued year-round use, including periods of illness.

MEAD'S Oleum Percomorphum furnishes 60,000 vitamin A units and 8,500 vitamin D units per gram. Supplied in 10- and 50-c.c. bottles and bottles of 50 and 250 capsules. Ethically marketed.

MEAD JOHNSON & COMPANY, Evansville 21, Ind., U.S.A.

Every epileptic seizure takes its toll—psychically and somatically. Mental deterioration, extreme emotional instability and physical decline are generally the ultimate fate of the untreated.

DILANTIN SODIUM KAPSEALS, by effective anti-convulsant action with comparatively little hypnotic effect, help grant the epileptic a happier life—freer from attacks and from the *fear* of attacks.

DILANTIN SODIUM KAPSEALS are one of a long line of Parke-Davis preparations whose service to the profession created a dependable symbol of significance in medical therapeutics—MEDICAMENTA VERA.

DILANTIN SODIUM KAPSEALS
(diphenylhydantoin sodium), containing 0.03 gm.
(1/2 grain) and 0.1 gm. (1-1/2 grains), are
supplied in bottles of 100 and 1000.
Individual dosage is determined by the response
of the patient.

Kar-Shave

makes it
Easy
to be
Clean-Shaved
on every call
and occasion,
day and night

A Revelation in Convenience & Time Economy

Kar-Shave is new! It is Here! It fills a long-felt need. Wonder is it wasn't developed a long time ago. Physicians and Surgeons especially find it the only answer to a daily problem. Immediate deliveries are being made.

THINK back in your own experience, of the occasions when Kar-Shave would have been *"worth its weight in gold"* . . . Regular calls, full waiting rooms, and emergencies leave no time to maintain personal appearance, especially to shave. No time at the office, no time to wait in a shop, no time to rush home. *Kar-Shave* is the only answer. On the way to a patient, to a meeting, or a dinner, drive up to and stop at the curb. Plug *Kar-Shave* into the cigar lighter on the dash of your car. Plug your razor into *Kar-Shave.* In a few moments the job is done, neat, smooth, clean.

KAR-SHAVE CONVERTS 6 volts D.C. (car or boat battery) to 110 volts at 15 watts. Neat and compact, only 2"x2"x3½" in size. Habitually carried in the glove compartment in the dash. Ideal for use also in the boat, trailer, or in the car while at the lake cottage where line current is not available. *Kar-Shave* is built to last a lifetime. It makes any razor work better.

Fully guaranteed against defects of material and workmanship. Dealerships being established. Order direct for prompt delivery.

A richer life . . .

. . . / . . . *for your petit mal patients*

Immediate and substantial improvement in the great majority of cases—that is the encouraging prospect offered by Tridione to thousands of children suffering from *petit mal*. Tridione has achieved an outstanding clinical record in this field. In one study, for example, Tridione was given to 166 patients suffering from *petit mal* (pyknoepilepsy), myoclonic jerks or akinetic seizures.[1] This group had received only mediocre benefits from the use of other medicaments. With Tridione *83% were definitely improved*. Thirty-one percent became free of seizures; 32% had less than one-fourth of the previous number; 20% improved to a lesser extent; 13% were unchanged; and only 4% became worse. Furthermore, in some cases the seizures *did not return* when Tridione was withdrawn. • Clinical investigations have also shown that Tridione is beneficial in certain psychomotor cases when combined with other antiepileptic therapy.[2] You may obtain Tridione in 0.3-Gm. capsules and in pleasant-tasting aqueous solution containing 0.15 Gm. per fluidrachm. Wish literature? Just drop a line to Abbott Laboratories, North Chicago, Ill.

Formulac—

a modern

infant food

FORMULAC Infant Food is a concentrated milk in liquid form, fortified with all vitamins known to be necessary to adequate infant nutrition. No supplementary vitamin administration is required.

By incorporating the vitamins into the milk itself, the risk of human error or oversight is reduced. FORMULAC contains sufficient B complex, Vitamin C in stabilized form, Vitamin D (800 U.S.P. units), copper, manganese and easily assimilated ferric lactate—rendering it a flexible formula basis both for normal and difficult feeding cases. The only carbohydrate in FORMULAC is the natural lactose found in cow's milk. *No carbohydrate has been added.*

FORMULAC, a product of National Dairy research, has been tested clinically, and proved satisfactory. It is promoted to the medical profession alone. FORMULAC is on sale at grocery and drug stores nationally.

- For further information about FORMULAC, and for professional samples, mail a card to National Dairy Products Company, Inc., 230 Park Avenue, New York 17, N. Y.

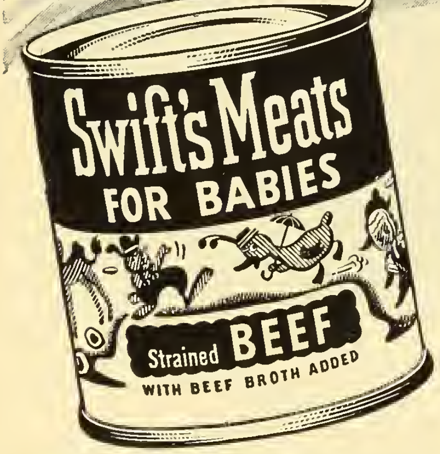
Here's tempting, real meat for patients on soft, smooth diets!



Swift's Strained Meats

specially prepared—fine enough for tube-feeding

All nutritional statements made in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association.

Here's protein-rich meat that patients on soft, smooth diets can eat and *enjoy!* Swift's specially prepared Strained Meats provide an excellent base for a high-protein, low-residue diet—in a form that is chemically and physically non-irritating. There are six different, highly palatable meats: beef, lamb, pork, veal, liver and heart. These wholesome meats are readily accepted by most patients, even when normal appetite is impaired.

Swift's Strained Meats were developed originally for feeding to young infants. The individual particles of meat are fine enough to pass through the nipple of a nursing bottle—may easily be used in tube-feeding. Swift's Strained Meats are prepared with expert care from selected, lean U. S. Government Inspected Meats, carefully trimmed to reduce fat content to a minimum, and cooked to retain a maximum of the valuable meat nutrients—biologically complete proteins, B vitamins and minerals. Swift's Strained Meats are convenient to use—come ready to heat and serve. Each vacuum-sealed tin contains three and one-half ounces of strained meat.

Swift's Diced Meats

For patients on a soft, high-protein, low-residue diet who can eat meat in a form less fine than Strained, Swift's Diced Meats offer an excellent, appetizing source of proteins, B vitamins and minerals. Swift's Diced Meats are tender, juicy cubes of meat—offer a variety of: beef, lamb, pork, veal, liver and heart, five ounces per tin.

If you wish samples of Swift's Strained and Swift's Diced Meats together with complete information, write: Swift & Company, Dept. B.F., Chicago 9, Ill.

ADD...a "plus"

An increasing number of investigators are commenting on the general "sense of well-being" which is usually experienced by menopausal patients following "Premarin" administration. This is a "plus" in therapy which is most gratifying to the woman crossing the threshold of the climacteric.

"Premarin" is supplied as follows:

Tablets of 2.5 mg.	bottles of 20 and 100
Tablets of 1.25 mg.	bottles of 20, 100 and 1000
Tablets of 0.625 mg.	bottles of 100 and 1000
Liquid, containing 0.625 mg. in each 4 cc. (1 teaspoonful)	bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens ...estradiol, equilin, equilenin, hippulin... are also present in varying small amounts, probably as water-soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract.

DESIGN

CAMP design is dedicated to meeting the physiological, surgical and maternity needs of the patient with the utmost in comfort and aesthetic appeal. Each specific design is further refined for the variety made necessary by the multiplicity of body builds and figure irregularities. The unique CAMP adjustment feature establishes a firm foundation about the pelvis as an "engineering" base for the distribution of regulated support. This makes it easy for the fitter to follow with precision the physician's recommendations for indicated firmness about the abdomen, pelvis and controlled support of the spinal column and gluteal region without pressure or compression.

CAMP ANATOMICAL SUPPORTS

Camp Anatomical Supports have met the exacting test of the profession for four decades. Prescribed and recommended in many types for prenatal, postnatal, postoperative, pendulous abdomen, visceroptosis, nephroptosis, hernia, orthopedic and other conditions. If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent upon request.

NOW . . .
A Truly Modern
Home Cleaning
Appliance

LEADING home economists have called Rexair, "The greatest advance in home cleaning methods in more than thirty years."

There is a reason for this enthusiasm. That reason is Rexair's entirely new cleaning principle.

To begin with, Rexair uses neither a bag nor a filter. Bags and filters depend for their operation on *porousness*. They must be porous to let the air escape; and when air escapes, small particles of dust escape with it. You take dust from the floor and actually blow it into the air you breathe.

Bags and filters also clog up, and then cleaning efficiency drops.

Rexair completely does away with bags, filters, screens, or anything else that depends on porousness for its operation. Instead Rexair—*and only Rexair*—uses a bath of pure water to catch and hold dust and dirt.

Wet dust cannot fly. A water bath cannot clog up. Learn more about Rexair today!

Rexair

SEND FOR THIS FREE BOOK

The complete story of Rexair, told in colorful pictures and text. Shows how Rexair performs all home cleaning tasks and gives vitalizing freshness to the air you breathe.

Experience is the Best Teacher

Thomas Addison
(1793-1860)
proved it in Clinical Medicine

Addison's clinical experience supported by continued research and a careful collection of cases led to his greatest discovery: the distinction between two types of anemia—pernicious in which there is no organic lesion, and the anemia in which the suprarenal capsules are diseased. The latter type of anemia is still known as Addison's disease.

Yes! And experience is the best teacher in smoking, too!

DURING the wartime cigarette shortage, people smoked—and compared—many different brands . . . any brand they could get. That's when so many people learned the big differences in cigarette quality. And, out of that experience, more and more smokers found that Camels suit them best. As a result, ***more people are smoking Camels than ever before!***

Try Camels! Let your "T-Zone"—your taste and throat—tell you why, with millions who have tried and compared, Camels are the "choice of experience."

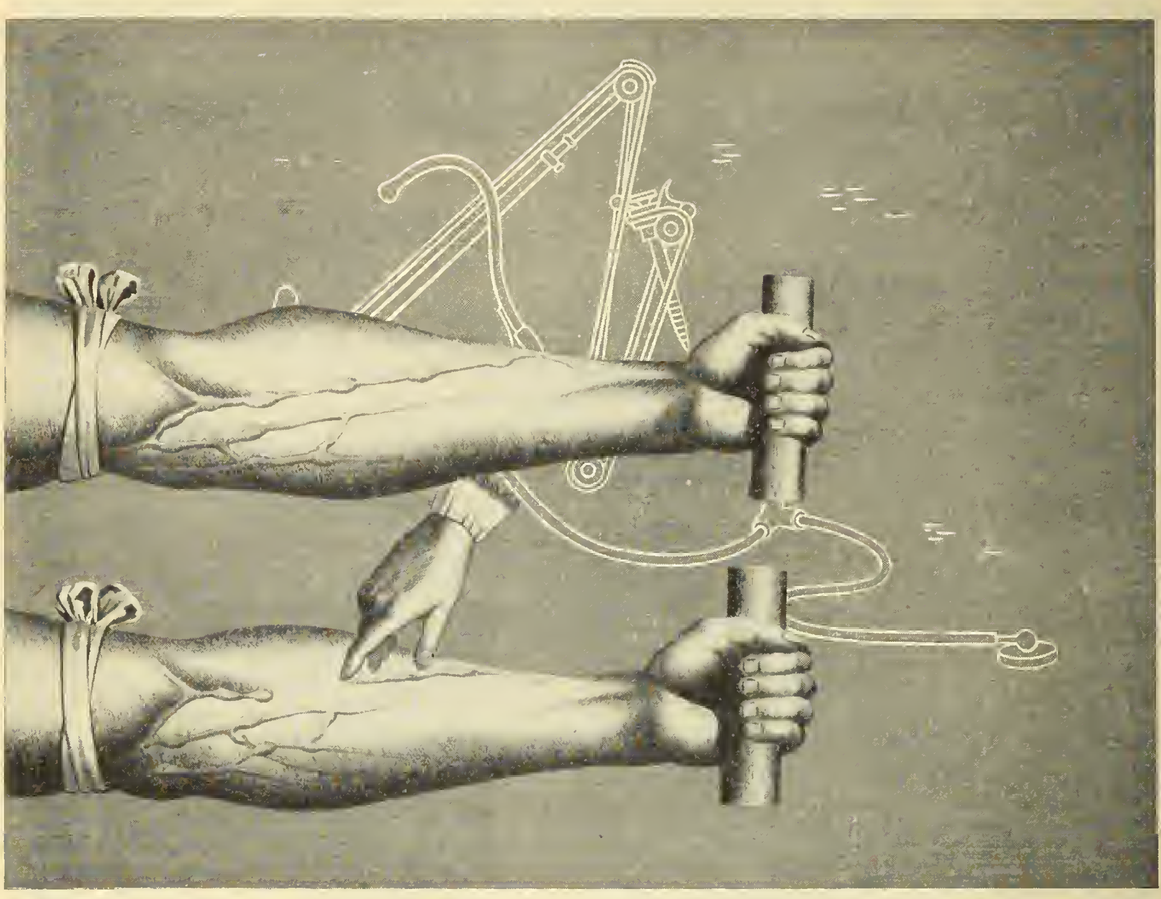
According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Three nationally known independent research organizations asked 113,597 doctors—in every branch of medicine—to name the cigarette they smoked. *More doctors named Camel than any other brand.*



The First Modern Physiology...

Medicine and Dentistry, before Harvey (1578-1657), knew little about organic *function*. But, after discovery of valves in the veins by Fabricus, his teacher at Padua, Harvey was ready for his great work.

He saw blood spurt from a snake's artery nicked *above* a ligature. When he nicked its main artery *below* a ligature, he saw no spurt of blood; and its heart swelled to bursting. He found only 4 pounds of blood in a sheep's body, but its heart was pumping out 3.5 pounds in an hour. It must *return* to the heart! It must make a *circuit!* Now a doctor could really *understand* the spread of infection and the function of major organs, and perform more intelligent surgery.

A doctor's responsibility was growing as fast as his knowledge. By 1553, he was liable for negligence, even without breach of contract. Tort law was on the way, with its newer doctrines of the doctor's liability.

radiographic vs. **surgical**

Exploration

When confusing abdominal symptoms and signs create a diagnostic tangle or do not yield properly to medical management, *radiographic exploration* of the gallbladder with PRIODAX will often reduce the need for *surgical exploration.* PRIODAX cholecystography almost never fails to reveal disease of the gallbladder if it exists, or to produce unequivocally clear silhouettes if the organ is normal.

PRIODAX

(brand of iodoalphionic acid)

PRIODAX is rarely eliminated prematurely from the gastrointestinal tract. The opacities produced by it are homogeneous, sharp and unstratified. Moreover, clear visualization will not be obscured by contrast substance in the colon when PRIODAX is used. PRIODAX, therefore, provides maximum dependable concentration of the most desirable type for reliable interpretation.

PRIODAX Tablets, beta-(4-hydroxy-3,5-diiodophenyl)-alpha-phenylpropionic acid, available as six 0.5 Gm. tablets in individual cellophane envelopes. Boxes of 1, 5, 25 and 100 envelopes.

THE FENESTRATION OPERATION FOR OTOSCLEROSIS

GEORGE E. SHAMBAUGH, JR., M.D.

Chicago, Illinois

NINE years ago a new operation was described for restoring hearing in certain cases of progressive deafness. From a small begining beset with difficulties, the fenestration operation has become one of the major advances in surgery of recent years.

The principle of the fenestration operation is simple. Otosclerosis, the most important cause for progressive deafness in early and middle adult life, blocks the conduction of sound to the inner ear by a formation of spongy bone in the oval window. The fenestration operation removes the block by making a new window into the labyrinth and connecting it with the tympanic membrane by a plastic skin flap.

The principle of the fenestration operation was thought of many years ago, but the early attempts to restore hearing in otosclerosis failed, for the new window always closed by new bone formation following operation. The first successful operation was by a French otologist some twenty years ago, whose complicated several-stage procedure was simplified nine years ago by Lempert in the one-stage fenestration operation.

As with the earlier operations, bony closure of the new window was the chief obstacle to the fenestration operation. At first 50 per cent or more of the fenestrae closed within a few months after operation. This difficulty has been overcome largely from knowledge gained by animal experiments.

The six factors that were found to influence new bone formation at the fenestra may be applicable to other operations on bone, and are, therefore, of general interest.

First, we observed in our animal experiments that particles of bone dust, even microscopic in size, exert a powerful stimulus to osteogenesis, new bone forming rapidly around such particles. The first requisite in making a fenestra that will remain open is to make a clean window entirely free from any particles of bone dust.

Second, we found that the middle layer of bone of the labyrinthine capsule, called the enchondral layer because it comes from the fetal cartilage, is much less active in forming new bone than the outer periosteal layer or the innermost layer of endosteal bone. The second requisite in preventing closure is to expose the inert enchondral layer as far as possible around the new window.

Third, we demonstrated that stratified squamous epithelium lying close to bone inhibits osteogenesis. Therefore, the fenestra should be covered with the thinnest possible skin flap closely applied to the margins of the fenestra.

Fourth, we proved that trauma to the endosteum that lines the labyrinth stimulates osteogenesis. In making the fenestra great care must be taken not to scrape or strip the endosteum within the labyrinth.

Fifth, we discovered that bone polished with a hard gold burnishing burr rarely shows osteogenesis from the polished surface.

Sixth, we confirmed the known fact that fibrosis tends to be followed by osteogenesis in bone injuries. Accordingly fibrosis must be kept to a

---

Read at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 30, 1947.

minimum by controlling hemorrhage, preventing infection and minimizing inflammatory reaction due to tissue trauma.

The application of these six factors demonstrated by our animal experiments to the fenestration operation has resulted in reducing bony closures to less than 3 per cent of operations followed for more than two years.

This does not mean that nearly every patient operated upon experiences a good result, for there are still problems to be overcome. But it does mean that once the patient experiences a good hearing improvement he may expect to keep it permanently, with the technique that is now being used.

The risks of the fenestration operation have proved to be slight, despite the proximity to the facial nerve, to the dura of the middle and posterior cranial fossa, and to the sigmoid portion of the lateral sinus. In more than 1,600 operations over a nine-year period we have had no deaths and no serious complication. Temporary paralysis of the facial nerve is the most frequent complication. Dizziness lasting a few weeks, and in some cases persisting in a mild form for as long as two years, is the most annoying symptom following operation.

The careful selection of cases for the operation is very important, for the outcome will depend as much upon the selection of cases as upon the correct surgical technique properly carried out.

The fenestration operation is first of all an elective operation, and the patient must be in good health.

The tympanic membranes must be intact and within normal limits.

Above all, the cochlear nerve function must be good for the speech frequencies as measured by the bone-conduction hearing tests. Making a new window cannot improve the hearing if the hearing nerve does not respond.

According to the bone-conduction hearing tests we classify each patient and give him an approximate prognosis with regard to his chances of regaining practical hearing.

The ideal "Class A" candidate for the fenestration has normal hearing by bone conduction for all three of the speech tones of 512, 1,024 and 2,048 vibrations per second. Such a patient has at least eight chances out of ten of regaining permanent hearing sufficient to do without a hearing aid.

The suitable but not ideal "Class B" case has normal hearing for all but one of the speech frequencies by bone conduction. He has about five or six chances out of ten of a permanent good hearing result.

The borderline "Class C" case shows a bone conduction curve below normal for two or three of the speech frequencies. He has only about one chance out of ten of a good hearing improvement, and as a rule such patients are encouraged to use a hearing aid rather than to be operated upon.

In conclusion, the fenestration operation offers the victim of progressive deafness from otosclerosis a chance to regain sufficient hearing to do without a hearing aid. The prognosis in a particular case depends upon the condition of the auditory nerve as measured by the bone-conduction hearing tests for the speech frequencies.

If the operation is not successful, the hearing in the operated ear may be improved too little to be of value, or it may remain the same as before operation, or, in about one per cent of cases, the hearing may be worse in the operated ear. For this reason the poorer hearing ear is selected for operation.

At the present time, with the technique that is being used, the ideal candidate for the fenestration operation has eight chances out of ten of regaining and keeping practical hearing.

FBI CHECKS STATE MEDICINE

One of the most startling misuses of public funds in many years was disclosed last week by Congressman Harness of Indiana who divulged that the FBI has commenced an investigation of Federal agencies illegally propagandizing for socialized medicine.

The Bureau of Research and Statistics of the Social Security Board was characterized by Harness as the "nerve center of socialized medicine propaganda for the entire world." Harness declared that if the medical profession "can be taken over by the Federal Government and forged into a new and gigantic health bureaucracy, it would only be a question of time until Washington likewise moved into the field of education, religion, the press and radio."

Bureaus are charged by law with responsibility for administering legislation enacted by Congress, but the spending of huge funds by government agencies to "pressure" the enactment of legislation is a relatively new and alarming development. Since the first of this year various Federal agencies, according to Congressman Harness, have spent nearly 75 million dollars for publicity and propaganda work.—*California Feature Service,* October 6, 1947.

FOLLOW-UP OF ABNORMAL PULMONARY FINDINGS OBSERVED IN MASS CHEST X-RAY SURVEYS

HILBERT MARK, M.D., M.P.H.
Director, Division of Tuberculosis, Minnesota Department of Health
Minneapolis, Minnesota

SURVEY FILMING is only a means of screening the apparently healthy population into two groups: (1) those persons with essentially negative chests and (2) those in whom the project x-rays give an impression of some abnormality.

Further examinations of the individuals in group 2 and adequate clinical evaluations are required to sort out those in need of medical supervision. All examinees who require such evaluation are referred back to their preferred physician. Although every pulmonary shadow is not tuberculosis, yet tuberculosis should be ruled in or out as soon as possible. Primary tumors of the lung and other non-tuberculous pulmonary diseases may simulate tuberculosis. It is possible to diagnose early bronchiogenic tumors, benign or malignant, by adequate follow-up of localized emphysemas which appear as a result of partial obstruction of a bronchus. This could lead to an earlier surgical attack on this type of tumor. Of course, there are other causes of localized distention of the lung.

The prompt clinical attention of the first physician to see the patient after the survey report of a possible pathological condition is a serious responsibility. In many of these cases the determination of a correct diagnosis may require varied diagnostic tests.

It can be said, therefore, that the clinical evaluation should determine the following:

1. Definite diagnosis and whether the disease is communicable
2. Extent of the disease and whether it is acute or chronic
3. Prognosis and determination of therapeutic procedure
4. If tuberculosis, disposition of the patient and whether his condition requires hospital or sanatorium care or whether he may continue under local medical supervision.

Since tuberculosis should be ruled in or out without undue delay, a complete clinical study should include the following:

1. *History.*—As the abnormality found will vary from very recent to very old, the degree and variety of symptoms present will also vary widely from no apparent to marked symptoms. Past history should be checked for tuberculosis exposure, hemoptysis, extended colds and coughs, malaise, et cetera.

Occupational history may be exceedingly important in the differential diagnosis. The results of previous tuberculin tests and roentgen examinations should be obtained in detail and verified.

2. *Physical Examination.*—A complete physical examination should be made, and although a chest x-ray has been obtained, the examination of the chest should not be omitted. Temperaure recordings at different times of day and sedimentation rates should be obtained. Special attention should be given to the determination of the presence or absence of increased temperature, fatigue, or loss of weight.

3. *Tuberculin Tests.*—To be of value, this test must be given correctly with potent material and then interpreted correctly. It is then an extremely valuable test in establishing the diagnosis of the case. Usually, the single test with 0.1 cc. of a 1:1000 dilution of old tuberculin (0.1 mgm) will suffice. A negative test on several trials will rule out tuberculosis except under the following conditions:

- (a) fulminating cases when the ability to react to the antigen is lost
- (b) overwhelming miliary infections
- (c) recent cases when the infection has not been present long enough to produce the allergic phenomenon
- (d) following some infectious diseases such as measles when the allergic respone is temporarily lost.

4. *Sputum Tests*—It is exceedingly important that a thorough search be made for tubercle bacilli. The presence of proved tubercle bacilli establishes the diagnosis. When sputum is present the initial examination can be by direct smear, but if no bacilli are found on direct smear, cultural studies should be made.

TABLE I. GUIDE FOR DISPOSITION OF PERSONS DIAGNOSED AS TUBERCULOUS*

Group	Tubercle Bacilli	Cavity on X-Ray Film	Changes on X-Ray Film	Tuberculin Test (1:1000 O.T.) Intracutaneous	Principal Symptoms: Temperature, Fatigue, or Weight Loss	Disposition of Case

6.		S		+	0		X	
7.	Sputum Culture Negative and Gastric Culture Positive	S		+	+	X		
8.		+		+	0 or +	X		
9.	Sputum, Smear or Culture Positive	0 or +		0 or +	0 or +	X		

*Suggested modification of guide proposed by Hilleboe & Holm published in December 6, 1946, issue of **Public Health Reports.**

In the absence of expectoration, a gastric lavage of the fasting stomach is indicated in order to obtain the required specimen.

The work of a number of bacteriologists has shown that the gastric acid or enzymes or both have a deleterious effect on the tubercle bacilli. A twenty-four-hour delay markedly reduces the chance of recovery of viable tubercle bacilli. Both sputum and gastric specimens should be mailed to an accredited official or private laboratory without delay.

If there are beds available in the sanatorium, it is better to have the patient admitted to the institution so that the gastric lavage can be done early in the morning before the patient has had an opportunity to move about or to drink. The specimen obtained can then also be handled promptly and cultures inoculated while the tubercle bacilli, if present, are still viable.

5. *Serial and Special X-Ray Studies.*—If possible, previous chest films should be obtained and used in review. These examinations may be indicated to determine the extent and position of the lesion. Changes or lack of changes of the pulmonary lesions will aid in determining whether the disease is acute or chronic and whether the lesion is stable, retrogressive, or progressive.

If the diagnosis is tuberculosis, the next consideration is the disposition of the patient. To determine this the physician should consider the status of the disease, the presence or absence of tubercle bacilli, the extent and character of the pulmonary lesion as revealed by the roentgenograms, and the presence or absence of cavities.

It is hoped that the clinicians will submit sputum or gastric specimens periodically to the Health Department Laboratories on *all patients* remaining home under medical supervision.

Contacts of positive sputum cases should be given the Mantoux test. If there is no reaction, the test should be repeated in two months and again in four months. If no reaction, further follow-up is not required. If the contact reacts, he should be x-rayed at the time of the Mantoux reaction, and rerayed in six months. If the x-ray examinations are negative, reray yearly unless the contacts are children, then reray at the age of twelve, and annually thereafter.

Summary

1. The necessity for a complete clinical evaluation by the private physician is discussed. Recommendations are made of the points to consider in making such an evaluation.

2. A modification of the Guide for Disposition of Persons with Lesions Diagnosed as Tuberculosis as outlined by Hilleboe and Holm is presented.

ACUTE PERFORATED GASTRIC AND DUODENAL ULCER

An Eighteen-Year Survey

DONALD C. MacKINNON, M.D., F.A.C.S.
Minneapolis, Minnesota

THE general interest in acute perforated gastric and duodenal ulcer is indicated by the tremendous number of recorded observations, and the excellent reviews of this subject reported in the literature. Most of the publications disclose an obvious dissatisfaction with the high mortality rate in this acute abdominal catastrophy. Furthermore, there is a unified effort to correct the deplorably high mortality by outlining treatment along certain definite and well-established principles.

During the first three decades of the twentieth century, the mortality in perforated ulcers decreased considerably, according to DeBakey,[6] whereas, during the fourth decade, it diminished only 2.4 per cent with an operative mortality during that period of 23.4 per cent. The operative mortality figures of Sallick[28] (10.8 per cent in seventy-four cases), Berson[3] (15.2 per cent in 151 cases), and Black and Blackford[4] (11.8 per cent in ninety-three cases) are more favorable. According to DeBakey,[6] the lowest mortality rates have been reported in the smaller series of cases.

With refinements in surgical technique, anesthesia, chemotherapy and preoperative and postoperative care, more encouraging results should be recorded in the future. However, there has been very little published during the last few years in support of this contention, except in the smaller series of cases. Graham[12,13] reported fifty-one cases with one death, but when his series was extended to 111 cases, the operative mortality rate was 6.3 per cent. From the United States Navy, Lyons and Sinclair[23] reported one death in twenty-two Seabees. The recent figures of Baritell[2] (1.1 per cent operative mortality in eighty-eight cases) were unique. Whether these figures can be approached in the larger series, where the mortality risk is increased by including more individuals who are likely to develop cardiac, renal, and pulmonary complications, is problematic. Only by repeated analyses and reviews of this subject can lowered mortality rates be revealed and improved methods of procedure be developed.

During the past six years, the members of the surgical staff of the Minneapolis General Hospital have been impressed with an apparent decrease in the mortality from acute perforated gastric and duodenal ulcers operated upon in that hospital. In order to prove this impression, the present study was undertaken. Furthermore, a more complete interpretation of our changes in therapy and an opportunity to compare the statistical aspects of our series with other collected series would then be possible.

Source of Material

This study includes all the cases of acute perforated gastric and duodenal ulcers in which operation was performed at the Minneapolis General Hospital during an eighteen-year period from 1929 to 1946, inclusive. This represents a series of 176 cases. These patients were indigent, in a poor physical, economic, and social status, quite unlike patients in private practice. The emergency operations were performed in thirty-seven instances by ten visiting staff surgeons. One hundred thirty-nine patients were operated upon by thirty-four senior resident surgeons during their final six-month training period of the three-year fellowship in general surgery. The operations performed by the visiting staff were done, for the most part, during the first three years of the series before postgraduate training was well established in this hospital.

Only the acute perforated gastric and duodenal ulcers treated surgically were included. Penetrating ulcers and elderly moribund individuals who were admitted to the medical service with a diagnosis of coronary thrombosis, or other incorrect diagnoses, showing perforated ulcers at necropsy, were excluded. Three patients treated conservatively were excluded. Two of these died and the diagnosis was verified at necropsy. One recovered and was operated on for a second perforation three years later. One young woman was excluded whose appendix was removed and the overlooked perforated duodenal ulcer was discovered at necropsy.

From the Minneapolis General Hospital and the Department of Surgery, University of Minnesota Medical School, Minneapolis, Minnesota.

Presented before the Minneapolis Surgical Society, April 3, 1947.

TABLE I. MORTALITY FOR THE SERIES AND ACCORDING TO SIX-YEAR AND NINE-YEAR PERIODS (176 CASES)

Period	No. Cases	No. Deaths	Mortality Per cent
1929-1946	176	38	21.6
1929-1934	49	12	24.5
1935-1940	63	21	33.3
1941-1946	64	5	7.8
1929-1937	82	24	29.3
1938-1946	94	14	14.9

TABLE II. MORTALITY ACCORDING TO THE AGE IN OUR SERIES AND IN THE COLLECTED SERIES[6]

Age Decades	Our Cases (176)			Collected Cases (4,147)
	No. Cases	No. Deaths	Mortality Per cent	Mortality Per cent
10-19	2	0	0.0	14.3
20-29	26	1	3.8	12.2
30-39	40	3	7.5	18.9
40-49	46	10	21.7	28.0
50-59	39	12	30.7	40.8
60-69	17	9	52.9	55.3
70-79	6	3	50.0	53.8

TABLE III. MORTALITY ACCORDING TO SEASONS (176 CASES)

Season	No. Cases	No. Deaths	Mortality Per cent
Winter	47	10	21.3
Spring	55	15	27.3
Summer	33	4	12.1
Autumn	41	9	21.9

Table I shows the mortality rates for the entire series: three consecutive periods of six years or two consecutive periods of nine years. The operative mortality rate of 21.6 per cent approximates the figure of 23.4 per cent in the collected series of 15,340 cases reported by DeBakey.[6] The higher mortality rate in the second six-year period is due to a greater number of poor risk patients operated upon during that period. A more marked reduction in the mortality rate is found in the last six years of our series (7.8 per cent in sixty-four cases), than in the last nine years of the series (14.9 per cent in ninety-four cases). Factors contributing to this reduction will be discussed later in this report. At present, it is of interest to correlate various factors of the disease with the death rate in order to determine their importance in the immediate prognosis.

Age

Age has long been recognized as being an important prognostic factor. In this series the range was from fifteen to seventy-six years. The average age of the entire series was 44.3 years. The average age of the survivors was 41.8 years and of those who died 53.5 years. The patients of the entire series were in a significantly older age group, 35 per cent being fifty years or older. According to six-year periods, the number of patients over fifty years of age was 22.4 per cent for the first period, 38.1 per cent for the second period and 39.1 per cent for the third period. These figures show that from the standpoint of age, the greatest number of poor risk patients were in the last six-year period when our mortality was the lowest, making our figure of 7.8 per cent statistically significant. Table II shows a correlation between the mortality incidence and age according to decades in our cases and the collected series.[6] There is a definite increase in the mortality with each succeeding decade. These figures do not differ markedly from those already reported by Graves,[14] Judine,[18] and DeBakey.[6] Their exceedingly high mortality incidence of 33.3 to 50 per cent in individuals over fifty years clearly indicates the seriousness of the disease in people of that age group.

Sex

In uncomplicated ulcer there is a ratio of six males to one female. The incidence of perforation is much greater in the male, exceeding this ratio by four or five times. In our series there were 171 males and five females, a ratio of 34 to 1. There were no deaths among the females. DeBakey[6] reported a mortality rate of 43.9 per cent in 474 females and 25.7 per cent in 2,152 males, indicating that the prognosis is not as favorable in the female sex. Possibly this can be explained by the fact that women are more likely to develop gastric rather than duodenal perforations, which, as will be shown later, usually result in a higher mortality rate.

Seasonal Incidence

Ulcer activity is considered to be greatest during the spring and autumn seasons. Table III shows the higher incidence of perforation in the spring and autumn, but also high during the winter, with the lowest incidence during the summer season. Ulfelder and Allen[35] correlated the mortality incidence with the season in which upper respiratory infections were frequent and found a close relationship. In late autumn, winter, and early spring respiratory infections are frequent in Minnesota. In our series the mortality incidence was highest during these seasons and lowest during the summer months.

Previous History

A correlation between mortality and the presence or absence of either a positive or a suggestive history of ulcer did not disclose a significant relationship in our series. There was a rather high incidence of some type of ulcer distress as shown by the fact that 21.5 per cent of our patients gave a positive history of ulcer for a year or longer, 59.6 per cent gave a suggestive history of ulcer for a few weeks to several years, 17 per cent gave no history of ulcer, and in three cases the history of ulcer was unspecified. All patients with a positive and suggestive history of ulcer had carelessly and stupidly neglected adequate medical therapy, in many instances having resorted at irregular intervals to alkalies or food for relief of their symptoms. Emphasis must again be placed upon the fact that these patients were indigent; most of them from the lower social and economic levels of society. Some were chronic alcoholics, others were transient and homeless, so there should be little difficulty understanding that adequate medical management in such individuals is often unsuccessful and occasionally impracticable. Though perforation can occur in the presence of an adequate medical regimen, as observed in a few cases reported by Eliason and Ebeling,[8] it did not occur under similar circumstances in any of our cases. There were three patients with recurrent perforations in our series. The original perforations were treated elsewhere in two patients. In one patient, a simple closure was performed one year prior to the second perforation. In the second patient, the initial perforation was closed and a gastroenterostomy was performed; seven years later this patient had a perforated gastrojejunal ulcer. The third case was of interest because the patient had a perforation three times at three-year intervals. The first perforation was treated conservatively, and the last two were duodenal perforations treated by simple closure. Subsequently, this patient had a subtotal gastric resection.

TABLE IV. MORTALITY ACCORDING TO THE PREOPERATIVE TIME INTERVAL IN OUR SERIES AND IN THE COLLECTED SERIES[6]

Time Interval Hours	Our Cases (176) No. Cases	No. Deaths	Mortality Per cent	Collected Cases (7,683) Mortality Per cent
0-6	92	10	10.9	10.5
7-12	59	14	23.7	21.4
13-18	14	6	42.8	38.5
19-24	5	4	80.0	62.4
Over 24	5	4	80.0	61.5
Unspecified	1	0	0.0	0.0

Time of Perforation

In the literature, reference is made to the causative relationship of activity, trauma, and occupation, to perforation. Little attention has been given to the time perforation occurs in relation to ordinary mealtime. There is a general conception that perforation often takes place during or after a heavy meal. In our series it was possible to determine the hour of perforation in 172 cases. In 121 cases (70.3 per cent) perforations occurred between 9 a.m. and noon, 3 p.m. and 6 p.m., and 9 p.m. and 6 a.m., with slightly more than 50 per cent occurring during the latter period or night hours. This figure might even be higher if one could assume that some of the twenty-five patients whose perforations occurred during the dinner and supper hours had not eaten. This analysis is only presumptive evidence that perforation occurred more often during the periods when highly acid gastric secretions were less likely to be neutralized by food. In our series, only four patients definitely had a perforation while eating, six immediately after eating, one after drinking coffee, two after drinking beer, and two a few hours after a gastrointestinal x-ray study.

Preoperative Time Interval

Another extremely important factor, contributing to the high mortality rate, is the lapse of time between perforation and operation. The rapid rise in mortality rate is clearly demonstrated in Table IV where our figures are compared with DeBakey's[6] collected series. The mortality doubles, approximately, with the lapse of each succeeding six-hour interval up to twenty-four hours. In our series the operation was performed during the first twelve hours in 85.7 per cent of the cases, indicating that there was little delay in operating upon these patients. According to six-year periods, the number of patients with perforations over twelve hours old before operation was 14.2 per cent for the first period, 25.4 per cent for the second period, and 19.1 per cent for the third period. The greatest number of poor risk patients were in the second period when our mortality was the highest. There were more patients with perforations over twelve hours in the last period when our mortality was the lowest, than in the first period. Therefore, from the standpoint of the preoperative time interval, a relatively large number of poor risk patients were operated upon during the last six years, making our mortality rate of 7.8 per cent significant for that period.

The preoperative time interval is uncontrollable until the patient is within the jurisdiction of the medical attendant, when it then becomes a factor directly under his control. This was shown in one of our deaths which was attributed, in part, to unnecessary delay. A thirty-three-year-old man was admitted three hours after first noticing symptoms of perforation but he was not operated upon until six hours more had elapsed. It is our policy to operate upon these patients immediately after making the diagnosis, which usually can be determined quickly and easily. Scoutter[29] has shown that true shock is infrequent in these cases. This was also true in our patients where it was found rarely in a few late cases. Therefore, a short period of preoperative preparation ordinarily can be accomplished. We are also in accord with Olson and Norgore,[27] and Graham,[12] who believe that a sufficient delay is justifiable in the late case to correct the secondary manifestations of perforation, such as shock, and fluid and biochemical depletions.

Though there is a tendency for the perforation to become sealed in late cases, this fact cannot be determined definitely with any degree of accuracy. Only three of our patients were treated conservatively and only one recovered. These three were seen late and were admitted in such poor condition that they were inoperable, or in sufficiently good condition to indicate that the perforation may have been sealed and recovery might have been taken place. Baritell[2] treated five patients conservatively who were seen late when their signs and symptoms were subsiding, with recovery in all cases. He emphasizes careful evaluation, constant observation, and surgical intervention only when there were signs indicating a relapse. Ulfelder and Allen[35] agree with Wangensteen[37] that nonoperative therapy should be considered in the older age group seen twelve hours after onset and showing signs of localization. Sherman[32] reported a 50 per cent mortality in fifty patients not submitted to operation; this group was not analyzed so the high mortality was equivocal. Visick[36] reported two deaths in fourteen unselected patients treated conservatively. Taylor[34] bases surgical intervention on the degree of leakage that takes place, recommending conservative management in the early perforations and operation in the late cases. He reported four deaths in twenty-eight patients treated conservatively. Unquestionably, patients admitted to the hospital after the optimum time for operation has passed, and who are in poor physical condition, constitute a real problem in therapy and surgical judgment, as shown by two of our patients who died of profound shock during and immediately after the operation. We now believe that in the late case the patient should have a reasonable chance to survive the operation before operation is undertaken.

Pneumoperitoneum

The scope of this report does not include a detailed study of the symptoms and signs which are characteristic and helpful in making the diagnosis of perforated ulcer. Roentgen-ray evidence of free air under the diaphragm in the upright position, or between the liver and the chest wall in the left lateral decubitus position is practically pathognomonic of a perforated viscus.

Due to improved x-ray technique, the accuracy of this procedure has improved noticeably during the last ten years of our survey. Pneumoperitoneum is not present in all cases, especially when the perforation is small, of short duration, or when the air bubble becomes pocketed by adhesions in a subhepatic position. The injection of air through an indwelling catheter in the stomach to increase the accuracy of this diagnostic aid was not practiced. Intraperitoneal free air was observed in the usual locations by roentgen-ray examination in only 55.6 per cent of our patients. It was not demonstrated in one-fourth of the cases, and in the remaining patients an x-ray was not taken or was unsatisfactory. The literature contains numerous reports in which pneumoperitoneum was demonstrated in from 50 per cent, as shown by McCabe and Mersheimer,[25] to 95 per cent of the cases, as reported by Shallow.[30] In the absence of pneumoperitoneum, an elevated serum amylase, as shown by Elman,[9] is helpful in distinguishing acute pancreatitis. Serum amylase determinations were done shortly after admission to the hospital in only eight of our patients, and in two cases they were abnormally high. Needle aspiration of the peritoneal cavity was done occasionally. The diagnostic value of this procedure has been reported by Steinberg.[33] If a small amount of methylene blue given orally can be retrieved by peritoneal aspiration, a perforation is present. Recently, this procedure has been used in the cases showing no air under the diaphragm. When these procedures are positive, they are valuable diagnostic aids. When they are negative, they may cause further confusion and unnecessary delay in which valuable time is lost prior to surgical intervention. The diagnosis is not difficult in most cases and must be interpreted in the light of the characteristic history and physical findings.

Leukocyte Count

The average initial leukocyte count performed on admission to the hospital was 14,250. The range was from 3,200 to 29,800. In some instances there was no leukocytosis. Among the deaths there were seven cases with an initial leukopenia of counts below 6,350. In perforation of less than twelve hours' duration, the average initial leukocyte count in 118 patients who survived was 14,550, and in sixteen deaths was 11,950. When perforation had been present more than twelve hours the leukocyte count was not of prognostic value—for the average count in those who survived was 14,600 and in those who died 14,050. Berson[3] reports a mortality of 52.4 per cent in patients with a leukocyte count under 10,000. From these figures a normal leukocyte count or an initial leukopenia may indicate a grave prognosis.

Anesthesia

There is a controversy regarding the anesthetic of choice in operating for perforated gastric and duodenal ulcer. Sallick[28] and McCreery[26] found a lower mortality in those operated upon under general anesthesia, while Fallis,[10] Shawan,[31] and Judine[18] found mortality rates from two to four times as great under general as under spinal anesthesia. Baritell,[2] in his spectacular series of eighty-eight cases with a 1.1 per cent mortality rate, used spinal anesthesia routinely. In a series of 1,776 collected cases, DeBakey[6] reported a mortality under general anesthesia of 29.9 per cent, under spinal anesthesia of 17 per cent, and under local anesthesia of 52.8 per cent. The higher mortality rate in the local anesthetic group can be explained by the fact that local was the anesthetic of choice in the late and originally poor risk patients.

TABLE V. MORTALITY ACCORDING TO ANESTHESIA (176 CASES)

Anesthetic	No. Cases	No. Deaths	Mortality Per cent
Ether	9	1	11.1
Ethylene ether	65	16	24.6
Cyclopropane ether	32	6	18.8
Pentothal induction, cyclopropane ether	5	0	0.0
Pentothal induction, cyclopropane or nitrous oxide oxygen, curare	27	2	7.4
Total general anesthetics	138	25	18.1
Spinal	22	7	31.8
Spinal, Ethylene ether	7	2	28.6
Total spinal analgesia	29	9	31.0
Local	2	1	50.0
Local, Ethylene ether	3	3	100.0
Local, Pentothal	4	0	0.0
Total local analgesia	9	4	44.4

Table V shows a large variety of general, spinal, and local anesthetics, and combinations of anesthetics used in our patients. They actually ran the gamut of anesthetic agents from the days of drop ether. This is a startling example of the changing trends in anesthesia and of the new discoveries constantly being made to find the most satisfactory and safest anesthetic or combination of anesthetic agents for abdominal operations. In our series the mortality incidence for the general anesthetic group was 18.1 per cent, spinal analgesia group 31 per cent, and local analgesia group 44.4 per cent. Supplementary anesthesia was frequently used in the spinal and local groups. Local analgesia was used in the poor risk patients. In this hospital spinal analgesia has been used frequently in lower abdominal operations, although it has never been popular in upper abdominal operations as shown by the relatively few times it was employed in our cases. The newer general anesthetic agents have definitely contributed to our lower mortality rate during the last six-year period. A combination of these agents recommended by Knight,[20] with the administration of pentothal induction, cyclopropane or 70 per cent nitrous oxide and oxygen, and the injection of curare intravenously, pro-

TABLE VI. MORTALITY ACCORDING TO THE LOCATION OF THE PERFORATION IN OUR SERIES AND THE COLLECTED SERIES[6]

Location	Our Cases (176)			Collected Cases (4,825)
	No. Cases	No. Deaths	Mortality Per cent	Mortality Per cent
Gastric	64	12	18.7	33.3
Duodenal	103	23	22.3	21.1
Pyloric	8	2	25.0	22.2
Gastrojejunal	1	1	100.0	——

duces a pleasant induction, adequate anesthesia with a high concentration of oxygen, excellent relaxation, and a short recovery period which are all the desirable features of perfect anesthesia.

Incision

A right rectus muscle-splitting incision was used in 65.9 per cent of our cases. Other incisions employed were the left rectus, midline, subcostal, and transverse. Wound infection and evisceration are frequent complications following operations for perforated ulcer, ranging from 25.6 to 37 per cent of the cases reported by DeBakey and Odom,[7] Meade,[24] and Kelly.[19] Wound infection, minor degrees of separation, and evisceration occurred in 18.7 per cent of our patients. There were five cases of extensive wound disruption and evisceration.

Adequate exposure for closure of a perforation can be accomplished through a small vertical or transverse incision. Amendola[1] used a small, oblique subcostal approach for suture of his perforations. Hartzell and Sorock[16] recommended a short, transverse incision and lateral retraction of the rectus muscle for simple closure of acute perforation. During the past four years our wound complications have been reduced to a minimum and no eviscerations have occurred following a small transverse incision used in twenty-six cases in which the diagnosis was certain. The incision was made 2 or 3 inches above and to the right of the umbilicus, transversely, through all layers of the abdominal wall. When more exposure was required, the incision was extended to the right or left. Therefore, our incision was usually one-half the length of the transverse upper abdominal incision described by Lynn and Hull.[22] A sulfonamide was frequently applied to the wound prior to opening the peritoneum, and the edges of the wound were carefully protected with abdominal packs. The wounds were closed with fine, interrupted, non-absorbable sutures. By using this type of incision and wound closure, complications were reduced, and the patients were ambulatory within a few days.

Site of Perforation

The site of perforation is a significant factor in the prognosis. Some observers found a higher mortality rate in duodenal ulcers. However, the majority of authors report a higher death rate in gastric perforations, explained on the theory that they are likely to occur in older individuals, and produce greater spillage and contamination of the peritoneal cavity. In 4,825 cases collected by DeBakey,[6] the mortality incidence was 33.3 per cent in gastric perforations, 21.1 per cent in duodenal perforations, and 22.2 per cent in pyloric perforations. As shown in Table VI, there was a slightly higher mortality rate in our duodenal perforations. Also contrary to the rule, there were no deaths in our five female patients, and four of their perforations were in the duodenum. There was one perforation at the site of an old gastrojejunal anastomosis which resulted in a fatality.

Unquestionably, in our series, there were several errors made in correctly locating the site of perforation at the time of operation, especially in the prepyloric ulcers. This was established in some patients by biopsies taken from the edges of what appeared to be gastric perforations but which proved to be inflamed duodenal mucosa. Likewise, in some cases in the gastric group, gastrointestinal x-ray studies taken before the patient was discharged from the hospital revealed a duodenal niche or deformity and a normal stomach. The error can be explained in most instances, by the obliteration of the normal landmarks around the pylorus in the presence of large ulcerations with widespread inflammation, induration, and edema.

Graham[13] included only the duodenal perforations in his most recent report, excluding the gastric cases on the basis that malignant degeneration was of common occurrence. Malignant degeneration was not found in our gastric perforations. However, it must be admitted that biopsies were not taken in all of our cases, and immediate postoperative x-ray studies were also incomplete. A more careful immediate examination and follow-up study must be made to determine the incidence of malignancy in this group of patients.

There were no multiple perforations discov-

TABLE VII. MORTALITY ACCORDING TO THE SIZE OF THE PERFORATION (176 CASES)

Size mm.	No. Cases	No. Deaths	Mortality Per cent
1-5	92	16	17.4
6-10	26	6	23.1
Over 10	9	5	55.5
Unspecified	49	11	——

ered at operation. However, in our deaths, multiple ulcerations were found at necropsy in two gastric ulcers, four duodenal ulcers, and one duodenal ulcer with concurrent gastric ulceration. The second ulcer in the duodenum usually was found on the posterior wall opposite the anterior wall ulcer, the so-called "kissing ulcer." The second ulcer was not perforated and, therefore, not a contributory cause of death in any of these cases. The possibility of a second perforation, though rather infrequent, must always be kept in mind.

Size of Perforation

Statistical data correlating the death rate with the size of the perforation are noticeably lacking in the literature. If the amount of spillage into the peritoneal cavity, which is an accepted etiological factor in many deaths, is directly proportional to the length of time the perforation has been present, there should also be a similar relationship between the amount of peritoneal soiling and the size of the opening. Accurate measurement of our perforations was not made. Nevertheless, in the majority of operative reports there was an estimated measurement or a comparative description of size noted. As shown in Table VII there was a definitely higher rate of mortality in the larger perforations. Therefore, this factor is important and bears a significant relationship to the prognosis.

Bacteriology

Davison, Aries, and Pilot[5] have shown that the peritoneal culture is usually sterile during the first six hours following perforation and the convalescence in these patients is good. When the peritoneal fluid contains organisms, the prognosis should be guarded. In our patients only forty-three cultures were taken. Two were unsatisfactory. Prior to twelve hours, thirty-four cultures were taken. In the patients who survived, fifteen showed no growth, thirteen were positive, and the six cultures taken on the patients who died were all positive. After twelve hours there were only eight cultures taken. All were positive. Four patients survived and four died. Of the twenty-seven patients with positive cultures, ten (39.3 per cent) died. A variety of mixed and single growths of pathogenic and nonpathogenic organisms were found. The more common organisms were the diphtheroids, yeast, staphylococcus, and hemolytic and nonhemolytic streptococcus. The streptococcus was found more often in the patients who died.

TABLE VIII. MORTALITY ACCORDING TO THE TYPE OF OPERATIVE PROCEDURE IN OUR SERIES AND IN THE COLLECTED SERIES[6]

Operative Procedure	Our Cases (176)			Collected Cases (11,284) Mortality Per cent
	No. Cases	No. Deaths	Mortality Per cent	
Simple closure	160	33	22.6	25.9
Closure and gastro-enterostomy	10	3	30.0	20.4
Excision and closure or pyloroplasty	6	2	33.3	15.9
Subtotal gastrectomy	0	0	0.0	13.4

Operative Procedure

During the past few years, the surgical procedures of pyloroplasty and gastroenterostomy have become relatively obsolete. Most surgeons with wide experience in this country agree that in this abdominal emergency a quick, simple closure of the perforation is the procedure of choice. Lahey[21] aptly stated that the life of the patient should be saved and no attempt made to cure the ulcer. Though there are numerous authors, including DeBakey[6] (Table VIII), who have reported a lower mortality following radical procedures, including partial gastrectomy, it should be understood that simple closure was admittedly performed in the poor risk patients. The late results of simple closure have been good in 65 to 90 per cent of the cases followed by Johnston,[17] Gutherie and Sharer,[15] and Williams,[38] indicating more extensive procedures are unnecessary. In DeBakey's collected series[6] of 1,525 cases, the follow-up results were good or fair in 65 per cent of the cases.

As shown in Table VIII, the mortality in our series is considerably lower for simple closure than for closure plus gastroenterostomy, or excision plus closure according to the Heincke-Mikulicz pyloroplasty. The latter procedures were done in only sixteen cases during the earlier years of the survey. Simple closure has been a routine procedure for several years in our institution. The ulcer was usually closed with two or three rows of sutures, incorporating an omental tab in the outer row. In some of the large indurated ulcers, this type of closure was accomplished with difficulty. A modification of the procedure of Gatch and Owen,[11] of approximating the anterior wall of the stomach to the duodenum over the perforation with interrupted silk sutures, was performed in a few cases. The method described by Graham,[12] of suturing a free omental graft over the opening, was done in two cases with success. A variety of suture material was used in our closures. In seventy-six cases in which absorbable suture material was used, the mortality incidence was 31.5 per cent. In seventy-seven cases in which non-absorbable sutures were used throughout, or chromic through the ulcer and non-absorbable sutures in the outer layers, the mortality incidence appears to be significantly lower, 7.8 per cent. However, such correlations have questionable statistical value since there are several factors having an important relationship to the death rate. A sulfonamide was frequently, but not routinely, implanted locally in the peritoneal cavity around the site of perforation. The value of this procedure has not been definitely determined. On two occasions, 100,000 units of diluted penicillin were used locally in the peritoneal cavity.

Drainage

Years ago drains were used frequently following operation for perforation. They were commonly placed either below the liver, in the pelvis, in the upper right lateral gutter, or in the subcutaneous space of the wound to prevent complications and abscess formation. Later, a period followed in which drainage was advocated only when there was rather marked peritoneal soiling. Though many surgeons continue to employ drainage, there seems to be an equal number of authors, as shown by DeBakey,[6] who believe drainage is contraindicated. At the present time there is an increasing tendency not to drain. Since fibrinous adhesions begin to form around the drains within the first twenty-four hours, it becomes apparent that drainage of the peritoneal cavity is impossible except for a very limited area directly around the drain.

Since 1935 drains have been rarely used in our cases. The incidence of wound closure without drainage was 46.5 per cent in our series. We believe that drainage is indicated only when a localized abscess is present. Much reliance is placed on thorough cleansing of the peritoneal cavity by adequate removal of free fluid and food particles. In many cases the peritoneal cavity in the region of the ulcer was washed with a liter or more of warm saline and removed by suction.

The problem of drainage is not of sufficient importance to make a statistical correlation significant between mortality and drainage, and such comparisons seem worthless. In our series the mortality rate was 34.6 per cent in the patients with intraperitoneal drainage, and 9.7 per cent in cases closed without drainage. The incidence of wound complications, such as infection, separation, and evisceration, was 12.8 per cent in the patients without drainage and 18.2 per cent in those who were drained.

Postoperative Management

An analysis of cases over an eighteen-year period naturally brings to light many new methods of postoperative care. Ever since 1932 we have employed constant gastric siphonage until peristalsis returns, which is usually on the third or fourth postoperative day. Adequate fluid and chemical balance were maintained; plasma and whole blood were administered when indicated. At present, fluids are routinely started at the beginning of the operation, if not before. Occasionally oxygen was required. Patients were hyperventilated for two or three days and encouraged to cough up tracheo-bronchial secretions. Vitamin B complex and ascorbic acid were administered on the assumption that a vitamin deficiency exists occasionally in the ulcer patient. With the discovery of sulfonamides, the various drugs were frequently, but not routinely, used in either one of three ways: in the peritoneal cavity, in the wound, and/or postoperatively. Since penicillin has been available, we have used it routinely; consequently the use of sulfonamides has diminished. By making a small transverse incision, tightly closed with a fine, interrupted silk technique in all layers of the wound, early ambulation was possible.

TABLE IX. POSTOPERATIVE COMPLICATIONS (176 CASES)

Complication	No.	Per cent
Bronchopneumonia	34	19.5
Wound infection, slight separation	28	15.9
Atelectasis	17	9.6
Paralytic ileus	8	4.5
Wound disruption, evisceration	5	2.9
Pleural effusion	4	2.2
Thrombophlebitis	2	1.1
Delirium tremens	2	1.1
Empyema	1	.5
Subdiaphragmatic abscess	1	.5
Intestinal obstruction	1	.5
Gastric fistula	1	.5
Others*	3	1.7

*Include needle in thigh, otitis media and mastoiditis, and abscess right flank.

TABLE X. CAUSES OF DEATH (38 CASES)

Causes of Death	No.
Necropsy Diagnosis (15 Cases)	
Bronchopneumonia	13
Generalized peritonitis	11
Cardiac disease*	4
Paralytic ileus	3
Subdiaphragmatic abscess	3
Subhepatic abscess	1
Pelvic abscess	1
Clinical Diagnosis (23 Cases)	
Generalized peritonitis	19
Bronchopneumonia	13
Localized peritonitis	3
Paralytic ileus	3
Pleural effusion	3
Profound shock	2
Wound evisceration	2
Cardiac disease	2
Atelectasis	1
Septicemia	1
Delirium tremens	1
Possible pulmonary embolism	1

*Include coronary sclerosis, rheumatic endocarditis (old valve defect), syphilitic aortitis, and mural thrombosis.

These are the postoperative measures which have reduced our complications and mortality during the past six years. When discharged from the hospital, the patients were referred to the outpatient clinic for further observation and management. A follow-up study of this series is contemplated as a problem for a subsequent report.

Postoperative Complications

Peritonitis is not classified as a complication because it is present in some degree, either chemical or bacterial, in all cases of perforated ulcer. Bronchopneumonia, with clinical symptoms and signs, together with roentgenological evidence, was the most frequent postoperative complication, occurring in thirty-four cases (19.5 per cent), as shown in Table IX. In twenty-six of those cases death occurred from bronchopneumonia as the chief, or as an important contributory cause of death, as shown in Table X. Wound infection with minor degrees of wound separation was the next most frequent complication. Various degrees of atelectasis, as demonstrated clinically and roentgenologically, was the third most common complication, occurring in seventeen cases (9.6 per cent). However, atelectasis was an associated cause of death in only one case. A few cases of massive collapse were saved by bronchoscopic aspiration. Paralytic ileus was marked in eight cases and an associated cause of death in six. Pleural effusion and empyema were present in a few cases. Among the five patients who eviscerated there were two deaths. The evisceration was not the sole cause of death in those cases but a secondary complication of bronchopneumonia or peritonitis with paralytic ileus and abdominal distention. Only one subdiaphragmatic abscess was recognized postoperatively and treated successfully. Other rare complications were intestinal obstruction, thrombophlebitis, gastric fistula, and delirium tremens. Our incidence of pulmonary complications including bronchopneumonia atelectasis, pleural effusion and empyema was 31.8 per cent. DeBakey's[6] incidence of pulmonary complications was 32.8 per cent in 772 collected complications.

Causes of Death

Necropsy was done in fifteen of the thirty-eight deaths. Causes of death frequently overlapped. For example, some patients died of either generalized peritonitis or bronchopneumonia, while others died with enough peritonitis and bronchopneumonia or some other associated condition, such as an intraperitoneal abscess, making it impossible to determine accurately, from the record, the chief cause of death. As shown in Table X, bronchopneumonia and generalized peritonitis were the most common causes of death. Pleural effusion, empyema, paralytic ileus, localized peritonitis were less commonly found. The two deaths from profound shock include a patient who died on the operating table and another who died a few minutes after the operation. A few patients with overlooked localized abscesses might have been salvaged. DeBakey[6] also reported peritonitis and pulmonary disease as the most frequent causes of death in his collected cases.

Conclusion

In general, our series is similar to other reported series. During the past six years our mortality rate has been reduced to 7.8 per cent in sixty-four consecutive cases. We attribute this reduction to factors within our control, such as early operation, improvements in anesthesia, refinements in surgical technique, and better preoperative and postoperative management acquired through more complete knowledge of the fluid, chemical, protein, and vitamin requirements of the surgical patient. The use of chemotherapeutic drugs, especially penicillin, postoperatively appears to be a very important recent advance in reducing our complications and mortality.

Summary

One hundred seventy-six cases of acute gastric or duodenal perforations with operations during an eighteen-year period are presented. Mortality rates are discussed for the series and by periods. Correlations are made between the mortality and factors known to have a significant relation to the prognosis, such as age, preoperative time interval, anesthetic, site of perforation, size of perforation, operative procedure, and postoperative management. Other factors such as sex, seasonal incidence, time of perforation, pneumoperitoneum, leukocyte count, incision, drainage, complications, and causes of death are discussed.

Discussion

Dr. Clarence E. Dennis: It is probable that Dr. MacKinnon's review reflects the more recent experience of most hospitals of the type of Minneapolis General. As he points out, the general improvements that have been widely adopted in anesthesia, preparation of the patient, surgical technique, and postoperative management have resulted in a marked drop in mortality rates in the past few years. The advent of penicillin has played no small part in this development.

This general change in type of management nullifies in part some arguments that one would like to draw from Dr. MacKinnon's figures. He found a 35 per cent mortality rate in those patients in whom the abdomen was drained and a 10 per cent mortality when drainage was omitted. The significance of these figures is open to doubt by the fact it is the recent cases only, by and large, which have been closed tightly. The same considerations apply to the use of nonabsorbable suture in the closure of the gastric or duodenal defect, a relatively recent development; in this group the mortality was one-fourth that of the older catgut closed group.

Even though one could challenge the argument that this showed silk intestinal closure to be safer than catgut, we are inclined to favor the use of silk throughout in view of the rather conclusive demonstration by Shambough and Dunphy (*Surgery*, 1937) that contaminated wounds heal more cleanly when closed by silk than by catgut.

A major share in the improvement in results comes from the quality of anesthesia now available to us. The exact type of anesthetic is much less important than the training which Dr. Knight and his group have provided

STREPTOMYCIN: ITS PRESENT USES

DONALD R. NICHOLS, M.D.
Rochester, Minnesota

THE effectiveness of streptomycin in controlling certain infections which are resistant to other chemotherapeutic agents is now well established. Most authors agree that the use of streptomycin is justified in the treatment of all serious or potentially serious infections caused by organisms which are known to be sensitive to this antibiotic agent. Streptomycin has been found to be definitely superior to other available therapeutic agents in the treatment of certain diseases. These diseases include tularemia, meningitis caused by Hemophilus influenzae, bacteriemia caused by susceptible organisms, uncomplicated infections of the urinary tract caused by certain organisms, pneumonia caused by Klebsiella pneumoniae or Hemophilus influenzae, and some forms of tuberculosis. Streptomycin appears to be of value in the treatment of certain other infections but further clinical research will be necessary before a final estimate of the value of streptomycin in the treatment of these infections can be made.

The effectiveness of streptomycin in most cases of tularemia has been amply demonstrated.[3,9,10] The morbidity and mortality from this disease have been significantly decreased.

Meningitis caused by Hemophilus influenzae usually responds well to treatment with streptomycin.[1,9,10] In cases in which the patients are seriously ill, the use of sulfadiazine and rabbit antiserum also should be considered. Meningitis caused by other organisms which are sensitive to streptomycin may respond to treatment with this antibiotic agent. Penicillin often is necessary to eradicate secondary invaders.

Bacteriemia caused by certain Gram-negative and Gram-positive organisms responds well to treatment with streptomycin if the organisms are sensitive to this antibiotic agent.[9,10] Streptomycin is often effective in the treatment of bacteriemia caused by organisms which are resistant to penicillin. The literature contains reports of a few cases of bacterial endocarditis in which administration of streptomycin produced a cure.[8,12]

Infections of the urinary tract caused by certain susceptible Gram-negative organisms respond well to treatment with streptomycin but the results of the routine treatment of urinary infections with streptomycin have been disappointing.[9,10] The best results appear to have been obtained in cases in which the infection was caused by Proteus ammoniae or Aerobacter aerogenes. Poor results usually are obtained when a foreign body or obstruction is present in the urinary tract. It should be remembered that streptomycin is most effective in an alkaline urine. Sodium bicarbonate or other alkalies should be administered when indicated.

Encouraging results have been obtained in the treatment of some types of pulmonary disease with streptomycin.[2,5] Pneumonia, particularly that caused by Klebsiella pneumoniae or Hemophilus influenzae, may respond to treatment with streptomycin. Empyema caused by sensitive organisms occasionally responds well.

Accumulating evidence indicates that streptomycin has a limited suppressive action on infections caused by Mycobacterium tuberculosis.[6] In many cases of predominantly exudative tuberculosis of the lungs, the immediate results have been satisfactory. Tuberculous lesions of the larynx and tracheobronchial tree usually have healed under treatment with streptomycin. Chronic draining sinus tracts may close within a few weeks after the administration of streptomycin is started. However, mortality rates remain high in cases of tuberculous meningitis and miliary tuberculosis in spite of treatment with streptomycin. In renal tuberculosis, actual healing has been observed only rarely. The place of streptomycin in the treatment of tuberculosis has not been fully determined. It appears, however, that this will be a useful adjunct when combined with standard methods of treatment.

Results obtained with streptomycin in the treatment of other types of infections have been variable. A suppressive effect has been noted[5,10] in some cases of acute brucellosis but there has been a recurrence of symptoms in most of the cases. No effect has been obtained in the treatment of chronic brucellosis. The results obtained to date in the treatment of typhoid fever have been disappointing. Laboratory studies suggest that

Read at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1947.

whooping cough may respond to treatment with streptomycin.[4]

Streptomycin is an effective agent when administered to certain types of surgical patients. Recent studies have indicated that streptomycin, when administered by the oral route, is the most effective agent available for reducing the number of bacterial organisms in the feces.[13] It has been used successfully in the preparation of patients prior to operations on the colon. When administered by intramuscular injection or by nebulization, it is a helpful adjunct in the preparation of patients prior to pulmonary resection.[11] In certain instances streptomycin appears indicated in the treatment of traumatic or operative wounds.[7]

There is evidence to suggest that streptomycin is of value in the treatment of experimental peritonitis[13] but clinical experience is as yet too limited to warrant any definite statements regarding the effectiveness of this agent in the treatment of clinical peritonitis.

The ability of some strains and species of organisms to develop a resistance to streptomycin rapidly *in vitro* has been demonstrated repeatedly.[10] Clinically, a similar development of resistance appears to take place. The ability of bacteria to develop a resistance to streptomycin is, of course, of great clinical importance. It appears essential that the bacteria be eradicated completely in the shortest possible time if satisfactory clinical results are to be obtained. This means the administration of adequate doses of streptomycin from the onset of treatment and the use of all other measures which will aid in eradicating the infecting organism rapidly.

Some toxic reactions have been encountered from the use of streptomycin. Disturbances in equilibrium and hearing may occur if treatment with streptomycin is prolonged. Dermatitis is encountered in some cases. Because of these toxic manifestations, care must be used in the administration of this antibiotic agent, and the indiscriminate use of streptomycin is to be condemned.

Summary

Streptomycin appears to be definitely superior to other available chemotherapeutic agents in the treatment of certain diseases. These diseases include tularemia, meningitis caused by Hemophilus influenzae, bacteriemia caused by susceptible organisms, uncomplicated infections of the urinary tract caused by certain organisms, pneumonia caused by Klebsiella pneumoniae or Hemophilus influenzae, and some forms of tuberculosis. Streptomycin appears to be of value in the treatment of certain other infections but further clinical research will be necessary before a final estimate of the value of this agent in the treatment of these infections can be made. Streptomycin is an effective agent when used in the preparation of patients for operations on the colon and prior to pulmonary resection. Certain toxic manifestations are occasionally encountered when streptomycin is administered to patients.

Think of the benefit from a campaign to stop the spray of infected mouth and nose droplets! Not only would the spread of the disease be slowed, but the seasonal surge of diseases like the common cold, influenza, measles, whooping cough and pneumonia would diminish. It would be possible to go to a movie without having a germ-laden spray hurled at one from behind and consequently having to suffer from the other fellow's respiratory infection. Under these conditions, dodging the tubercle bacillus, in and out of the hospital, would be possible for all of us.—Ezra Bridge, M.D., NTA *Bulletin,* June, 1947.

CARDIAC FINDINGS DUE TO STERNAL DEPRESSION

Report of Two Cases

ALLAN E. MOE, M.D.
Moorhead, Minnesota

An apical systolic murmur is often the dominating sign on which the diagnosis of organic heart disease is based. Rarely, it may be the only finding indicative of organic involvement. Incorrect evaluation of this murmur is frequently responsible for the erroneous diagnosis of heart disease. This is particularly serious in young individuals, usually resulting in unnecessary limitation of physical activities, and its implications lead many of them to a psychoneurotic state.

Sternal depression is a deformity commonly encountered in the average medical practice. It was found, according to Lang, in 3 to 5 per cent of children in the first year of school.[5] The pathogenesis of this condition is not clear. Some of the possibilities mentioned are: delayed and abnormally slow growth of the sternum; purely mechanical intra-uterine deformity caused by pressure of the chin, heel, or knee; trauma during the second half of pregnancy; fetal rickets; fetal mediastinitis; disturbances of the central nervous system; persistence of a physiologic depression in the anterior chest wall during the second month of fetal life.[3] Bromer[1] observed sternal deformities in rachitic children in the late stage of complete healing, and states that these deformities often remain throughout life.

When a sufficient degree of sternal depression exists, the heart is shifted to the left.[3,4,6] In cases where the heart is fixed in the normal position the sternal depression indents the heart.[6] Other findings noted in different cases are: basilar, apical, and pulmonary systolic murmurs; reduplication of the first and second heart sounds; accentuation of the second pulmonic sound.[2,3,4,7,]

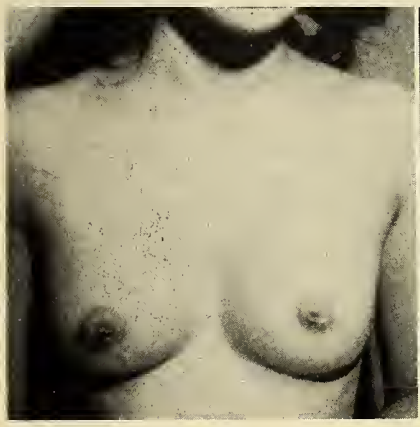

Fig. 1

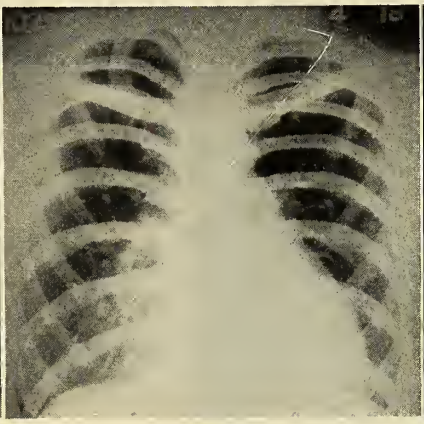

Fig. 2

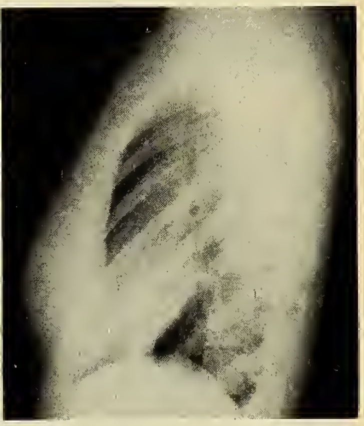

Fig. 3

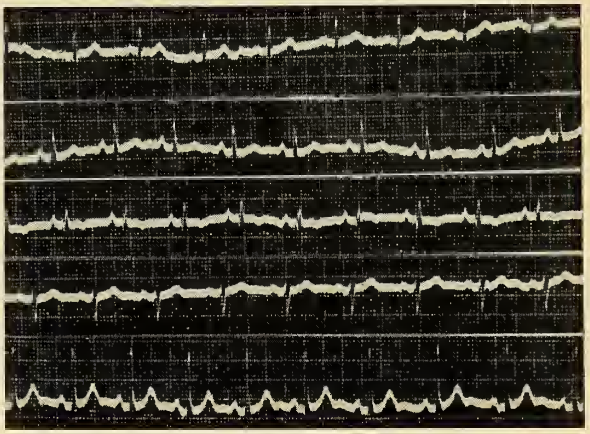

Fig. 4

The electrocardiographic findings are not characteristic. Evans[2] points out that apparent enlargement of the cardiac shadow in the anterior-posterior roentgenogram of the chest is not confirmed in the oblique views, where the heart shadow is normal in size or sometimes seems small. In a comprehensive review of a series of sixteen cases of sternal depression, he notes that the apex beat was displaced outward and a systolic

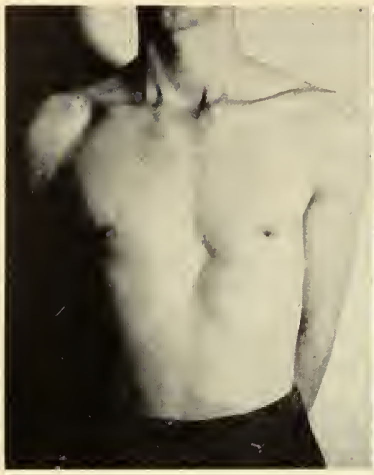

Fig. 5

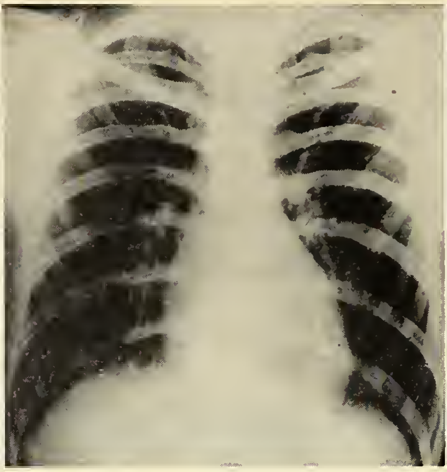

Fig. 6

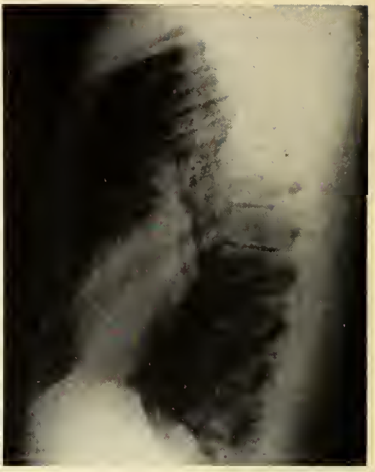

Fig. 7

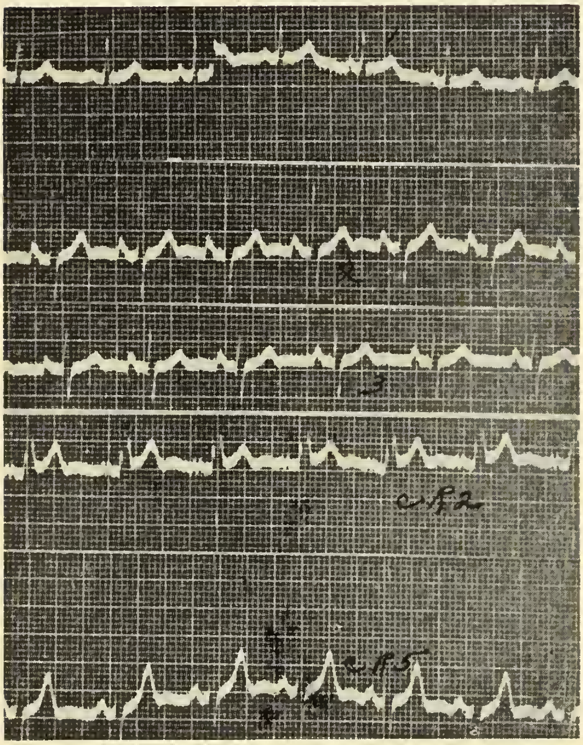

Fig. 8

murmur present in every case. In five of these cases rheumatic heart disease had been wrongly diagnosed. It can easily be seen how this combination of signs would lend itself to the erroneous diagnosis of heart disease.

The following two cases were thought worthy of presentation to emphasize this aspect of the problem.

Case Reports

Case 1.—A white girl, eighteen years of age, consulted me because of a "heart condition" discovered during a physical examination for college entrance. She had been advised to exclude all strenuous activity, and was not allowed to take gymnastic classes. She had no complaints and had always enjoyed good health. On questioning, she felt that she became slightly more dyspneic than her friends on strenuous exertion. There was no rheumatic or rachitic history. Family history was noncontributory.

On physical examination her height was 5 feet 5 inches, weight 125 pounds. She appeared in excellent health. A moderate degree of sternal depression was apparent (Fig. 1). A soft systolic murmur was heard over the pulmonic area and at the apex. There was a slight reduplication of the first sound at the apex. The pulmonic second sound was markedly accentuated. Pulse was 80 per minute and rhythm was regular. Blood pressure was 118 mm. of mercury systolic and 86 diastolic. After exercise the apical systolic murmur was accentuated, loudest during inspiration, returning to its original intensity within 10 seconds, as soon as the heart rate slowed somewhat. The heart size seemed within normal limits. The remainder of the physical examination was negative.

Routine laboratory studies, including urinalysis, complete blood counts and hemoglobin determination, blood sedimentation rate and Kahn flocculation test, were all interpreted as normal. In the anterior-posterior roentgenogram of the chest a slight shift of the entire heart to the left was noted (Fig. 2). The lateral view shows the sternal indentation with a heart shadow of normal size (Fig. 3). Fluoroscopic study revealed the heart to be within normal limits as to size and contour. The electrocardiogram was not abnormal (Fig. 4).

Case 2.—A sixteen-year-old boy in good health consulted me for a physical examination. He had no complaints. His past health had been excellent; however, he had been said to have had rickets during infancy. Family history was non-contributory.

On physical examination his height was 5 feet 11 inches, weight 140 pounds. A mild degree of pyorrhea was present. Moderate depression of the sternum was evident (Fig. 5). At rest a soft rubbing apical systolic murmur was heard during inspiration. The pulmonic second sound was moderately accentuated. Blood pressure was 130 mm. of mercury systolic and 76 diastolic. Pulse was 96 per minute and rhythm was regular. The heart size seemed within normal limits. The remainder of the physical examination was negative.

Routine laboratory studies, including urinalysis, hemoglobin determination, white blood count, blood sedimentation rate, and Kahn flocculation test, were all interpreted as normal. Roentgenographic study, including anterior-posterior (Fig. 6) and lateral films (Fig. 7) of the chest, with fluoroscopic study, revealed the sternal depression, with no alteration in the position of the heart. The heart size and contour were within normal limits. The electrocardiogram revealed no abnormal findings (Fig. 8).

Comment

Sternal depression is encountered frequently enough so that a clear understanding of possible abnormal cardiac findings due to this deformity is important. The erroneous diagnosis of organic heart disease in a young individual may needlessly deprive that person of a normal life, and build up psychoneurotic patterns which may endure. In sternal depression, apparent enlargement of the heart plus abnormally accentuated heart sounds and murmurs furnish the necessary criteria for a diagnosis of heart disease based upon a cursory examination. Thorough study, with roentgenograms of the anterior-posterior and lateral views of the chest, with fluoroscopic study, will eliminate erroneous diagnoses of heart disease in this type of case.

Summary

Two cases in which depression of the sternum produced abnormal cardiac findings are reported. There was no evidence of organic heart disease in either case. Attention is called to the abnormal cardiac findings possible on the basis of this deformity, and the importance of careful evaluation in order to avoid the erroneous diagnosis of organic heart disease, particularly in the young individual.

ACUTE PERFORATED GASTRIC AND DUODENAL ULCER

(Continued from Page 1262)

for our personnel. It is a pleasure to compliment Dr. MacKinnon on the excellent review which his study has provided.

Dr. Stanley R. Maxeiner: Ninety consecutive cases of perforated peptic ulcer were treated surgically at the Minneapolis Veterans Hospital with a mortality of 5.5 per cent, and sixty-two cases treated consecutively with but one death. Some of these patients were seen from twenty-four to thirty hours after perforation and still recovered. I might also add that we had no regular anesthetist and that anesthesia consisted of spinal and local done by the surgeon. I personally served in the capacity of consultant, and the greater part of the surgery was done by Doctors Sedgley, Culligan, Westphal and Mandell.

Dr. E. A. Regnier: I enjoyed hearing Doctor MacKinnon's paper immensely and I want to congratulate him on his presentation. The tables he presented afford a great deal of information. I was impressed by his conclusions that the type of incision and the type of closure of these wounds are important factors in morbidity and mortality. I definitely subscribe to the transverse incision or some modification of such incision for the repair of perforated ulcers.

Dr. MacKinnon (in closing): One should not include untreated cases having an incorrect diagnosis of perforation with the cases in which the diagnosis has been made and conservative management instituted. Our records reveal several deaths due to gastric and duodenal perforations in patients who were not operated upon or treated conservatively. In these cases the correct diagnosis was unknown until necropsy had been performed. Several of these perforations, with incorrect diagnoses, occurred in moribund and elderly people over seventy years of age. Due to their moribund condition, or the difficulty in obtaining an adequate history, or the presence of minimal abdominal findings, an incorrect diagnosis of coronary disease was frequently made. Apparently, acute perforations are difficult to detect in old people, but the possibility of this condition being present should be kept in mind.

From our analysis, the most important and constant factors having a relationship to the mortality are age and the interval between perforation and operation. Perforations present for longer than twelve hours, or perforations in people over fifty years of age, have a mortality rate higher than the general average. This rate increases in direct proportion to age and the lapse of time up to twenty-four hours. Since the physician has no control over age and only a partial control of the preoperative time interval, extremely low mortality figures for the larger series of cases seem unlikely in the future. Nevertheless, one must strive for a lowered mortality rate through the proper employment of the influential factors under his control.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN FILLMORE COUNTY PRIOR TO 1900

By NORA H. GUTHREY
Mayo Clinic
Rochester, Minnesota

(Continued from November issue)

H. Thomas, a general practitioner of the eclectic school, was in Chatfield from about 1865 through 1881, according to a business gazetteer, and although entries in such directories are not always indices to terms of residence, since their insertion presumably depended on the inclination of the subjects, the fact that Dr. Thomas' registration was continuous from 1865 through 1881 may reasonably be taken to mean that he left Chatfield in the year 1880 or 1881.

The venerable Timothy Halloran, in his history of Chatfield, in discussing physicians mentioned that "Dr. Thomas also practiced here for many years and moved to Saint Paul, where he died." In 1942 an eminent citizen of Chatfield recalled Dr. Thomas as a man of middle age who was in Chatfield ten or fifteen years, "about in line in professional ability with the rest of them." Another resident of Chatfield, one of the few to remember him, said that Dr. Thomas "was genteel and polished. His wife's maiden name was Berdon. She was the widow Terwilliger, living with her two children in Chatfield, when Dr. Thomas fell in love with her and married her." And still another early citizen, in 1943 in his nineties, described Dr. Thomas as one of dignified presence, meticulous grooming and fine clothes who habitually wore a tall silk hat and carried a cane. On one occasion, however, dignity and sartorial splendor were forgotten. It seems that on a day when the wooden sidewalk in front of Briley's Store was being torn up for replacement, sundry of the unoccupied citizens of the town were at hand, looking in hope of coins among the debris that had accumulated under the boards. A clerk in the store (the old gentleman of this reminiscence), happening to have a five dollar gold piece in his pocket, palmed the coin, ostensibly joined the search, and suddenly with a shout announced this imposing find. To his great delight, among the group of searchers which now rapidly increased, was Dr. Thomas, on his hands and knees, fine clothes, silk hat, cane and all.

In September, 1870, when Dr. O. A. Case, of Preston, was appointed deputy coroner of Fillmore County, he moved to Chatfield, where he entered partnership with Dr. Thomas, "who is well known in this county as a skillful practitioner." And it was in the office of Drs. Thomas and Case that a meeting of the Fillmore County Eclectic Medical Society, of which Dr. Case was president, was called for October 3, 1870, "all brethren of the profession in good standing" being invited to attend.

It is worthy of note, in view of scanty data and some necessarily unverified statements, that a Dr. Harold Thomas, residing in 1883 in Hubbard, Hubbard County, was licensed on examination under the "Diploma Law" of 1883, receiving state exemption certificate No. 598-1 (R), given on December 31, 1883.

It is believed worthy of note also that, as mentioned earlier in this series, there came to Minnesota in 1864 one "Hammond, Thos.," physician and surgeon, native of Adams County, Pennsylvania, who settled in section 31 (in which a part of the village of Chatfield lies), Elmira Township, Olmsted County. This man was listed, post office Chatfield, in an illustrated atlas of Minnesota of 1874 as one of the book's patrons. Considering the complete lack of information otherwise concerning a Dr. Hammond and the fact that Dr. H. Thomas supposedly came to Chatfield in 1864 or 1865, it is suggested that through a clerical error the name appeared "Hammond, Thos." instead of "Thomas, Hammond" (or, possibly, "Harold").

Edward R. Thompson was born in 1853 at Chicago, Illinois, one of a family of five boys. His father, Richard Iver Thompson, was a native of Bergen, Norway; his mother was an American woman, a native of Chicago. In their adult years the five Thompson brothers all were residents of Minnesota: Enos, a lawyer, and William, who had an abstract office, were in Preston; Clarence, a manufacturer, and Cilius, a lawyer, settled in Minneapolis.

Edward Thompson, on completion of his preliminary schooling, was a student at the Upper Iowa University, at Fayette, for two years and thereafter completed his academic work and took a course in pharmacy at the University of Minnesota. It is probable that immediately on completion of his work at the university he entered the Minnesota College Hospital, which was organized in East Minneapolis in the summer of 1881, for he was graduated from that school of medicine in 1882. On November 10, 1883, after the passage of the "Diploma Law" in Minnesota Dr. Thompson received certificate No. 275 (R). He was then practicing medicine in Minneapolis and the inference is that he remained in Minneapolis until moving to Harmony, Fillmore County, in 1893. Dr. Lewis K. Onsgard, a native of Spring Grove, Houston County, had just moved to the village of Houston after five years as a physician in Harmony and the village was temporarily without a resident physician. Here Dr. Thompson remained in general practice for fifteen years, a well-qualified physician who is recalled as progressive in his methods and in his use of superior equipment that was advanced for the time. He was a member of the Methodist Church and of fraternal orders, among them the Independent Order of Odd Fellows and the Modern Woodmen of America. In 1908 Dr. Thompson left Harmony to settle in the village of Peterson, a few miles from Rushford, where he spent the remainder of his life.

Edward R. Thompson was married to Harriet Lockwood, a schoolteacher, of Eau Claire, Wisconsin. One child was born of the marriage, Lulu, who became Mrs. E. R. Pitt, of Eau Claire, and Dr. and Mrs. Thompson adopted one daughter, Mae, Mrs. R. L. Hanson, of St. Paul. When Dr. Thompson died of pneumonia in 1918, in a La Crosse Hospital, he was survived by Mrs. Pitt and Mrs. Hanson and one brother, Clarence Thompson.

French W. Thornhill, son of Samuel Payne Thornhill, M.D., was born in Coshocton County, Ohio, on July 18, 1843.

Dr. Samuel Payne Thornhill, in any record of physicians in Minnesota and in any mention of his physician son, should receive consideration. Born in Rockingham County, Virginia, on March 21, 1821, Samuel P. Thornhill was left an orphan when he was a small child. For a few years he lived with relatives but early was thrown on his own resources for support and education, and the fact that he became an able physician bespeaks the caliber of his native ability. He studied medicine under a preceptor in West Carlisle, Coshocton County, Ohio; began medical practice there and married in the community. His sons, French W. Thornhill and Ampstead S. Thornhill and a third child were born in the county, presumably in West Carlisle, in the forties. While the children were young, Dr. Thornhill moved with his family to Wisconsin, settling first in Horicon; his wife had died, and in Horicon he married again. Of the second marriage there were two children. After a year or two he moved to Janesville, in 1848, where he was in partnership with Dr. Treat, who later practiced successfully in Chicago. In 1855 Dr. Thornhill settled in Hudson, Wisconsin, for seven years. When the Civil War broke out he was made regimental surgeon of the Eighth Wisconsin Volunteer Regiment, the Eagle Regiment under Colonel Murphy, and in 1862 he became brigade surgeon. In the winter of 1869-1870 Dr. Samuel P. Thornhill, accompanied by his son, French W. Thornhill, who had qualified as a physician, arrived in Austin, Mower County, and there he practiced medicine ably for the next ten years, the first three in partnership with Dr. French W. Thornhill, the last seven alone. He died in Austin in March, 1879, from gastric hemorrhage. At the time of his death he had for a period of years been making his home with Mr. and Mrs. (Ellen M. Backus) Fairbanks. (Mrs. Fairbanks studied medicine under Dr. T. Thornhill's instruction and subsequently, in 1881, she was graduated from the Women's Medical College of Chicago and carried on a successful practice in Austin.) Dr. S. P. Thornhill was known in Austin as an untiring, skillful physician, "second to none in his professional attainments" and, "if he had faults, he also had virtues," for he was a true and generous friend and a kind father.

French W. Thornhill at the age of nineteen years entered the Union Army during the Civil War and served as assistant surgeon in the Eighth Volunteer Wisconsin Regiment, in which his father was regimental surgeon. It seems obvious that Dr. Samuel P. Thornhill had been and continued to be his son's preceptor. After the war French Thornhill became a student at the Cincinnati Medical College, from which he was graduated in 1869. Soon after his graduation he was married and when, in 1869, he joined his father in moving to Minnesota, his young wife accompanied him. Minnie A. Smith was born in Daggett Hollow, Tioga County, Pennsylvania, moved with her family to Cambria, Columbia County, Wisconsin, when she was a young girl, and at Cambria was married to French W. Thornhill. There were four children of the marriage, two of whom died in infancy.

For a few years Dr. French W. Thornhill practiced medicine with his father in Austin and for a part of the time managed a farm in sections 5 and 6 of Austin Township that the senior Dr. Thornhill had bought from John I. Wheeler, who was going into Freeborn County. In 1872 with his family Dr. French W. Thornhill settled permanently in Spring Valley, Fillmore County. For many years his professional card appeared in the local newspaper, *Western Progress:* "F. Thornhill, M.D., Physician and Surgeon. Over Bank," and until after the turn of the century he was listed in a reliable gazetteer as a practicing physician of the village. In 1883, when the act to regulate medical practice in Minnesota was passed, he received an exemption certificate on the basis of his years of experience.

Dr. Thornhill followed his profession in Spring Valley and the surrounding community for forty years, combining his professional activities with farming and the raising of fine horses. He died at his home on February 4, 1912, in his sixty-ninth year, survived by his wife, two sons and his brother, Ampstead P. Thornhill, of Racine, Mower County, since deceased. Minnie A. Thornhill lived twenty-one years after her husband's death and died in Spring Valley on February 1, 1933, at the home of her son, Fred Thornhill. In 1943 the two sons, Fred and Frank Thornhill, both retired farmers, were living in Spring Valley.

Augustus Howland Trow was born at Cummington, Massachusetts, on October 22, 1822; he was graduated from the Castleton Medical College (sometimes known as the Academy of Medicine) at Castleton, Vermont, on November 13, 1853; and in the summer of 1856, physician and surgeon, Baptist minister and farmer, he came with his wife and four children into southern Minnesota and settled in Chatfield, Fillmore County. Olive Almira Trow, of equal age (October 17, 1822) with her husband, was a native of Stamford, Vermont. The children were Ellen Acenith, born on July 27, 1843, and Henry Nathaniel, born on July 24, 1849, both at Windsor, Massachusetts; William Howland, native of Victory, New York, born on August 8, 1851; and Milton Augustus, native of Montezuma, New York, on May 10, 1853.

A portion of Chatfield lies in the adjoining county of Olmsted on the north, but in 1856, as now, the greater part of the business section of the village was in Fillmore County. One of Dr. Trow's earliest acts of which there is record after his arrival in Chatfield was to conduct the first religious services to be held in the village, reading his texts from his sheepskin-covered Bible, and shortly afterward he preached in a neighboring community in Elmira Township, Olmsted County. The little congregation of Elmira met in a grove, for in the settlement less than two years old there was not yet a church building and the pioneers as a rule attended services at Chatfield (settled in 1853).

It was not long before Dr. Trow was well established in the practice of medicine, in business, civic affairs and politics, and in farming. In the course of a few years after his arrival he owned and farmed land in section 33, Elmira Township, Olmsted County, and in section 4, Chatfield Township, Fillmore County, and in the early period he hauled his grain, as was customary in the region, with horses or oxen to the mills and markets of Winona, on the Mississippi River. In uncertain autumn and winter weather, over rough and hilly roads, with thirty to forty bushels of grain to a load and each trip taking three or four days, those were long and cruel hauls for both men and beasts. It has been remembered that the route was dotted with the bones of animals that had succumbed to the rigors of the work.

In the autumn of 1856, then with his headquarters on Fillmore Street, Dr. Trow was one of the physicians of Chatfield who published professional cards in the first issue of the *Chatfield Republican*. And in the summer of 1858 he advertised in the *Chatfield Democrat*, as follows:

> DRUG STORE
>
> Dr. Trow would respectfully say to the public that he has on hand a full and well selected assortment of Drugs, Patent Medicine, Xc., which he will sell on the very lowest terms, for *Cash*—including Sloan's Medicine, which he will sell at the unprecedented low prices as follows:
>
> | | |
> |---|---|
> | Sloan's Ointment | 15 cts. per box |
> | Condition Powders | 20 and 4 per box |
>
> All other Medicines and Drugs in Proportion.
>
> July 31, 1858. A. H. Trow, M.D.

And, seasonably, in the late autumn appeared this announcement:

> CUTTERS! CUTTERS! Those who would like a sleigh ride, will do well to call upon the subscriber, who has on hand and offers for sale, a stock of splendid
>
> CUTTERS
>
> at the lowest market prices.
>
> Chatfield, November 20, 1858. A. H. Trow

Although his professional and business cards were not published regularly in the newspapers, his name was listed in various directories of the state from 1865 to and including 1887.

Apparently a man of foresight and sense of professional obligation, in the autumn of 1866 Dr. Trow joined a small group of physicians from various parts of the county in founding the Fillmore County Medical Society and he became the first treasurer of the organization. In one account, in the list of charter members appears the name of M. A. Trow, obviously by mistake, as related earlier, for Milton A. Trow, a son of Augustus H. Trow, although in due time a physician, was in 1866 only thirteen years of age. Dr. A. H. Trow became a member of the Minnesota State Medical Society not long after its re-organization in 1869; his name (A. Trow) appears in the transactions of 1873 as a member of the Committee on Obstetrics. And in 1879 and 1880, with nine other physicians, of Fillmore County, among whom was Dr. Refine W. Twitchell, of Chatfield, Dr. Trow and his son, Dr. Milton A. Trow (graduated in medicine in 1876), replied to circulars sent out from the State Board of Health by Dr. Franklin Staples, of Winona, asking for reports on the local incidence and control of diphtheria. Excerpts from the statements sent in from Chatfield and published in the official report without the reporters' names, were used in the narrative that preceded the present series of biographical notes. During these years Dr. Trow served locally in the interest of public health and sanitation; on April 14, 1880, he was appointed one of the three members of the local board of health, the first such board to be recorded in the community. After the "Diploma Law" of 1883 came into effect in Minnesota, Dr. Trow received state license No. 883 (R), given on April 19, 1884.

There are anecdotes of Dr. Trow's medical practice. A venerable citizen of Chatfield who in 1943 was ninety-two years of age, recalled that when he was fifteen he had lung fever and diphtheria and that Dr. Trow ("Old Doc Trow") was summoned. A few weeks previously the boy had had a severe cough that kept him, and his family, awake at night, and for relief from which his father had prescribed chewing black plug tobacco and swallowing the juice—"Don't be afraid if it makes you a little sick"—with unfortunate results. Dr. Trow came and bled the patient, who was giving evidence of extreme congestion, puncturing each arm three or four times, to produce bleeding from about noon to night, and, be it said, watching the boy the entire time. (Here was included a detailed description of the black blood and the patient's theory as to the circulation of the blood and the purpose of the bleeding.) After the bleeding stopped, the doctor instructed the family to put wilted cabbage leaves on the patient's chest and keep them warm, and by morning, the reminiscence ran, the poison was all out of the lungs, and the patient got better—but it took him a long time to get well after that.

And another resident of Chatfield, of the generation of the old doctor's sons, recalled his own father's description of Dr. Trow's technique of cutaneous vaccination against smallpox. The "old Doctor" carried around with him a tin can full of scabs from smallpox pustules. In vaccinating a patient, he first would scarify the skin, then search through the collection in the tin can for a suitable specimen and, when the choice had been made, would rub the scab vigorously onto the prepared field. "If the patient did not die," said the narrator, "he was immune." This method, however, as is well known, was not peculiar to Dr. Trow.

Dr. Trow was not negligent of civic duty. In 1859-1860 he served a term on the school board of Chatfield and at various times from 1859 to 1874 was a trustee on the village council. In 1873 he and Dr. Refine W. Twitchell, it appears, were of the same opinion about taxation for improvements and decided that it was best to let the village construct sidewalks as required and assess individual property owners for payment; his assessment was $40.78 and Dr. Twitchell's $10.14. In 1859 and in 1860 and again in 1872 Dr. Trow served as representative from the district in the state legislature, at the same time that another physician of Fillmore County, Dr. Thomas H. Everts, of Rushford, was a senator. In a candidacy of 1868, however, he evidently was defeated, on the Democratic ticket; of this campaign the *Chatfield Democrat* had to say on October 17 that "the way he used his opponent in a debate was cruelty to dumb animals."

Among many items in the local newspapers concerning Dr. Trow was an account, "Surprise for Dr. A. H. Trow," in the *Democrat* of February 3, 1883, that seems worthy of inclusion: When some forty to fifty ladies and gentlemen, the story ran, appeared at the Trow home, "Dr. Trow surrendered unconditionally." The ladies of the party had brought with them "an abundance of the good things that make up a rich collation," but before the collation was served, Milvin Bibbins, Esq. presented Dr. and Mrs. Trow "with two comfortable rocking chairs as a token of regard from their friends." Dr. Trow "was almost overcome, but rapidly recovered from his second surprise, and responded in well chosen and feeling words." All the guests, it followed, stayed until the witching hour of twelve under the hospitable roof of Dr. A. H. Trow.

By the early eighties Dr. Trow, a true pioneer, had turned his thoughts to the new Dakota Territory and had invested there in farm lands. Various references to his interest in Dakota have been noted in the Chatfield newspapers of the time. In August, 1883, for instance, he had returned from the territory, driving one team 372 miles in six days, and on the last day driving eighty-seven and a half miles and making thirteen stops; "How is that for mustangs?" he asked. A year later he again had just returned to Chatfield from Dakota where he had been all summer superintending his farm. In the spring of 1887 Dr. Trow and his son Dr. William H. Trow moved permanently from Minnesota to Dakota. Both father and son registered on the territorial roster of physicians on July 11, 1887, as from Carthage, Miner County, Dakota Territory.

(To be continued in the January issue.)

President's Letter

HIDE NOT YOUR LIGHT UNDER A BUSHEL

When looked upon in the aggregate, the accomplishments of medicine appear rich and imposing. In the field of public relations, however, medicine has lagged. Without attempting to offer full explanation of this situation, it may be said that, in our supposedly enlightened time, obstacles to medical progress nevertheless are so formidable that physicians have done creditably to progress at all. It is justifiable to believe that, as adverse pressure is diminished, advancement will become accelerated. I would like to devote a few moments here to further examination of some of these thoughts.

There are in the medical profession men so imbued with the ideals of public service that they volunteer for the task of mitigating those prejudices and obstructive notions, inimical to the public health, which are held by some of our citizens and by some of the personnel of our national governmental establishment. With the same high purpose of defending the people against quackery in society and government, the American Medical Association, through its House of Delegates, has recommended that effort be made by the medical profession to develop a comprehensive public relations program. Accordingly, physicians of Minnesota would do well to enlarge their public relations activities.

It has been said that one of the most fruitful sources of improved public relations is the physician's office. The truth of this statement cannot be denied; but were we to rely on that factor alone, the objective of the House of Delegates of the American Medical Association could not be accomplished.

How, then, can we expand our public relations program? Our approach to the problem must be realistic. We must recognize that publicity does not make up the major portion of such a program but that many other factors must be considered. These should include our relationship with other medical societies and other medical organizations, as well as with the individual members of the Medical Association and of the Woman's Auxiliary. We must strengthen our relationship with voluntary health agencies such as the Minnesota Heart Association, the American Cancer Society, the Minnesota Trudeau Society, and others. We must establish mutual understanding and good will with governmental agencies, the state legislature, the state departments of health, welfare, public assistance, and education, and with the governor's office. We must continue to improve our relationships with the Blue Cross, the Minnesota Medical Service; with private insurance companies, and with groups professionally allied with us, such as nurses, pharmacists, dentists and hospital administrators; with organizations such as women's clubs and men's clubs and with that active liaison which unofficially is known as the parent-teachers association; with farm and labor organizations and with newspaper editors, radio officials, civic leaders, the clergy and educators. We must not consider how well we are known by all these people but how favorably we are regarded by them.

We must establish methods whereby we can inform others of our activities and our problems and, at the same time, whereby we can learn as much as possible concerning their interests and difficulties. At its last meeting, the House of Delegates of the Minnesota State Medical Association instructed the Committee on Rural Medical Service to establish local health councils throughout the state. I attended the first meeting which was called in connection with this program. It was held in Austin on November 11 and was planned and carried through by Dr. Paul Leck, chairman of the Committee on Rural Medical Service. Among those who attended this meeting were representatives of the farm bureau, labor, pharmacists, nurses, schools, the American Red Cross, the League of Women Voters, mayors, county agents, and others, and the enthusiasm manifested augurs well for the project. That is what I mean.

The work of the speakers bureau of the State Medical Association was discontinued during the war. At this time, the demand for speakers exceeds greatly the facilities for meeting it. This bureau should be re-established as soon as possible in order to satisfy the needs of a citizenry which is becoming more health conscious. There is a great demand for information on health and it is very important that the association increase the amount of literature for general distribution.

These and many other developments are necessary if we hope to establish an efficient public relations program. If we fail in this responsibility, not only shall we find ourselves unknown among our neighbors, but the lack of understanding between us will be adverse to the interests of both.

The committees of the State Medical Association and of its component societies are the workshops in which plans of action are created. For many years these committees have proved their value. However, they are composed of practicing physicians who, in order to merit the trust imposed in them, must be concerned primarily with the welfare of their patients. They are, as I said earlier, volunteers who magnanimously take of their own time and energy and money in the interests of persons who often do not realize that the sacrifices just mentioned are being made in their behalf. From what has just been said, it is evident that these self-sacrificing physicians can be and should be only part-time workers. Therein, nevertheless, lies the most significant reason for failure in attainment of many of the objectives of the American Medical Association. Consequently, employment of additional full-time personnel looms as one of the most important needs of the State Medical Association as it faces the task of extending its public relations activities.

I would urge the House of Delegates and the Council to authorize the employment of one, later probably of more than one, full-time assistant in the office of the executive secretary. This assistant should be given the responsibility of co-ordinating the activities which have been mentioned herein and he should interpret them for the public. He should implement the public relations activities of the county medical societies and perform many important functions as an understudy of the executive secretary.

Of course, the price of expansion of the public relations program presents a serious problem. Unfortunately, the need has become imperative at a time when the association is obliged to use for current expenses funds which formerly have been used to supplement the reserve fund. Owing to the unsettled economic state of the world, our reserve fund has shrunk. From authoritative sources we learn that the dollar which was earned in 1940 is worth only fifty cents now, or even less. Industries have recognized this and have modified their financial structure in order to continue in business. State medical associations similarly have found it necessary to increase their annual membership dues in order to meet increased costs. Our annual dues are among the lowest of all the states. In many state medical associations, each member pays annual dues which are more than twice as much as each of us pays. Our out-of-state colleagues have chosen to accept this added financial responsibility because they realize the disastrous consequence to the public, and secondarily to themselves, which might attend their failure to do so. The Minnesota State Medical Association, too, will discharge its responsibilities creditably.

I say this with confidence because I know the aims and the character of my colleagues. Although their outward lives are those of men of the world, their duties often resemble those of the minister or the priest. They say little about it, but they recognize that their lives are dedicated, first, to the service of others, as was the life of Him whose birthday we celebrate in this final month of every year. It was He who, in the Sermon on the Mount, spoke the words which often are paraphrased as they are given at the heading of this letter and which, in full, according to Matthew*, read as follows:

> "Neither do men light a candle, and put it under a bushel, but on a candlestick; and it giveth light unto all that are in the house.
>
> "Let your light so shine before men, that they may see your good works and glorify your Father which is in heaven."

---

STREPTOMYCIN AND TUBERCULOSIS

PHYSICIANS are being asked about the value of streptomycin in tuberculosis. Sufficient experience has been had in the use of this new antibiotic in the treatment of tuberculosis to enable the physician at least to advise an inquiring patient.

A preliminary report by the Council on Pharmacy and Chemistry* concerning the results from 543 patients treated in twenty-two different Army, Navy and Veterans Hospitals appeared recently and is a fine presentation of the experience with the drug to date. We quote:

"Streptomycin is a useful adjunct in the treatment of tuberculosis. Indeed, this is an understatement in the case of tuberculous meningitis, miliary tuberculosis, tuberculous sinuses and tuberculous ulcerations of the tracheobronchial tree, for an occasional patient with meningitis has survived, a high percentage of pulmonary miliary lesions have cleared, and nearly all the sinuses and ulcers have healed."

Streptomycin, on the other hand, seems to have little value in the treatment of tuberculosis of the genitourinary tract or of bone or joint. It does not cure the old fibrocavernous lesions of pulmonary tuberculosis. It does, however, in conjunction with bed rest, clear a considerable proportion of exudative pulmonary disease.

As disadvantages to its use, aside from its cost ($6.00 per gram) and scarcity, must be mentioned its toxicity (which is a very serious drawback) and the development of resistance on the part of the tubercle bacilli during its use. The most serious toxic effect is on the labyrinth; this may be permanent and may be disabling. The development of resistance of the bacillus to streptomycin *in vitro* probably means resistance *in vivo*, and this probably means that, after a certain period of treatment, its administration is useless.

The conclusion is justified, therefore, that streptomycin should not be used in minimal pulmonary tuberculous infection in which the present methods of treatment are effective nor in the presence of advanced pulmonary lesions. Neither is it proven that it is indicated preparatory to operation. One can also conclude that in spite of the marvelous results obtained in certain cases, streptomycin is not the answer in the search for an antibiotic which will cure tuberculosis in all its protean manifestations.

SHORTAGE OF NURSES

THE shortage of nurses which was present before the war has become even more acute since the armistice. The causes are largely economic. The high wages available for a young woman in industries which require little or no training cause her to hesitate to devote the three years to training necessary to become a trained nurse. Taking advantage of the present level of high wages is likely to be a short-sighted policy.

A trained nurse acquires a profession which, like all professions, is something that cannot be taken away. While a member of a profession with a more or less stable income is at a disadvantage during periods of inflation, he or she has the advantage during hard times. In making this statement, we are not unmindful of the depression years when there was little or no employment for certain professional people, including nurses. Such periods, however, are fortunately comparatively brief, and the possession of professional training is not lost during such periods.

Today, in Minnesota at least, the trained nurse receives $9.00 a day, which for a five and a half day week and not counting holidays averages $185.00 a month. While a young woman in certain industries can obtain comparable compensation without much preliminary training, one should consider whether such available work is comparable with nursing in interest and importance.

In some states, the requirements for a registered nurse have been lowered, and training schools have been increased to meet the shortage. This has not occurred in Minnesota, and we approve of maintaining the present standards required for registration so that the possession of an R.N. degree may continue to mean the possession of high qualifications. Additional nurses can better be provided by opening new schools or new courses for the training of practical nurses with a year's training.

---

*The effects of streptomycin in tuberculosis in man. J.A.M.A., 135:634-643, (Nov. 8) 1947.

A nation-wide effort is being made to increase the enrollment in nurses' training schools. The American Nurses' Association, American Hospital Association and the American Medical Association have joined hands in an effort to remedy the shortage. Individual physicians, members of the Woman's Auxiliary and the public at large are urged to present to potential candidates the advantage of entering the nursing profession.

MINNESOTA MEDICAL SERVICE

IN the September, 1947, issue of MINNESOTA MEDICINE there appeared under "Medical Economics" an article by Mr. Don C. Hawkins, Chairman of the Liaison Committee of Insurance Underwriters, describing a prepayment plan of medical and surgical care.

When the question of prepayment medical insurance came up, two plans were studied, one to be managed by the doctors themselves and the other by commercial insurance companies, with the approval of the doctors as has been done in Wisconsin. The latter was the plan described by Mr. Don Hawkins in the September issue. The following is the doctor-backed nonprofit plan of the Minnesota State Medical Association.

A group of eleven doctors were commissioned by the State Medical Society to present a prepayment plan which would work on the same principle as the Blue Cross plan. This we have done. We have had the experience of many others to guide us and we hope we have avoided their mistakes.

The plan of the doctors is a *nonprofit corporation* which came into being January 4, 1946, under a special enabling act passed by the legislature in 1945. The object of it is "to make possible a wider and more timely availability of medical care, thereby advancing public health and the science and art of medicine in Minnesota."

Free choice of doctor is provided and the doctor may refuse to serve if he so desires. Most of the doctors in the state have signed up to co-operate with this plan. It will take care of doctors' bills in full for unmarried individuals with incomes of $1,500.00 or less, or $2,500.00 or less if they have families. Above that payments may be applied toward the doctor's bill. No attempt is made to set fees. The relation between the doctors and the patient is entirely unchanged. This is a means of helping people to pay their doctor bills and that is all. It will pay for surgical services and obstetrical services anywhere, and for medical services in the hospital only.

Payment will be made according to the schedule which is available to any doctor asking for it. This, of course, is subject to revision as experience dictates. The present schedule we realize is far from perfect. It was lifted "as is" from the Massachusetts plan and was the one we considered best suited to our needs as a starter.

The estimated cost to the patient is $1.00 a month for the individual and $2.25 a month for a family. The method of enrollment is as with the Blue Cross, in groups.

Again I wish to state that the patient may choose any doctor of medicine.

We are using the Blue Cross to do the mechanics of the job, selling, bookkeeping, billing, paying doctors, et cetera, but are an entirely separate and distinct organization.

This is the doctors' plan, the success or failure depends upon them and their co-operation. Improvements, changes, et cetera, will take place as experience warrants.

Preparations have been completed. We are now enrolling a few large groups and on December 1, we will begin to expand and accept all eligible applicants.

No one profits from this plan but it will help lower income people to pay for their medical and surgical expenses. It will, in my opinion, give people more for their money than any combination now offered to the general public.

OLAF I. SOHLBERG, M.D.

MORE CARE

IN our May issue, we mentioned CARE (Co-operative for American Remittances to Europe, Inc.) editorially. Since then, much publicity has been given to this philanthropic quasi-governmental organization, associated with some twenty-seven relief agencies.

It is not so well known that this agency has grown by leaps and bounds so that it is now delivering 10,000 packages daily to the needy in Europe and is prepared to increase the number to 50,000 a day. Also, instead of a limited choice in the make-up of packages, fourteen different types of packages are available, their contents ranging from twenty-two pounds of "standard foods" and special baby food packages to cotton, household utensils, blankets and knitting wool.

It is not necessary for one to know some needy family in Europe in order to take a small part in relieving the widespread suffering in Europe. A check for $10.00 sent to CARE, 50 Broad Street, New York 4, New York, will assure the delivery of a package to some needy family in the country designated. Instead of giving a useless Christmas Christmas present to some friend, in transmitting the order for a CARE package, that friend's name can be sent in and a Donor Certificate will be sent him or her, indicating that the CARE package has been given in the name of that individual.

If each reader would try to interest ten other people in this practical way of helping to meet the tragic situation in Europe today, the services of CARE would be greatly increased.

WILLIAM A. O'BRIEN

IN every field of human endeavor it happens that from time to time one individual is outstanding—head and shoulders above all others. This was true of Dr. William A. O'Brien, known as "O. B." to many of his friends.

Instead of one, he had two specialties. The one best known to the public was the education of the laity in medical matters. For twenty years, he had broadcast weekly over the radio under the sponsorship of the Minnesota State Medical Association. He also broadcast for the Minnesota Hospital Association and the Minnesota State Dental Association. For many years his nationally syndicated articles on health had appeared daily in the newspapers. His was a remarkable facility for putting information pertaining to medicine and health in the simple language understandable to the non-medical listener or reader. The field he covered was a wide one and showed a wide range of medical knowledge. This specialty alone would have been a full-time job for an ordinary mortal.

Dr. O'Brien's main vocation was as an educator. As director of the Center for Continuation Study of the University of Minnesota since its organization, the success of this pioneer undertaking in postgraduate instruction absorbed much of his thought and energy. Its outstanding success was due to Dr. O'Brien.

As though this were not enough, Dr. O'Brien was professor of preventive medicine and health education in the medical school. He was also active in cancer and tuberculosis control, being a member of the board of directors of the American Cancer Society and chairman of the Hennepin County Tuberculosis Association's annual Christmas Seal campaign for the past ten years.

Probably no member of our profession had such a wide acquaintance among the physicians of the state and he seems to have had a remarkable faculty for remembering names and faces. Thousands of citizens of Minnesota and bordering states who had heard his genial voice and had read his newspaper articles felt they had lost a personal friend when news of his sudden departure was announced.

While it seems likely that Dr. O'Brien's strenuous existence may have shortened his life, he used his abilities to the utmost for the benefit of medicine and mankind. The proposal of Dean Harold Diehl to start a memorial fund to provide for the inclusion in The Mayo Memorial Center of new and more adequate quarters for the Center of Continuation Study in memory of Dr. O'Brien seems most timely and appropriate.

A MEMORIAL TO DR. O'BRIEN

WHEN death claimed Dr. William A. O'Brien last month many thousands of people felt a sense of great personal loss. In his individual contacts, in his classes, in his public lectures, in his radio talks, and in the many groups with which he worked, Dr. O'Brien radiated friendship, interest and wise counsel. It can be truly said that the world is better for his having lived in it.

Since Dr. O'Brien's death many of these friends have suggested that in appreciation of what he meant to them they would like to contribute toward a memorial in his honor. In response to these suggestions, Dr. Harold S. Diehl, Dean of Medical Sciences at the University, appointed a special committee, under the chairmanship of Mr. Ray M. Amberg, Superintendent of the University Hospitals, to consider an appropriate memorial. This committee proposes that adequate facilities be provided in the new medical center for the continuation study programs in medical and health fields which Dr. O'Brien developed. These programs were Dr. O'Brien's primary interest because they contribute so directly to better health and better medical care; they reach down into every home and community in the state.

This memorial will perpetuate the memory of Dr. O'Brien, and insure continuation of the work in which he pioneered.

Contributions toward this memorial may be sent to the University of Minnesota for the William A. O'Brien Memorial Fund. The names of contributors will be made a matter of record and sent to the family.

WILLIAM A. O'BRIEN

A Tribute

When Dr. O'Brien signed off on his radio program the morning of November 15, no one could have suspected that his life's work of public education had been finished. For years his voice had entered classrooms throughout this State and had also been listened to attentively by thousands who welcomed this opportunity of attending school in their homes and learning from him the message of good health. Through his radio programs, through his newspaper articles, his countless addresses, and his personal contacts, he had become one of the best-known and best-loved citizens of this State. Barely nine hours after this last broadcast Dr. William A. O'Brien lay physically dead but his spirit and influence continue to live as powerful and moving as was the personality which they reflected.

It is probable that most people in Minnesota never saw Dr. O'Brien though many of them knew him by his pictures. It is equally certain that he had never seen most of them. But no one could listen to him week after week without coming to know him, for it was his personality as well as his voice that entered the classroom and the home. They came to know him as a person of great human warmth, who radiate a sense of well-being and good cheer. They recognized him as a genial friend who inspired confidence in all who came within his sphere. They felt that here was an inspired teacher who had a profound affection for all mankind and was anxious to carry his message of health to all his friends.

And it was as one friend to another that he met the public over the air, through his speeches and his personal contacts. While he may not have known most of his public by sight, there were many whom he did know in person, many more whom he knew through friends and relatives, and all of them he knew as a group. In these radio or public addresses, as in his University classroom, he loved to think that he was talking to his friends or to the sons or daughters of those whom he knew well or whom he had met as he travelled around Minnesota. Dr. O'Brien was a man of vast acquaintances. Few have been privileged to know personally so many people throughout the State and few have ever cherished these friendships as deeply as did he. Apart from his family they were his most prized possession. He also knew human nature, and had a singularly broad understanding of young and old alike and a capacity to project himself into their situation and understand their needs and uncertainties. It was from this basis of understanding and love of mankind that Dr. O'Brien talked or wrote his way into the hearts and lives of millions throughout the nation.

Dr. O'Brien talked and wrote simply, naturally and directly, in keeping with his character. He did not resort to oratorical or rhetorical devices, to tricks of delivery or teaching. He had a message to deliver, a message that came from the heart, one that he was most anxious to have heard because it was designed for friends whom he wanted to help. The public recognized the reliability of this message for it was a reflection of the integrity of his character. It was something more than a mere message of medical facts. He was teaching facts, to be sure, but he was most interested in these as part of the normal development for life and the tasks and responsibilities that citizenship imposes on the individual. He was most eager that everyone should learn to assume his share of the burden of protecting the health and well-being of the community.

To the medical profession of the Northwest and of Minnesota in particular, Dr. O'Brien was a symbol of continuing professional development. He had a singular capacity for sympathetic understanding of the professional and educational needs of the practitioner. This was coupled with an impelling urge to help his fellow physicians in their quest for that further knowledge needed to keep them abreast of the rapid current changes in medical practice. He was not satisfied with a career devoted solely to public education for health but took unto himself the added burden of helping his medical friends to appreciate the benefits of postgraduate study and to obtain that instruction required to satisfy their needs. This he did, not out of a detached interest in the scope and techniques of postgraduate medical education, but as a personal friend of the physician imbued with an overwhelming desire to put his talents to work to improve the profession to which he was so proud to belong.

Dr. O'Brien was also a man of great courage. Few realized the last few months that they were listening to one who was not well, who knew that he was staring death in the face. He knew it probably better than did anyone else. Yet in this realization he deviated in no respect from his normal warmth of personality, his devotion to his work, his firm desire to help to a more healthful living. So strong was this devotion to the task which he had set himself that he continued his teaching, his talking to various groups long after the time had come when for his own good he should have rested. Courageously and unchanged, he walked in the shadow of death, a kindred soul who could sing with the poet:

Fear death? to feel the fog in my throat,
The mist in my face,
When the snows begin, and the blasts denote
I am nearing the place,
The power of the night, the press of the storm,
The post of the foe;
Where he stands, the Arch Fear in a visible form,
Yet the strong man must go:
For the journey is done and the summit atained,
And the barriers fall,
Though a battle's to fight ere the guerdon be gained,
The reward of it all.
I was ever a fighter, so—one fight more,
The best and the last!
I would hate that death bandaged my eyes, and forbore
And bade me creep past.
No! let me taste the whole of it, fare like my peers
The heroes of old,
Bear the brunt, in a minute pay glad life's arrears
Of pain, darkness and cold.
For sudden the worst turns the best to the brave,
The black minute's at end,
And the elements' rage, the fiend-voices that rave,
Shall dwindle, shall blend,
Shall change, shall become first a peace out of pain,
Then a light, then thy breast,
O thou soul of my soul! I shall clasp thee again,
And with God be the rest!

Today the voice of Dr. O'Brien is stilled. We shall not be privileged to hear it further. We shall miss it. But though the voice is stilled, his spirit remains and pervades the classrooms and homes where he taught. The memory of his life and the warmth of his personality will linger in the minds and hearts of all who knew him, whether directly or through these indirect radio, newspaper or lecture contacts. Those of us who knew him best and worked side by side with him know that we, like the reading and listening public, have lost a true friend. Like them we have had a great privilege in being associated with him. Few persons have touched the lives of so many of their fellow beings, and of few can it be so truly said that they left the world a better place from the fact that they lived in it. As his friends pick up the torch and prepare to carry on the work which he would wish to have continued without interruption, they pause humbly and reverently to pay tribute to his memory and to say simply as he would have had it, "Well done, Dr. O'Brien."

Gaylord W. Anderson, M.D.

COMPARATIVE COSTS OF MEDICAL CARE

Expenditures for medical care in comparison with such items as alcoholic beverages, recreation, tobacco, personal care and jewelry, using the figures published by the U. S. Department of Commerce published in July, 1947, has been made by Dr. Frank G. Dickinson, Director of the Bureau of Medical Economic Research of the American Medical Association, and he presents some interesting findings. The cost of operating veterans hospitals and governmental tuberculosis sanatoriums are not included in the government's figures. The items for physicians' services include the gross receipts of physicians in private practice exclusive of payments from life insurance companies, fees from businesses and the like. It is admitted that the reduction in the number of physicians and dentists in private practice, due to the war, affects the figures somewhat.

The total expenditures for all the items selected (medical care, alcoholic beverages, recreation, tobacco, personal care and jewelry) increased from 11.8 billions in the basic period (the average for the years 1933-1939) to 29.4 billions in 1946. The cost of medical care alone increased from 2.6 billions to 5.6 billions during the same period. In 1945, the amount paid for physicians' services alone was 1.3 billions compared with 0.8 billion in the basic period. The figure for 1946 is not available.

The totals spent in 1946 compared with the basic period increased from 3.2 to 8.8 billions for alcoholic beverages; from 3.1 to 7.9 billions for recreation; from 1.6 to 3.4 billions for tobacco; from 0.9 to 2.3 billions for personal care and from 0.3 to 1.4 billions for jewelry.

The total amount spent for medical care from this basic period (the average for 1933-39) to 1946 went up 211 per cent; alcoholic beverages 277 per cent; recreation 253 per cent; tobacco 210 per cent; personal care 253 per cent and jewelry 408 per cent. The total spent on physicians' services increased only 163 per cent from the basic period to 1945.

The personal income of the American people not including amounts received by the armed forces increased from 68.7 billions in the basic period to 149.1 billions in 1945. The percentage of these totals paid for physicians' services decreased from 1.2 per cent to 0.9 per cent during this period. The percentage total income paid to hospitals during this same period also decreased from 0.2 per cent to 0.5 per cent. The total cost of medical care similarily showed a reduction from 3.8 per cent to 3.3 per cent of total income.

How is the cost of medical care divided? It is interesting to note that in 1945, the physician received 30.8 per cent; the hospitals 16.8 per cent; drugs and sundries 21.2 per cent; dentists 13.4 per cent and all other medical care 17.8 per cent of the total.

To quote: "Medical care is expensive; it is becoming more expensive; yet, as a percentage of national income in a period of frenzied prosperity, it is a shrinking item. Medical care is expensive, but patients are getting more for their money in terms of longer life."

MEDICAL ECONOMICS

Minnesota State Medical Association
George Earl, M.D., Chairman

PREPAYMENT MEDICAL CARE TERMED "JIG-SAW PUZZLE"

A jig-saw puzzle, in need of being fitted together—that is the way the present prepayment medical care picture was sketched for delegates to the annual North Central Medical conference, held in Saint Paul, November 23.

Finding the proper place for health co-operatives in the prepayment picture was one of the several economic questions facing doctors in the north central states discussed at the conference which was attended by about 75 officers and committee chairmen of the medical associations of Minnesota, Iowa, Nebraska, North and South Dakota and Wisconsin.

Speaking on the health co-ops was Mr. L. S. Kleinschmidt who has been studying the rural aspects of prepayment medical care programs and particularly the health co-operative movement for the American Medical Association since 1945.

Speaking from his thirty-two years' experience in dealing with the developing of organizations for meeting special rural problems, which began with his employment in 1919 as one of the first county agents in Missouri, Mr. Kleinschmidt gave the doctors some of the background of the co-operative or so-called consumer-sponsored movements.

Health Co-Ops Not New

"The health co-operative movement is not new," Mr. Kleinschmidt said. "It dates back ninety-six years to the 'French Mutual Benevolent Society of San Francisco,' organized in California in December, 1851. The AMA has been particularly interested in health co-ops for the last decade."

Mr. Kleinschmidt stressed the importance of the medical profession's making certain that the highest possible level of medical care standards are maintained in all prepayment medical care proposals, including the co-ops. Back in 1941, he said, the AMA announced that it was not opposed to the use of the principle of insurance purely as a means of meeting the cost of medical care when there is no interference with the quality of service. The AMA has since been working to set up standards to be used by co-operative or consumer-controlled health plans when providing medical services.

About two-thirds of all consumer-sponsored medical care plans have been developed within the last nine years, Mr. Kleinschmidt said. However, he pointed out, medical society plans have an actual enrollment six times as large as the probable enrollment of consumer-sponsored plans.

Doctors Ideal Community Leaders

Doctors as community leaders was the subject discussed by Mr. Thomas A. Hendricks, secretary of the AMA Council on Medical Service. Pointing out the tremendous possibilities physicians have as molders of public opinion, Mr. Hendricks declared:

"Endowed with a formal education and background beyond that available to any other group in the community and experienced in daily intimate contacts with their fellow men as are no other individuals, the members of the medical profession are expected to have a conception of affairs, an analytical power, an outspoken, independent viewpoint that gives warmth, expression, humor, philosophy and 'color' to their communities.

"The physician more than any other person should have a decisive influence on the life, the thinking and the daily habits of the people."

Mr. Hendricks warned that the American medical profession jeopardizes its position of authority and its possibilities for leadership in the preservation of the American ideals of freedom if it allows its members to become what he termed "intellectually colorless." The American medical profession, he declared, must never backslide from the fearlessness and courage of its men "who told their world what they thought and their world listened and molded its action accordingly."

Vets Home-Town Care Expanding

Home-town medical care for veterans is due to expand in the future, according to Dr. W. A. Wright, Williston, N. D., who reported to the doctors on a recent national conference on veterans' medical care held in Chicago.

Dr. Wright, chairman of the North Dakota State Medical Association's economic committee, predicted that the administration of the veterans' medical care program will improve as it continues in operation.

Dr. Paul R. Hawley, medical director of the Veterans Administration in Washington, expressed general satisfaction with the Home-Town Care program at the Chicago Conference, Dr. Wright said; and he indicated that the VA apparently intends to use the services of private physicians even more in the next few years.

The future course of home-town care for veterans will depend on whether the doctors themselves, through their local medical societies, determine to co-operate to the fullest in the present program and whether they can enlist the support of veterans' organizations and lawmakers to keep veterans' medical care on a sound, workable basis.

Improve Agency Relations

Better relations with the public through better co-operation with public agencies providing medical care was recommended for medical societies by Dr. F. L. Rogers of Lincoln, Nebraska, chairman of the planning committee of the medical association in that state.

National, state, county and local agencies, during recent years, Dr. Rogers said, have been requesting an ever-increasing amount of medical service for such groups as the aged, the blind, the handicapped, dependent children, veterans and indigents; and with this there is a growing demand for some sort of uniform plan or policy to apply to all such requests for doctors' services.

Dr. Rogers described the Nebraska physicians' solution—a carefully worked out system of closer co-operation between the medical profession and these agencies wherein doctors endeavor to interpret medical problems to agency administrators and to understand, in turn, the problems of the various agencies.

Speaking on the administration of state medical organizations, Dr. W. D. Stovall, president of the Wisconsin State Medical Society, called attention to the present trend toward organization in which the individual has apparently been forgotten.

Must Act as Individuals

"We have allowed ourselves to be sucked into a whirlpool of organization," Dr. Stovall declared. "We must give more consideration to the individual . . . all our plans are simply words—action takes place around the individual."

Dr. Stovall's remarks were in accord with other conference talks calling for leadership by physicians at the community level. Setting up local health councils, extending medical service and increasing co-operation with public agencies—all are worthy objectives, he said; they are accomplished best through effective local leadership. Local leadership is the key to good medical practice and good government, Dr. Stovall maintained.

Dr. Stovall also suggested certain steps that could be taken by a State Medical organization wishing to revise its methods of operation. He recommended that the society first appoint a committee to thoroughly analyze and evaluate the present setup before attemping to revamp it.

Discuss Local Health Councils

A plan for establishing local health councils was discussed by Dr. Fred Sternagel, a member of the Iowa Interprofessional Association. Dr. Sternagel described the plan in Iowa which is closely allied with the work of a health council and in which the Interprofessional Association cooperates with the state health department to carry health education to the people by conducting local forums on health topics.

Working through public-spirited citizens and organizations in the individual communities—such as the local Parent-Teacher Association—speakers are provided to go out and talk, in language that lay audiences can understand, on topics that the local organization has itself selected.

Professor John O. Christianson, superintendent of the University of Minnesota school of agriculture, who spoke at the conference dinner, encouraged the doctors to continue to increase their efforts in behalf of better rural health by taking advantage of the awakening of farm people to the need for improved living conditions.

For his presidential message, Dr. William Duncan of South Dakota reviewed the situation with regard to the present need for more general practitioners and an accompanying demand for more service from specialists. According to Dr. Duncan, the problem is a combination of maldistribution of the available medical men; not enough emphasis on the ideals of service inherent in the practice of medicine; and a tendency to over-rate the advantages of specialization.

Dr. Gavin Named President-Elect

At the business session of the conference, Dr. S. E. Gavin of Fond du Lac, Wisconsin, was named president-elect, to serve as head of the conference in 1949. Mr. R. R. Rosell, Minnesota's executive secretary, was re-elected to the secretary-treasurership.

Dr. A. W. Adson, in his remarks as incoming president of the North Central Medical Conference, concluded that physicians have a duty to shape public opinion within their own communities and their own states. They likewise, he said, have a responsibility to utilize every possible and workable means to extend medical care to all the people.

Reflecting the entire spirit of the 1947 conference, the Resolutions Committee, of which Dr. Roy W. Fouts of Omaha, Nebraska, was chairman, submitted the following recommendation which was unanimously adopted by the conference:

WHEREAS the principal purpose of these meetings is to stimulate thinking and to develop ideas in connection with the changing concepts with reference to medical needs as they affect both the public and the medical profession, and

WHEREAS prudence would seem to indicate that it is wise to confine our activities to the educational phase of these questions rather than to engage in policy-making by becoming a resoluting organization, therefore, be it

RESOLVED that the delegates and officers of the various state medical organizations represented in this conference and their delegates to the American Medical Association, that are in attendance at this meeting, be requested to carry back to their respective societies the ideas proposed in our discussions to the end that these ideas may be properly presented to the appropriate committees and councils of both state and national organizations.

MOWER COUNTY TO ORGANIZE STATE'S FIRST HEALTH COUNCIL

Steps to organize a local health council, the first in Minnesota, were taken at a meeting November 11 held at Austin. The meeting, to which were invited representatives of organizations and agencies interested in rural health, was called by Dr. Paul C. Leck of Austin, chairman of the Committee on Rural Medical Service of the Minnesota State Medical Association.

About twenty-five organizations (including some of the surrounding towns and villages) were represented. The meeting was conducted purely to acquaint those present with the purposes behind health councils, the possibilities for betterment of health services in the community and to determine whether the professional groups, government officials and the citizens generally would be interested in such a project and would support it.

The keenest possible enthusiasm was displayed by everyone present at the meeting. Assisting Dr. Leck in outlining the possibilities of a health council were Mr. J. S. Jones, secretary of the Minnesota Farm Bureau Federation, Dr. Robert N. Barr of the State Health Department, and Dr. Louis A. Buie, president of the Minnesota State Medical Association.

Mountain Lake Pharmacist Sentenced to Prison Term of Eighteen Months for Criminal Abortion

Re: State of Minnesota vs. Jacob S. Balzer

On November 11, 1947, Jacob S. Balzer, fifty-four years of age, a registered pharmacist of Mountain Lake, Minnesota, entered a plea of guilty in the District Court of Cottonwood County to an information charging him with the crime of abortion. Following a statement of the facts to the Court, Balzer was sentenced to a term of not to exceed eighteen months in the State Prison at Stillwater, by the Hon. Charles A. Flinn, Judge of the District Court. In sentencing the defendant, Judge Flinn pointed out that Balzer, as a layman, was jeopardizing the life of each person upon whom he attempted to perform an abortion.

Balzer was arrested on October 18, 1947, following an investigation made by the Minnesota State Board of Medical Examiners, County Attorney Milton F. Juhnke and Sheriff N. J. Bell, both of Cottonwood County. This investigation disclosed that Balzer had performed a criminal abortion on an eighteen-year-old Mountain Lake girl on October 15, 1947. The abortion was performed by injecting an abortifacient paste manufactured by the defendant. The paste consisted of a soft soap base together with iodine, potassium iodide, alcohol and water. Balzer was to receive $100 for his services but the fee was not paid. The patient became critically ill and was hospitalized at Mountain Lake. Following his arrest, Balzer gave a statement in which he admitted having performed approximately fifteen criminal abortions over a period of the past several years.

Balzer was born at Mountain Lake, Minnesota, in 1893, and graduated from the University of Minnesota in 1916, from the School of Pharmacy. He also stated that he took a massage course at the Chicago College of Chiropractic. Balzer holds no license to practice massage in the State of Minnesota. The Minnesota State Board of Medical Examiners wishes to acknowledge the very splendid co-operation that it received in this case from County Attorney Milton F. Juhnke and Sheriff N. J. Bell of Windom, Minnesota.

Minneapolis Surgical Society

Meeting of May 1, 1947

Dr. Thomas J. Kinsella, Presiding

ALIMENTARY DIVERTICULA

Single-Stage Cervical, Thoracic and Abdominal Diverticulectomy

HORACE G. SCOTT, M.D., F.A.C.S.
Minneapolis, Minnesota

My interest in the subject of diverticula of the alimentary tract was aroused during the past fifteen months, as I had the opportunity to see and operate upon four patients with such lesions. Each of these patients had a rather unusual lesion either from the standpoint of size, location, preoperative or postoperative course. These four patients happened to be quite representative of diverticula of the alimentary tract in general, as one was located in the hypopharynx, one in the lower thoracic esophagus, one in the third portion of the duodenum, and one was a Meckel's diverticulum containing gastric mucosa with acute ulceration and hemorrhage. In each instance a single-stage operative procedure was employed for the removal of the diverticulum, in spite of the fact that in the first three cases the lesions were quite large for their respective locations. In each of the first two cases the base of attachment to the esophagus measured 4 centimeters in diameter. The duodenal lesion had a base which measured 3 centimeters in diameter. All four patients recovered and are in excellent health and free from symptoms at the present time.

In addition to these four patients, I had the privilege of seeing ten other patients with diverticula in the upper alimentary tract and eleven additional ones with lesions in the colon, during the past three years. In view of the fact that most of the colon cases were asymptomatic and had only incidental findings in the course of eighty-eight x-ray studies of the colon, I shall exclude these cases from this paper except to mention them and comment briefly on their surgical significance. This paper, therefore, concerns fourteen diverticula of the upper alimentary tract seen in thirteen different patients, four of whom came to operation (Table I).

Of the fourteen diverticula, two occurred in the upper esophagus, one in the lower esophagus, one in the cardia of the stomach, one in the first portion of the duodenum, five in the second portion of the duodenum, and three in the third portion of the duodenum, with the Meckel's diverticulum in the terminal ileum. Four of the thirteen patients were males and nine were females. This fact is of interest because in most reported series the males predominate two to one, whereas in this series the ratio was reversed. Their ages ranged from twenty-two to sixty-nine years. Their average age was fifty-two years. Of the nine duodenal lesions, three were associated with active duodenal ulcers, one with a healed ulcer, one with a large hiatus hernia of the diaphragm and a sixth with metastatic melanoma of the liver. Six, or two-thirds, of the duodenal diverticula were therefore associated with other lesions of the gastrointestinal tract.

I shall briefly review the literature relative to the history of these lesions, their embryology and surgical significance, and shall try to cover the highlights of the past and the pertinent papers of the last five years. In order to present the literature in a logical sequence, I shall divide the gastrointestinal tract, from the pharynx to the rectum, into seven parts. The first part is represented by the pharynx and cervical esophagus; the second, the thoracic esophagus; the third, the stomach; the fourth, the duodenum; the fifth, the small bowel; the sixth, the Meckel's diverticulum, and the seventh, the colon.

Pharyngo-Esophageal Diverticula

The history of diverticula of the cervical esophagus dates back to 1767, when a case of pharyngoesophageal diverticulum was observed by Ludlow. Strickly speaking, these lesions are not true esophageal lesions in that they arise from the lower portion of the pharynx close to the junction with the upper end of the esophagus—wherefore the name pharyngoesophageal diverticula. Harrington has shown that these lesions arise chiefly from three places. First, they arise on the left or right side of the posterior hypopharynx between the inferior constrictor and cricopharyngeal muscles. Secondly, they may arise in the midline between these muscle bundles, or they may arise immediately beneath the cricopharyngeal muscle above the circular fibres of the esophagus. He believes that there may be congenital malformations in the attachment of these muscles and that with advancing years a herniation may develop as the result of constant and increasing pressure on this congenitally weak region. To support his theory, he stated that in his series of 140 cases the average age of these patients was fifty-seven years. Jackson, the Philadelphia endoscopist, has frequently noted a spasm in the cricopharyngeal muscle while passing an esophagoscope and believes that this too may be a factor in causing increased pressure in the hypopharynx. He likes to dilate this muscle to prevent recurrences. McQuillan thinks that in addition to these factors there may be a neuromuscular dysfunction and associated cardiospasm at the lower end of the esophagus and that there may also be a constitutional basis, as diverticula of the esophagus, duodenum and colon are often found in the same individual.

Although this lesion was first described 180 years ago, the first surgical attempt to extirpate one of these pouches was not tried until 60 years ago. At that time,

---

Inaugural thesis.

TABLE I. ALIMENTARY DIVERTICULA

Case	Age	Sex	Location of Lesion	Symptoms	Other Pathology
1.	64	M	Esophagus-Upper	Choking, regurgitation	None
2.	57	F	Esophagus-Upper	Dysphagia, neck enlargement	None
3.	56	F	Esophagus-Lower	Dysphagia, regurgitation	Cardiospasm
4.	22	M	Stomach-Cardia	Halitosis, pain	Meckel's diverticulum
5.	28	M	Duodenum—First part	Epigastric pain	Active duodenal ulcer
6.	48	F	Duodenum—Second part	Epigastric pain	Active duodenal ulcer
7.	63	M	Duodenum—Second part	Pain and soreness	Active duodenal ulcer
8.	69	F	Duodenum—Second part	Epigastric pain	Hiatus hernia
9.	65	F	Duodenum—Second part	Epigastric pain	Melanoma
10.	58	F	Duodenum—Second part	Epigastric pain	None
11.	54	F	Duodenum—Third part	Pain and nausea	None
12.	32	F	Duodenum—Third part	Pain and soreness	Healed duodenal ulcer
13.	66	F	Duodenum—Third part	Epigastric pain	None
14.	22	M	Meckel's diverticulum	Bowel hemorrhage	Gastric 'tic'

Nicoladoni produced a servical fistula by diverticulotomy. The first successful operation was performed forty-five years ago by Von Bergmann. Since this time the operation has been performed successfully by many surgeons throughout the world. However, the early reports contained many fatalities from mediastinitis and a high morbidity rate because of cervical fistulas. These complications led to the two-stage operation, which has been employed until fairly recently. The two-stage procedure reduced the mortality greatly, but led not infrequently to constriction of the esophagus, necessitating postoperative dilatations.

In 1941 Stanley Maxeiner presented a single-stage operation, used successfully in three cases, where the danger of leakage was obviated by leaving a clamp on the stump until it sloughed away spontaneously about five days later. More recently the introduction of the sulfa drugs and penicillin has definitely reduced the hazard of the single-stage operation to the near zero mark. Harrington reported 115 single-stage operations in 1945 with no mortality. Only five of his cases required postoperative dilatation and only five developed a temporary fistula. He has abandoned the routine use of the indwelling catheter. After the experience which I had in one of the cases I am about to present, I shall do likewise, because I feel that the failure of this tube to remove gastric contents led in this case to the patient's aspiration of bile vomitus which almost resulted in her death the night of the operation.

Case Reports

The first two cases in my series are of this pharyngoesophageal type. Case 1 is a typical average sized lesion. Up to the present time, this lesion has not been removed, although removal is definitely indicated.

Case 1.—Mr. H. C., aged sixty-four, had been troubled for several years with paroxysms of coughing associated with regurgitation of undigested food which he had eaten the night before. He stated that he had brought up whole grapes and capsules of medicine the morning after taking them. On hearing his story, my clinical impression was that he had an esophageal diverticulum, On November 16, 1944, his pharynx and esophagus were x-rayed, and a typical esophageal diverticulum of moderate size was found. The pouch contained food from the day before. This lesion was rechecked by x-ray again in June, 1946, and the pouch was found to be about 10 per cent larger than when first examined. To date the lesion has not been removed.

Case 2 represents a very large diverticulum in this same area. In fact, the lesion was so large that it completely filled the entire cervical mediastinum. In Harrington's series of 140 cases, he reports fifteen cases of this large variety. The rest of his series were similar to Case 1 of this series. Two hundred and forty cubic centimeters of barium were needed to fill the pouch in the upright position before the barium would trickle over into the esophagus and down into the stomach. X-rays taken with this amount of barium in the pouch reveal an air pocket over the barium equal in size to about 50 per cent of the filled diverticulum. Therefore, the completely filled diverticulum was capable of holding about 360 c.c. or more of fluid material. When it was filled, the patient's neck protruded like a patient with a moderately large colloid goiter.

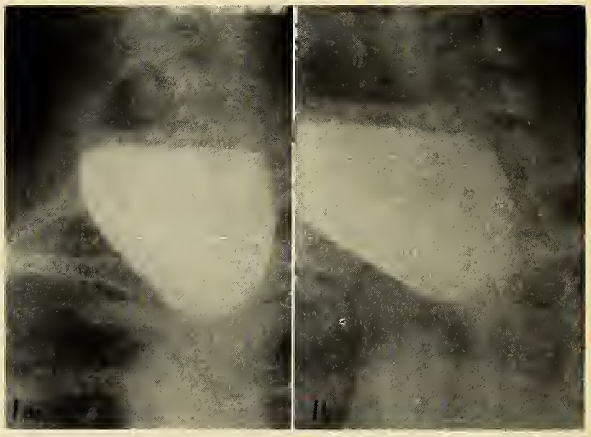

Fig. 1. Case 2. (a) Posterior-anterior x-ray view of the upper esophagus with 200 c.c. of barium in the pouch. Note fluid level and gas bubble overlying barium. (b) Oblique view of same patient preoperatively.

Case 2.—Mrs. M.D., aged fifty-seven, was first seen by me on January 12, 1946. At that time she sought medical aid for what she thought was a goiter. Her chief complaint when seen was difficulty in swallowing. She stated that she could bring up liquids as well as solids two to three hours after eating. She had noted a gradual enlargement in her neck during the past ten years. About four years ago, she began having choking spells when she swallowed solid food. This condition had grown progressively worse during the past year.

X-rays of her esophagus were taken and she was found to have a very large pharyngoesophageal diverticulum coming off the right side of the esophagus at the level of the cricoid cartilage (Fig. 1, a and b).

She was admitted to the hospital on January 21, 1946, for blood typing and intravenous fluids. Two days later the operation was performed. Under sodium pentothal, cyclopropane endotracheal anesthesia, a collar type of incision was made about 4 centimeters above the clavicles. The platysma muscles together with the skin flaps were reflected upward to the level of the superior border of the thyroid cartilage and downward for several centimeters. The carotid sheath with its contained vessels, together with the sternomastoid muscle on the right side were retracted laterally and the space between these structures and the lateral border of the right lobe of the thyroid was deepened down to the sac which projected laterally from the esophagus into this space. The sac was rather easily separated from the surrounding structures. It proved to be a very large sac, measuring approximately 10 centimeters in length and varying from 4 to 5 centimeters in diameter; the base coming off the esophagus also measured 4 centimeters in length. It was invested by an outer fascial structure which probably represented the deep layer of the cervical fascia. This fascial structure was opened into and the sac was isolated near its base.

Dr. Kenneth Phelps then passed an esophagoscope down to the sac and fed a No. 18 long catheter into the distal esophagus. Several attempts were made before the distal esophagus could be identified and the tube inserted into it. A few muscle bundles were found and separated from either side of the sac; the base was then clamped and cut between the forceps. After excising the sac and treating the edges of the mucosa with tincture of merthiolate, a continuous chromic catgut dulox suture was used to close the base. A second row of continuous catgut was placed over this first row and then about fifteen interrupted mattress sutures of silk were used to reinforce these sutures. Following this, two rows of running chromic catgut sutures were placed in the muscle bundles surrounding the esophagus to further reinforce the suture line. After completing the closure of the esophageal defect, about 2 grams of microform sulfathiazole were placed in the wound. A small Penrose drain was placed down to the point from which the sac was removed and the flaps were reapproximated using interrupted chromic catgut sutures in the platysma muscles and skin clips in the skin. The drain was brought out through the incision about 3 centimeters to the right of the midline. The patient left the operating room in good condition with a rubber suction tube extending down the esophagus about half way to the stomach. Later an attempt was made to insert the tube into the stomach, but a spasm of the cardia prevented inserting it into the stomach without exerting undue force on the suture line. The tube was left in the esophagus and connected to a suction bottle.

About 7 o'clock p.m. on the day of operation, the patient had an emesis which was followed at once by marked respiratory difficulty. The patient became cyanotic and comatose. Her pulse became very rapid, respirations labored and her blood pressure rose to 190 systolic. An intern, not knowing she had vomited and thinking that she had an obstruction from a hemorrhage around the trachea, opened the wound. However, as no hemorrhage was found, she was taken immediately to the operating room where an intratracheal tube was introduced and a large amount of bile-stained fluid was aspirated from her bronchi and trachea. Her color soon returned to normal, following which her pulse rate and blood pressure also became normal. The wound was resutured and the intraesophageal tube was then inserted into the stomach. The patient was returned to her room.

The intratracheal tube was also left in the trachea during the night and bile-stained fluid was aspirated frequently from this tube through a catheter connected to an electric suction pump. The following morning the intratracheal tube was removed. As a result of the aspiration of bile into the bronchi, the patient developed one small patch of atelectasis at the base of the right lobe. On the second postoperative day, she developed evidence of a wound infection probably due to the emergency opening of the wound. A few days later, a stab wound was made just above the sternal notch and some seropurulent fluid evacuated. She was given penicillin, 20,000 units, every three hours, but did not respond well to it. She was given one deep x-ray treatment to the neck. When she was discharged from the hospital, on the fifteenth postoperative day, she still had some drainage from the wound. However, she was eating well and within a week the wound had stopped draining. An esophagram on February third revealed a normal outline. It was almost impossible to find the site from which the diverticulum had been removed.

When the diverticulum was examined in the laboratory, microscopically, it measured 7 centimeters in length and 6 centimeters in diameter. It had a fibrous wall 1 to 3 millimeters thick and a white smooth lining. There were several pieces of cooked meat 1 to 2 centimeters in diameter in the sac, in spite of the fact that the patient had been on a liquid diet for four days before the operation. Microscopically, the diverticulum had a wall of smooth muscle and a little fibrous tissue with a moderate number of lymphocytes in it. It was lined by a thick layer of stratified squamous epithelium.

During the past year, the patient has been examined by fluoroscopy and x-ray at regular three-month intervals. A small fleck of barium is seen to cling to the wall of the esophagus at the site from which the former diverticulum was removed. The scar in the neck is almost invisible in spite of the postoperative infection, owing no doubt to the fact that a "collar" type of incision was employed instead of the customary incision parallel to the border of the sternomastoid muscle.

She has gained weight and has felt much better since the operation. She no longer has any difficulty in swallowing either liquids or solids.

Thoracic Esophageal Diverticula

Case 3 in this series is a large pulsion diverticulum of the lower esophagus, which arose from the anterior surface of the esophagus probably initially as a traction diverticulum and later became a pulsion diverticulum because of an associated spasm at the lower end of the esophagus. When first seen two years earlier by another doctor, the diverticulum was mistaken for a simple aclasia of the esophagus. This is not an uncommon occurance especially when only an anterior-posterior view of the esophagus is made. However, a good oblique or lateral view of the barium-filled esophagus should reveal the true nature of this lesion. Most of the diverticula of the lower third of the esophagus are of this type. However, the most common lesion of the thoracic esophagus is the small traction type, located in the middle or upper third of the esophagus behind the bifurcation of the trachea. Here inflammatory peribronchial and mediastinal nodes frequently lead to extension of the process to the adjacent esophagus with resultant scar tissue contracture leading to small out-pouchings of the esophagus. Unless these lesions are associated with an aclasia they rarely attain size sufficient to produce symptoms.

This is not true, however, of the less common pulsion type seen just above the diaphragm. To date, few operative reports concerning removal of these lesions can be found in the literature. Most of the lesions in the past have been treated by dilatation of the cardiac sphincter. Hurst in 1925, Jackson and Jackson in 1933 and Nissen in 1934 have all obtained relief of symptoms in similar cases by dilatation of the cardia. The patient included in this report, likewise, was relieved by dilatation for about twenty months after this was done in 1944. She then had a return of her former symptoms.

Based on experimental work, Gosset in 1903 and Lotheissen in 1908 suggested transdiaphragmatic anastomosis of these lesions with the stomach. According to Hergrovsky in 1912, this was actually done by Lotheissen. In 1931, Lotheissen briefly referred to his case and reported that esophagogastrostomies supposedly for diverticulum had been carried out by Sauerbruch and Henschen. However, the first extirpation of one of these diverticula was apparently carried out successfully by Clairmont in 1924, using the abdominal transdiaphragmatic route. He displaced the sac and adjacent esophagus into the peritoneal cavity and then removed the pouch. Von Hacker and Lotheissen in 1926 noted the successful removal of a sac from the lower esophagus by Willy Meyer. In 1927, Sauerbruch reported three successful cases, one by the transpleural route, the other two through the anterior and posterior mediastinum. One additional case each was reported by Quartero in 1931 and Barrett in 1933, making a total of seven successful cases, five by the transpleural route. Turner attempted to avoid the dangers of opening the esophagus by inverting a small pouch. Recently, this same procedure has been employed by Ferguson and Cameron in handling lesions of the duodenum. In 1937, Lahey sutured the sac in an inverted manner. This same method had been employed by Bortone in lesions of the hypopharynx to avoid the dangers of infection.

In 1945, Lahey reported successful transpleural removal of a pulsion diverticulum and stated that he now had treated a total of six such cases with no mortality. In five of these cases the sac was not removed. He employed the method of fixing the apex of the sac upward along the paravertebral bodies. Recently Janes and Harrington have each reported the removal of four diverticula of the thoracic esophagus by the transpleural route. To date, fourteen transpleural extirpations of the sac have been reported in the literature, in addition to one transabdominal removal, several treated by transdiaphragmatic anastomosis to the stomach, and six apical fixations of the sac in an upward direction. The following case represents another successful transpleural extirpation of a large pouch of the lower esophagus.

Case 3.—Mrs. E. C., aged fifty-six, gave a history of bouts of intermittent vomiting since 1913. For the past twelve to fifteen years, she has had difficulty in swallowing and has had a feeling that foods stuck back of the lower sternum and that she had to wash them down with water or else vomit. Two years ago, a diagnosis of aclasia was made and her cardiac sphincter was dilated. She was relieved for some time, but during the two months preceding the operation, her former symptoms returned and she regurgitated liquids whenever she bent over to pick something up from the floor.

On August 26, 1946, she was admitted to the hospital. X-rays were taken which revealed a rather large diverticulum coming off from the anterior part of the distal fourth of the esophagus about 4 centimeters above the dome of the diaphragm, just back of the heart (Fig. 2, a and b).

An indwelling gastric tube was inserted through the nose five days prior to operation and Varco feedings with added vitamins were started. The patient was operated on, September 3, under endotracheal cyclopropane, sodium pentothal and curare anesthesia. The ninth rib was removed on the left side in the usual manner. The chest was opened through the bed from which the ninth rib was removed. The ribs were then spread, exposing the left lower lobe of the lung. Adhesions were found between the diaphragm and the base of the lower lobe. These were cut carefully and all bleeding points were ligated as they were encountered with 000 chromic catgut sutures. The pulmonary ligament to the left lower lobe was then cut up to the point where the bronchial veins were seen coming from the hilum of the lung. The lung was then pushed upward exposing the heart and the thoracic aorta. The esophagus between these two structures above the dome of the diaphragm was seen to be broader and fuller than normal at this point. The reflection of the pleura over the esophagus was then split vertically and separated gradually by blunt dissection from this portion of the esophagus and the diverticulum. Gradually the entire diverticulum was exposed and pulled upward into the wound until its base, which measured about 4 centimeters in diameter, was visualized clearly. Two Carmault clamps were then placed across the base and the diverticulum was removed by cutting between these clamps.

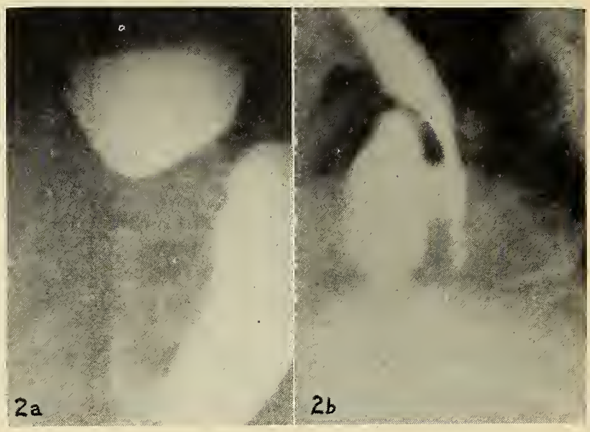

Fig. 2. Case 3. (a) Posterior-anterior x-ray view of large diverticulum of lower esophagus. Note x-ray resemblance to an aclasia of the esophagus. (b) Lateral x-ray view of same patient shows location of diverticulum just above the dome of the diaphragm.

The mucosa was phenolized and then inverted with an over and over running dulox suture. A second row of running suture was applied over the first row and then reinforced with about fifteen mattress sutures of fine silk. Several interrupted sutures were placed in the pleural covering of the esophagus to reapproximate these leaves loosely. Then a drain was placed down to the base of the esophageal incision in the form of a soft rubber catheter and this was brought out through the posterior end of the incision. The chest was closed in the usual manner, using through and through sutures of 00 chromic catgut. In order to facilitate the closure, four heavy silk sutures were placed around the ribs to approximate them. These were removed after the muscle closure had been effected. The skin was closed with a running lock silk suture. The patient left the operating room in good condition. After she had returned to her room, the end of the chest catheter was placed in a bottle of sterile saline. About 200 c.c. of serosanguineous fluid drained into the bottle during the first twenty-four hours. Three days later this tube was removed from the chest.

The pathologist reported the diverticulum to be 5 by 4 centimeters with an opening 2 centimeters in diameter. It had a fibrous wall 3 millimeters thick and was lined by white epithelium similar to that of the esophagus. Microscopically, the diverticulum was lined by stratified squamous epithelium and had a wall composed of bundles of smooth muscle and fibrous tissue. One cluster of mucous glands was noted in the submucosa.

Following the operation, nasal suction was continued for five days. Varco feedings, through the tube, were started on the second postoperative day and continued until the tube was removed five days later. On the ninth postoperative day she was placed on a soft diet. On the tenth day x-rays were taken which revealed a straight esophagus with only slight narrowing at the site of the resection. The chest contained only a small amount of fluid in the left costophrenic angle.

She has been rerayed following the operation at three-month intervals, and to date the esophagus appears essentially normal. The patient feels very well, has gained weight and has none of her former symptoms.

Gastric Diverticula

Case 4 in this series is that of a gastric diverticulum involving the cardia of the stomach. These lesions are found less often than are diverticula in any other part of the gastrointestinal tract. Rivers, Stevens and Kirklin found only twenty-five lesions in 91,532 routine x-ray studies at the Mayo Clinic since 1926. Four specimens were found at that institution in 3,662 postmortem examinations, and ten lesions were discovered in 11,234 exploratory operations on the stomach. Thus the incidence varies from one in 1,000 to about one in 4,000 cases. Forty-three per cent of their lesions were located in the cardia, 43 per cent in the pylorus and 14 per cent in the fundus of the stomach.

Case 4.—Mr. R. D., aged twenty-two, came in to see me on February 25, 1946. He complained of occasional bouts of epigastric pain, failure to gain weight, and halitosis for which he was unable to find relief. A general examination was essentially negative and he was advised to have gastrointestinal studies, which were done March 4. The upper gastrointestinal tract was normal except for a large diverticulum extending outward from the cardiac portion of the stomach on the lesser curvature just below the esophageal hiatus (Fig. 3). He was advised of the nature of his lesion and told that it could be removed if he felt that his symptoms warranted it. He felt that they did, but before he could be operated upon for this lesion he was seen for a massive rectal hemorrhage and was operated upon for a bleeding Meckel's diverticulum. This report will be given later in detail as Case 14.

Duodenal Diverticula

Next to the colon, the duodenum is the most common site of diverticula. Several excellent articles have been written on this subject, by Ferguson, and Cameron, Lahey, Pearse, Edwards, and most recently Arthur Collins of Duluth in the March, 1947, issue of MINNESOTA MEDICINE. Beaver and Boland each have reported acute perforations of duodenal diverticula. In view of the many articles on this subject, I will make no attempt to review the history, treatment and complications of these lesions, but should like to confine my remarks to their etiology.

Numerous theories have been proposed to explain the high frequency of these lesions in the duodenum. None seems adequate to me to explain all of these pouches and therefore, I would like to suggest another explanation to account for the diverticula of the third part of the duodenum, in particular. I believe, like most authors, that the infrequent lesions of the first part of the duodenum are probably secondary to ulcers which have weakened the wall in this area. Secondly, I believe the pouches of the second part of the duodenum form in the weak areas produced by the entrance of the common bile and pancreatic ducts and their accompanying blood vessels. This is the general opinion held by most authors. However, I have not found a good explanation for the large mushroom type of pouches seen in the third part of the duodenum. Those formed in this area, cephalad to the point where the mesenteric vessels cross the duodenum, I believe, arise as the result of increased intraluminal pressure which reaches a maximum just proximal to the point of this crossing. When a partial obstruction of the duodenum exists at the mesenteric crossing, a high intraluminal pressure develops just proximal to this point as the result of peristaltic waves passing down the duodenum. Just why some vessels produce a partial obstruction I am not prepared to say. A number of different factors may be responsible, such as short mesentery, lumbar lordosis or heavy loops of small bowel. The patient to be reported had a very large duodenal loop cephalad to these vessels. It was about 50 per cent larger than normal, indicating a probable partial obstruction where the mesenteric vessels cross the duodenum.

A summary of nine duodenal diverticula encountered in my practice, including a detailed report of the operation in this one case, follows:

Case 5.—Mr. V. J., aged twenty-three, came in on September 19, 1944, with a history of recurrent epigastric pain. X-rays and fluoroscopic examination made after the barium meal showed a fairly large duodenal ulcer and a small diverticulum in the first portion of the duodenum. He was placed on an ulcer regimen and made a good recovery. The x-rays revealed a small stalk connecting the diverticulum with the floor of the ulcer, revealing the etiology of this lesion to be a duodenal ulcer.

Case 6.—Mrs. H. J., aged fifty-three, had a history of epigastric pain and tenderness in the epigastrium. On November 29, 1944, films and fluoroscopic examination was done. These revealed a scar of a healed duodenal ulcer and a small diverticulum in the second portion of the duodenum. This patient was placed on ulcer treatment. She has had intermittent exacerbations of her ulcer symptoms, but it is difficult to evaluate the role that the diverticulum plays, if any, in the causation of her symptoms.

Case 7.—Mr. A. H. D., aged sixty-three, complained chiefly of "heart burn," also some intolerance to fatty foods. On April 27, 1946, he had upper gastrointestinal studies done. These revealed a moderate amount of pylorospasm, an ulcer crater in the duodenal bulb and also a diverticulum of the descending portion of the duodenum. He was placed on ulcer management and made a good recovery.

Case 8.—Mrs. A. H., aged sixty-nine, had a history of recurring pains in the left upper epigastrium immediately after meals. She had noted these symptoms for the past two years but they had become more frequent of late. On December 29, 1945, she had gastrointestinal studies done. These showed approximately the upper three-

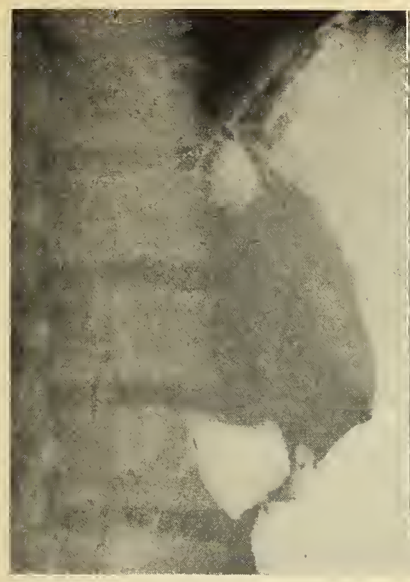

Fig. 3. Case 4. Oblique x-ray view of stomach shows diverticulum high on lesser curvature near entrance of esophagus.

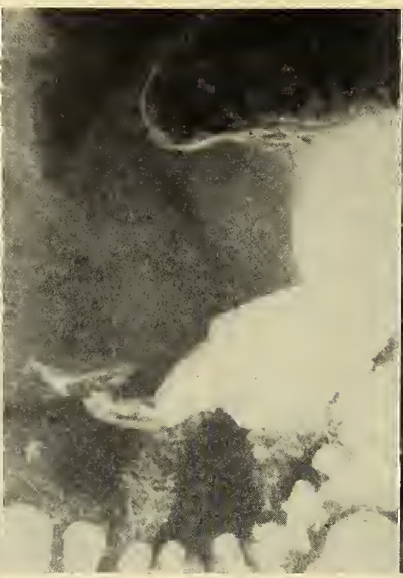

Fig. 4. Case 10. Oblique x-ray view of stomach, cap and duodenum, shows small diverticulum of second portion of the duodenum.

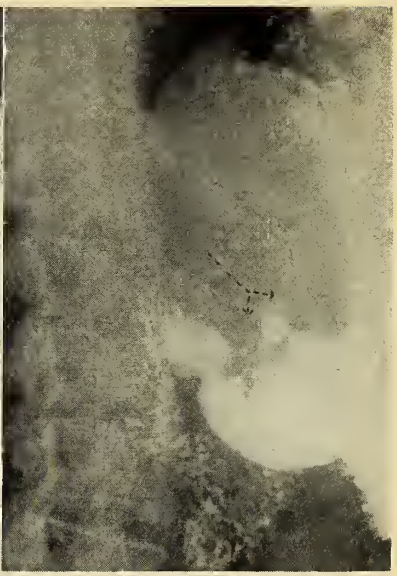

Fig. 5. Case 11. Oblique x-ray view of stomach, cap and duodenum, shows moderate-sized diverticulum of third portion of the duodenum.

quarters of the stomach to be herniated into the thoracic cavity, through the esophageal hiatus. There was an associated diverticulum of the descending portion of the duodenal loop. Surgical repair of the diaphragmatic hernia was suggested, but the patient declined operation because of her age.

Case 9.—Mrs. M. L., aged sixty-five, came in on September 24, 1945, for relief of her symptoms which consisted of pains in the left upper abdomen radiating into the rectum. This patient had had her left eye removed one month previous to this examination. A malignant melanoma had been found. Upper gastrointestinal and colon x-rays were done. These revealed a normal colon, hypertrophic gastritis and a diverticulum of the second portion of the duodenum. This patient has since died from liver matastases from the primary malignant melanoma of the choroid plexus of the eye.

Case 10.—Mrs. I. N., aged fifty-nine, complained of recurrent attacks of pain in the epigastrium which radiated into the back. On October 16, 1946, a complete gastrointestinal study was done and was negative except for a small diverticulum of the second portion of the duodenum (Fig. 4). A gall bladder study was likewise negative. This patient's symptoms are probably due to the diverticulum, but have not been considered severe enough to warrant operation.

Case 11.—Mrs. M. N., aged fifty-four, was first seen by me on January 10, 1944. She gave a history of epigastric pain radiating into her back, nausea and vomiting. On January 14, 1944, gastrointestinal studies were done. These showed no evidence of gastric or duodenal ulcer or cancer. However, they did show a large diverticulum of the third portion of the duodenum with retained food (Fig. 5). A six-hour examination showed barium still in the diverticulum. Since this study, she has had another bout of severe pain, associated with nausea and vomiting. This has been the sixth such episode in the past ten years, with each episode she has been hospitalized and intravenous fluids have been given from one to several days before the vomiting could be controlled. Operation, I feel, is definitely indicated in this case, but so far has not been carried out.

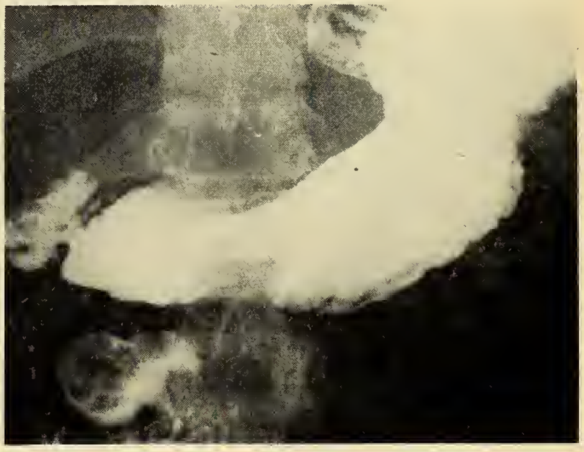

Fig. 6. Case 12. Anterior-posterior x-ray view of stomach, cap and duodenum, shows mushroom type of diverticulum in the third portion of the duodenum.

Case 12.—Mrs. R. E., aged thirty-two, was first seen on January 31, 1947. She gave a history of intermittent bouts of pain in the epigastrium which sometimes radiated into her back, associated with nausea and sometimes vomiting. Certain foods seemed to aggravate this condition. However, she always had a tender spot in the right lower epigastrium. For the month previous to the examination, she ran a fever from 99° to 100° F. every afternoon.

She had been advised on previous occasions to have gastrointestinal and gall-bladder x-rays, but had not done so until February 5, 1947. This examination revealed a deformed duodenal bulb due to an old healed ulcer. She also had a large duodenal diverticulum measuring approximately 5.5 centimeters in its greatest diameter (Fig. 6). The roentgenologist reported that considerable pain and tenderness were elicited when pressure was exerted on the diverticulum but not over the duodenal cap. The diverticulum was located at the junction of the second and third portions of the duodenum on the lesser curvature side. Within the diverticulum there were some rarefactions which probably represented retained food. After four hours, the diverticulum still retained considerable barium. Chest and gall-bladder x-rays were negative for abnormalities.

On March 8, 1947, under sodium pentothal, curare and nitrous oxide anesthesia, a diverticulectomy was performed. A high right rectus incision was made and the rectus muscle was retracted laterally. The stomach and duodenum were examined. The scar from the old duodenal ulcer was found but no evidence of an active ulcer could be made out. The duodenum was quite large and redundant. The duodenal portion of the gastrocolic omentum was opened, exposing the descending portion of the duodenum; the superior mesenteric vessels were located and retracted medially.

The diverticulum was then seen on the mesenteric border just lateral to the point at which the mesenteric vessels crossed the duodenum. Several small blood vessels between the pancreas and the duodenum were clamped, cut and tied off. The diverticulum was gradually pulled out from beneath the head of the pancreas under which it was hidden. The diverticulum had a second small pouch projecting from the medial side near the base. After freeing the muscular fibers which constricted the neck, it was found to have a base measuring about 3 centimeters in diameter. The base was then clamped with two Carmault forceps and cut between the clamps. The mucosa was phenolized and a running dulox suture placed over the clamp to approximate the edges. After removing the clamp, a second row of dulox sutures was taken and this row was reinforced with an interrupted row of silk sutures. The gastrocolic omentum was then closed with a few interrupted sutures. The appendix was located and found to be quite injected; it was amputated and the stump inverted with a purse string suture.

Gastric suction was started following the operation. The tube was left in place for three days and the patient was given the usual postoperative care, including intravenous fluids and penicillin. On the fourth postoperative day, she was able to take soft foods. She made an uneventful convalescence and left the hospital on the ninth postoperative day.

After the diverticulum was removed it measured 3.5 centimeters in length and 2.5 centimeters in width. It was attached by a broad neck and had a thin wall lined with mucosa. Microscopically, the diverticulum was lined by small bowel type of mucosa, the outside of which was a small amount of fibrous tissue and smooth muscle.

The patient was re-examined by x-ray one month following the operation and showed a normal continuity of the duodenum and jejunum where the diverticulum was removed. She has been able to eat all nonirritating foods and has been completely free from pain and soreness in the epigastrium. It is undoubtedly too soon to know whether her symptoms have been relieved completely and permanently. The young woman, who happens to be a graduate nurse, states that she feels like a different person already and seems confident that she is cured of her troubles.

Case 13.—Mrs. M. L., aged sixty-six, first consulted me on March 11, 1947. Her symptoms were chiefly epigastric in character, but extremely vague in nature. Abdominal findings were essentially negative. A gastrointestinal study on April 4, 1947, revealed a normal esophagus, stomach and duodenum with a moderately large diverticulum of the third portion of the duodenum near the duodeno-jejunal junction. It is hard to know how much her symptoms are attributal to the diverticulum. Her case will be studied further before any definite conclusions can be drawn relative to the role that this lesion plays in her symptomatology.

Small Bowel Diverticula

Diverticula of the jejunum and ileum other than a Meckel's are rare. Only a few cases have been reported in the literature. One such case was reported to this society by Dr. James A. Johnson in December, 1944. According to him, Kozium and Jennings, reporting in 1941, found only one hundred and eighty-seven cases recorded in the literature. There are no cases in this series of a small bowel lesion other than the Meckel's diverticulum to be reported next.

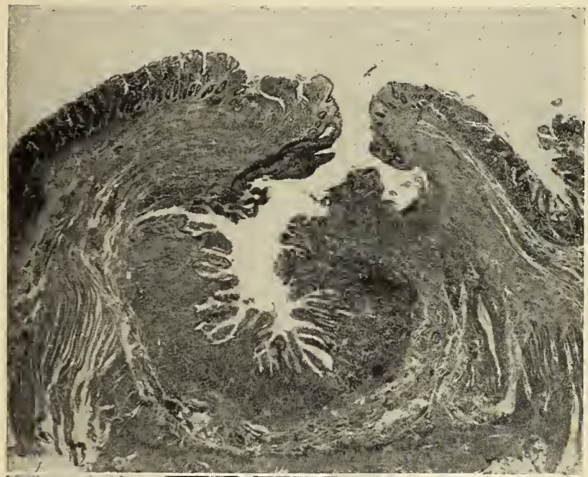
Meckel's Diverticulum

The so-called Meckel's diverticulum is probably the only true congenital diverticulum found in the entire alimentary tract. As is well known, it represents the persistent ileal end of the omphalomesenteric or viteline duct which in early fetal life connects the mid-gut with the yolk sac. Normally the duct closes in the fifth week of fetal life. It is found in about 2 per cent of all people, with a ratio of about two males to one female. It is usually found about one to three feet from the ileocecal valve, although it may be found anywhere from the duodenum to the cecum. About 25 per cent of these lesions contain pancreatic tissue, gastric, jejunal or duodenal mucosa.

The chief complications arise from intestinal obstruction, diverticulitis, perforation or hemorrhage. It may become strangulated or form the head of an intussusception. It has been known to contain foreign bodies and neoplasms. Hemorrhage and intussusception from these lesions are seen most often in infants. Ladd and Gross report twenty-six cases of hemorrhage and seventeen cases of intussusception in seventy-three patients operated upon by them. Strangulation and diverticulitis are more often seen in adults, although hemorrhage is not uncommon in young adults between seventeen and twenty-two years. A bleeding Meckel's lesion should always be considered in painless massive hemorrhage from the rectum in this age group.

Case 14.—Mr. R. D., aged twenty-two, called me to his home on the evening of March 18, 1946. He had been having frequent bloody stools for the past forty-eight hours and profound hemorrhage with the last two bowel movements. The patient was almost completely exsanguinated from blood loss. His blood pressure was 86/46. He was taken to the hospital by ambulance, where he was given 3 pints of blood and 2 liters of 5 per cent glucose in saline during the night. He was also given 8 milligrams of vitamin K and Coaglin (Ciba) intramuscularly. Oxygen was given by the BLB mask. He was given another 3 pints of blood the following day. By the end of that day, his hemoglobin was 53 per cent, his bleeding time was 1 minute and 55 seconds and clotting time 2 minutes. A proctoscopic examination was not satisfactory owing to the large amount of blood in the bowel. The lower rectum was essentially negative.

He continued to have bloody stools for the next two days and more blood was given each day. During the first ninety-six hours in the hospital, he had 9 pints of blood, 94 milligrams of vitamin K, several ampules of Coaglin (Ciba), and several pints of 5 per cent glucose in saline. On March 23, he had an x-ray study of his colon. This revealed a very ragged outline to the colon and terminal ileum which filled with barium for about 18 inches. This was interpreted as representing blood in the colon and terminal ileum, otherwise the x-ray findings were negative. In view of the fact that he had not been nauseated or vomited blood, we felt certain that he was not bleeding from the gastric diverticulum; therefore, by indirect deduction a diagnosis of bleeding Meckel's diverticulum was made.



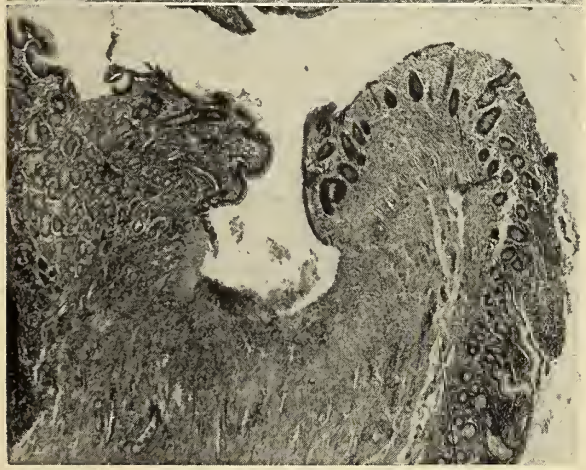


Fig. 7. (*above*) Case 14. Low-power photomicrograph shows ulcer and gastric mucosa in fundus of Meckel's diverticulum.

Fig. 8. (*below*) Case 14. High-power photomicrograph shows bleeding ulcer in ectopic gastric mucosa of Meckel's diverticulum.

About two o'clock p.m., March 23, 1946, under sodium pentothal, cyclopropane and curare anesthesia, a right rectus incision was made. The rectus muscle was retracted laterally and the abdomen opened. The cecum had a very long mesentery allowing it to be pulled well outside the abdomen with ease. No lesion was found in the cecum but there was much old blood within it, as well as in the lower 6 or 8 inches of the terminal ileum. A Meckel's diverticulum was found about 2 feet from the ileocecal valve. It measured 2 by 2 by 4 centimeters. The distal 1 centimeter was firm and solid in consistency. It had a mesentery of its own, containing moderate-sized blood vessels. The diverticulum was amputated transversely to the long axis of the ileum. Wangensteen bowel clamps were used for this purpose. A running dulox suture was placed over the clamp after first using phenol and alcohol on the cut edges. Then the clamp was withdrawn and the suture tightened, inverting the mucous membrane. The suture was reinforced with a second layer of dulox catgut and then the serosa was inverted with a row of mattress silk suture. No blood was found proximal to the Mekel's diverticulum. The appendix was missing, as it had been removed at a previous operation. The stomach was examined because of the presence of the diverticulum high in the cardia which had previously been disclosed one month before. This diverticulum could be palpated and apparently had an extremely thin wall. The abdomen was then closed in layers in the usual manner.

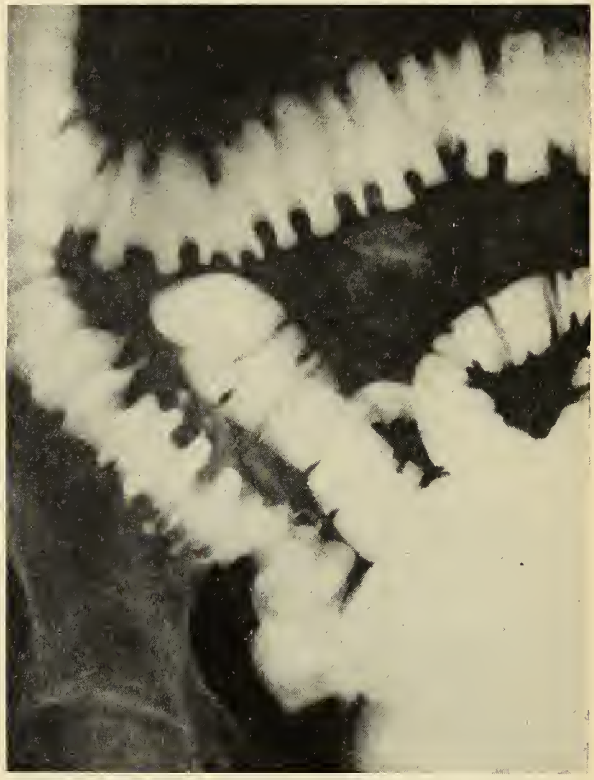

Fig. 9. Diverticulum of colon. Typical x-ray picture of multiple diverticula of colon.

At the conclusion of the operation, the Meckel's lesion was opened and a small ulcer was noted in the fundus. Blood was seen to come from a marginal vessel on the circumference of its base. The outer surface of the diverticulum was pale, smooth and shiny. It was about 25 millimeters long and 16 millimeters wide. The wall was about 2 millimeters thick and there was a marked stenosis about 10 millimeters from the tip, after which the lumen opened out again. The diverticulum was lined with mucosa with transverse rugae. There was a shallow ulcer 3 millimeters in diameter just to the side of the constriction on the proximal side. Microscopically, the upper three-fourths of the diverticulum was lined with intestinal mucosa; the smooth area near the tip and the extra pocket were lined by gastric (fundic) mucosa. The ulcer was partially covered by a single layer of epithelium (Figs. 7 and 8).

Following the operation, gastric suction through an indwelling nasal tube was started for twenty-four hours. He was given two more pints of blood and two liters of 5 per cent glucose in saline. He then made an uneventful convalescence and left the hospital on the eleventh postoperative day. A total of 4,825 cubic centimeters, or roughly 11 pints, of blood were given in order to restore the major part of that which was lost. During the past year, he has remained entirely well except for his one complaint of halitosis, which we feel is due no doubt to fermentation of food in the diverticulum in the cardia of his stomach. A transthoracic approach is planned for the removal of this lesion sometime this coming year.

Diverticula of the Colon

Diverticula of the colon occur quite frequently in the older age groups (Fig. 9). Most roentgenologists report finding these lesions chiefly in the sigmoid colon in about 12 to 16 per cent of all colon studies. The chief significance of these lesions lies in the fact that about 15 per cent become inflamed. A smaller percentage cause general peritonitis and obstruction due to peridiverticulitis. A few will develop internal or external fistulae. Those causing obstruction may be difficult to differentiate from neoplasms. The sigmoid colon being a common site for both conditions, the two may be easily confused. Not until the lesion has been resected may a definite diagnosis be made at times. However, with the use of penicillin and the sulfonamide drugs today, most cases of diverticulitis will resolve on a restricted bland diet combined with the use of large amounts of mineral oil.

Conclusions

1. Single-stage resections of diverticula of the upper and lower esophagus may be safely carried out today, even with lesions having a large base of attachment.

2. Lesions of the duodenum not infrequently cause sufficient symptoms to warrant their removal. Whenever they are large enough to retain food or barium for more than four hours, I think that they should be removed because of the hazard of perforation, obstruction or hemorrhage.

3. Diverticula of the third part of the duodenum are thought to be caused by partial obstruction of the duodenum resulting from pressure caused by the mesenteric vessels crossing this part of the duodenum.

4. A ragged barium x-ray pattern in the colon and terminal ileum is indicative of blood in these parts. Whenever these findings are noted in the absence of other demonstrable pathologic conditions in the colon, a bleeding Meckel's diverticulum should be considered.

Discussion

Kenneth A. Phelps, M.D.: Thank you very much for asking me to discuss Dr. Scott's excellent paper. The only part of his paper I am at all qualified to discuss is diverticulum of the pharynx, which he refers to as "pharyngo-esophageal." Before long we will eliminate one part of this term and refer to diverticula which are anatomically pharyngeal as "pharyngeal" diverticula and not "pharyngo-esophageal."

I have had the opportunity of seeing about twenty-five of these cases and have used the esophagoscope to help the surgeon during the operation. It has been of great interest to watch different surgeons handle the same problem. The method of closing the stump of the sac has varied from a careful suturing, layer by layer, to no suturing whatever, merely a clamp being applied and allowed to remain for several days until it sloughs off. All have closed satisfactorily.

Operation should be advised even if the patient is seen when the diverticulum is small and the symptoms are insignificant. The sac always enlarges, and the patient's discomfort will increase, making operation a necessity. As a general rule, the smaller the sac, the easier the operation is, on both patient and surgeon.

In the few cases I have seen I have been surprised at the number of complications, such as paralysis of the recurrent laryngeal nerve, pneumothorax, postoperative atelectasis, fistula, postoperative stenosis, recurrence of the sac, but no mediastinitis.

Dr. Scott's handling of his patient who aspirated vomitus on the night of the operation, deserves commendation. He inserted a rubber intratracheal anesthetic tube and through this passed aspirating catheters. He was thus able to keep up more or less continuous bronchial aspiration for several hours, a thing that would have been impossible had a bronchoscope been employed. This technique could be recommended as a good method of draining the bronchi in any case of postoperative atelectasis.

I enjoyed Dr. Scott's paper tremendously and I appreciate your giving me this opportunity to discuss it.

CONSTRICTIVE FIBRINO-PLEURISY

N. K. JENSEN, M.D.
Minneapolis, Minnesota

The development of chemotherapy and antibotics over the past ten years has brought about considerable confusion in the management of empyema. Following the studies of the Empyema Commission[4] in the First World War, the treatment of empyema became standardized. This standardization was based on well-tested and rational concepts, the major consideration of which may be summarized as follows:

1. Vital capacity is protected during the acute phase of the pneumonic process by avoidance of open thoracotomy and reduction of the pleural effusion by needle aspiration.

2. The pleural pocket is completely evacuated and kept so by adequate dependent drainage as soon as the lung has become firmly adherent to the chest wall about the margins of the pocket.

3. The sealed-off uninvolved pleural space is strictly avoided upon draining the empyema pocket, for to expose the uninvolved pleura frequently results in further pulmonary collapse with a sucking chest wound and a massive empyema from dissemination of the infectious contents of the pleural pocket.

4. Re-expansion of the pulmonary tissue, collapsed by the space-filling empyema, is left to the slow process of fibrous tissue contraction and obliteration of the space.

The object of this standardized management of empyema is twofold: first, to reduce the mortality of empyema and, second, to avoid the development of chronic empyema. In the period from 1918 to the introduction of the sulfonamides, empyema, as known to the Empyema Commission, regularly occurred, and by all odds its best management was that outlined by the Commission.

With the introduction of the sulfonamides, and to an even greater extent with the introduction of penicillin, empyema has become less frequent and much less standardized in its manifestations and evolution. The most confusing difference is that the fluid fails to become purulent on schedule, and as a result treatment by aspiration may be greatly prolonged. However, under this management, despite the apparent sterilization of the empyema pocket, absorption of the fluid often fails to occur and in a distressing percentage of cases the fluid loculates and organizes. Removal of the fluid now is no longer possible by aspiration, and open drainage is resorted to. Re-expansion of the lung frequently fails to occur despite the open drainage and secondary infection of the pocket follows. This result is a chronic empyema very incapacitating and difficult to cure.

Chronic empyema was not totally avoided in the period prior to the introduction of the sulfonamides and penicillin, but it probably occurred in a smaller percentage of the cases than now. In any event, either with antibiotics or without, open drainage of a pleural effusion which has been allowed to persist until it has clotted and loculated, or until the pus has become too thick, is followed by failure of the lung to re-expand in a fair percentage of cases.

Since the work of the Empyema Commission, a direct attack on the empyema pocket to bring about re-expansion of the lung, has generally been avoided. If re-expansion did not spontaneously occur with prolonged open drainage, the chest wall was deribbed and allowed to fall into the pleural space, bringing about its obliteration.

These principles in the management of both acute and chronic empyema were crystallized prior to the development of anesthetic agents and techniques which allow respiration to be easily maintained with wide thoracotomy, and before the discovery of effective antibiotics; that is, they were developed to make surgical treatment of empyema safe by avoiding open pneumothorax and dissemination of infectious material at a time when even the temporary occurrence of either was frequently disastrous.

A further factor which has conditioned the management of chronic empyema was the misconception commonly held that in instances when the lung failed to re-expand, following open drainage, the failure of expansion was due to thickening and contraction of the visceral pleura.

Theoretically, a more radical mechanical removal of the fluid and fibrin from the pleural space, allowing immediate complete expansion of the lung, offers the possibility of shortening the recovery time and preserving respiratory function. Consequently many surgeons have attempted this procedure since the appearance of a brief report by Fowler[3] in 1893. He excised the fibrous envelope of a chronic empyema cavity and allowed the lung to re-expand. Delorme[2] at about this same time carried out excision of a localized tuberculous empyema pocket with freeing of the underlying lung and later extended his experiences. Both Fowler and Delorme understood that in any empyema it is not thickened pleura which makes up the wall of the empyema cavity, but rather an organized layer of fibrin which is gradually converted to dense fibrous tissue. This layer only gradually fuses with the pleura. Unfortunately this concept was lost, and soon the erroneous idea that thickened pleura constituted the wall of the empyema cavity came to have wide acceptance.

Lilienthal[5] in 1915 was the first to treat acute empyema by decortication, and he carried out the procedure much as we do today except that he hesitated to separate the lung from the mediastinal pleura, or thoracic wall. He feared the dissemination of infection. Ware[7] also reported a series, in 1917, of acute empyemas treated by decortication. Many others, from the time of Fowler and Delorme to the beginning of World War I, reported on the treatment of empyema by decortication, but due to the constant hazards of anesthesia in open thoracotomy, the inability to prevent the dissemination of infection, and inadequate means of replacing blood loss, the procedure never gained wide acceptance.

Initially, pulmonary decortication was revived in World War II as a procedure to deal with sterile constrictive fibrino-pleurisy accompanying massive hemothorax. The first such decortication was performed by Thomas H. Burford[1] in May of 1943. In the months that followed, this surgeon and gradually many others, working first in the Mediterranean theater and then throughout the armed forces, became more aggressive. By the last of 1943 frank empyemas resulting from infected hemothoraces were being drained by rib-resection, and subsequently, as the patient's sepsis subsided, decortication was carried out. The type of organism recovered from the pleural pocket was not an influencing factor in electing decortication, but rather the degree of pulmonary compression present. With the introduction of penicillin early in 1944 for the treatment of surgical infections, the preliminary rib-resection drainage was largely abandoned and primary decortication of grossly purulent hemothoraces became routine.

I have chosen the title, Constrictive Fibrino-Pleurisy, for this paper as I wish to emphasize that hemothorax is not the only intrapleural pathological process which results in compression of a lung and its imprisonment by a dense shell of organized and fibrosed fibrin. Universally this process occurs sooner or later in the development of every neglected empyema. Blood introduced into the pleural cavity is irritating to the pleura, and promptly there is laid down over the pleural surfaces a layer of fibrin. This undergoes organization by the ingrowth of fibroblasts and capillaries. Exactly the same thing happens in a bacterial pleurisy. The subpleural inflammatory process within the lung irritates the pleura; a pleural effusion forms and fibrin is laid down over the pleura. The effusion gradually becomes more purulent; fibrin clots frequently form within the effusion and organization of the fibrin deposit on the pleura occurs. However the visceral pleura itself is not thickened, if at all, until many weeks later. In 1893 Delorme removed, at autopsy, a leatherlike membrane from the lung of a patient who had had tuberculous pleurisy for six months. The underlying lung was healthy and could be detached, its pleura still thin and elastic. Paulson[6] has recently reported successful decortication of thoracic empyemas which have existed for more than a year. These followed such various primary pleural effusions as postpneumonic pleurisy, subphrenic abscess, and hemothorax.

The following seven cases* are reported to illustrate the similarity between the constrictive fibrino-pleurisy produced by pyogenic infections of the pleura, tuberculous infections of the pleura, and hemothorax. The hemothorax cases are of further interest as they illustrate some of the mechanism producing hemothorax in civilian life, and demonstrate the various stages of constrictive fibrino-pleurisy associated with hemothorax.

Case Reports

Case 1.—A nineteen-year-old boy accidentally shot by a .22 caliber pistol at close range was admitted to St. Mary's Hospital two hours after the injury. The bullet had passed through the soft tissues on the dorsum of the right forearm and entered the thorax through the sternum. It traversed the left upper lobe and left the thorax through an interspace to lodge in the subscapular area.

The patient had no pulmonary symptoms on admission, but both physical signs and roentgen examination demonstrated a closed pneumothorax on the left of moderate degree, and some fluid at the base almost covering the diaphragm which was elevated three interspaces. There was no dyspnea. Color was good and pain was limited to the right forearm.

The fluid in the left chest increased in the next twenty-four hours, completely covering the diaphragm and reaching up to the eighth rib posteriorly. There was a slight shift of the mediastinum and no dyspnea. A total of 750 c.c. of dark blood and 200 c.c. of air were aspirated at this time. Full re-expansion of the lung followed, with only a small amount of fluid remaining in the costophrenic angles. Subsequently the residual fluid absorbed and the roentgenogram studies revealed a normal-appearing chest.

This case illustrates that prompt re-expansion of the lung by complete aspiration of the irritating pleural fluid prevents fibrino-pleurisy and subsequent constrictive pleuritis.

Case 2.—Three weeks prior to admission to St. Mary's Hospital this eleven-year-old boy fell in the snow and was stabbed in the back by an unrecognized object. Examination immediately after the injury revealed a small puncture wound, and only some days later did symptoms suggestive of a pleurisy develop, associated with moderate dyspnea. A roentgenogram on admission to the hospital revealed a massive pleural effusion extending almost to the apex of the right pleural cavity with marked compression of the lung and a small pointed foreign body, 3 cm. in length, occupying the costophrenic angle (Fig. 1).

---

*Three of the cases of hemothorax are from the Thoracic Surgical Service of the United States Veterans Hospital, Minneapolis, Minnesota. Dr. Penn Harper performed these decortications under my supervision. The other five cases are from the Minneapolis St. Mary's Hospital service of my senior associate, Dr. T. J. Kinsella, and were cared for jointly.

A diagnosis of hemothorax was made, and thoracotomy with evacuation of the hemothorax and decortication of the lung was carried out promptly. The postoperative course was entirely uneventful and two weeks later the patient was discharged from the hospital with complete re-expansion of the lung and good respiratory motion on both sides (Fig. 2).

This very excellent result was possible because the decortication was carried out early. The peel was only about 5 to 8 mm. in thickness and came away from the pleural surfaces easily and without bleeding. Diaphragmatic mobilization was accomplished completely, as the peel could be removed from its entire surface. It moved well postoperatively and has continued to do so. The histologic condition of the peel removed in this case is illustrated and discussed later in this paper.

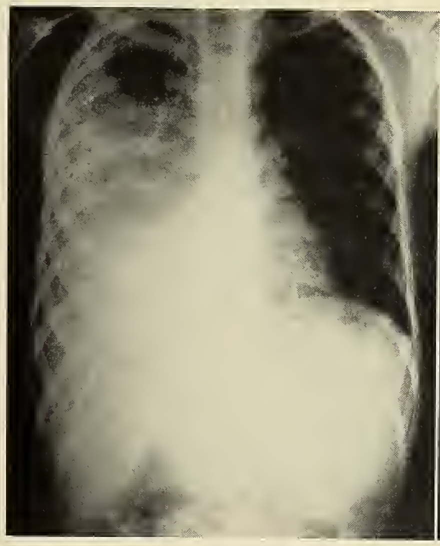

Fig. 1. Case 2. Admission roentgenogram of eleven-year-old boy three weeks after sustaining small puncture wound in posterior sixth intercostal space. Foreign body seen in last interspace proved to be a sliver of window-pane glass.

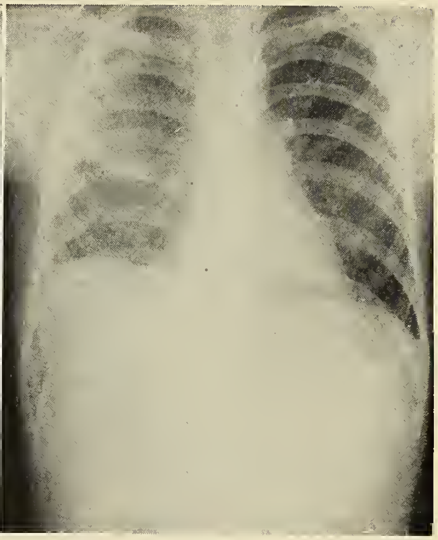

Fig. 2. Case 2. Roentgenogram two weeks after decortication, at time of discharge from hospital. Note fragment of glass has been removed from pleural space.

Case 3.—A twenty-four-year-old man sustained closed fractures of ribs 7, 8, and 9 on the left, and a severe head injury in an auto accident. He was unconscious for many hours and confused for several days. During this time his thoracic injury received little attention other than strapping which relieved his pain. Two weeks later severe pleuritic pain developed on the left accompanied by chills and fever. Despite several aspirations of the chest and vigorous systemic antibiotic therapy, the septic course persisted for the following three weeks. Marked weakness and weight loss resulted, and five weeks after injury, the patient was transferred to the Minneapolis Veterans Hospital.

Aspiration of the chest on admission to the Veterans Hospital demonstrated frank pus containing hemolytic streptococci. Dyspnea was marked at this time. A diagnosis of empyema was made and the patient treated vigorously by interpleural and parenteral penicillin with frequent aspirations of the chest. The infection was controlled but pulmonary re-expansion failed to occur, and after eighteen days a trochar thoracotomy with establishment of closed drainage was resorted to. Frequent pleural irrigations, with penicillin, and continuous negative pressure failed to bring about any pulmonary expansion over the next ten days. A roentgenogram of the chest at this time showed complete collapse of the left lung except for a small area of air-bearing tissue above the clavicle. The entire left thorax was filled with an empyema pocket reaching from above the third rib posteriorly to the eleventh inferiorly.

Nine weeks after injury the patient was transferred to the surgical service, and pulmonary decortication was carried out. Exploration revealed a typical hemothorax with thick peel over all the pleural surfaces. The peel separated easily from the pulmonary surfaces but was densely adherent to the parietal pleura. Care was taken to free the diaphragm but no effort was made to remove all the peel from the parietal surfaces. Bleeding was troublesome. Complete pulmonary expansion was obtained and the chest closed with three suction catheters in place. These were removed in seventy-two hours. Upon discharge from the hospital twelve days later, vital capacity had returned to 2,700 c.c. He was seen six weeks later, and a roentgenogram at this time showed only residual pleural thickening at the base.

This case is of interest in that the hemothorax was unrecognized and misinterpreted as a massive empyema for almost nine weeks of treatment in two different hospitals. It also illustrates that a closed hemothorax will become infected spontaneously and the infection responds to intrapleural and parenteral penicillin, and further that once constrictive fibrino-pleurisy has become established, pulmonary re-expansion can only be gained by decortication. The histologic picture of the peel removed in this case is illustrated and discussed later in this paper.

Case 4.—A thirty-six-year-old man, an office worker, developed a spontaneous pneumothorax which rapidly became a hemo-pneumothorax of such magnitude that he spent most of the first three weeks of his illness in an oxygen tent. Aspiration of 1,000 c.c. of dark wine-colored fluid on the twentieth day relieved the dyspnea. During the next two weeks, five more aspirations were carried out. He was admitted to the Veterans Hospital six weeks after onset of his illness.

Roentgenograms on admission demonstrated a massive pneumothorax. Five additional weeks of intrapleural and parenteral penicillin with frequent aspirations of the chest failed to re-expand the lung or control the severe staphylococcic infection which developed during this treatment. The first aspirations on admission were sterile, but the subsequent cultures showed staphylococci despite the penicillin.

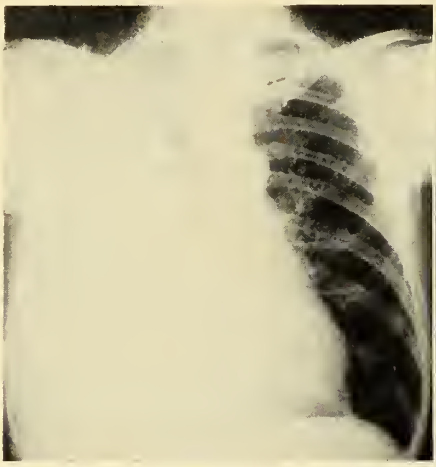

Fig. 3. Case 5. Roentgenogram on admission to hospital forty-nine days after injury. This shows the typical features of a massive hemothorax before attempted pleural drainage has created a pneumo-hemothorax. The only air-bearing lung remaining is in the upper medial portion of the pleural space. The remainder of the lung is completely collapsed in the paravertebral gutter.

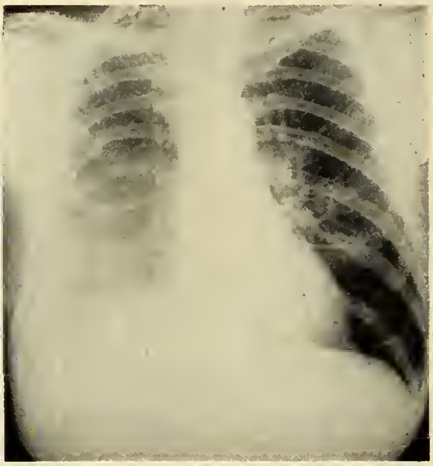

Fig. 4. Case 5. Roentgenogram three months after decortication. Lung is fully re-expanded, pleural space obliterated, considerable pleural thickening persists at the base. Peel was not removed from parietal pleural, and is thickest in this region.

Ten weeks after onset of the hemothorax, the patient was transferred to the surgical service and a decortication carried out. A typical hemothorax, grossly infected, was found. The peel separated easily from the visceral pleura but was densly adherent to the parietal pleura, from which it was removed only over the diaphragm. Excellent re-expansion was obtained and the chest closed with the usual three suction catheters.

Following decortication the patient's sepsis promptly subsided but six days later he again became febrile. A small basal pleural pocket was identified and drained by catheter. This patient's vital capacity just prior to decortication was 1,900 c.c. Two months later it was 3,000 c.c.

This case illustrates several interesting features. Hemothorax can occur without any trauma. Here, with the development of the spontaneous pneumothorax, an adhesion must have torn and subsequently bled. The true nature of the condition was unrecognized even after aspiration of a liter of "dark wine-colored fluid." On admission to the second hospital, the hemothorax, now six weeks old, became infected despite intrapleural and parenteral penicillin. Pulmonary re-expansion could not be accomplished until decortication was carried out, which in turn obliterated the pleural pocket and controlled the infection. The histologic picture of the peel will be discussed later.

Case 5.—A fifty-five-year-old male was admitted to the Veterans Hospital six weeks after falling when he tripped over a railroad tie. At the time of the fall on June 20, he sustained several minor lacerations, including one on the right anterior chest. He continued to work without noticeable symptoms until July 8 when dyspnea, inspiratory chest pain, weakness and weight loss incapacitated him. These symptoms persisted for the next month, accompanied by fever and progressive weakness. He entered the hospital on August 8. On admission, 500 c.c. of syrupy dark-red fluid was aspirated which contained hemolytic staphylococcus aureus.

Figure 3 shows the massive hemothorax present on admission. Decortication was carried out with complete re-expansion of the lung. The peel separated readily from the lung and with some difficulty from the diaphragm. It was not removed from the remaining parietal pleura. The usual closure with catheters was carried out. Healing per prium occurred, and the patient was ambulatory by the ninth postoperative day.

Figure 4 is a roentgenogram made three months after decortication. At this time the patient was asymptomatic and had regained 14 pounds.

This case is of interest because of the slow development of a massive hemothorax following minimal trauma and its subsequent spontaneous infection by hemolytic staphylococcus aureus. This man was septic on admission to the hospital and had been so for a month. His sepsis continued despite penicillin parenterally, but promptly subsided following decortication.

Case 6.—A fourteen-month-old infant was admitted to St. Mary's Hospital three weeks after the onset of left-sided pneumonia which had been followed by pleural effusion in six days. The infant had been treated with sulfamerizine from the time of onset of pneumonia, with normal temperature after the third day. The pleural effusion became massive with displacement of the heart to right, and catheter drainage was instituted the third week but was ineffective.

A roentgenogram on admission showed a massive clotted fibrino-thorax with marked displacement of the mediastinum. At this time the child's respiratory rate was above 60 in an oxygen tent. The pulse was 130 to 150 per minute. Thoracotomy with evacuation of the fibrin was performed under local anesthesia. Only partial expansion was obtained, as formal decortication could not be carried out completely. Postoperatively, the infant did well out of oxygen, and on discharge seven weeks later, the chest was closed and the left lung was functioning despite the greatly thickened pleura remaining. Pulmonary function could have been re-established much more quickly and effectively in this case

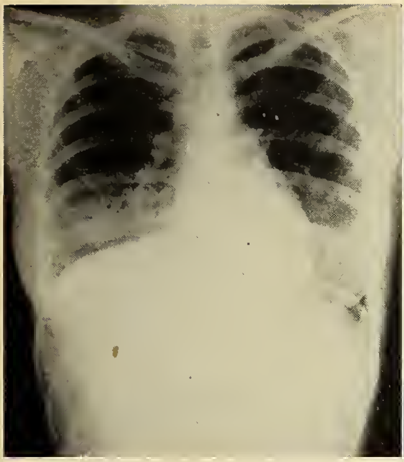

Fig. 5. Case 7. Roentgenogram one week after onset of illness showing parenchymal infiltration in right lower lung field. Etiology at this time undetermined. Sputum negative for acid-fast organisms on smear and concentration.

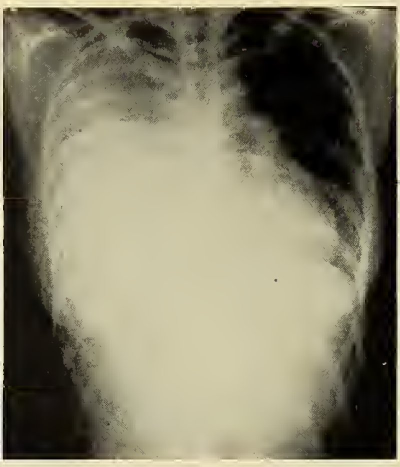

Fig. 6. Case 7. Roentgenogram seventeen days after onset of illness. Note the similarity to Figure 3. Massive pleural effusion gives same x-ray pictures as massive hemothorax and compresses lung in same fashion.

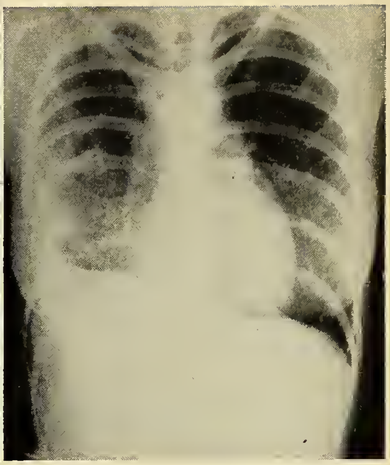

Fig. 7. Case 7. Chest roentgenogram three months after decortication. Lung expanded, pleural space obliterated, tuberculous process in lower lobe clearing.

had the patient been old enough to withstand wide costectomy with pulmonary and mediastinal liberation without great anesthetic difficulties.

Comment—The type of empyema developing in this case has become much more frequent since the introduction of sulfonamide drugs. Occasionally in the presulfonamide days, a pneumonic empyema would undergo autosterilizaton and fibrinous organization and clotting, with the production of a large intrapleural mass of gradually organizing fibrin. Subsequently, infection usually recurred with suppuration and the development of a massive chronic empyema overlying a collapsed bound-down lung. With the use of sulfonamides, however, sterilization of the empyema has occurred much more frequently, and fibrino-thorax has developed if the effusion has not been promptly and completely evacuated by adequate drainage.

Autosterilization or sterilization by the sulfonamide drugs occurs gradually and incompletely, during which time exudation of serum and fibrin continues, with organization of the fibrin overlying the pleural surfaces proceeding rapidly. Each day the irritating effusion persists, more fibrin is laid down on the pleural surfaces, and more of it undergoes fibroblastic organization. A constrictive fibrino-pleurisy is occurring. Drainage of the pocket after this process is well established (sometimes as early as three weeks) fails to re-expand the lung, and chronic empyema is established unless the lung be freed by decortication at time of drainage.

It may be that the treatment of early empyema by parenteral and intrapleural penicillin and needle aspiration will not result in this process so frequently. With penicillin, much more rapid sterilization is obtained, and in those patients I have followed, whose empyemas have promptly become sterile with penicillin, the purulent effusion has rapidly thinned out with loss of fibrin content and ever-increasing ease of aspiration. Satisfactory pulmonary expansion has occurred in these cases. Penicillin will not dissolve the fibrin already deposited on the pleural surfaces nor will it prevent its deposition unless it promptly sterilizes the pleura and the effusion is completely aspirated.

Case 7.—A nineteen-year-old girl was admitted to St. Mary's Hospital after seventeen days of illness which had its onset with pain in chest, dyspnea, mild dry cough, and fever. At time of admission she had been on a sulfonamide drug two weeks. Figure 5 shows the chest roentgenogram taken one week after onset of illness. Figure 6 shows the chest at time of admission. The patient was quite toxic with temperature ranging up to 103° Fahrenheit at this time. Aspiration revealed cloudy amber fluid, and 650 c.c. were removed.

Continued aspirations failed to expand the lung, and on the thirty-ninth hospital day decortication was carried out (fifty-three days after onset). The large pleural pocket contained syrupy, greenish-yellow, slightly sour fluid with several fibrin masses floating free. The peel was from 3 to 8 mm. thick and separated easily from the visceral pleural surfaces and diaphragm. It was not removed from the parietal pleura. Figure 7 shows the chest three months later.

Postoperatively the patient did very well. The operative wound healed by first intention, and on the eighth postoperative day the patient became completely afebrile and remained so for the first time since the onset of the illness.

Initially the possibility of a tuberculous pneumonia with tuberculous pleurisy was suspected. The first pleural fluid removed was sterile. Repeated sputum examinations were negative for acid-fast organisms. Later a nonhemolytic streptococcus was recovered from the pleural effusion. At the time of decortication, the diagnosis was postpneumonia empyema with constrictive fibrino-pleurisy. Culture of the pus obtained, however, revealed both non-hemolytic streptococcus and tubercle bacilli, and the peel showed tuberculosis on microscopic examination. Due to the development of sensitivity to penicillin, this drug had been discontinued ten days before operation. Three days preoperatively, simply as the only available antibiotic which the patient could tolerate, 1.8 grams of streptomycin daily was started. This was continued for seven days postoperatively. She also was given 400,000 units of penicillin daily along with benadryl for the first eleven postoperative days, as tests had shown the streptococcus to be insensitive to

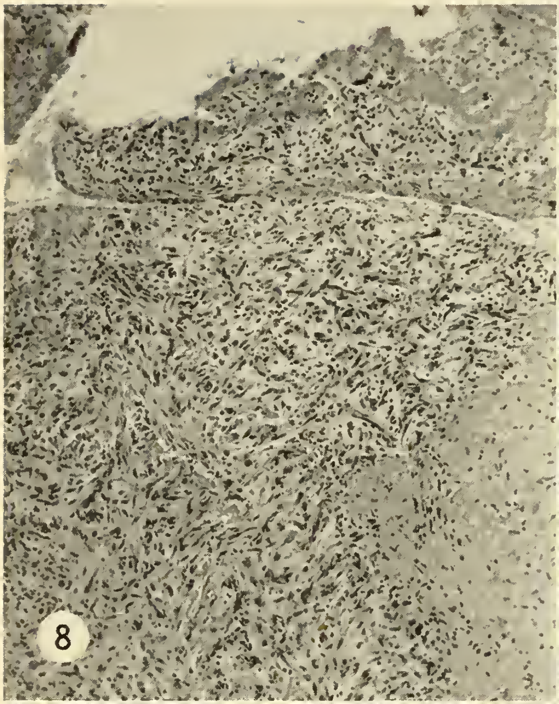

Fig. 8. Section of a peel removed twenty-one days after formation of a sterile hemothorax (Case 2). Note absence of blood vessels and leukocytes. Masses of fibrin are still being actively infiltrated by fibroblasts.

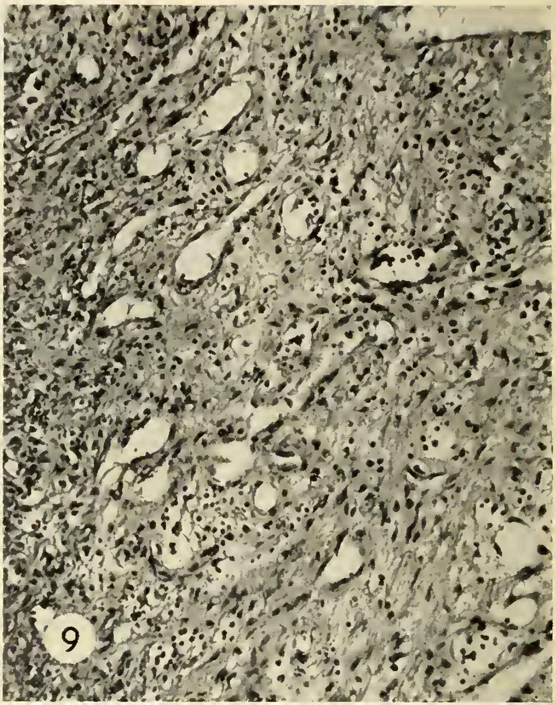

Fig. 9. Peel removed in Case 3. Hemothorax nine weeks old. Note rich vascularity, complete infiltration of fibrin by fibroblasts, and scarcity of leukocytes. Removal of this peel was accompanied by brisk bleeding.

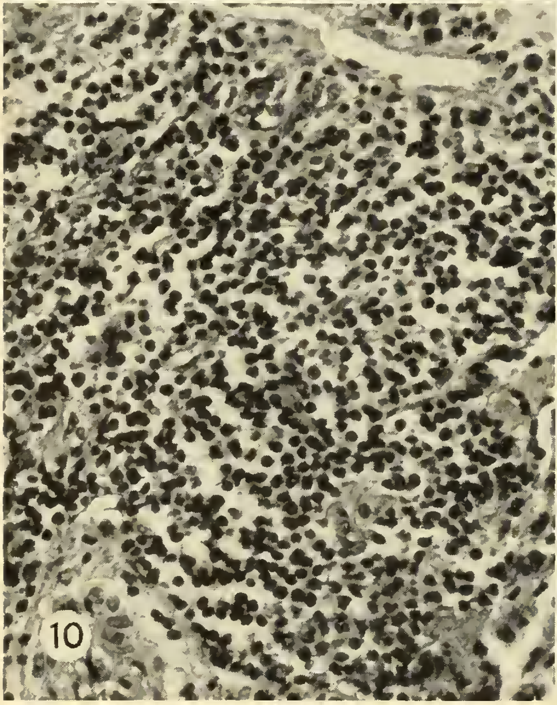

Fig. 10. Section of peel removed in Case 4. Infected hemothorax of ten weeks' duration. Leukocytic infiltration very well shown, vascularity marked.

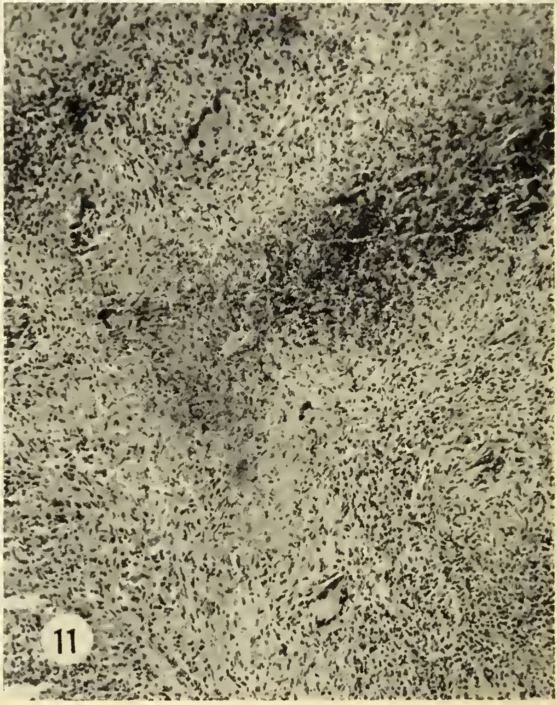

Fig. 11. Case 7. This peel is approximately eight weeks old. It shows the same basic features as those arising in hemothorax and in pyogenic empyemas. In addition, the giant cells and necrosis of tuberculosis are apparent.

streptomycin but very sensitive to penicillin. During these days the penicillin was well tolerated.

This patient certainly was saved a very prolonged and difficult course of chronic tuberculous empyema complicated by mixed pyogenic infection. She unquestionably would have come to thoracoplasty for obliteration of the large pleural space and even at final recovery would have been left with a bound-down seriously crippled lung. However, decortication of the lung in tuberculous empyemas is not unreservedly recommended. The considerations involved in the treatment of tuberculous empyema are beyond the scope of this paper.

Comparison of the fibrino-fibrous peels or membranes from the pleural surfaces of the lungs in these cases is of interest:

In the first case, no opportunity for a peel to form was allowed and there is none to show. Case 2 was twenty-one days old, that is, the hemothorax had existed twenty-one days. Figure 8 shows this peel. Note the fibrin being invaded by the actively poliferating fibroblasts and the absence of new blood vessels. This is the ideal time for decortication as the fibroblastic proliferation has advanced far enough to make the peel easy to remove. It wipes away in sheets. Bleeding does not occur as the vascular proliferation from the lung has not yet occurred to any degree. Infection had not occurred in this case, and we find few leukocytes in the peel.

Case 3, on admission, showed hemolytic streptococci on aspiration of the hemothorax, but subsequently became sterile. The microscopic sections show advanced fibrosis of the peel with some leukocytic infiltration on the lung side, but little deep in the peel. The vascularity is marked, and Figure 9 shows this intense vascular proliferation. These cases tend to bleed more during decortication. This peel is nine weeks old.

In Case 4 futile efforts were made to evacuate the hemothorax by aspiration. The hemothorax became infected with staphylococcus aureus hemolyticus, coagulase positive, and for some time prior to decortication, was septic. This peel, ten weeks old, shows the same general fibrosis and vascularity as the peel in Case 3 but in addition shows intense leukocytic infiltration. Figure 10 shows this leukocytic infiltration and the usual vascularization.

The peel from Case 7 on low-power magnification shows the same general features as these others. In addition, small miliary tubercles, giant cells, and microscopic areas of necrosis characteristic of tuberculosis are seen. These features are well shown in Figure 11. In Case 4, the modification of a constrictive fibrinopleurisy membrane or peel by pyogenic infection is demonstrated. This section of Case 7 demonstrates a tuberculous infection of a similar membrane or peel.

In comparing these sections it is readily apparent that all represent the same process, namely, the progressive fibrosis of a fibrin layer deposited over the pleural surfaces. Vascularization follows, and the various infecting organisms elicit the same tissue responses here as they do in other tissues. It is the fibrosis, however, that binds down the lung and creates thereby the pleural pocket which leads to chronicity.

In summary, it is well to emphasize that fibrino-pleurisy will occur whenever an effusion of some magnitude persists in the pleural space long enough for fibrin to be laid down over the pleural surfaces and become organized. Once this process is well established, simple drainage by whatever means frequently fails to bring about pulmonary re-expansion with obliteration of the pleural pocket. Chronic empyema ensues and persists until the space is obliterated. This can be accomplished by either collapsing the chest wall into the pocket or liberating the lung and allowing it to reoccupy the space. Modern anesthesia and antibacterial agents have made excision of the empyema pocket feasible. This allows re-expansion of the lung. Respiratory capacity is salvaged by this procedure and hospital stay and disability greatly shortened. Decortication is applicable to bacterial empyemas resulting in constrictive fibrinopleurisy as to those developing secondary to a clotted hemothorax. Streptomycin may bring certain tuberculous empyemas occurring without underlying cavitary disease into the same category as other becterial empyemas.

Finally, here is a word of recommendation for early adequate drainage of all pleural effusions, by frequent aspiration till the pus is too thick for the needle and then, if necessary, by costectomy. The best decortication is the one avoided by early adequate pleural drainage, and the best "deribbing and unroofing" is the one avoided by decortication if the needle and tube have been either too little or too late.

Discussion

L. HAYNES FOWLER, M.D.: This has been very interesting to me. In the army we had quite a little experience with traumatic hemothorax, chiefly with noninfected cases. I can only reiterate what Dr. Jensen has said. In following the work of Dr. Burford who was stationed near us, I found that the results from decortication were remarkable. The ease with which decortication of the lung is accomplished in the early cases is really astounding. It is a most satisfying experience to open a chest and see the lung bound by a thick fibrinous layer. With all the pressure the anesthetist can give, the lung will not expand. Peel that layer off, the anesthetist expands the lung, and it comes out like a balloon right under your eyes.

Later in the war we had a few cases of infected pleural effusion and empyema in which we did this procedure. Although the x-ray pictures did not look as nice as those with simple hemothorax, the clinical results were good in the few cases we had. I haven't had the opportunity to do any since returning to civilian life. It is a question of judgment as to how long to wait for expansion before operating. I am sure Dr. Jensen will agree that the sooner we can decorticate, the easier it will be.

I was glad to hear Dr. Jensen discuss the question of sterile pleural effusion. I recently had a case of a young man who had a pneumonia. The pneumonic process had cleared up as far as the internist could tell, but the patient had effusion in the chest and was running a septic temperature. I aspirated the chest and took off a couple of hundred cubic centimeters of clear straw-colored fluid. This was reported by the laboratory as negative as far as smear and culture were concerned. The patient continued to run a septic temperature, and an x-ray showed a large shadow due to pocketed fluid in the posterior right chest. He had been on penicillin. I decided to aspirate again and aspirated 900 c.c. of clear sterile fluid. The pocket disappeared and the temperature dropped to normal and the patient got well. I don't know how to explain it, but we may be coming to the stage with penicillin and sulfonamides when we will have to pay more attention to complete, thorough, and more frequent aspiration of apparently sterile fluid from the chest.

I want to thank Dr. Jensen for a very fine and interesting presentation.

Thomas J. Kinsella, M.D.: There is one point which I would like to bring out. There is considerable difference between the thin serous effusion of a tuberculous pleurisy with effusion and the fluid of high fibrin content following a pneumonia or in a hemothorax. The former, lying in a pleural membrane but slightly damaged, frequently absorbs in a matter of days, weeks or months, leaving but little evidence of its former presence except an obliterated pleural space. The latter, because of the high fibrin content and its deposit on the pleural surfaces, soon comes to lie in a fibrin-lined pocket from which it is not absorbed. If the fluid is not removed, additional fibrin is deposited and the lung becomes bound down in the collapsed position and loses its function.

To avoid this, aspiration must be started early and carried out frequently (once or twice daily) and completely. Only in this way can we obtain results following empyema and hemothorax by aspiration alone. Once fibrin becomes deposited in appreciable amounts, it tends to increase, and then you are in a jam. If bacteria were present, digestion of the fibrin mass by enzymes from the bacteria and the leukocytes might take place, but this does not occur in the sterile exudates. Fibrin solvents may be of use, but if results are not obtained promptly, decortication is mandatory if the function of the lung is to be restored.

Nathan K. Jensen, M.D.: The remarks of Dr. Fowler are well made. In the one case presented tonight, the pleural fluid contained a nonhemolytic streptococcus which misled us and we missed the tuberculous infection until we obtained sections of the peel.

Doctor Kinsella I would answer this way. If a patient developing an empyema never gets any chemotherapy, the migration of leukocytes into the fluid is intense and it rapidly becomes purulent fluid. The leukocytes liberate trypsin which digests the fibrin. If the pleural effusion is sterilized by chemotherapy or if it occurs as the result of hemorrhage, the fibrin content remains high. Unless it is quickly and completely aspirated, fibrin is laid down on the walls of the pocket, and organization proceeds rapidly.

Humanity has always shunned responsibility. Even today, though there is widespread intellectual acceptance of the concept that much disease is preventable, the emotional attitude is not much altered and illness is considered an intrusion, a misfortune due to factors beyond control of the individual. As a whole we have not yet awakened to the idea that the health of men and women is their own responsibility.—Edward J. Stieglitz, M.D., A Future for Preventive Medicine, The Commonwealth Fund, 1945.

TEN-YEAR HEART STUDY AT UNIVERSITY

About 300 Saint Paul and Minneapolis businessmen between the ages of forty-five and fifty-four are being selected to serve as volunteer "human guinea pigs" at the University of Minnesota in a ten-year study of factors influencing the development of arteriosclerosis and hypertension.

The study, conducted under the direction of physiologist Dr. Ancel Keys, will attempt to discover whether habits of diet and physical activity will prevent or delay the development of degenerative cardiovascular disease. Effects of worry and nervous tension also will be carefully studied.

Men participating in the study will undergo a thorough examination of their cardiac and vascular conditions once each year for five years at the University laboratory of physiological hygiene, then will be checked intermittently by investigators for the next five years. Invitations to participate in the study have been sent out to employes of twenty-three Twin Cities business organizations who are in the proper age group. Participants will be selected from the volunteers.

A special group of the 300 participants will be composed of thirty men who have been following a systematic program of exercise for a considerable period. From this group Dr. Keys hopes to obtain information as to any beneficial or harmful effects of systematic exercise after the age of forty.

Supported by the United States Public Health Service, the project has been endorsed by the Heart Committee of the Minnesota State Medical Association and by the Hennepin and Ramsey County Medical Societies.

USE OF RURAL HOSPITALS INCREASES

Rural Minnesotans are losing their "prejudice against going to a hospital except as a last resort."

That is the conclusion of a University of Minnesota sociologist who has just completed a study of the distribution and use of Minnesota hospitals.

The greatest increase in the use of hospital beds between 1930 and 1946 has been in rural counties with no towns of more than 2,500 population. Hospital beds in those counties were only 50 per cent used in 1930; they were 74 per cent used in 1946.

The study also showed that there are fewer small hospitals in the state than in 1930, but that the number of hospital beds has increased from 24,974 to 31,952. Of this increase of 6,978 beds, 80 per cent have been for mental patients. In spite of additional facilities there are still thirteen rural counties without hospitals. Two-thirds of the hospital beds in Minnesota are in the four counties with the largest urban centers: Hennepin, Ramsey, St. Louis and Olmsted.

Small general hospitals with fifteen beds or less—too small for efficient operation—have tended to disappear, the study showed. There were less than half as many in 1946 as there were in 1930.

Without accurate knowledge... of human anatomy and physiology, without stethoscope or electrocardiograph, it is small wonder that physicians of the 16th Century were helpless before many of the conditions for which present day medicine possesses efficient treatment.

Present day knowledge of the anatomy and physiology of the heart and respiratory tract has led to the widespread use of

In Memoriam

ARNT G. ANDERSEN

Dr. Arnt G. Andersen of Minneapolis passed away November 1, 1947 at the age of sixty-six.

Dr. Andersen was born in Minneapolis, December 31, 1880. He graduated from the University of Minnesota medical school in 1904 and interned at St. Barnabas and Swedish hospitals in Minneapolis. He practiced at Hillsboro, North Dakota, from 1904 to 1914 before moving to Minneapolis. He took postgraduate work in Vienna in 1910 and again in 1927.

He was a member of the American College of Surgeons, the Hennepin County Medical Society, the Minnesota State and American Medical Associations. He had a captain's commission during World War I and served on the Mexican border and in the national home guard. For his services in World War II, he was awarded the selective service medal and certificate of merit. He was a member of Our Saviour's Lutheran church, Scottish Rite bodies, Zuhrah Temple of Shriners' Legion of Honor and Masonic Order of Hillsboro, North Dakota.

Dr. Andersen is survived by his wife, two sons, Arthur R. of Minneapolis, and Wagner L. of St. Cloud, and a daughter, Mrs. Noel M. Kiefer of Skokie, Illinois.

H. MILTON CONNER

Dr. H. Milton Conner, former consulting physician at the Mayo Clinic and Assistant Professor of Medicine at the Mayo Foundation, died October 18, 1947, following an illness of fifteen years.

Dr. Conner was born May 21, 1881 at Morrison, Illinois. He attended high school at Merrill, Kansas, and the Hiawatha Kansas Academy and obtained his M.D. degree in 1909 at the Kansas Medical College, Topeka, Kansas. His interne year was spent at Stormont Hospital in Topeka, and he took postgraduate work as a special student in pathology at the College of Physicians and Surgeons of the University of Illinois in 1910. He was Professor of Pathology at the Kansas Medical College from 1910 to 1913 and practiced in Topeka from 1910 to 1918. He became Assistant in Surgical Pathology at the Mayo Clinic in 1918 and Assistant Professor of Medicine at the Mayo Foundation in 1920.

Dr. Conner was a fellow of the American College of Physicians, the Central Society for Clinical Research, the Minnesota Society of Internal Medicine, the Southern Minnesota Medical Association, the Olmsted-Houston-Fillmore-Dodge County Medical Society and the Minnesota State and American Medical Associations. He was also a member of Sigma Xi.

Dr. Conner married Pana Charlotte Adamson, June 18, 1902. He is survived by his widow and two daughters, Mrs. J. Stuart McQuiston of Cedar Rapids, Iowa, and Mrs. H. C. Ochner of Indianapolis, Indiana.

HARRY LEE D'ARMS

Dr. H. L. D'Arms of Hector, Minnesota, died September 9, 1947 at the University Hospital. He was seventy-nine years old.

Dr. D'Arms was born in Stillwater, Minnesota, May 14, 1868. After graduating from the Stillwater High School, he attended the medical department of the University of Michigan in 1888. In 1891 he transferred to the University of Minnesota medical school, from which he graduated in 1892. After a year's internship at the Minneapolis City Hospital, he practiced for five years at McKinley and Eveleth before going to Hector in 1898. From 1910 to 1912 he served as county coroner.

On September 27, 1893, he married Maude O. Bearley of Minneapolis and both lived to celebrate their golden wedding in 1943. He is survived by his wife and two brothers.

Dr. D'Arms was an ardent worker for Hector and its community. In early days, he was organist for several churches in the town. In World War I, a boys and girls victory campaign was organized in Renville County with Dr. D'Arms as chairman. With the assistance of Mrs. D'Arms, more than their quota was raised.

He was a member of the Camp Release County Society, the Minnesota State and American Medical Associations.

PAUL W. GAMBLE

Dr. Paul W. Gamble, a member of the Gamble Clinic at Albert Lea, Minnesota, passed away September 14, 1947, at the age of forty-nine. Death was due to cancer of the lung. His death followed that of his brother, J. Will Gamble, some six weeks previous who was also a member of the Gamble Clinic.

Dr. Gamble was born July 25, 1898, in St. Paul. He graduated with a degree of B.S. from the University of Minnesota in 1922 and an M.D. in 1924. Internship was served at Abbott Hospital, Minneapolis, and the Ancker Hospital, St. Paul.

In 1924, he began practicing in Albert Lea with his brothers, Will and Ross, in the Gamble Clinic. He was active in numerous religious, civic, fraternal, and professional organizations. He was a member of the First Baptist Church and served as the president of its Board of Trustees. He served one term as a member of the Albert Lea district school board, was a member of the Chamber of Commerce, the Rotary Club and a leader in the Shellrock district of the Boy Scouts of America. During World War I, he was in the Student Army Training Corps and belonged to the American Legion.

In the past, he was president of the medical staff of Naeve Hospital and at the time of his death was a member of the planning board for the hospital addition now under construction. He was president of the Freeborn

FOR BETTER NUTRITIONAL HEALTH IN THE AGED

Impaired strength and poor general health in the aged, which have so erroneously become associated with senility, are in reality often due to no more than a state of subnutrition. Food dislikes, personal idiosyncrasies, masticatory difficulties, and digestive abnormalities are the usual contributing factors. The use of an easily digested, nutritious food supplement can do much in preventing these nutritional deficiencies, and in giving new strength and vigor to patients well advanced in years.

The delicious food drink made by mixing Ovaltine with milk is advantageously employed in augmenting the nutrient intake of the aged. This well rounded dietary supplement imposes no digestive burdens, and provides in generous amounts the very nutrients needed. Because of its low curd tension, it leaves the stomach quickly, and is easily digested. The table indicates its rational nutritional composition. Two or three glassfuls daily bring to full nutritional acceptability even a fair diet.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

*Based on average reported values for milk.

(Continued from Page 1302)

County Medical Society at the time of his death and a member of the Minnesota State and American Medical Associations.

In 1924, Dr. Gamble married Jeanette B. Northam of Minneapolis who, with three children, survives.

ALFONSO GRANA

Word has been received of the death of Dr. Alfonso Graña, which occurred on August 26, 1947, in Uruguay.

Dr. Graña was born June 3, 1912. He came to the Mayo Foundation in November, 1945, on a fellowship of the Guggenheim Memorial Foundation. Previous to this time he was an investigator for the Institute of Experimental Medicine at Montevideo, Uruguay. While he was in Rochester Dr. Graña studied at the Laboratory of Physiology at the Institute of Experimental Medicine. He left in July, 1946, to return to Uruguay.

HOWARD ELMER JOHNSON

Dr. Howard E. Johnson of Bird Island died from a heart attack, October 26, 1947, at the age of thirty-six.

A native of Benson, Minnesota, Dr. Johnson practiced at Ortonville before locating in Bird Island four years ago.

Dr. Johnson was secretary of the Renville County Medical Society and a member of the Minnesota State and American Medical Associations. He is survived by his wife and two children—Mary, aged five, and Francis, aged three.

NIELAMBER C. JOSHIE

Dr. N. C. Joshie, a native of India and a former fellow at the Mayo Foundation, Rochester, Minnesota, was assassinated recently in India.

He was born at Almora, India, in 1888. He received his medical degree from the Medical College of Lahore, Punjab University, India, in 1913. After serving internships in Indian government hospitals from 1913 to 1917, he took a three-year fellowship in surgery at the Mayo Foundation. He returned to India in 1920, and it is reported he had planned the construction of a clinic at Dehra Dun in India when death came.

EDWIN JOHN KEPLER

Dr. E. J. Kepler, a member of the staff of the Mayo Clinic, was found dead aboard his cabin cruiser on Lake Pepin on October 20, 1947.

Dr. Kepler was born January 22, 1894, in Erie, Pennsylvania. He obtained a B.S. degree from Pennsylvania State College in 1916 and an M.D. degree from the University of Minnesota in 1924. After interning at the Philadelphia General Hospital, he took a three-year fellowship at the Mayo Foundation. He became an Associate in a section of the Division of Medicine in the Mayo Clinic and an Assistant Professor of Medicine in the Mayo Foundation.

Dr. Kepler was a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State and American Medical Associations.

He is survived by his widow and two daughters.

MAY-O-LITE Helps Solve Reflection Problem

As you know, surfaces of glasses reflect light. This in turn, produces out-of-focus "ghost images." These reflections interfere with the transmitted image light, reduce definition and contribute to eye strain.

Usually this is considered the normal burden of a person who wears glasses. This need no longer be so. By application of our Low Reflection Lens Coating, most of these out-of-focus "ghost images" are converted into transmitted light, providing more transparent glass.

Let's see what this amounts to.

Our Low Reflection Lens Coating,

1. **Reduces out-of-focus surface reflections 75% to 90%.**
2. **Improves image definition.**
3. **Increases transmission of light—more transparent glass.**
4. **Hardens the lens surfaces—reducing surface scratching.**
5. **Provides better vision—less eye strain.**

Developed for the armed services during the war as a means to improve image definition in military instruments, our Low Reflection Lens Coating is now available to your patients.

Explain this revolutionary new process to your next patient! It is available through most manufacturing and dispensing opticians. Write for descriptive pamphlet and coated sample of glass, today.

MUHLENBURG KELLER KNAUFF

Dr. M. K. Knauff, of Saint Paul, passed away July 17, 1947, at the Miller Hospital after an illness of six weeks. Muhlenburg Keller Knauff was born in Philadelphia, Pennsylvania, on May 16, 1868. He was the son of Henry W. and Catherine Eliza (Keller) Knauff, with whom he came to Saint Paul in 1883. Here he completed his high school education and then returned to Philadelphia University for his academic education. In 1895 he was graduated from the University of Minnesota Medical School, and then served his internship at Ancker Hospital, Saint Paul.

Dr. Knauff was associated with Dr. Bertram Sippy prior to serving in the Spanish American War as the Regimental Surgeon of the 1st Cavalry Division at Fort Keogh, Montana. On June 20, 1899, he was married to Anna Lillian Munson. In 1901 he practiced medicine and operated the hospital in Two Harbors, Minnesota. During this period he served two terms as the mayor of Two Harbors and during the severe outbreak of typhoid fever in 1912, he was instrumental in securing for the city a safe water supply.

In 1914 he sold his hospital and with Mrs. Knauff went to Germany for further study. Later he went to England where he took postgraduate work in orthopedics under Sir Robert Jones. He returned to Saint Paul and established a medical practice in which he was active until May 27, 1947, when taken ill.

In 1945 he was honored with the fifty-year club plaque. He was a member of Nu Sigma Nu Medical fraternity. He served generously on the out-patient staff of Ancker Hospital and Wilder Charity Dispensary.

Dr. Knauff was a charter member of the Reformation Church of Saint Paul and took an active part in all the activities of the church. He was also active in the Boy Scout work of the church, and at the time of his death, was a member of the Board of Directors of the Northwestern Theological Seminary of the United Lutheran Church of America. He was a member of the Spanish American War Veterans' Wirth Bagley Post No. 2, Saint Paul.

Dr. Knauff was especially fond of music and poetry. He had written poems as a hobby for many years and was a member of the League of Minnesota Poets.

He is survived by his wife, Anna, and a sister, Mrs. Emily Marshall of Minneapolis.

JAMES ROLLIN MANLEY

Dr. James R. Manley, well known obstetrician and gynecologist of Duluth, passed away October 21, 1947, at the age of sixty-two. He had been elected first vice president of the Minnesota State Medical Association to take office in 1948.

Born March 21, 1885, in Bellona, New York, Dr. Manley came to Duluth in 1891. He obtained his medical degree from the University of Minnesota in 1908 and interned at St. Mary's Hospital, Duluth. After practicing at Niagara, North Dakota, from 1909 to 1913, he took postgraduate work at the Chicago and New York Lying-In Hospitals. He also spent a year in Vienna in 1925.

North Shore Health Resort

Winnetka, Illinois

A completely equipped sanitarium for the care of nervous and mental disorders, alcoholism and drug addiction offering all forms of treatment, including electric shock.

SAMUEL LIEBMAN, M.S., M.D.

225 Sheridan Road **Medical Director** **Phone Winnetka 211**

Dr. Manley was a member of the American College of Surgeons, the American Board of Obstetrics and Gynecology, the Minnesota Obstetrical Society, the Interurban Academy of Medicine, the Central Association of Obstetricians and Gynecologists, and in 1937 was president of the St. Louis County Medical Society. He was also a former chief of staff of St. Luke's and St. Mary's Hospitals. In 1929, he was called to give a series of lectures on obstetrics by the Universities of Nebraska and Oklahoma. He was a member of the St. Louis County Medical Society, the Minnesota State and American Medical Associations.

In 1910, Dr. Manley married Dorothy L. Lucke, who survives him. He is survived also by a daughter, Mrs. Jesse D. Bradley, and a son, James R. Manley, Jr., a brother, Howard G. Manley, and his father, R. F. Manley—all of Duluth.

WILLIAM AUSTIN O'BRIEN

Dr. W. A. O'Brien, Professor of Preventive Medicine and Health Education at the University of Minnesota Medical School and well known for his radio broadcasts and syndicated health articles, died suddenly of a cerebral hemorrhage on November 15, 1947, at the age of fifty-four.

Born in Fairbury, Illinois, February 28, 1893, Dr. O'Brien attended St. Bede college at Peru, Illinois, and Notre Dame University. He graduated from the St. Louis University School of Medicine in 1913 and interned at Mt. St. Rose Hospital and St. John's Hospital, both in St. Louis.

He practiced medicine in Detroit, Michigan, and served from 1919 to 1921 with the Detroit Department of Health. During World War I he served as first lieutenant in the Army Medical Corps with the 15th Cavalry at Fort Bliss, Texas.

He did postgraduate work at the University of Minnesota from 1921 to 1923 when he became an instructor in pathology. He became a full professor of Preventive Medicine and Health Education in 1940.

Dr. O'Brien was a member of the Board of Directors of the American Cancer Society and president of the Minnesota branch. For fifteen years he had been a member of the Board of the Hennepin County Tuberculosis Association and had been chairman of the Association's annual Christmas Seal Campaign for the past ten years.

Dr. O'Brien married Dorathy Beharrell on March 3, 1919, and to this union were born two children, William Austin, Jr., and Margaret Jean. Mrs. O'Brien passed away on March 10, 1934. On November 28, 1935, he married Virginia Mary Benton of Minneapolis.

He is survived by his wife, and six children, William Austin, Jr., Margaret Jean, Kathleen Ann, Patrick James, Michael Paul and Molly.

HENRY W. REITER

Dr. Henry W. Reiter of Shakopee, Minnesota, died October 30, 1947, at the age of eighty-three.

Dr. Reiter was born November 15, 1863, at Rockville, Minnesota. Graduating from the State Normal College at St. Cloud in 1889, he taught school for a year before attending the University of Minnesota medical school where he graduated in 1893. He practiced in Clara City and Kerkhoven from 1894 to 1897, then located at Shakopee.

Dr. Reiter served as a member of the Shakopee Board of Education, was city health officer at different times, and was coroner from 1914 until last year. During World War I, he was chairman of the local draft board.

In 1904, Dr. Reiter married Anna Mary Marschall, who died several years ago. They had no children.

Dr. Reiter was a member of the Scott-Carver County Medical Society, the Minnesota State and American Medical Associations.

ROBERT E. MORRIS

Dr. R. E. Morris, a physician on the staff of Mineral Springs Sanatorium at Cannon Falls since May, 1947, died at Colonial Hospital, Rochester, October 25, 1947, at the age of thirty-two.

Dr. Morris is survived by his wife and two sons, Robert Earl and John.

ROOD TAYLOR

Dr. Rood Taylor, well-known pediatrician of Minneapolis, passed away on May 2, 1947. Dr. Taylor had retired from active practice some time ago.

Rood Taylor was born May 12, 1885, at Columbia, South Dakota. He received his M.D. degree from the University of Michigan in 1910 and interned from 1910 to 1912 at the Northern Pacific Hospital in Brainerd, Minnesota. From 1914 to 1917, he was a teaching fellow in pediatrics at the University of Minnesota Medical School and received the degree of Ph.D. in Pediatrics from the University of Minnesota in 1917. He became an associate in pediatrics at the Mayo Clinic in July, 1917, and left in February, 1919, to practice pediatrics in Minneapolis. He was an associate professor of pediatrics at the University of Minnesota.

Dr. Taylor, before his retirement, was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations, the American Pediatric Society, Phi Beta Pi, and Sigma Xi medical fraternities.

HENRY EDWARD WUNDER

Dr. H. E. Wunder, recently Medical Director of Mudcura Sanatorium at Shakopee, died in October while visiting a daughter in Milwaukee. He was seventy-seven years of age.

Born in Ohio, June 2, 1869, Dr. Wunder settled in Ely, where for twenty years he was physician for the Oliver Iron Mining Company. He then moved to Duluth where he practiced until the late twenties.

He was a former member of the Scott-Carver County Medical Society and the Minnesota State and American Medical Associations.

◆ Reports and Announcements ◆

AMERICAN COLLEGE OF SURGEONS

The American College of Surgeons will hold six sectional meetings, one of which will be at the Nicollet Hotel, Minneapolis, March 15 and 16, 1948. These meetings are open not only to members but to the medical profession at large and to hospital personnel. Addresses and panel discussions will be held daily on subjects in each field of surgery by authorities in the various spheres. Headquarters are at 40 E. Erie Street, Chicago 11, Illinois.

ARMY INTERNSHIPS AND RESIDENCES

The Army in 1948 is offering 200 rotating internships, open to recent graduates. Pay schedules and allowances will be those of a first lieutenant.

There will also be 350 residences for periods of one, two, and three years in the various specialties. These will be available in the various Army General Hospitals to regular Army medical officers or applicants for the regular Army who are graduates of approved medical schools and have had a year of rotating internship in an approved hospital.

The Technical Information Officer in the office of the Surgeon General, Washington, D.C., may be contacted for further information.

CHICAGO MEDICAL SOCIETY

The Chicago Medical Society will hold its Fourth Annual Clinical Conference at the Palmer House, Chicago, on March 2, 3, 4 and 5, 1948.

This Conference represents an intensive four-day postgraduate course for the general practitioner and specialist with leading teachers from all over the United States.

The morning and afternoon lectures, the panel discussions, the clinicopathologic conference and the roundtable discussions each noon will cover newer methods of diagnosis and treatment which will be of interest to all physicians. The scientific and technical exhibits will be of the highest quality and attractively presented.

The Chicago Medical Society is extending all physicians a most cordial invitation to come to Chicago for the Conference. Reservations should be made direct with the Palmer House.

MEDICAL SOCIAL SERVICE

A continuation course in medical social service, open to all members of the American Association of Medical Social Workers and practicing workers in the field, was

Rx *for Your* FLORIDA HOLIDAY

PINE-AIRE is ideal for your winter vacation. It is located right on the water's edge of the Gulf of Mexico, 26 miles from Ft. Myers. Bathing at your doorstep . . . excellent fishing. Wonderful climate.

We specialize in comfort and cuisine. Our select clientele is made up of members of the professional group who appreciate the utmost in fine living.

Send for descriptive folder to PINE-AIRE LODGE, Pineland, Lee County, Florida.

PINE-AIRE LODGE *on the Gulf of Mexico*

held at the University of Minnesota Thursday, Friday and Saturday, November 20, 21 and 22, 1947.

With the increasing use of the consultation process as a technique used by all medical social workers, the subject selected for discussion was "The Consultation Process in the Field of Medical Social Work."

Leading the discussion was Mrs. Elizabeth E. Payne, associate professor of the graduate school of social work at the University of Southern California. In addition, several members of the group attending presented their own material on consultations in the fields of public assistance programs, public health or medical programs, federal or state hospitals and private hospitals or clinics.

MICHIGAN POSTGRADUATE CLINICAL INSTITUTE

The second annual Michigan Postgraduate Clinical Institute will be held at the Book-Cadillac Hotel, Detroit, Wednesday, Thursday and Friday, March 10, 11 and 12, 1948. Forty-nine outstanding clinicians and lecturers will present a concentrated three-day postgraduate course covering the newest developments in medicine, surgery, obstetrics, pediatrics, dermatology, ophthalmo-otolaryngology and general practice.

Two evening sessions will be held, the Wednesday night presentation being a "question box" and the Thursday evening program being a panel discussion on "First Aid to the Acutely Injured Patient."

All members of the American Medical Association and of the Canadian Medical Association are cordially invited to attend the Michigan Postgraduate Clinical Institute. No registration fee.

MISSISSIPPI VALLEY MEDICAL SOCIETY 1948 ESSAY CONTEST

The eighth annual essay contest of the Mississippi Valley Medical Society will be held in 1948. The society will offer a cash prize of $100, gold medal, and a certificate of award for the best unpublished essay on any subject of general medical interest (including medical economics and education) and practical value to the general practitioner of medicine. Certificates of merit may also be granted to the physicians whose essays are rated second and third best. Contestants must be members of the American Medical Association who are residents of the United States. The winner will be invited to present his contribution before the thirteenth annual meeting of the Mississippi Valley Medical Society to be held in Springfield, Illinois, September 29, 30, October 1, 1948, the society reserving the exclusive right to first publish the essay in its official publication, the *Mississippi Valley Medical Journal* (incorporating the *Radiologic Review*). All contributions shall be typewritten in English in manuscript form, submitted in five copies, not to exceed 5,000 words, and must be received not later than May 1. 1948. The winning essay in the 1947 contest appears in the January, 1948, issue of the *Mississippi Valley Medical Journal* (Quincy, Illinois).

Further details may be secured from Harold Swan-

CHICAGO MEDICAL SOCIETY

Fourth Annual Clinical Conference

March 2, 3, 4, 5, 1948

Palmer House, Chicago

Four full days of lectures, panel discussions and clinicopathologic conferences presented by outstanding speakers and teachers from all sections of the country.

Scientific exhibits well worth seeing.

Technical exhibits on the newer drugs and equipment.

If you have attended previous Conferences, you probably are planning to come again in 1948. If you have not yet attended, you should make plans now to be present.

MAKE YOUR RESERVATION AT THE PALMER HOUSE

berg, M.D., Secretary, Mississippi Valley Medical Society, 209-224 W. C. U. Building, Quincy, Illinois.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and Country Club in Saint Paul on the evening of November 18, 1947.

Following dinner at 6:30 p.m., the scientific program was presented, consisting of two inaugural theses. Dr. Clifford O. Erickson, Minneapolis, presented as his thesis, "Psychoses Arising in Combat," while Dr. Philip K. Arzt, Saint Paul, spoke on "Electroencephalogram Findings in Central Nervous System Disease."

MINNESOTA SOCIETY OF ANESTHESIOLOGISTS

On August 30, 1947, the Minnesota Society of Anesthesiologists was formed. The following officers were elected: Ralph T. Knight, M.D., Minneapolis, president; T. Harry Seldon, M.D., Rochester, vice president; Frank Cole, M.D., Duluth, secretary-treasurer. All physicians interested in anesthesiology are invited to apply for membership in this society. Address such applications for membership to Frank Cole, M.D., chairman, Membership Committee, St. Mary's Hospital, Duluth.

SOUTHWESTERN MINNESOTA MEDICAL ASSOCIATION

The 1947 annual meeting of the Southwestern Minnesota Medical Association was held at Worthington on October 28.

Principal speaker at the evening meeting was Dr. Clarence Dennis, professor of surgery at the University of Minnesota Medical School, who talked on "Small Bowel Obstructions."

Dr. F. L. Schade, Worthington, was elected president of the association, while Dr. John Lohmann, Pipestone, was named president-elect. Dr. Gerrit Beckering, Edgerton, was elected vice president, and Dr. B. O. Mork, Jr., Worthington, was re-elected secretary-treasurer. Named to the board of delegates were Dr. Schade and Dr. S. A. Slater, Worthington, with Dr. Lohmann and Dr. Mork as alternates. Dr. C. L. Sherman, Luverne, and Dr. W. A. Piper, Mountain Lake, were chosen members of the board of censors.

WRIGHT COUNTY SOCIETY

The annual meeting of the Wright County Medical Society was held at the home of Dr. John Catlin in Buffalo on October 7. A scientific program was presented in the afternoon, followed by a banquet at six o'clock and election of officers of the society.

Dr. Hartwig Roholt, Waverly, was elected president; Dr. Vincent Ryding, Howard Lake, vice president, and Dr. John Catlin, Buffalo, secretary-treasurer. Twenty-two physicians attended the meeting.

Woman's Auxiliary

MEMBERS of the Medical Auxiliaries are deeply shocked to learn of the death of Dr. Wm. A. O'Brien. His friendly smile and talks will be missed by all.

Olmsted-Houston-Fillmore-Dodge

Members of the Olmsted-Houston-Fillmore-Dodge County Medical Auxiliary held their November meeting at the Mayo Foundation House. Miss Eleanor Smith, science instructor at the Kahler School of Nursing, led a discussion on "present-day problems of the nursing profession." "Raise the nurses' status," suggested Miss Smith. "By making the professional status of nursing more attractive, the present shortage of nurses will be eased," she said.

Mrs. W. A. Merritt of Rochester presided over the meeting and Mrs. A. B. Hagedorn poured.

On Tuesdays and Fridays members meet at the home of Mrs. M. S. Henderson in Rochester, and work on cancer dressings.

Redwood-Brown

The Redwood-Brown County Medical Society and Auxiliary entertained the Blue Earth and Nicollet County Societies on October 22 at New Ulm. After a dinner served at Turner Hall, the Auxiliaries enjoyed a program which included a talk by Mrs. Carl Fritsche on her recent trip to Alaska.

Renville County

The members of Renville County Auxiliary were entertained at a turkey dinner when the doctors met for their annual meeting at Hector on November 11. Guest speaker for the evening was Dr. W. A. Hanson of Minneapolis. While the doctors held their business meeting, members of the Auxiliary were entertained at the home of Dr. and Mrs. R. E. Erickson. Several subscriptions to *Hygeia* were taken.

IN wishing you a Merry Christmas this year we would capture for you as much of the old time holiday spirit as possible. Accept our sincere thanks for your generous patronage, which has been a source of real encouragement to us in 1947.

Hospital, Saint Paul, and later held a fellowship in ophthalmology, after which he was associated in private practice with Dr. Frank E. Burch, Saint Paul.

* * *

New member of the staff of the Mankato Clinic is Dr. J. Donald Sjoding, who recently completed a three-year fellowship in otolaryngology and broncho-esophagology at the University of Minnesota Hospitals.

After graduating from the University of Minnesota in 1942, Dr. Sjoding served for two and a half years in the medical corps of the army air forces, fifteen months of the period in the India-Burma theater.

* * *

A graduate of the University of Minnesota Medical School in 1929, Dr. Frank P. Light has been appointed chief of the Department of Obstetrics and Gynecology of Long Island College Hospital, succeeding Dr. Alfred C. Beck, who recently resigned. Dr. Light joined the teaching staff of the Long Island College of Medicine in 1935 and was appointed clinical professor of obstetrics and gynecology in 1946.

* * *

Resignation of Dr. Edwin J. Simons, Swanville, as chief of the medical services unit of the State Division of Social Welfare, was announced on October 21. Dr. Simons has resumed his practice at Swanville, where he has been located since his graduation from the University of Minnesota in 1925.

In 1940 Dr. Simons was named a member of the state-wide medical advisory committee of the Division of Social Welfare, and he served in that capacity until January 1, 1942, when he was named chief of the medical services unit. In 1946 he was president of the Minnesota State Medical Association.

* * *

Recently named chief medical consultant for Europe of the International Children's Emergency Fund of the United Nations, Dr. H. F. Helmholz, Rochester, is now in Paris where he is helping to organize and direct a European technical staff of pediatricians, nutritionists, nurses and child welfare consultants in the work of child feeding, health and welfare. Dr. Helmholz has been granted a year's leave of absence from the Mayo Clinic to carry out the European assignment.

* * *

Speaking at a tuberculosis continuation course at the University of Minnesota on October 30, Dr. Percy T. Watson, director of local health services in the State Board of Health, declared that the health of Minnesota's 24,000 Indians and Mexicans was periled by a Federal cut in tuberculosis control funds. Because $30,000 was removed from Federal appropriations, the state sanatorium at Walker was being forced to turn away many Indians with active tuberculosis, Dr. Watson said.

* * *

Vice chairman of the newly organized Lake County Advisory Health Council is Dr. Ralph Papermaster, Two Harbors, who was elected to office at a meeting held in Two Harbors on October 7. The newly formed organization will promote individual and community health, co-operating with officials and agencies interested in public health, co-ordinating the school health program with the community program, and interpreting the health program to the community.

* * *

Physical examinations were done on 127 crippled children at an orthopedic clinic held October 25 in Crookston. At the clinic, which was under the sponsorship of the Red River Valley Medical Society auxiliary, physicians examined the following numbers of children from eleven northwestern counties: Polk, 37; Marshall, 27; Pennington, 12; Red Lake, 8; Roseau, 10; Kittson, 8; Norman, 17; Mahnomen, 8; Clearwater, 3; Clay, 1, and Becker, 2.

* * *

At the annual dinner meeting of the medical faculty of the University of Minnesota, held in Coffman Memorial Union on November 6, Dr. Victor H. Johnson, director of the Mayo Foundation at Rochester, was the principal speaker. Significant developments in the medical school during the past year were reviewed at the meeting, and an outline of future plans was discussed. New medical faculty members were introduced and welcomed at a reception after the dinner.

* * *

Four papers were presented by Dr. M. B. Dockerty, Rochester, at a postgraduate course on tumors held in Galveston, Texas, in November, by the Department of Pathology, the John Sealy Hospital Tumor Clinic and the Postgraduate Division of the School of Medicine of the University of Texas. The four papers were entitled "Malignancies of the Breast," "Carcinoma of the Cervix and Fundus Uteri," "Carcinoma of the Fallopian Tubes and Ovaries" and "Tumors of the Salivary Gland."

* * *

"Dr. Hagen Day" was celebrated on November 16 when residents of Butterfield and the surrounding area gathered to honor Dr. O. E. Hagen, seventy-six-year-old physician who has practiced in Butterfield for forty-four years. Plans for the occasion were worked out by representatives of the village churches, council, school board, community club and school faculty. A special program was held in the local high school auditorium in the afternoon, and tribute was paid to Dr. Hagen for his many years of work in the field of medicine.

* * *

Announcement has been made that Dr. S. C. G. Oeljen, Waseca, has been certified by the American Board of Ophthalmology and will remain in Waseca, limiting his practice to ophthalmology. A graduate of the University of Minnesota, Dr. Oeljen has also studied at Columbia University, New York City, at George Washington University, Washington, D. C., and at the Chicago Eye, Ear, Nose and Throat Hospital. He has taken postgraduate work in Vienna, Austria, under ophthalmologist Dr. Adalbert Fuchs.

* * *

One of sixty prominent Ripon College (Wisconsin) alumni to receive citations at the college's pre-centennial celebration November 1, Dr. J. Allen Wilson, Saint Paul, was honored by the college for his work in the field of

medicine. A graduate of the college in 1922, Dr. Wilson began practicing medicine in Saint Paul in 1930. During the war he served in the navy, being discharged in 1946 with the rank of captain. At present he is a clinical instructor in medicine at the University of Minnesota and a consultant in medicine at the Veterans Hospital.

* * *

A former resident of Ivanhoe, Dr. Arthur R. Andrejek became associated with the Madison Clinic on October 1. After graduating from the University of Minnesota in 1946, Dr. Andrejek served a sixteen-month internship at Henry Ford Hospital, Detroit, Michigan, then took postgraduate work in obstetrics and gynecology for four months before moving to Madison. In addition to Dr. Andrejek, the staff of the Madison Clinic now includes Dr. Walter N. Lee, Dr. Magnus Westby and Dr. Nels Westby.

* * *

As the fifth son of Dr. W. F. C. Heise to enter medical practice with his father in Winona, Dr. Phillip R. Heise joined the staff of the Heise Clinic on November 3. The unique medical family became complete on that date, with father and five sons in practice together.

Dr. Phillip Heise was graduated from the University of Arkansas, served his internship at Baptist Memorial Hospital in Memphis, Tennessee, spent three years in the army medical corps, then took postgraduate work in obstetrics and gynecology at St. Barnabas Hospital, Minneapolis, and John Gaston Hospital, Memphis, before returning to Winona to join his brothers and father at the Heise Clinic.

The U. S. Army and Air Force require 30,000 recruits monthly to maintain personnel to man occupation areas, to train for national defense, and to conduct research and development programs.

The Army and Air Force offer unusual opportunities for interesting careers or for training for future civilian jobs. Enlisted men are entitled to compete for officer's training schools; all personnel may advance their education by enrolling in any of the hundreds of courses offered by the U. S. Armed Forces Institute; pay is high; thirty days of vacation are allowed.

Further information may be obtained from the Military Personnel Procurement Service, Room 5D675, Pentagon Building, Washington 25, D. C.

* * *

Valuable clinical and research data often remain unpublished because a physician does not have time or facilities for checking and editing a manuscript. Submission of manuscripts can thus be delayed and an author's productivity limited. Available now to ease the burden of the physician-writer are the services of an organization called Manuscript Service, Inc.

Located at 6432 Cass Avenue, Detroit 2, Michigan, Manuscript Service, Inc. will provide abstracts of literature, compile data from the literature, suggest methods of assembling or compiling author's material, suggest organization of manuscripts, design tables and charts, verify references, check bibliographies, and compile indexes.

The Ward Burdick medal of the American Society of Clinical Pathologists was awarded to Dr. Charles Sheard, Rochester, at a meeting of the society in Chicago, October 28. The citation was made to Dr. Sheard, who is director of the division of biophysical research at the Mayo Clinic and professor of biophysics in the Mayo Foundation, in recognition of his contributions to the theoretical, experimental and instrumentational developments in the field of spectroscopy, photelometry and spectrophotometry.

At a November meeting in Chicago, the American Academy of Ophthalmology and Otolaryngology elected Dr. Sheard to honorary fellowship in recognition of his contributions to theoretical and applied physiological optics.

November 7 was the one hundredth anniversary of the acceptance of Elizabeth Blackwell as the first woman medical student in the United States.

Eleven medical schools had refused admission to Elizabeth Blackwell in 1847 when the Geneva, New York, Medical School finally accepted her, more or less as an experiment, after a vote of the student body. She was graduated with high honors, the first woman physician in the country.

At present there are approximately 8,000 women physicians in the United States, with 518 licensed in Minnesota as of June 1, 1947. Of sixty-nine approved medical schools, the AMA reported in 1946, only three refuse to accept women as students. At the University of Minnesota Medical School, each class of 100 now has an average of ten women students.

* * *

During October and November, twelve rural school health clinics were held in Goodhue County to give rural school children the same health benefits that are available in town and city schools.

Physicians of Goodhue County traveled to twelve rural schools to inoculate children for smallpox and diphtheria and to administer Mantoux tests.

This year's series of clinics was the third held since 1942 when Goodhue County established the first rural school health clinic of its kind in the country. Cost of the clinics was about fifty cents per child, and county officials estimated that more than 1,500 children took advantage of the voluntary checkup this year.

The clinics are sponsored jointly by the county agent's office, the county Farm Bureau Federation, the county rural schools, and the local physicians.

* * *

Rural counties in Minnesota have only one-fourth as many physicians for every 1,000 persons as the state's more urban counties, it was pointed out recently in a study published by the Minnesota Agricultural Experiment Station.

The survey indicates, however, that urban centers provide medical service for rural people, so the ratio is not as disturbing as it might seem.

Distribution of physicians in Minnesota counties varies from one for every sixty-three persons in Olmsted County, home of the Mayo Clinic, to one physician for every 4,129 persons in Cass County. Hennepin County (Minneapolis) has 480 persons per physician; Pine County has 3,068.

In addition, counties having less than five physicians to serve their entire area are Cook, Lake of the Woods, Hubbard, Clearwater, Kanabec, Traverse, Red Lake, Kittson and Mahnomen.

* * *

With the addition of a general practitioner to its medical faculty, the University of Minnesota Medical School is attempting to strike a better balance between the two approaches to medical work, specialization and general practice.

In line with a growing interest in general practice displayed by both undergraduate and graduate students, the Medical School has secured the services of Dr. Thomas E. Eyres, a general practitioner at Pequot Lakes for nine years, to put a greater emphasis on medical training for that type of work.

For the next year Dr. Eyres will conduct a three-point program: (1) give advice to medical students who plan to enter general practice, (2) assist in arranging continuation study courses for general practitioners, and (3) compile reports on characteristics of teaching in relation to needs of the general practitioner. In addition, during winter and spring quarters, Dr. Eyres plans to teach an elective course on general practice to senior medical students.

* * *

Public health administration in Minneapolis was attacked by Dr. Gaylord W. Anderson, director of the University of Minnesota School of Public Health, in a speech made at a Health Action Committee executive board meeting in Minneapolis, October 22.

Dr. Anderson stated that failure to adopt modern methods of public health administration is costing the people of Minneapolis a heavy price in sickness and money. He accused the city of (1) unwillingness to unify health administration on a joint city-county basis, (2) too much dependence on charitable voluntary agencies for doing essential anti-disease jobs, (3) keeping public health work under the board of public welfare, primarily a relief-administering agency, and (4) failing to change public health emphasis from infectious diseases to today's major problems, such as cancer, heart disease, mental illness.

Urging the city to drop its horse-and-buggy-age methods, Dr. Anderson advocated the setting up of a separate public health department with a chief health officer and semi-legislative responsibilities.

* * *

At ninety years of age, Dr. George D. Haggard is still practicing medicine at his home in Minneapolis.

Born in a cabin north of Rochester in 1857 when Minnesota was still a territory, Dr. Haggard is probably the oldest practicing physician in the state. Thirty-three years of age before he decided to become a physician, Dr. Haggard was graduated from the University of Minnesota in 1893, the oldest man in his class. Shortly after he began practice, he was appointed assistant city health officer in Minneapolis and served in that capacity for four years. He then taught physiology and

chemistry in the medical school for six years. During the early 1900's, while working for the state health department, he battled typhoid, smallpox and poliomyelitis epidemics both in Minneapolis and in northern Minnesota. Shortly before World War I, he was Prohibition Party candidate for governor, gathering 32,000 votes in the election.

Although Dr. Haggard stopped going out of his home more than a year ago, he still sees patients who come to him. Some of them are from families in which four generations have been treated by the aged physician.

* * *

Three Mankato physicians met November 1 with city officials of North Mankato and Parents and Teachers Association representatives to oppose the city's plan to have a second county nurse hired.

Dr. H. J. Nilson, spokesman of the medical group which consisted of Dr. Hobart Johnson and Dr. A. A. Giroux, North Mankato, stated at the meeting that Minnesota hospitals need 2,500 nurses and that an attempt to hire a second county nurse would only aggravate the situation. On that basis Dr. Nilson said he opposed the plan "practically but not in principle."

PTA representatives had stated that there was an urgent need for an additional nurse since the Nicollet County nurse could spend only one day per week in North Mankato's public school. After the local superintendent of schools pointed out that there was not enough work for a full-time school nurse, the city council suggested that the county commissioners could be asked to hire a second county nurse who could be based in North Mankato, serving also as city and school nurse. The protest of the local physicians then arose.

Formation of a cancer control advisory committee was announced on October 30 by Dr. A. J. Chesley, secretary and executive officer of the Minnesota Department of Health. The committee will aid the Division of Cancer Control of the state health department in planning and carrying out a program of cancer control.

Named as members of the advisory group, with organizations they represent, were:

Dr. A. H. Wells, Duluth, Minnesota State Medical Association; Dr. Clayton Swanson, Minneapolis, Minnesota Dental Association; Dr. D. W. Pollard, Minneapolis, Minnesota Hospital Association; Dr. William A. O'Brien,* Saint Paul, Minnesota Division, American Cancer Society; Dr. Owen H. Wangensteen, Minneapolis, University of Minnesota Medical School; Dr. Kano Ikeda, Saint Paul, Minnesota Society of Clinical Pathologists.

Named as members-at-large were: Dr. E. T. Bell, Minneapolis; Dr. James Johnson, Minneapolis; Dr. William W. Will, Bertha; Dr. D. P. Anderson, Jr., Austin; Dr. W. C. Popp, Rochester; Dr. Joseph Bierkson, Rochester, and Sister Patricia, St. Mary's Hospital, Duluth.

* * *

Fifty members of the Bloomington (Minneapolis suburb) 4H Club have launched a project, which may become a nationwide campaign, to raise funds for the battle against heart disease in children.

---

*Deceased.

Under the Bloomington plan, club members will "sponsor" a young calf, taking care of it for a year on a co-operative basis. When the calf has reached top market stage, it will be sold and the proceeds will go into a special fund to cover the cost of treatment for any member who may develop rheumatic fever or any other heart disease. Some of the money may be used for related educational efforts.

The project, which is sponsored by the Minnesota Heart Association, will vary in type as it is taken up by other 4H clubs throughout the state. Some clubs may devote acreage to a special crop of grain for the heart disease campaign instead of raising livestock. Several farmers have already indicated a desire to contribute starting stock to the project. State 4H executives and Minnesota Heart Association officers are convinced that the idea will be taken up on a national scale in a comparatively short time.

* * *

The part played by physicians in the synthesis of science was described by Dr. Richard E. Scammon at the first fall meeting of the Medical History Society in Rochester, October 17.

Principal speaker at the meeting of the society, which was organized one year ago by a group of men interested in medical history, Dr. Scammon is former dean of medical sciences of the University of Chicago and is distinguished service professor emeritus of anatomy at the University of Minnesota. He was introduced to the group by Dr. H. A. Wilmer, Rochester, who commented on Dr. Scammon's versatility as an anatomist, artist, biometrician and scientific historian, adding that many former medical students remember Dr. Scammon for his ability to draw with both hands at the same time while lecturing on anatomy.

In his talk Dr. Scammon described the bringing together of scientific knowledge and scientific workers, a synthesis of science that first took place during the century following the middle 1600's. He traced the formation of scientific societies throughout Europe and the United States, emphasizing the work of numerous physicians in starting and maintaining the trend towards organization. He indicated the possibility of another great synthesis of science in this century and expressed the hope that medical men would be as useful in it as they had in the past.

* * *

Minnesota leads the nation in the hospitalization of tuberculosis patients, it was stated at the annual Christmas Seal dinner of the Minnesota Public Health Association, held October 31 at Hotel Nicollet in Minneapolis.

Authority for the statement was Dr. Herbert L. Mantz, president-elect of the National Tuberculosis Association, who stated that 84 per cent of the deaths from tuberculosis in Minnesota were hospital cases. "This figure reflects the effectiveness of precautionary care undertaken by the state," he said. In comparison Dr. Mantz pointed out that in his home state of Kansas 65 per cent of tuberculosis deaths occur in homes.

Quoting from a 1945 survey by the New York City Tuberculosis and Health Association, Dr. Mantz said that Minneapolis has the lowest tuberculosis death rate among the larger cities of the country.

Other speakers on the dinner program were Dr. Hilbert Mark, Minnesota director of the division of tuberculosis control, and Dr. H. A. Wilmer, author of *Huber the Tuber* and fellow in the Mayo Foundation. Earlier in the day, Christmas Seal workers heard, among other speakers, Dr. James E. Perkins, a former Saint Paul resident, now managing director of the National Tuberculosis Association.

With the election of officers at the meeting, Mrs. John

A. Thabes, Sr., Brainerd, became the first woman president of the organization in its forty-one-year history. Also named to office were N. Vere Sanders, Albert Lea, first vice president; Albert A. Anderson, Buffalo, second vice president; Mrs. Clarke Dodds, Baudette, secretary, and John B. Burke, Saint Paul, treasurer.

* * *

Seventy-five years of public health work were celebrated November 14 when the Minnesota Department of Health observed its diamond jubilee with an all-day session at the Hotel Radisson in Minneapolis.

The celebration was marked by the first annual meeting of the Minnesota Public Health Conference, an organization which supersedes the former state sanitary commission.

During the day, conferences were held for physicians and health officers, public health nurses, environmental sanitation personnel, and health education and school health workers. Among the speakers at the group meetings were Dr. A. J. Chesley, secretary and executive officer of the Minnesota Department of Health, Dr. Dean F. Smiley, consultant in health and physical fitness for the AMA, and Dr. E. L. Tuohy, chief of laboratories at St. Mary's Hospital, Duluth.

At the evening banquet which honored the state organization, Dr. T. B. Magath, Rochester, served as toastmaster, introducing Governor Luther W. Youngdahl and other prominent guests who congratulated Dr. Chesley, state health officer since 1921, on the outstanding achievements of the Minnesota Department of Health. Dr. Floyd M. Feldman, Rochester, president of the Minnesota Public Health Conference, delivered his presidential address at the banquet.

PHYSICIANS

OPENINGS—Established practice in South Dakota; community will arrange for hospital; an excellent opportunity for an ambitious young doctor to build a future.

ENT MAN for group in West; plenty of hunting and fishing; these doctors are willing to meet the terms of "the right man."

INDUSTRIAL POSITION, including directorship of small industrial hospital, Iowa. Ample salary, living quarters, and field for private practice.

AVAILABLE—Internist for locum tenens, Dec. 18. Surgeon for group, residency, or clinic.

MEDICAL PLACEMENT REGISTRY

916 Medical Arts Building, Minneapolis Ge. 7839

"Four offices to serve you"—Minneapolis, St. Paul, Duluth, Long Beach, Calif.

New officers of the Minnesota Public Health Conference, elected at a meeting earlier in the day, are Dr. J. Lawrence McLeod, Grand Rapids, president; Melvina Palmer, Minneapolis, first vice president; S. P. Kingston, Rochester, second vice president, and Dr. Charles E. Sheppard, Hutchinson, treasurer.

* * *

Outdoor living, wild-life conservation, and experimental farming compete with medicine for the attention and time of Dr. M. M. Hargraves, staff member of the Mayo Clinic and state president of the Izaak Walton League.

To Dr. Hargraves conservation means more than maintaining a supply of fish and game; it means the preservation of human values and all natural resources, particularly the soil. With that belief he and four partners recently purchased a farm north of Rochester, a farm with hills, an erosion problem, a spring, a view and possibilities for improvement. There Dr. Hargraves and his associates are putting into practice all principles of conservation, with development of contour fields, elimination of old gullies, and planting of permanent grass. They have a small herd of Holsteins and a herd of Angus beef cattle, all registered animals. A fish pond, to be stocked with bass, bluegill and trout, is planned as soon as a dam can be built below the spring.

Dr. Hargraves, who has been at the Mayo Clinic since 1935, finds little time for rest with his double duties as physician and as state president of the Izaak Walton League. A fairly typical twenty-four hour schedule for him includes a full day at the clinic, a late afternoon or dinner talk to some conservation group in Olmsted County, an evening meeting in the Twin Cities, and a morning look at the farm before starting another session at the clinic. Every other Friday evening he conducts a radio program on fundamental conservation over a Rochester station.

Not content with this, Dr. Hargraves looks forward to the founding of a permanent state educational foundation for conservation, with motion pictures, a speakers bureau, and an annual short course of two or three days at some lake, to inform and educate the public as to the importance of generalized conservation.

HOSPITAL NEWS

More than $1,000,000 will be spent to enlarge Minnesota's oldest and largest mental institution, the St. Peter State Hospital, where construction work on the new expansion project has already started.

Two new buildings, to house 150 senile patients each, will be constructed on the bluffs in the rear of the old receiving ward, while a new service building will house a kitchen, storage rooms and other shops. It is anticipated that when the new buildings are completed, fifty additional attendants and possibly six more physicians will be added to staff the increased facilities.

Construction of a new cattle barn for the institution, to replace the one destroyed by fire a year ago, has already begun, and the work is expected to be completed in January.

* * *

Announcement was made early in November by Dr. W. C. Heiam, Cook, that the modernization and remodeling of the Cook General Hospital had been completed.

The building has been completely rewired, and new plumbing and heating facilities have been installed. An addition has been built onto the structure to house more hospital beds and provide better operational facilities. Floors have been covered with asphalt tile, and the entire building has been repainted. New therapeutic and nursing equipment has been installed. Cost of the remodeling was more than $10,000.

* * *

The problem of coping with increasing operational costs of a hospital was studied at a one-day institute November 13 at Northwestern Hospital, Minneapolis.

Speakers at the meeting included James Hamilton, professor of hospital administration at the University of Minnesota, and Dr. Arthur C. Bachmeyer, director of the University of Chicago Hospital and Clinics.

Thank you doctor,

for a job well done

We wish to take this opportunity to extend our sincere thanks for the excellent co-operation you have afforded our nursing program over the past year. The many prospective candidates that you have referred to us have made it possible for the Nursing School to furnish an added number of well trained nurses to the medical profession. With your splendid support this work will continue to grow.

The two-fold purpose for which this school was founded —to offer to the student a short but complete course in nursing and also próvide to the doctor and hospital a supply of capable nurses, well trained in patient care—can only be realized to the fullest with your support.

The need for additional nurses is great. The gratifying way in which you continue to assist in increasing the number of student nurses now in training indicates an early relief to this shortage.
